Don't know whther it was the original idea that all water was to be sold on the west side of the Platte river. Agents' campaign was to persuade people that water could be kept on the west side, but did not meet with much success; represented to a purchaser that there was sufficient water supply, but it would not be guaranteed any more than other ditch companies would guarantee the supply; we put our money into it, and had confidence in it, and would sell so many shares of stock which represented so many acre-feet; anticipated shortage, but expected that under normal conditions the purchaser would get his water; would talk of 10 acre-feet of water to a share, and talks it yet; has not represented that each holder of a share would get 10 acre-feet every year, but 10,000 shares were to be sold. When Standley lake reached completion, it only had a capacity of 60,000 acre-feet; Marshall reservoir had a capacity of 5,000 acre-feet, and was increased to 10,000 acre-feet.

843 Does not think the farmers believed the representations. Has had lots of experience with farmers; did not consider it remarkable that the sales were small, but did no better after the system was completed. About February, 1909, began another branch of the campaign, that was to sell shares to the irrigation districts. After that date, caused several districts to be organized, including Denver-Greeley, to which 4,000 shares were sold, at the rate of $500 per share, or $50 per acre-foot. Part of the water was to be used on

the east and part on the west side of the river—that is, the Denver-Greeley is on the west side, and the Denver-St. Vrain is on the west side, and the North Denver is on the east side; Platteville is on the east side. All these districts were organized and sales made between February, 1909, and June, 1910. Did not attempt to sell the stock on the east side of the river; organized the districts there; took district bonds in payment for the stock; expected to get the water for the lands on the east side from Standley and Barr Lakes. Barr Lake is an enlargement of the Oasis reservoir. Milton reservoir was first conceived after the Denver-Greeley project was started. Barr lake has a capacity of 40,000 acre-feet, from which must be deducted original Barr Lake capacity of 10,000 acre-feet, of which the D. R. I. Company owns a part, controlling, say, 35,000 acre-feet. Milton Lake and Barr reservoir together have a capacity of about 75,000 acre-feet; these are the company's two reservoirs on the east side, and Standley Lake and Marshall Lake and McKay Lake and West Lake and others on the east and west sides; 140,000 to 150,000 acre-feet capacity all together; about 14,000 shares of stock sold, representing 140,000 acre-feet; about 7,000 more for sale, making a total of 210,000 acre-feet.

This is a combination of reservoir and direct-flow rights; do not know what would be obtained from the direct-flow rights; does not know what the decreed capacity of the direct-flow right is. When speaking of the delivery of water at the canal headgate, witness had reference to the headgate of the farmer's lateral. Does not think there was any provision in the contracts requiring the delivery of water at the farmer's headgate. Would not guarantee 100 per cent delivery; there is no ditch in the country that does it, and one would not do it with any reservoir.

No company has ever guaranteed water; if it did not rain here for ten years, none of us would have water, but Standley Lake had the capacity, and competent engineers had given the owners to understand, after thorough examinations, that a certain amount of water could normally be expected, some years more, some
844 years less; does not know what the engineers' investigations covered, nor what result they arrived at with regard to the efficiency of the system.

There was not a time when he sold in excess of the capacity, except insofar as the construction work was not complete. Even though stockholders are entitled to participate in whatever the supply is, it would make a difference whether it was measured at the reservoir or at the lateral; if at reservoir they would not get as much water at the headgate. If there was a shortage of water, the shareholder would only get his proportion of the water in the reservoir. Witness supposes it could be measured in one place as well as another.

Purchasers of shares would be entitled to participate in whatever water there is in the reservoir; thinks, however, that a man down on the ditch would be entitled to have those higher up on the ditch contribute for his benefit, in that the man down the ditch whose seepage is great would get more water out of the reservoir than the

man up the ditch whose seepage is less. That has not been the custom in Colorado, but that is the D. R. I. Company's scheme; there is nothing in the share of stock which indicates that, but there may be letters to that effect. Never heard of any irrigation system that had such a contract, but that is the D. R. I. Company's intention.

Does not remember whether Milton Lake had been completed in July, 1910, at the time of the first receivership, but does not think it had. Barr Lake and the O'Brien canal had not been finished; kept in close touch with the situation during the receivership, although not employed; selling campaign was inactive during receivership; mostly engaged in making arrangements to go ahead with construction.

The condition of the D. R. I. Company had been bad for a considerable period before it went into the hands of a receiver, but the agents did not commerce to notice it until 30 or 60 days before. Does not remember financial condition of the company interfering with sales; sold some stock right up to the last month. When witness says he sold stock, he includes land. Witness only sold 15 or 16 shares in his campaigns prior to 1910.

The company officials took a number of shares; does not know what they gave for them. The fifteen or sixteen shares represented 150 or 160 acre-feet, and all the other agents sold about an equal amount. Means to say that financial conditions did not affect sales to the districts, abandoned individual sales for district sales; it was easier.

Sale to the Henrylyn was made when the company was in financial difficulty during interruption of construction work, while the
845 company was in the hands of receivers. Henrylyn was not organized by the company; Henrylyn took 75,000 acre-feet for bonds.

The reservoirs in the Henrylyn district could only be used to impound the supply which the D. R. I. Company furnished; floodwaters had been used through the O'Brien canal in the summer of 1913.

Milton reservoir gets its supply from the Platte river and through the Beebee canal, which comes down through the center of the Greeley-Valley district; this is a seepage canal, built by the D. R. I. Company.

Does not know what was the object in constructing a reservoir of 40,000 acre-feet for the purpose of irrigating eight or ten thousand acres. The market for the Milton lake water is very much restricted; does not think that the people under Milton lake have the money to buy.

Has sold water out of every one of the lakes, by selling to districts.

The Denver-Greeley Valley Irrigation District has stock in the general system, and gets its supply from such parts of the system as the operators think advisable; cannot tell how many acres in the Denver-Greeley district get water from Milton lake.

There is a lot of land that has no other available source of supply.

All kinds of legitimate schemes had to be worked to sell the water. Purchasers agreed to pay interest on the deferred payments.

Before going with the D. R. I. Company was traveling salesman. State oil inspector, bailiff in the district court, water commissioner of the city of Denver, all of which positions, except traveling salesman, were political positions; was bailiff of the district court for six years; has learned the water business principally in the last seven years. The position as water commissioner for the city involved the operation of the City Ditch.

Thinks political experience qualified him for work with the D. R. I. Company.

Redirect examination by Mr. Nye:

In speaking of certain water sales as "inclusions," means that some person was induced to include his land in the district; his land would then be bonded to pay for water acquired by the district; regarded that as a sale of water.

District bonds were taken out of escrow as more land was included.

846 WILLIAM B. MCGILVRAY, a witness for the defendants.

Direct examination by Mr. Lieberman:

Superintendent of asphalt and sewers for 17 or 18 years.

Examined inlets on Lowell Boulevard, 20th, 21st and 22nd, where there had been some connection made from the wooden main on the street to the catch basins and storm sewers. Did not observe the water company mains at that point; water was coming from the wooden main into the catch basin from leakage; the connection with the mains was made where it would drain the leakage water into the sewers; this was done by the permission of the city, on application of the company; observed that condition at a great many places. There are various places along the line where it leaks, and is being repaired frequently, clear out to two miles beyond Wynetka; that was about three weeks ago; they were simply repairing pipes at that point; know of no other such connections in the city. Connections on Lowell Boulevard were made probably five years ago.

Inspected the pipe line on the road to Platte Canon about a month ago, and found many places there where the pipe was leaky and wood decayed in the pipe line, and they were repairing it in sections; where the dirt was cleared away from the main, the pipe was dry; water shut off; there was a great deal of decayed wood; it was being cut out and replaced with new wood; mains were of wood, with steel bands. (Witness produces three pieces of wood which are marked Exhibit 48), which consists of pieces picked up promiscuously at various points, fairly representative of the portions cut out; there were some places there five, six and eight feet long, maybe twenty feet long; inspected several of them—probably four or five places; in some place- cutting out from top of the pipe, which usually decays first, and in some places cut around to the bottom.

The iron bands were in fair condition—a little rusty, but otherwise in good condition. The pipe at either end of the repairs is not very good—not as bad as that cut out. The connections on Lowell Boulevard were made with witness' permission; the leakage from the mains was such that it became annoying for the street traffic, on account of the softening of the street; inspected the places where the connections were made; street was very wet and soft. Thinks the mains at that point were 36 inches; did not measure them; don't know of any change in the sewer connections. There have been no recent applications. Has not observed the mains or sewer
847 connections at other parts of the city; pipe connecting the mains with the sewer was iron pipe; mains were of wood.

Cross-examination by Mr. Dorsey:

Duties are to see to the flushing, cleaning and keeping of sewers in repair, both storm and sanitary; is under the commissioner of improvements, John B. Hunter; has been superintendent of asphalt, paving, stone, concrete; has care of all the streets, and keeps them in repair and resurfacing; has been witness' business for seventeen or eighteen years, with the exception of two years.

Was stone cutter and mason. Lowell Boulevard is in North Denver, lying just to the east of Sloan's lake, in the extreme western part of the city; settled fairly thickly up towards 23rd avenue and in through that way. The main of the water company referred to is one of the conduits which leads to the Ashland Avenue reservoir; was constructed quite a long time ago; the connection with the sewers was not made when the conduit was laid; would not be positive of that, but think it was made a long time afterwards; did not keep any tab on it; connection made at three places—20th, 21st and 22nd. Knows of no other application. Main extends for several miles within the city limits, along Lowell Boulevard.

Very little water running through the sewer connections at this time; have seen the connections three or four times since May; inspects them by taking up cover and looking into the manhole. Sometimes more is running than others; when inspected about a month ago very little was running; about a year before that it was running a little heavier.

Water was leaking from the main when the connections were made. There are various places where it is leaking, probably nearly as bad; many places in the city where it has leaked; no other connections have been made; the company takes up the dirt around the pipe and repairs it; that corrects it to a great extent.

Went out on the Wynetka trip with Mr. Phillips and Mr. Hill; Mr. Hill was some gentleman with Mr. Phillips; went out by automobile, by Littleton, clear to Wynetka, and along the pipe line; struck the pipe at Wynetka, then went along the road at Wynetka up toward Platte Canon; knows he was following the line of the pipe; expects it is the same pipe that comes in on Lowell Boulevard; thinks there are two pipes in the vicinity of the road; was looking at the one on the east side; nothing about the one on the west side

to look at; the east side was uncovered and excavated in repairing the pipe. The pipe was uncovered in four places.

848 Made one trip of inspection; probably went three miles beyond Wynetka; in that distance found the pipe uncovered in three or four places; in some places it was uncovered for 20 feet; in others 8 or 10 or 15, maybe 6 or 7 feet; water company men there and repairing pipe; could not tell whether he went as far as Chatfield or the Wayside ranch; out there half an hour or so; has brought three pieces into court, but has more of them; could not tell just which place they were picked up; they were waste pieces thrown away.

Has helped to work on wood stave pipe for the Denver Union Water Company, about 18 years ago; built in wooden water pipes on the Sullivan line, to keep the pipe from falling apart. Thinks a conduit ought to be sufficient to take care of itself, without stone masonry. If a wood-stave conduit is in a healthy condition it will take care of itself; if it is rotten, it will not.

Has worked some on wood-stave pipe; don't pretend to be an expert in building water mains; has helped repair them. The life of a wood stave pipe is longer at the bottom than at the top. If you keep them full of water they will last longer than when half empty. The condition of the soil may have something to do with it. It may be true that the condition of a conduit in one kind of soil is no indication of its condition in another.

Ground pretty nearly level where repairs were being made. Knows Mr. Sweeney of the water company, and talked with him at the place where the repairs were being made.

Did not inspect the pipe at any place where it was not uncovered. More pipe uncovered than was cut out, in order to give room to work. Just looked at the staves. Went down into the excavation to look at one pipe, where the large excavation was, and the pipe was cut down to the bottom. In the other cases, looked at it from the top of the bank. If the remaining staves had been in the condition of those cut out, they would have been cut out also.

Witness indicates which is the outside and which the inside of the pieces of wood produced in evidence. Staves get bad on both sides. Individual staves differ; sometimes one will give way and destroy much sooner than others; quite a job to repair them.

Is called upon to repair brick sewers. Denver sewers are made of brick, concrete, clay pipe, vitrified sewer pipe.

Need repairs very infrequently; do not remember repairing any except the outlet into Cherry Creek storm sewers. (Witness not permitted to tell to what extent he has had to repair storm sew-

849 ers.) There were at least three or four openings on the conduit inspected; one opening was five feet long; the longest about 20 feet long.

Did not measure any of them; could not tell the real length; does not know the total length of the conduit, probably several miles; thinks the conduit was No. 1.

Redirect examination by Mr. Lieberman:

When witness went into the large hole to observe the ends of the

pipe, the lower end of the pipe was partially decayed and soggy; it was all decayed, to a certain extent.

JOSEPH NOSEK, a witness for the defendants.

Direct examination by Mr. Lieberman:

Foreman of the sewer flushing department of the city of Denver; in the service about eight years; has observed one sewer connection with water mains on Lowell Boulevard between 20th and 22nd; streets were in bad condition; could not say what the condition of the water main was; saw it, but did not observe the condition. The condition of the street was caused by leakage from seepage from the water mains; three connections—two with the storm sewer and one with the sanitary; see these connections every summer; same conditions exist; have not observed conditions in any other part of the city; saw the water company working on the pipes. Saw that they were wood pipes.

Cross-examination by Mr. Dorsey:

Is Mr. McGilvray's foreman; testifying to the identical connections mentioned by McGilvray; does not know whether he was foreman when the connections in question were made; his men discovered them when they were flushing the sewers.

About four years ago was first knowledge of the instance of the connections; observed the streets to be muddy; bad condition from seepage during the course of his work; noticed it the last time he was out this summer; water company employes were making repairs this last summer, near the place where the connections were made.

JOHN HENSLER, a witness for the defendants.

Direct examination by Mr. Lieberman:

Plumber; engaged in that occupation fifteen years, in Denver.

Water company makes a tap, and the plumbers connect onto
850 their taps with the coupling provided by the water company; puts the service pipes into the users' premises; in order to make such attachment, it is necessary to obtain permission from the water company; a written application has to be signed by the owner of the property and by the plumber making the application; this application is a printed blank. Exhibit 49 is a regular application of water company for tapping the water service.

(Exhibits 48 and 49 offered in evidence.)

Size of service pipe is determined according to the rules of the water company—certain specified sizes for certain sizes of houses and lots. An ordinary lot would be ⅝-inch pipe and one-half inch tap for an ordinary five-room cottage. They allow a three-quarter inch pipe for two lots; the tap is five-eighths inch, a smaller tap than the pipe. Guides himself at all times according to the rules of the company. One-inch pipe can be put in for a terrace or large apartment house, or something where there are three or four houses; always uses a tap smaller than the pipe.

The sizes given refer to the inside diameter; the company governs the size of the pipe.

Cross-examination by Mr. Dorsey:

No connection permitted except after application similar to Exhibit 49 has been signed. The company has a fixed standard by which it determines size of the taps into the mains, and regulates size of the service pipes, up to stop box; from that point, the user puts in whatever size pipe he wants.

Redirect examination by Mr. Lieberman:

Having a one-inch pipe and three-quarter inch tap, it would do no good to have a larger pipe inside.

Recross-examination by Mr. Dorsey:

Does not know anything about water pressure.

JAMES J. MOSES, a witness for the defendants.

Direct examination by Mr. Lieberman:

Deputy fire chief for seventeen months; been in department for 20 years next January; now in charge of Capitol Hill district; 8th Avenue north to Elyria, Broadway to City line, east; practice of fire deputy to attend all fires in his district; off service every sixth day; all other days on duty 24 hours; attends all fires in the district.
851 Superintends work of the department at the fire. Several times had difficulty in extinguishing fires, because of lack of pressure where the fire was above the second floor. On February 16, 1914, at 1576 Pearl Street, compelled to work engine 58 minutes to get pressure to a roof fire; pressure from the plug would not raise the water to the roof; had made an effort to do so.

Always have an engine connected up as soon as it arrives. Release horses, take off suction, connect same to plug, and connect hose to engine; always a short delay. Fire was two-story dwelling, and was in ceiling below roof. On April 19, 1914, at 1760 Williams, fire at Mr. Adams' house; took no chances at all on the pressure; had engine connected up at once; fire on the first floor, and worked the engine; might possibly have gotten pressure from the plug, but took no chances; engine was coming along and the fire was going pretty good; it was shooting out of the doors and windows. Hadn't had experience right in that location before. June 22, 1914, a roof fire at 1138 Clarkson; dwelling house; two stories; found lack of water pressure; put the engine to work and used the engine. October 4, 1914, 1517 Clarkson; dwelling, two-story; connected right up to the engine; used chemicals; first-rate stream from the engine.

Had experience further south on Clarkson. Did not make test personally. Reports were sent in to him; made by the chief and master mechanic. Had talked over weak pressure with the chief. (Witness not permitted to say that these conversations were the reason for taking no chances with the pressure, because lower down on Clarkson pressure was weak); registered 19 pounds at the engine.

October 8, 1914, fire on Ogden close to 9th; roof fire; used the engine; made an effort to use the hose at the plug; was not sufficient force to put the fire out.

Connected engine as soon as it came; just the delay of shifting from one plug to another; got a good stream from the engine. November 1, 1914, 1544 Downing; two and a half stories; fire in the roof; worked first with chemicals and then with the engine; from 17th to 10th and 11th Avenues, north and south, and practically from Logan out around Downing have had the most trouble. That is all the cases witness can cite. Has had, maybe, 200 other fires. The ones mentioned were where the engine was worked. Outside of that has not had a great deal of difficulty getting water. There might have been one or two or three others. Selected at random the instances testified to; has had instances where there was not pressure enough to take the kinks out of the hose; and those instances where
connected up with the engine at once it was because the fire
852 had advanced, and thought best not to take chances on anything.

Headquarters engine 8, 16th and Marion. Travels to fire in automobile, and reaches it about as quick as the department.

Cross-examination by Mr. Dorsey:

Deputy fire chief for 17 months. During that time has attended hundreds of fires.

Has not described all of the fires where engines were used; might be a few more; might be eight out of several hundred; is not the practice to connect up the engine whether required or not. If there is a line laid out and using water and the fire is small, they will not connect the engine. Out of the six instances cited, there were three in which the pressure from the plug was not tried; that was because the fire had advanced considerably. It is true that fire in an advanced stage needs heavy pressure; that is why connects engine right away.

In the other three instances the fire was in the roof, and found that the pressure from the fire plug was insufficient to give adequate pressure at the roof at the nozzle. These three instances were 1576 Pearl, 1138 Clarkson, Ogden near 9th. There might be three, five or six instances; does not just know. Looked up data hurriedly. Remembers one or two where it was necessary to work the engine; buildings over two stories.

One was on Clarkson; both were cases where the fire was much advanced on the arrival of the department. Would not have been advisable to use the engine if pressure had been as great as pressure in the city. Thinks it was between 12th and 13th on Clarkson. Has not the date of the fire; it was before December, 1913; would not say whether it was fall or winter.

Has testified to all the fires within 17 months where it was necessary to use engines. When engine was connected up, had no difficulty and plenty of water in any case. Knows that engines are used for fire-extinguishing purposes in other cities besides Denver.

Redirect examination of Mr. Lieberman:

Does not think there were a dozen more fires where the engine was used; perhaps half a dozen.

HARRY WHITEHOUSE, a witness for the defendants.

Direct examination by Mr. Lieberman:

Superintendent of water and sewer work for city and county of Denver; also constructed work outside the state; not in the
853 employ of the city and county of Denver. Had occasion in past to examine some water mains of The Denver Union Water Company in the fall of 1912, at 22nd and Lowell Boulevard. Was superintendent of consrtuction work for Mr. Gibbons on line that was to run up 22nd Avenue and turn at right angles on Lowell Boulevard, and go out Lowell Boulevard. At that point ran into a main, with water conditions that interrupted work; had to change the line.

Between Julian and Lowell were digging a sewer; making progress of 200 feet a day; there was no water there; the dirt was just about moist; when we got to Lowell Boulevard and turned around, set ditching machine in, and started to go out Lowell Boulevard, and in less than six feet from the surface ran into large quantities of water; ground was saturated; water company was doing no work there at that time. When ditching machine was sunk in ground, exposed about three feet of the wooden main; seemed to be of a very advanced age. It was leaking a great deal. The bands were rusty and rotten, and also the wood. Water was coming out of each and every individual joint. That was last part of 1912. Has not run into the mains in any other part of the city, except once in awhile just a short strip in crossing them.

Found no leakage in other places, no more than natural seepage around some joints.

Cross-examination by Mr. Dorsey:

Witness asked how he knew that all the water found at 22nd and Lowell came from the wood-stave conduits; said the condition of the ground up to that point was dry, and were only using braces every 10 or 12 feet, but allowed to put in 60 feet before the city engineer came out and stopped them and changed the sewer down one block; when turned corner and started sinking the ditch, tie-sheeted and cribbed it; and when he moved down a block from that point, didn't have to sheet again; just went along putting it in at the rate of three or four hundred feet a day, against four or five feet a day at the wet place; so there was water at Lowell Boulevard and not at other places.

Found that there was a feeder pipe running from catch basin; heard the water running in there; found it was running from the big water main in the street. From those facts draws the conclusion that all the water came from a leak in the wood-stave pipe; understood the pipe came somewhere from Marston lake along Boulevard F. Delivers water in the reservoir on the north side; several miles in length.

If it was leaking like that everywhere along the line, would
854 not much water get to the lower end of the pipe; would depend upon how much pressure there was; water was coming out between each and every pair of staves. Wood pipe in that condition is not leaking so terribly much until the dirt pressure around it is removed. That pressure helps to hold the pipe in place and supports the bands. When the dirt is taken away it relieves a lot of the pressure. Thinks taking away the dirt in that particular place increased the leakage. Saw about three feet of the pipe; just crossed over it; does not know anything about the condition of the pipe anywhere but at those three feet. Trenching machine is a big wheel with buckets on the end of it, operated by steam; it is a traction machine; did not run the trenching machine into the pipe; pipe was uncovered by a caving away of ground. Trenching machine could dig 13½ feet, and did not get down over five feet until the machine would not turn, because of the mud; tried three times, and then let it stand idle; started to dig by hand. Encountered the pipe while digging by hand. Has placed several miles of wood-stave conduits. The kind of pipe is commonly used for that purpose in the western country.

Redirect examination by Mr. Lieberman:

Met the condition at three places 20 feet apart.

ANDREW ANDERSON, a witness for the defendants.

Direct examination by Mr. Lieberman.

Janitor at 322 E. 17th Ave., Kensington Apartments. Resided there 14 months. Visits all portions of the building. Have some tenants on the top floor, who have telephoned many times wanting to know why they could not get water on the third floor. Once or twice telephoned from the second floor. Nothing wrong with the plumbing in the house. This happened last winter; last spring, often, but not since the middle of the summer.

Cross-examination by Mr. Dorsey:

Has not had any trouble since the middle of the summer, when there was difficulty getting water for irrigation purposes. Never heard of any trouble since then. Three floors and basement in the Kensington. No trouble in the basement. There is not pressure enough for the third floor. Brings a little stream, but it takes a half hour to get a two or three-gallon pail; complaints come mostly in the forenoon before nine o'clock; some people are irrigating about that time.

855 Redirect examination by Mr. Lieberman:

Never got any complaints in the middle of the day. Does not remember; mostly around nine o'clock.

E. E. PATRICK, a witness for the defendants.

Direct examination by Mr. Lieberman:

Assistant chief of fire department about two years; been in the department about 23 years; has the northern district; everything north and west of the Platte river, from Broadway to 8th avenue; attends all fires, except every 6th day when he is off duty.

Has had difficulty with the pressure. Had trouble at 44th and Umatilla; a little pressure, but not enough to cope with the fire; a little corrugated iron barn was on fire; not very good stream; could get water, but could not throw the water more than 10 or 15 feet; that was about September or October of 1913. Had the hose connected directly to the plug. Had greenhouse fire at 35th and Wolff; fire in the engine room, one story; boiler in the basement; got a very poor stream; would throw 15 to 20 feet with three-quarter-inch tip; not very much pressure; probably 25 or 30 pounds. Headquarters 26th and Boulevard F; travels in automobile; has an engine city service truck and hose wagon. Has a hose wagon at engine 17 and engine 7. Just one engine in the district. Engine has territory in which it answers every alarm; that is not the entire district. If another engine is needed, is called from the nearest station; three fire houses in the district; part of the district served by wagons from other districts.

Has attended two or three hundred fires during the time he has been assistant chief. During that time pressume has been fairly good in some places and others it has been bad. Trouble has been in certain localities.

Do not get pressure in bad districts without an engine; in good districts has good pressure all the time; taking everything from Federal Boulevard out to county line and as far south as 8th Avenue; above Federal Boulevard the pressure is very poor, and the engine goes there. It don't go below Colfax avenue without a special call.

Bad district around Berkley, 36th and 38th Avenue, out to county line; engine district is practically all the same; south of Colfax Avenue don't get much pressure.

856 Cross-examination by Mr. Dorsey:

District lies entirely on the north and west of the Platte river; extends to the river; 8th Avenue is the south boundary line, and the county line is on the north; takes in Argo, but not Globeville. In all that district there are three fire stations and one fire engine. That is not enough fire engines and stations for district of that size.

Pressure is poor around Berkeley, and is poor from the district from Federal Boulevard west and north, when indicated east and west boundary line. It is rather high ground; does not know who owns the distribution pipes in district indicated. Put out lots of fires without an engine, but needs engine for a big fire. Engine goes to most of the places indicated, except east of Colfax Avenue; always managed there without; it is thinly settled and scattered out a good deal.

Thinks he has to use the engine three or four times. Other chiefs have had to use them on witness' day off. Possibly, if witness looked over the books, he could find more instances of using the engine.

Could not say whether it was necessary for the other chiefs to use the engine. Out of the three or four occasions when the engine was used, there was one when there was failure of water. Had to lay out a line of hose, and the main seemed to be small, and the suction would collapse. That was at 46th and Bryant. Does not think Chief Healy attended that fire. Thinks the hydrant used was at 46th and Bryant. That was not one of the instances mentioned on direct examination. Must have been a small sized main, because the suction would collapse. At 35th and Wolff could not get the engine there on account of the storm; managed to save the flowers.

At 44th and Umatilla kept fire from spreading, but the shed burned. 35th and Wolff was out near the city limits. The other place was 46th and Bryant, at the outer limits of the water system. The hydrant at 46th and Bryant is the last hyrant in that direction. At 46th and Bryant had out 1,950 feet of hose; at 44th and Umatilla had 250 feet of hose, possibly 300; at 35th and Wolff put out 250 feet of hose.

Redirect examination by Mr. Lieberman:

Witness' testimony is the result of experience.

857 N. E. RUMERY, a witness for the defendants.

Direct-examination by Mr. Lieberman:

Occupation, mining; resides 1912 Logan; owns the property; double house, eight rooms on each side; lives on one side; has had difficulty with water. When irrigating there is no water on the second floor; on the other side there is no water on the second floor when drawing water in the basement.

(Statement as to what other people living in the house have complained of was objected to and ruled out.)

Since February last there has been trouble on both sides; trouble at the present time.

Cross-examination by Mr. Dorsey:

Owns the entire building. Bought the house in January, 1908; does not know when it was built; is the old George E. Ross-Lewin place; diffculty on second floor occurs during irrigation time or when drawing water in basement; in winter as well as summer. There is three-fourths-inch pipe inside. Does not know the size of pipe from the main to the street. Three-quarters-inch riser, lead pipe. One pipe comes into each side. Is sure there are two connections to the main. Does not know the size of either of them.

Four taps in basement, all together; hot and cold for the laundry tubs; water closet in basement; two taps on the first floor in the kitchen; no running water in the butler's pantry; when drawing water in the kitchen it will just barely run out of the faucet on the

upper floor; when drawing water in the laundry it will not run at all on the upper floor. Pipes were examined by a plumber about two years ago. Does not know what was done. On the second floor there were two taps in the bathroom and two in the wash basin and water closet; there is no third floor.

Both sides of the double house are occupied in the same manner. Talked to man who came around and turned water on. He said witness was on a side street. Whenever a house is vacated, water is shut off; turned the water on in January on one side of the house and turned it on on the other side when witness moved in. The Gallup Rental Agency attends to house; has spoken to no one except the man who turned the water on.

Redirect examination by Mr. Lieberman:

Witness complained to representative of the company about pressure.

858 (Objection to testimony and to representative's statement overruled.)

Witness said to representative that the valve was not wide open. Representative said "You are not on the main line." "The main line runs on 19th." He said "that is the reason you don't get the pressure."

J. S. WHITESIDE, a witness for the defendants.

Direct-examination by Mr. Lieberman:

1625 Clarkson; janitor of the building; six apartments; three stories; half basement.

Has been on the premises for six months; have not been entirely out of water. There has been times when the pressure was weak; could not get water for the lawn and house at the same time; it would run in the house, but it was weak; had trouble just this last summer; not all the way around.

Cross-examination by Mr. Dorsey:

Shortage was during irrigation season. Could not say definitely what date; thinks it was July and August in the mornings; didn't have the trouble every morning.

It seems as though the hose was taking all the water that was coming. There was a weak pressure on the lower floor; cannot say what it was on the upper floor, for the tenant was away. When the hose was shut off the pressure was better. Pressure was as good in the summer as it is now. It would be a little better after irrigation hours; runs very slowly on the lower floor. Get plenty of water, but the pressure is too weak. House is 30 feet wide and two apartments on each floor; it is not a very large building; constructed seven or eight years ago; does not know about the size pipe which leads from the main in the street to the building; don't know how many faucets there are on a floor; two openings for irrigating the lawn; one on the side of the building and one in front, located on the side

of the building; part of the time operates them both at once. Don't know whether they are both on one pipe. Does not read the newspapers. Never complained to the Denver Union Water Company. Does not know whether the difficulty of last summer was at the time certain repairs were being made.

859 MICHAEL MCGOVERN, a witness for the defendants.

Direct examination by Mr. Lieberman:

530 E. 19th Avenue; resided there about 17 years; have had difficulty with water pressure; one tap for six houses; eight rooms and bath in each house; two stories. When irrigating on the outside very often would only get water in the kitchen, and none at all upstairs. Has such trouble all the time when irrigating; would get some water when not irrigating, but not the pressure he ought to have. When drawing water on the lower floor any time, cannot get it on the upper floor.

Cross-examination by Mr. Dorsey:

There is one pipe that leads from the main in the street, in the center, and then branches off on each side. Can't say what is the size of the tap. Pipe from the main to the branches extends across the street, to some point on the lawn in front of the center of the terrace, a few feet inside of the curb, where it divides into six branches. Understands that there is an ordinance regulation which requires pipe of a certain size from the tap to the stop box. Does not know exactly the size of the pipe in this particular case.

There is only one place to water all the lawns from; that is located 15 feet from the end line from one of the branches on the corner of 19th Avenue. Don't remember the size of risers. No taps in basement; two taps on first floor in the kitchen. Bath tub, wash basin, water closet, on the second floor. Witness and brother lived together in one house and rent the other five. Built the property 16 or 17 years ago. Made complaint to Mr. Maloney and Mr. Robinson of the water company. Took witness' brother to basement of water company office, showed the pressure gauge. That was about three years ago. They sent a man up to the house; he tested the pressure himself and did nothing; pressure was tested at the irrigation tap at the end of a pipe extending about 60 feet from the branch point; did not test at any other place; difficulty occurs during irrigation season, and sometimes when not irrigating. Any time when drawing water in the kitchen, gets no water on the second floor, either summer or winter; sometimes might get a little; no pressure on the second floor when drawing water in the kitchen; had no irrigation there until about three years ago.

Trouble occurs principally when irrigating outside. Don't have the pressure he ought to have.

(Witness asked if he read Denver Express, and objection sustained.)

860 THOMAS McGOVERN, a witness for the defendants.

Direct examination by Mr. Lieberman:

Brother of Michael McGovern; resides 530 E. 19th Ave. Had some difficulty getting water during time of irrigation season, and at some other times; has difficulty getting water on the second floor when drawing on the first, and has very little if any water at that time.

Built terrace 16 or 17 years ago. Five-eighths tap, three-quarter inch pipe; five-eighths inch pipe leading into each house; up to second story it is a half-inch pipe. Water company made the connection with the main and inserted tap. Plumber made the application.

Cross-examination by Mr. Dorsey:

Thinks tap is not large enough. Does not think that three-quarter inch tap will be all right. Thinks whole trouble is with the pressure. That the size of pipe would not make a difference. There is five-eighths tap in the main. Leading from that main onto the property is a three-quarter inch pipe. After that pipe reaches the property, divides into six pipes, five eighths or three-quarter inch in diameter. Inside of the house it is half inch to the second story; the five-eighths or three-quarter inch pipe runs along in front of the house, and there is a connection from that pipe to each one of the houses. The house occupied by witness would be at the very end of the three-quarter inch pipe. The tap for irrigating lawn is connected with three-quarter inch pipe inside the house, and runs out through the wall of the house on the corner, and irrigates all the lawns from that tap. The trouble with pressure affects all the houses. All the tenants claim they cannot draw water on the second floor when the water is running downstairs. Two taps, hot and cold water, downstairs, two taps at the bath tub, hot and cold water; two in the wash basin, and water closet; same number in each one of six houses.

CHARLES P. ALLEN, a witness for the defendants.

Direct examination by Mr. Lieberman:

Engineering, contracting; specialized in water works; about 45 years. Has made tests of water pressures in the city and county of Denver, for the Denver Public Utilities Commission; made them several months ago. Exhibit 50 produced and marked. Represents the pressures taken at Wolfe Hall. Three sheets marked Exhibit 50-*a*, 50-*b* and 50-*c*, respectively.

861 Exhibit 50-*a* represents pressure taken on June 21st to June 23rd at Wolfe Hall, between 13th and 14th on Clarkson. They were made in the boiler room of the heating plant with a Bristol recording gauge, on pipe coming in from the street main. The Bristol recording gauge is furnished with a paper chart, on which is a record showing hours of the day and the lines of the

pressure. An arm on the gauge, regulated by the pressure, makes the record, automatically in ink; is a standard method of making water records. Has had various experience with automatic instruments in past twenty years.

Reads the record shown on Exhibit 50-*a*, *b* and c, Exhibits 51-*a* to 51-*z*, marked for identification.

Exhibits 51-*a* to 51-*z* represent pressures taken at engine house 8 at 1681 Marion, on the fire hydrant immediately in front of the station. Tests were made in the same way as Wolfe Hall tests. Describes Exhibits 51-*a* to 51-*z*, giving times when records were taken by day and hour, and the reading of the record. This description proceeds on 3301-2. Papers marked for identification Exhibits 52-*a*, 52-*b* and 52-*c*, which represent pressures taken at Broadway and Center St., engine 13, at the fire hydrant in front of the house. Describes the exhibit. Continues description of Exhibits 52-*a*, 52-*b* and 52-*c*. Exhibits 53-*a*, 53-*b* and 53-*c*, marked for identification, represent water pressures taken at Blake Street engine house between 18th and 19th, taken in the same way. Describes exhibits. Continues description of Exhibits 53-*a*, 53-*b* and 53-*c*.

Reads from Exhibit 51-*g*, 51-*h*, 51-*i*, 51-*j*, 51-*k*, 51-*l*, 51-*m*, 51-*n*, 51-*o*.

Reads from Exhibits 51-*p*, 51-*q*, 51-*r*, 51-*s*, 51-*t*, 51-*u*, 51-*v*, 51-*w*, 51-*x*, 51-*y*, 51-*z*. Average on Exhibit 51-*a* is 29.4 pounds; 51-*b*, 31.6 pounds; 51-*c*, 33.3 pounds; 51-*d*, 34.1 pounds; 51-*e*, 35.2 pounds; 51-*f*, 34.1 pounds. Exhibits 51-*a* to 51-*z*, 53-*a*, 53-*b*, 53-*c*, 52-*a*, 52-*b* and 52-*c*, and Exhibits 50 and 50-*a*, 50-*b* and 50-*c* introduced in evidence.

Cross-examination by Mr. Dorsey:

All the pressures were taken June and July, 1914. Remembers that water company had a break in the conduits in June and July. Does not recollect when the first break occurred. Don't remember the dates when permanent repairs were completed. Wolfe Hall is within a few blocks of where the upper and lower services separate, and Wolfe Hall is not far from the top of the gravity service; just above that pumping service begins.

The charts cover periods of 24 hours, running from one calendar day into another. Wolfe Hall chart was put in the boiler
862 house and heating plant away from the main building, about five or six feet above the surface of the ground. The averages given are the averages for the readings on each hour. The lowest pressure was minimum 19 pounds on June 19th to 20th, which would carry water a little over 40 feet. Wolfe Hall does not exceed 50 feet.

Pressure becomes greater as one proceeds from Wolf Hall towards town. The hydrant was at Marion and 16th; also used for sprinkling. Opening of the hydrant would affect the pressure. Got the average by adding up the pressures on each hour of the 24 and dividing it by 24. Minimum pressure was 15 pounds, except on June 26, on which there was a minimum pressure of 2 pounds

recorded; on which occasion the pressure fluctuated. Visited gauges once a day.

The foreman at the fire house had a key to the box in which the gauge was locked. Gauges have bleed cocks which anybody can open, and when opened they do not register. Leaving out the low pressure of two pounds, the average was in excess of thirty pounds, and a good part of the time was in excess of 35 pounds.

With regards to tests at Broadway and Center St., there were a large number of readings taken which were not introduced in evidence. Those taken average close to those omitted. Witness did not make the selection; does not know why three certain ones were picked out. Gauge was on a fire hydrant right close to the fire house. The Blake Street gauge was attached to a tap in the building, which is the same faucet used by the fireman for various purposes. The opening of any tap in the fire house would be reflected on the gauge. Quite a number of other measurements than those presented were taken. Does not know who selected the particular ones which were testified about. Got the average in the same way as on the other charts. Thinks a fair average can be gotten. Has not considered the sharp jumpings of the needle, but at the Marion St. house did consider the two-pound minimum.

Redirect examination by Mr. Lieberman:

Did not consider short thin lines breaking away from the general trend of the needle.

C. P. ALLEN, a witness for defendants, recalled.

Direct examination by Mr. Nye:

Was at one time engineer for The Denver Union Water Company, for 27 years; member of the committee of engineers
863 appointed by the Public Utilities Commission. Made and filed a report to Public Utilities Commission in January, 1914. Witness' particular work was gathering various items and overseeing the estimates; estimates were made by different subcommittees and individuals.

Witness was suprintendent of the work. Consulted with the other members of the committee as to general policy and findings, and agreed with them. Approves and stands by Exhibit 19 and Exhibit 54, being the valuations checked and re-checked by Mr. Van Diest.

Cross-examination by Mr. Dorsey:

Heard a great part of the testimony of Mr. Van Diest and Mr. Fellows. Is willing to accept as his own the cross-examination and questions and answers propounded to Messrs. Van Diest and Fellows. Would have answered the same questions in the same way. With regard to the quantity of excavation at the Capitol Hill reservoir, engineers used the quantity given by the water company. Witness did not figure it. It was furnished either by Mr. Barnes or Mr. Hawes.

Either Mr. Barnes or Mr. Hawes gave excavation, waste material, embankment, lining, the under-drainage system and the pipeage in the reservoir. Does not know what quantities of excavation were taken and incorporated in the report. Witness began as engineer for The Denver Union Water Company in 1875 with the old Denver City Water Company, and continued until 1902. Signed the first organization papers of the Citizens' Water Company; left the old Denver company and went over to the Citizens' at the time the Citizens' was organized.

Returned to the Denver Union Water Company when the Citizens' and Denver were consolidated, and from that time remained with The Denver Union Water Company until 1902, at all times as chief engineer. Had something to do with the construction of the earlier wood-stave conduits; devised and supervised their construction. Cheesman lake was in process of construction in 1902. Witness was fired from The Denver Union Water Company for doing what the president told him to. There was a misunderstanding between Mr. Cheesman and the witness. There was a lack of friendly relations for a few days. There was afterwards litigation with The Denver Union Water Company and the South Platte company over some stock that witness claimed to own. Litigation was pending over a great many years, until witness licked them. It was a personal affair which did not affect the other members of the company. At the time witness was fired, the company, acting through Mr.
864 Cheesman, blamed him for things that he did not feel himself responsible for.

Redirect examination by **Mr. Nye**:

Entertains no animosity towards the company now, nor at the time the appraisal was made. Undertook to give the company the best of it.

Recross-examination by **Mr. Dorsey**:

Whenever there was any question of doubt witness gave the company the best of it. If there was any doubt at all it was resolved in favor of the water company. Undertook to have the appraisement just right.

JOHN GAFFY, a witness for the defendants.

Direct examination by **Mr. Stevens**:

Has resided in Denver since 1890; is a general contractor; has been engaged in general contracting for himself about 24 years, and for others about 12 years; a great deal of witness' work is along line similar to water company work, such as excavation, building dams and reservoirs; has never laid much pipe, except several miles of sewer pipe; laying of sewer pipe is practically witness' sole occupation.

Has recently made an examination of the physical system of the water company for the purpose of fixing valuation upon physical plant; employed some time in July, 1914, and has been working

from that time up to the present; has made an estimate of what would be willing to reproduce the system of the water company for—made at the request of Mr. Hunter, Commissioner of Improvements; total cost would be $10,109,789; made written report to Mr. Hunter, embracing all the details.

Exhibit 57 and 58 produced. These exhibits are the reports of the witness to Mr. Hunter; there are about sixteen pages missing. The original estimate was based on the present city schedule of work, which is eight hours a day, for $2.50, as a minimum price for labor; witness has made another schedule, on a nine-hour basis, $2.25 a day, which makes a difference of one hundred and some odd thousand dollars; that estimate is in a complete copy which witness has, and the other copies of the exhibit are being corrected; in witness' own copy it is $137,000; that would be taken from the $10,109,000; the latter figure based on an 8-hour day, $2.50 minimum scale for common labor; does not change price for skilled
865 labor. Witness made examination in person and fixed prices or value of the work for the purpose of ascertaining what he, as a practical contractor, would be willing to reproduce the plant for of similar material and under as similar conditions as possible attending the construction of the plant.

Discussion between counsel relating to exhibits 57 and 58.

In compiling figures, in order to know what to figure from, the only thing witness had to use was Exhibit C; tried to keep the same relationship all the way through; compiled estimates upon the articles and quantities mentioned in Exhibit C. The reproduction value for Cheesman dam is $915,449, shown on page 11 of Exhibit 57; the items are all shown on pages 6 and 11.

Whenever the figures are in red they are the original figures that were in Exhibit C, and were not changed. Where the figures are in blue, they show a change. In Exhibit 57 the starred figures mean the same as red figures. In sub-division D, South Platte river division, found at pages 12 to 15, inclusive, the items are set forth as found in Exhibit C, and the valuations at which witness would be willing to reproduce the work are set forth correctly. Exhibit 58 are reference notes on items set forth in Exhibit 57.

Exhibit 58 explains but does not alter the estimates contained in Exhibit 57. Exhibit 58 contains the explanations which witness would give on the stand if testifying orally in relation to the various items there mentioned.

The first thing witness did was to make several trips up to Cheesman dam and make a thorough survey of the road up there and the dam site; allowed a certain amount of money for opening quarries, putting in diversion dams for the outlet of the water through the tunnels, and to get ready for excavation; that would be the preliminary work. The balance of it would be quarrying, getting tracks and machinery and everything installed, getting ready for the actual construction of the masonry; went into it very thoroughly; figured to build the dam in three years; thinks an additional year was added for preliminary work.

In comparison with the estimates in Exhibit C, changed barbed

wire to 75 cents per yard, the price of clearing to 50 cents per yard, changing the total cost of fencing, including clearing, from $5,891 to $6,468; raised the water company's estimate of constructing the road from $15,000 to $25,610. This increased estimate was made to build a first-class road for delivering material with motor trucks, reducing the maximum grade to not exceed fifteen per cent; $6,000 allowed as preliminary dam expense on account of road from Buffalo to Cheesman; total cost of the road would therefore be $31,-
866 610; period of maintenance reduced from seven years to four years; changed price of telephone lines from Buffalo to Cheesman, 18.2 miles, to $217 per mile; whenever found that water company's estimates were too low, raised them. There seems to be a difference of $1 on the total cost of construction of telephone line; raised the cost of clearing reservoir site $100. In Exhibit C there is an item headed "Preliminary dam expense" estimated at $84,748, but the details are not sufficient. Water company was requested to furnish details, but failed. Has allowed a reasonable amount for preliminary dam expense, including the $6,000 for preliminary road expenses referred to.

Preliminary survey and examination of dam site, $12,500; clearing dam site, $500; constructing temporary crib dam, $8,260; flood contingencies, $30,000; total, $57,260. This makes a difference between $84,748.00 and $57,260.00 in preliminary expense. Gives details of estimate cost of the diverting dam and total estimated cost is $8,260. Changing unit cost of excavation for dam and spillway, changes total cost from $35,621 to $29,710.

Discussion between counsel and master as to method of examining witness.

Has made no allowance for depreciation on account of age, or otherwise.

In making estimates figured the regular municipal scale of wages; $2.50 a day for eight hours for common labor; $5 for eight hours for teaming.

There is a letter to go into Exhibit 58, giving the basis on which these things should be figured in a private enterprise. The revised figures are approximate. The total is $132,243; that is by changing to $2.25 for 10 hours' work and $5 for teams on 10 hours' work. That has made the difference of $132,243 as against original estimate. The wages used for the revision are the current prices for common labor. After arriving at the basic figure for all the different works, added twelve per cent for contractor's profit; not always, but in most every case twelve per cent would be the cost of the entire division. Cast iron pipe in the city, added five per cent; Cheesman lake, fifteen per cent, because it is a trifle more hazardous than the other construction; harder to get men in from a railroad; handled at larger expenses; being away from the base of labor and supplies.

Exhibit 58 is now a complete report, with the addition of the pages of the details of the estimate and report to the Commissioner of Improvements.

Cross-examination by Mr. Dorsey:

Approaches the question from the point of view of a practical contractor, and undertakes to estimate the aggregate price
867 at which witness, as a practical contractor, would undertake, at the present time, to reproduce the structural part of the water plant; does not include rights of way or land, or the costs of acquiring these items of property in the plant; does not include anything on account of water rights, or any cost connected with the acquisition of them; confines himself strictly to the structures. Administration, legal expense, was figured in acquiring rights of way and things like that, but not figured on any cost of the right of way.

Referring to Exhibit 57, witness omitted pavement of Ashland Avenue reservoir estimated by Metcalf and Anderson, gross reproduction cost $49,425; omitted service taps; the extra cost of laying mains under parallel tracks and conduits, both of which were estimated in Metcalf and Anderson's estimate at $249,960. In a sense, omitted preliminary organization expenses, but made provision in the total to cover a good deal of it; not all of it. Witness' letter appearing on page 5 of Exhibit 57 is right in saying that the estimate does not include water rights, lands, rights of way or preliminary organization expenses. Does include all items of expense properly chargeable to the construction cost. Price at which witness, as a practical contractor, would undertake to produce the items of the plant and the cost mentioned is $10,109,789, as stated in summary on page 143 of Exhibit 57, and that is the sum which witness would expect to get from the water company employing him. The subtotal of $8,178,047 appearing on page 143 of Exhibit 57 is the actual cost of labor, material, plus the contractor's profits. Contractor's profit was figured at twelve per cent, applied to the total of labor and material on each class of structure except the installation of the cast iron pipe within the city limits, to which a percentage of five per cent was applied, and the Lake Cheesman construction, to which an item of fifteen per cent for material and labor is applied as contractor's profit.

There is some iron pipe in the conduit system to which the twelve per cent has been applied. There is some cast iron pipe and specials in the conduit system that has fifteen per cent profit, plus twenty per cent profit in addition to it, on account of the different places, but in a general way fifteen per cent, five per cent and twelve per cent cover the profits. The special instances referred to where profits, different from the ordinary profits given, were applied, are of relatively small importance. These profits are the ones which a contractor would ordinarily demand. Contractor would assume that after he had paid out everything he was required to pay, he would have in hand profit equal to these estimates.

868 Contractor aims to get his basis cost first. He sometimes errs. After getting the basic cost he aims to add profit to it. In the total of $10,109,789; contractor's bonds, administration, legal

expense and other like matters are included; that is the way witness takes care of them.

Thinks contingencies will be encountered in a work of this kind. On page 143 of Exhibit 57 witness has apparently included contractor's profit on all classes of structures, except buildings, before reaching the sub-total of $8,000,000 and some odd thousand dollars, and then added contractor's profit below on the assumption that the estimate of Willison and Walsh include contractor's profit, and that five per cent should be added for general contractor's profit. In arriving at the total cost, has assumed that contractor would be paid on the basis of thirty days' estimate upon the amount of work done the previous month, barring ten per cent retained.

Ten per cent generally covers the amount retained. Does not know what the statutes require. Has not taken the requirements of the statutes into consideration. Does not know that it provides that the ten per cent retained shall be permitted to accumulate and be held for thirty-five days after the completion of the work. Has made provision in the interest rate for paying half of the interest on the total for the entire time. The interest item is $607,479, on page 143 of Exhibit 57; assumed a year to construct the distribution system, and a year and a half on the dam and supply line. Interest periods are arrived at in the following way: Figured the working days 22 days a month, between 7 and 9 months a year; distribution system figured on 9 months a year and the dam 7 months. The interest is figured on that basis on the time that would be occupied in installing everything from C down to S. Total time would be three years on the dam and two years on the distribution.

Have allowed 90 days for preliminary work on the dam. Would start that before starting the work downtown. Figured on starting the dam a year ahead of the distribution system, and having the interest period expire on both of them at the same time; use six per cent; witness borrows money at that rate. A contractor would also have costs for administration and office expense at Denver, office force, transportation of superintendents, engineering expense, and so forth, which is covered on page 143 of the exhibit.

Under item of administration and legal expenses, $200,000; engineering and supervision, $429,942. Any contractor would be subjected to such expenses. Would also have a cost for testing material, one per cent, appearing on page 143 of Exhibit
869 57. Would not buy the material without its being inspected and tested, and someone would have to do it. The basis of witness' estimate is that the contractor buys the material and furnishes it. The chances are the contractor would not do the engineering, but provision is made for it. If the city did it, the contract would cost them so much less. According to witness' estimate, the actual construction would cost $8,178,047, and other incidental costs added to it in addition. To that has been added about $2,000,000, and the total covers the overhead costs or charges to which the company or the city would be subjected, and any other expenses the city or company would be put to would not alter the contract price of $8,178,047. The incidentals of $408,902 the city would have to

provide for. The contract would provide for the construction of the plant for $8,178,047. The money for contingencies would not be used unless it was needed, and is then to be paid to the contractor to meet his contingencies. Has made the figures in case the contingencies arise. The total of $8,596,846 refers to the contract price, contractor's incidentals, contingencies and contractor's profit on the construction. The item of $90,797, in Exhibit 57, page 143, covers bonds that the contractor would have to give the city or the water company, and would be the premium therefor, and it is figured as part of the cost, the contractor pays his own bond, and adds it to the contract price when he makes the bid.

The cost of testing and inspecting material would not be added to the bid. That is an item that the city or corporation would have to pay, and would be the same as the engineering. The item on page 143 of Exhibit 57, referring to engineering and supervision, and totalling $429,342, is the amount that would have to be paid for engineering. If the contractor did it, he would have to be paid that much. If the city or corporation did it, there would be that much expense to it.

The contractor's own engineering expenses are taken care of out of his profit and overhead expense. The cost of an engineer is included in the item of estimated cost on page 148, and is in the sum to which the contractor's profits were applied. Thinks about one and one-eighth per cent actual cost is included in the twelve per cent contractor's profit. That is the only allowance made to cover the overhead expense to which the contractor may be put. In Exhibit 58 has not given detailed distribution of the one and one-eighth per cent. None of it was for contractor's engineering. To give the details, would be running down so small that it would be hard to adjust each item. There would have to be headquarters, an
870 office in Denver, and bookkeepers, auditors, paymasters, superintendent, and various employes. This is taken care of by the one and one-eighth per cent, which is ample to take care of the whole thing. Had previously stated that he had figured out the various costs and arrived at one and one-eighth, but has destroyed the figures.

Never executed a contract involving ten million dollars. Would not keep his own engineer, and does not think it is necessary. Gives no figures for the cost of headquarters and administration, but insists that one and one-eighth per cent would take care of it. Does not take care of contractor's contingencies. Has provided for that in five per cent allowance. One and one-eighth per cent does not cover interest during construction. Would have to provide considerable funds at the outset and keep a good deal of contractor's money invested throughout the performance of the work. Interest would have to be paid on that. That interest is included in the item of six hundred and some odd thousand dollars. The chances are the contractor would have to pay all the interest during construction. If he took bonds, the coupons would be cut off, or it would be necessary to pay accrued interest up to the time of taking the bonds.

Imagines that contractor would have to take city bonds delivered

in installments with the coupons cut off. Would make no difference whether paid in money or bonds. Would rather be paid in bonds. If working for a private corporation would expect to be paid in money. The $600,000 item covers the interest which would have to be paid by the contractor, who would be paid for his work in installments every thirty days. When the company pays the contractor, the company is out that much money and has it actually invested, and would be getting no interest on it until the plant was completed, and would therefore be subjected to a large interest-during-construction charge. When the contractor is carrying the company for thirty days, he is paying interest. When the company pays him, they pay interest, and witness figured that the item of $607,479 covered interest paid by both company and contractor.

Did not separate the company's interest and the contractor's interest. Somebody would be paying interest on the whole amount for half of the contractor's construction period. Interest during construction would not cease on each structure as soon as completed, but would continue until the time that the system was in operation. Manifestly, in arriving at figure at which any contractor would be willing to contract to reproduce the plant, there must be added to the sum of $8,178,047, the incidentals and contingencies and
871 profits of the contractor, cost of bonding, interest during construction, or liability insurance.

$10,109,789 is the figure at which the witness would build the whole plant himself and turn it over to the city. If the city had its own engineer, superintendence and overseeing of the job, the contractor would not need to spend so much money. Does not think the contractor would need an engineer if the city did it. Has been on a job amounting to two or three million dollars where there was no engineer. Has never seen a double set of engineers complete upon any job. Has seen a few inspectors; has never been on a ten million dollar job. Most of the witness' contracts have been with cities and towns, and the major part with the city of Denver. The largest of these was for about a half million dollars. In contract with the city, has employed the service of engineers especially in making estimates.

Has had assistance in making estimates before making bids, but believes he has not done it on five per cent of all the work done. It is not always the larger contracts that are difficult to carry out. Exhibit 57, page 143, the item of liability and public insurance, $96,737, is for protection against employes and the public. That would be a cost of construction to be borne by the contractor.

The $200,000 legal expense is put there for anybody who has to use it.

If witness was making contract with The Denver Union Water Company, and the company had prepared its specifications, witness would not include anything in his bid on account of administration and legal expense. There would be nothing out of the ordinary in getting up the contracts.

Administration expense, supervision, headquarters, etc., would not be incurred by the contractor. The cost which the contractor would be put to for superintendents, foremen, headquarters cost,

office, bookkeeper, auditor, telephone, would go into the one and one-eighth per cent which goes to make up the twelve per cent.

Witness was asked to take the figures as they appear on page 143 of his exhibit, and figure out what his bid would be and what he would expect to get as a contractor if the water company at this time were about to reproduce these structures, and had itself prepared the necessary plans and specifications, and had offered to competitive bidding a contract for the reproduction of the work in accordance with the plans and specifications and set out separately in his figures what is included in total bid in addition to basic figures of $8,178,047, on account of each item there referred to, including interest during construction. Has not included Classes A,
872 B and T, shown on Exhibit C. The witness compares his estimate of $8,178,047 with the Anderson and Metcalfe estimate of $9,413,049.

In order to make a fair comparison it is necessary to include the Ashland Avenue reservoir lining, service connections and the additional cost of reproduction where the mains parallel the railroad tracks or the street car tracks.

Mr. Hunter's instructions were not to use the figures on the connections or on the parallel lines.

Witness always took the quantities estimated in Exhibit C. Says offhand that Lehow lake infiltration and intake, and in the tops of both Capitol Hill and Ashland Avenue reservoirs, and in the Bear Lake pipe lines, were calculated to different quantities, but Lehow lake infiltration means infiltration galleries at Platte Canon. These quantities refer to excavation in some instances and lumber in others. Witness gave credit for 20,000 feet of lumber more than called for in Exhibit C, and as to quantities thinks there was a mistake in measuring.

These are the major differences in quantities. In all items has made determination of and applied own practices, which differ from those of Metcalfe and Anderson in many cases.

The figures set forth in Exhibit 57 in the various classes are the totals estimated by the witness without the addition of any overhead sub-contractor's profit, which was added at the various rates mentioned. The architect who estimated the buildings added a sub-contractor's profit, and witness added a principal contractor's profit of five per cent. There is a large amount of cement used in the construction of the water works plant. Could not get specifications for anything except the Cheesman dam, and so estimated his own mix, which appears on page 14 of Exhibit 58. Estimated price, $1.62 for the cement for the whole job, to which freight and cartage was added; 20 cents per ton-mile added in all cases, except Cheesman, and that is 23 cents. On Cheesman lake took the quantities from the inventory: 86,000 barrels at Lake Cheesman and a great deal more at the other structures.

The cost of handling cement was estimated on a basis of unloading from the cars into the warehouse, from the warehouse onto the wagon, taking it from the wagon and unloading it on the dam. Would have a small warehouse, but haul a great deal of it right out of the cars to the works. Corrugated warehouse for 8000 bar-

rels would not cover over $1000. Would not have all the cement on the job at once. Would come in carload lots. Would keep two or three thousand barrels on hand for washout or breakdown, or any delay.

Witness would test cement at the plant. Don't examine the cement when it has been tested at the plant. If not, it is covered by the one per cent inspection charge. If any cement was
873 delivered that did not pass inspection, would charge the cost to the cement company. Cement in large quantities is always inspected at the plant, and every car number is taken. Never has performed a contract requiring such large quantities of cement, but has used a great many thousand barrels of cement a season, and has used it where it is inspected at the plant right along.

There will be 35,000 barrels in the Larimer St. viaduct; that is being inspected in Denver when it arrives from the plant, but that is not usual. But the item for field and shop inspection would take care of any such costs. Contractor would be satisfied to accept the factory inspection.

In a great many cases it is provided that a warehouse shall be kept wherein the cement may be inspected so as to give a thirty-day test. Does not impose a very great cost on contractor; cost would not be very great. Can keep the cement 30 or 60 days in the bins at the plant, and witness so assumed in this case. If not inspected at the plant, the cost of inspection in Denver would not be very much, but allowance of one per cent for inspection made by witness would cover it.

On a basis of 240 yards a day, there would be 200 barrels of cement; in thirty days there would be 6000 barrels of cement, if the whole cement was carried thirty days in stock. This would be on Cheesman lake alone. Witness' figures are ample to cover the cement proposition any way you take it.

Witness states: "The only man's judgment that enters into this is mine. If this estimate is right, I am right; if I am wrong, the whole estimate is wrong, because there is nobody else's judgment there but mine. If I was figuring on this job tomorrow I would use my judgment, the same as I have used it here. Consequently, if I made a mistake on this and figured it too low, I am the loser; if I have a fair profit, I am the gainer. This is my estimate and my way of handling the proposition."

Witness' allowance of one per cent, specified on page 143 of Exhibit 57, and there designated as an allowance for testing material, and so forth, includes the cost of handling the cement. Nothing more need be added.

The cost of the cement, allowing $1.62 for the cement, 60 cents for handling, which is 12 cents; freight to Buffalo, 14 cents; hauling 24 cents, is 94 cents, making a total of $3.25, to which has been added a profit of 39 cents a barrel. If all the money to handle the cement is borrowed at 6 per cent per year, the interest is 19½ cents, and there is 39 cents for handling the barrel of cement in addition to the actual cost. There is not an item of risk involved.
874 Would not allow anything to cover the item. It is already there. It is in that one per cent, $85,988.

Is asked how much there is in that one per cent on that account. Answers, whatever it would pro rate at. The contractor would not pay any of the one per cent. It appears from the witness' testimony that the cost of handling the cement to the contractor is not in his estimate of cost, but he says it is in a one per cent allowance for inspection, and so forth, and the cost that the company would be put to for handling the cement is nowhere set down as an item of cost, but is in the one per cent.

Exhibit 57, Class F, page 27, item 5, sub-item A, are the Platte Canon infiltration galleries; is one of the instances where the quantities did not agree with Metcalfe and Anderson. That item does not cover any excavation or backfilling of the excavation, merely piping itself and the placing of it, 4,111 feet at 95 cents, total $3,905. The item of crib, 3,912 lineal feet, and so forth, amounting to $4,172, does not include excavation. The item of excavation, 12,000 cubic yards at $2.10 per cubic yard, amounting to $25,200, covers cost of excavating trench for the crib, and the item on page 28 of Exhibit 57 for backfilling, 12,000 cubic yards, $1,200, relates to the backfilling of the excavation for the crib.

There is no allowance for the excavation for the 24-inch perforated pipe. Class J in Exhibit 57, page 58 thereof, shows the difference between Metcalfe and Anderson and the witness on that class to be $18,000, of which $12,930 appears to be a difference in estimate upon the Littleton mill building, which was estimated by Willison and Walsh.

The item of transportation enters largely into the estimate. Figured on doing most of the hauling by motor trucks, and very little by wagons. Figures on the transportation of material for Lake Cheesman as 23.8 per ton-mile, as it is on page 10, item 6-E, Exhibit 58; and on page 97 of Exhibit 58 cost of 20 cents per ton-mile is arrived at for haulage in the city, and everywhere else except Lake Cheesman. Has never made use of motor trucks.

Got information from truck owners in Denver and Portland, Oregon. Can haul the stuff by wagon for the same figures. Hauling by wagon on the eight-hour basis would be 33 1-3 per ton-mile, but on ten-hour basis would change the proposition. Could not haul cement for 20 cents per ton-mile with a wagon on eight-hour day, but could be done with a truck. Would have to make roads from Buffalo to Cheesman.

Truck owners in Denver have guaranteed to do certain loads,
hauls and hills. Witness has had no experience at Portland.
875 Was assisted by Mr. Frank Kelsey of Portland. Got Portland information by letter. Trucks are not used here at all, hardly. Don't recollect who the Portland informant was. Thinks it was a contractor. There is not a town in the country half as big as Denver that don't use a hundred times more trucks.

Witness has an automobile and finds it expensive. All automobiles are not what the agents say they will be. Only knows of one or two trucks that have been used, and they not very generally. Other contractors over the country are surprised we are not using them here. They are using them on fifteen per cent grades and hauling five tons with them in Portland. There has been no real

experience in Denver on the use of trucks. Knows one five-ton truck here that is hauling crushed rock over good roads, would not be afraid to take a gamble on it.

The altitude has some effect, but can be met by adjustment of carburetors, condition of roads affects the use of trucks. Roads are pretty good. All the roads in Denver are safe for truck work. The routes would be changed. Could not go anywhere with a team that trucks would not work. The majority haul would be along main travelled roads. The wheels of the trucks are twelve inches wide. Knows that a very large per cent of the total conduit length is along private roads. Storms interrupt motor-truck transportation.

Does not know the cost of trucks. Allows 12 minutes for unloading and 12 minutes for loading the truck. This can be done. Five-ton load would equal 38 four-inch pipes; 26 six-inch pipe, 19 ten-inch pipe, 11 twelve-inch pipe. Figured on loading and unloading such pipe with movable derricks attached to the truck.

Expects to get a five-ton truck with a movable derrick for $4,900. Loading apparatus adds $400, and would be stationary in the yard all the time. The unloading apparatus would be attched to the truck, and would be a sort of a crane which would lift two or three pipes, and drop them on the ground. Would operate it by hand power. Knows that he can handle the pipe, unload it and distribute it for 20 cents per ton-mile. Could haul it for $1.20. Has never hauled with trucks, but has done like hauling. On the 6-inch pipe would have to stop twelve or thirteen times, and throw off a length of pipe at each stop; possibly the same for the 10-inch pipe. On the twelve-inch pipe would make eleven stops. Thinks five per cent of all the pipe is 6 inches and under, and 86 per cent is 12 inches and under, so that on 86 per cent of the pipe that would be distributed there would be fifteen to nineteen stops. Don't
876 think anyone will make such an average on this job, but thinks it can be done. Estimated an average speed of eight miles an hour.

Counsel read from the proceedings of the 14th Annual Convention of the American Transfer Men's Association, held in Detroit, June 16, 1914, in which the maximum speed for five-ton trucks was said to be 7 miles. Witness charged his downtown trucks off in two years and mountain trucks in three years; is not a truck expert, but if the trucks would not make eight miles an hour they would not be any better than teams.

Witness' attention called to page 97 of Exhibit 58, where the trucks were assumed to be written off in three years. The efficiency of gasoline was arrived at from the same source of information. Figures two and a half miles in the mountains and four miles in Denver. The truck pulls by chains. Knows that he can haul by teams for the money estimated on the truck basis. Mr. Hunter does not want the figures except on the 8-hour basis and witness has made figures on that basis and got the trucks on account of the 8-hour day. Is satisfied he can do the hauling by teams for 20 cents a mile.

Witness will stand on the estimate for doing the hauling by trucks,

and bases the estimate on the information gathered by others. A two-horse team carrying a two-ton load a distance of ten miles would cost 40 cents per ton-mile. A team could haul at least 5 ton-miles and return unloaded, two miles an hour, on an eight-hour basis. If the load was two tons it would be 25 cents per ton-mile. Are hauling every day with teams making that speed. Estimates one set of tires per year. Got this data from the same source of information.

Did not investigate what the Denver Omnibus and Cab Company would have to pay for their light trucks on city paved streets. In figuring interest on the investment in trucks, figured it for two years, or total of six per cent.

In making an estimate on trucks, had the White truck in mind. Is satisfied ought to use total of 6 per cent interest on the trucks. Makes the same estimate per year for tires used at Lake Cheesman.

Divided the city into eight districts, in which the loaded railroad cars would be set for delivery of the freight. In order to do this it would only be necessary to put in one or more tracks on the Union Pacific at Kearney and 47th Avenue. The other seven are now available. One at Josephine on the Union Pacific; Colorado & Southern at Franklin and Mexico; one at Delaware and Virginia on the Colorado & Southern; one at West Tejon and Mulberry on the D. & R. G.; one on South Water and 7th on the C. & S.;
877 one at 45th and Gallepago on Colorado & Southern.

Thinks the railroads, on arrival in the city, would switch at various points without additional charge, whether they came in over their own line or some other railroad.

Does not know that there is a published tariff of 20 cents per ton for such service. Does not think the shipper would pay this charge. Has never had any trouble on shipments from outside the state; set where wanted. Thinks the railroad of original routing would certainly deliver freight anywhere in Denver. It is a fact that the Union Pacific delivers their routed material anywhere on their line. Did not take into account any extra cost for switching in Denver.

Referring to Exhibit 57, page 38, item 8-I, 48,780 cubic yards at $1.25, $60,975, and the subsequent item of 15,400 cubic yards at $1.25 per cubic yard, $19,250, figured the delivery of sand mentioned after washing and grading at the bank. Would then put it on a chute and send it down to the bed. Has never had any experience in constructing a slow-sand filter. It would have to be taken over the surface with wheelbarrows and distributed that way. It does not cost $1.25 to take out the sand and deliver it on the bank.

Witness' estimate in Exhibit 58, page 23, item H-I, allows 75 cents per cubic yard for the sand and gravel delivered; 25 cents for screening and 25 cents for washing, but it would not cost 25 cents to wash or screen it, and that estimate would cover putting it in place. Would require different size screens. It would be done in one operation. Has made the different sizes with one operation. Has never constructed a filter bed, but sees nothing out of the ordinary in the construction of it.

Witness' attention is called to his previous testimony and the statements in his exhibits with regard to the preparation of sand for the Platte Canon filters. Witness explains that 25 cents per cubic yard would cover the cost of washing and screening, which would be done at the same time, and that the further sum of 25 cents allowed would be sufficient to place the sand and gravel on the surface; that the estimate of 25 cents "for screening" should have read "for screening and washing"; this will be ample allowance for screening, washing and separating into four different sizes. Sand and gravel would be put into a revolving screen, with different meshes, and the water would be pumped into the screen while it was in operation; the machine would be engine-driven; the 25-cent estimate covers cost of the machine.

Witness thinks operation of cleaning and separating could be done in the manner he has indicated; does not know of any case where it has been done that way; does not know that in
878 water works construction it has been found that it cannot be done that way. Cost of screening alone without washing would be from 15 to 18 cents; has washed sand and gravel for concrete purposes. The object of washing sand and gravel for any purpose is to eliminate the loam and other admixtures.

Don't know of anything that would be done with the sand except to wash it. Don't think there is any operation that will wash sand as thoroughly as revolving screen, with plenty of water. Witness thinks his washing operations have left two or three per cent of loam in the sand; that would be a clean material. If it had to be cleaner, that could be accomplished by adding more water. The item of trenching for the purpose of laying conduits and other apparatus and the item of backfilling after the apparatus is laid are very large and important items of the total cost. The work of trenching for conduit lines and backfilling the same differs somewhat from the city lines. Has adopted a standard price of 12½ cents per cubic yard for the excavation and 10 cents for the backfilling. Refers to Exhibit 57, page 23, Class E, item 5-C, steel pipe in place, and the item of excavation therefor, the allowance being 12½ cents per cubic yard. Compares same with Metcalfe and Anderson's estimate, Exhibit C, page 166, of 25 cents per cubic yard; backfilling, 10 cents per cubic yard, as compared with Metcalfe and Anderson's estimate of 14.6 cents per cubic yard.

Figures that in the construction of the conduits ten per cent of the work would be hand work and team work, and 90 per cent trenching; would use a No. 10 Austin machine, which would dig successfully 7 feet wide and 20 feet deep, if necessary; this is one of the largest machines they make. Operated by steam power; has a boom with a chain, and belt revolves around the boom; excavation buckets on the belt. Cost of No. 10 Austin machine with freight to Denver added is $11,700; adds no cost for transportation to the work. Estimates repairs on machine at $5 per day; does not have much breakage; has operated an Austin machine a great deal that would dig deeper, but not quite so wide, just as good a machine; dug a trench 48 inches wide and 22 feet deep, hard

ground. Some of them dig ten feet; 6 feet by 20 is the capacity of the No. 10 machine. Witness has never tried to dig a trench more than four feet wide. Operated the machine in question in Denver for nearly three years, and did six or seven miles of work with it. The chain belt is changed for the different sizes of trenches. The engine capacity is always strong enough to take care of the maximum. A No. 10 machine is guaranteed for a 6-foot trench; does not know that they have had trouble in maintaining that guarantee, or that that increases the cost; has had experience with
879 ditch 20 feet deep and 4 feet wide, which would be harder than a 6-foot trench six or seven feet wide. It is really the greater depth which makes greater difficulty. Where a ditch is shallower, have had no trouble extending the width.

Witness' experience is that the deeper one goes the harder the excavation is. Would rather dig a ditch averaging seven or eight feet in depth than one averaging 16 feet to 20 feet in depth and yielding the same yardage per lineal foot. Does not think that a smaller change in width will add proportionately more than a larger change in depth.

Put in a trench five feet wide for the Denver-Laramie Irrigation people—very hard ground; made about 1100 feet a day; it was for a 36-inch pipe; dug 37,000 or 40,000 feet; trench was 6½ feet deep. The price was something like 50 cents a foot for the excavation and backfilling, hauling pipe and putting it in place; did not include the cost of the pipe.

The ditch was a kind of a siphon from Church's ditch to the top of Westminster, and the work was done for the D. R. I. Company; made a little profit; the average haul of the pipe was about three miles; did the riveting as well as the laying. That is the only experience in operating trenching machines on a trench as wide as five feet. Has operated smaller trenches, from 24 inches up to 5 feet; don't know whether ever dug a 20-inch trench; dug a 4-foot trench about four years ago on the Washington Park storm sewer; there were several thousand feet of work on that storm sewer, different size trenches. Machine only dug six or seven feet deep; in some places had to dig deeper than that; did more than half of the work with machine—about fifty per cent of it. Had two different kinds of machines on the job; one was a Potter machine, for digging wide trenches for brick sewers; they are more of a conveyor; the material is loaded onto the Potter machine by hand; some of the trench had to be 8 feet wide, and did not use machine on that; cannot tell the cost on the Washington sewer job; so many changes are made in sewer construction, but on conduit construction would dig practically the same size for several miles; obstructions in the streets do not bother so much for sewer work; would use the trenching machines between obstructions—just raise the machine over the obstruction, excavating to the depth of the pipe while going over; it does not delay the machine, but involves a certain amount of cost in locating the pipe, but not in excavating. Figured on the salvage in the machine taking care of extraordinary

repairs; charged machine off entirely during the life; there is more or less repair work on the machine.

880 Five dollars a day will take care of everything except breakdowns, or something of that character. Breakdowns do not occur so much on new machinery. After an Austin No. 10 machine has been used for two years, there might be fifty per cent salvage—no question but what there would be 25 per cent; estimate is based on that assumption; has estimated the digging of distribution pipe trenches to some extent by machines; the details appear on page 103 of Exhibit 58, and assumes the use of a No. 1 Austin machine; trenches would be much narrower than the conduit trenches; the distribution pipe trenches would be 12 inches in excess of the size of pipe, and the main does not exceed 24-inch trench, or about one-third of the size that would be required for the conduits; made the same allowance of $5 a day for machine repairs; this would be possibly 60 per cent more than ample for it. Although the estimate is too large, simply left it at that figure. Wrote off both conduit machines and distribution pipe machine in two years. Thinks there would be more salvage in distribution pipe machine. Interest on investment in the trenching machines is figured on page 25 of Exhibit 58, at $1.60 per day. The interest is figured by the year, but divided by the working days. Recalculates and thinks that the $1.60 should be changed to $2.40 per day; estimates an average speed of 500 lineal feet, and feels confident that that can be done; has dug as high as 1100 feet per day. There is no machine that will not dig more than that average; there is no better digging than that out there any place; no trouble in making creek and river crossings; runs the machine on large timbers, and the caving is taken care of by putting in boards to hold the banks; the men with the machine will do that; there are four laborers with machine.

Allowing 10 per cent hand work at 25 cents per cubic yard, the total cost of incidentals would be one cent per cubic yard; never has used machines on work of such magnitude as involved in the estimates; there are people who have done a good deal of work in digging conduits of this kind; it will be found that such trenches are dug by machines.

Knows W. F. Allen; supposes he has done a great deal of work of this kind; did not hear his testimony; on the viaduct Mr. Allen bid $7 a yard, and witness bid $17; that is the only way can compare his judgment with Allen's—does not know of anybody's experience on trenches except his own.

Thinks the estimate of 12½ cents per cubic yard is ample; wishes he could get all he could do at that price. The contract price on heaviest railroad excavation runs from 9 to 18 cents per cubic yard; has seen it handled for 7 cents, on the Colorado & Southern, on the line from Walsenburg to Pueblo; Sheridan, of St. Joe, Mis-

881 souri, took the contracts; would not take a job at that price.

Witness' average figure on sewer work has been 25 to 35 cents per cubic yard; has not taken a sewer in three years; that figure includes the backfilling; no one would get a job here on deep-cut

sewer work on a basis of 80 cents to a dollar per cubic yard and two to three dollars for wet material and quicksand.

Has bid 25 cents per yard for excavation and backfilling of sewers and has not secured the job; that would mean about 25 cents for excavation. Sewers are deeper than the water works and some wider; cannot afford to equip for a small job as could for large job; thinks difference in equipment would cut the price in two; equipment would be large and expensive, but there is work to pay for it.

Witness knows that Mr. O'Gara had a machine to dig a trench and abandoned it; had a Parsons machine, and that is not the right kind; never knew anybody else to have a trenching machine and abandon it except O'Gara; figures that there is about ten per cent on the conduits that cannot be excavated by machines; made an examination by going over the ground, not personally, but at a distance; some places went over the road; examined the river crossings; made seven or eight trips; as a general thing, traveled along the road, and covered most of the line that way. Witness' standard estimate for backfilling is 10 cents per cubic yard, as against Metcalfe & Anderson's 14½ cents; both estimated on doing it by machinery.

There are two or three grades of machinery; can use steam shovels or go-devils; simply involves putting the earth back in the trench; don't think it makes any difference whether the backfilling is put in by hand or not, so long as it is put up to the spring line; would be no more necessary than in the case of backfilling a green brick sewer; that would not withstand the pressure as well as a wood pipe; it must be tamped carefully for a green brick sewer.

Figured on tamping it by layers, but it is not necessary to put it back by hand; would not have to add anything to the unit price of ten cents on account of tamping in layers of four to six inches in thickness; the average cost is nowhere near 6 cents; it would have to be tamped beyond the spring line, which is a very small yardage proportionately; does not think the tamping material would average one-third of the whole; handled in that way, costs more, but would not exceed the 10-cent estimate. Figured on tamping to the spring line and under the pipe; is not figuring on sacrificing any profit; figures on backfilling by machine. It would cost more to fill it by hand; if one-third was filled by hand, it would cost more than
882 filling by machine. Metcalfe and Anderson's figure on the distribution system is $4,332,677, and witness' figure is $3,618,051, or a difference of $714,626. Witness has omitted cost of laying pipes parallel to street cars and the cost of the taps for service connection, which accounts for a difference of $249,960, leaving a net difference of $464,666.

A very large item is the cast iron pipe itself. Compared Exhibit 57, page 130, item 1, with Exhibit C, page 365; there is a difference in allowance on the cost of the pipe of $26,645. If additional switching charges had to be paid to the railroad, that would have to be added; there is an average haul of two miles, and witness figures 20 cents per ton-mile, making a transportation cost of 40 cents per ton; if this estimate is too low, that would have to be added. Figur-

ing on the basis of 30 cents per ton-mile, it would make a difference of $12,000. These two items would possibly absorb the difference between the two estimates.

As to specials or castings, witness' estimate, shown on Exhibit 57, page 170, item 2, is $95,557; Metcalfe and Anderson's estimate, Exhibit C, page 365, item 2, $106,540. It appears on page 110-B, of Exhibit C, Class S, item 2, special weights, should have been 3,044,000 pounds, which makes a correction of 11½ tons; witness overlooked that. The average price used by witness $50 per ton; is not aware that the average price that the water company has had to pay for such items from 1904 to 1913 is $70 per ton, and never less than $60 per ton. Witness took the quotation of the C. F. & I.; was not aware that the water company had purchased a great many from the C. F. & I. Such items vary in price, and witness took the present-day quotations. Thinks price on the specials is reasonably low; not necessary to take an average price; would be willing to take the C. F. & I. prices; presumes they would agree to deliver that quantity of pipe in the future as needed.

Unit price on cast iron pipe, F. O. B. Denver, is considerably higher than it has been in the past, and witness thinks one offsets the other; is not aware that the unit price for cast iron pipe used by him is close to the average paid by the water company. With regard to the specials, has made no attempt to arrive at average unit price; simply took last quotation.

Estimates that sixty per cent of the distribution work could be done by trenching machines, forty per cent by hand.

The unit price for excavation only with machines is 21.4 cents per cubic yard, and 10 cents per cubic yard for backfill; arrives at this by calculating the estimated cost of operation of the machine per day, including depreciation and interest on capital, assumes an average lineal footage per day, translates that into cubic
883 yards, and divides the day's cost by the daily cubic yardage; would have two men on the machine—an engineer and fireman; does not have a gang with the machine; has a watchman at night. That is all the crew witness ever used on a machine in the city.

Has operated machines a great many months and years at a time in Denver, and has never had a large crew; the machine moves itself from one place to another.

On sixty per cent of the work there would be no obstruction, and it is so assumed. Would dig the trenches two feet; five per cent allowed for bell holes. Different widths of trench are tabulated on Exhibit 58, page 116. Has estimated a thousand linear feet per day on the distribution system.

In building the Montclair sewer, averaged 980 feet a day, 9 feet six inches deep, 80,000 or 90,000 feet long. There was some of it 24 feet deep that was dug by hand; dug 90 per cent of it with machines. There were 17 or 18 miles of trench; 15 miles was dug with machine; that was five or six years ago. Understands that the distribution system would require several hundred miles of ditch; that would not alter the conditions.

That sewer district was mostly south of Colfax and west of Phipps Sanatorium; does not remember the exact western boundary; thinks it was Monaco Street. The country there is sparsely settled. The work was in the streets; had some obstructions. The sewer was nearly twice as deep as the water line would be. Have operated in North Denver, East Denver, South Denver, but none in West Denver. A thousand feet per day on such a sewer would be equivalent in capacity to 2,000 feet per day on a water line. Has used a trenching machine in South Denver, where it is all settled up, for water and gas pipes and sewer work; work was in the streets, sometimes in the middle and sometimes to one side of the street; used a Potter machine in South Denver; that is not a trenching machine; thinks he averaged five, six or seven hundred feet per day, and hauled away the surplus dirt; but did not have a breakdown that could not be fixed in a few minutes; had to stop the machine once in a while, and the fixed charges went on; have done work from Boulevard F out as far south as 20th Street and as far north as 24th, and as far west as Manhattan Beach; that was sewer work; a great deal of that district pretty well settled; it was a sanitary sewer. Never did less than 500 feet with a trenching machine—from that up to seven and eight hundred; allowed for the hand work mostly in the main part of the city; could use the trenching machines on the east side of Boulevard F.

Put a sewer down 16th Street about ten or twelve years ago by hand work, after the street was paved; went twice or three
884 times as deep as with a water works system; backfilling did not cost much; it is the excavation that costs; does not recollect what the costs were; maybe somewhere between 75 cents and a dollar; it was a difficult job; had water mains to battle with; would not have the same difficulties with a water system; ought not to have trouble with the telephone conduits; would meet with the steam heating conduits.

Made estimate on the theory that the obstructions mentioned would not interfere much; put in storm sewer from 14th Street down to Cherry Creek and from City Hall up to Colfax, without any trouble; that is on the edge of the down town district; encountered a great many gas service pipes.

The steam heating company recently relaid nine miles of conduits, and work was done by hand; does not know what their cost was. The total cost of trenching and backfilling distribution system, as shown in Exhibit 57, pages 134 and 135, was $724,101, and that compares with the Metcalfe and Anderson figures in Exhibit C, aggregating $995,817; realizes that that difference is $271,716, and is an important part of the difference between the two sets of estimates on distribution system. Witness is satisfied that his estimate will cover the trenching, with a reasonable profit.

Exhibit 57, pages 135 and 136, contains estimate of $378,507 for removing and replacing asphalt paving alone. There is an error in asphalt paving; it reads "6½ inches", and should be "8½" on page 106 of Exhibit 58.

Witness' estimate of $378,507 varies somewhat from the Metcalfe

and Anderson estimate of $539,558, and the Public Utilities Engineers' estimate of $504,310.

The width of the cut is the same width as the trench. Has had experience in cutting and replacing pavement. Thinks it is necessary to make the cut a trifle wider than the trench—has not the details with him—and made allowance for that. Thinks provision was made for margin of six inches on each side of the trench; this applies to all the paving. Has not found any estimate in connection with the infiltration galleries of Platte Canon covering the trenching for 4,111 feet of perforated wood-stave pipe; there is no question but what it is omitted. On the Cheesman dam construction, took the quantities used by Metcalfe and Anderson; did not know that they had deducted from the total contents of the dam the amount that was there by reason of the prior construction.

Witness' estimate of preliminary expenses included no part of the construction of the dam; had no way of finding out the fact that the quantities estimated by Metcalfe and Anderson for the dam were exclusive of other quantities left in the dam from previous work; were not able to get any information on the point from the
885 water company; took the matter up with Mr. Skouland. Witness had before him the data in Exhibit C, page 121, item 6-*a*.

There were items aggregating $27,193, for iron, steel, concrete and labor, concerning which witness could get no information. Witness took only the quantities in Exhibit C for the Cheesman dam construction. By taking Exhibit C, witness cannot see where there is any omitted yardage; witness has an item of $57,260, which covers preliminary expenses; witness has an item of $30,000 to cover flood contingencies. If there were quantities in the dam in excess of those shown in Exhibit C, they would belong there, but witness was not able to find out from the officers of the company what the fact was regarding it.

Witness disallows entirely item of $1,200 for ice-cutting in connection with the Platte river intake works. There is always a water hazard in connection with the construction of a dam in a flowing stream; there is danger of floods in the summer. Would try to start such construction at the most favorable period of the year; more apt to do that on a large job than on a small one; has made allowance for dikes, diversion dams, etc.

There is an allowance of $1,361 for diversion dam; thinks that dam would handle the water; has made no other allowance for flood hazard; understands the Intake dam work was done in the winter time; did not know that in the construction of the dam there was actually a flood in September, that washed it all out. Has been fighting water in Cherry Creek for two years; never has seen an estimate for water hazard; has allowed flood damage to be liberal; actually allowed more for the flood than for the actual cost of the diversion dam; at the lower location, an item of $1,600 is stricken out, and no similar allowance has been made. Has had some experience in sidewalk concrete work and work in buildings; the fair cost of laying Portland cement—concrete cement—six inches in thickness, would be $1.35 per square yard, as prices exist today; they are pretty low.

Gravel is pretty cheap; it is getting scarcer now. Three or four years ago cement was higher; figured the concrete in the bottom of the Capitol Hill reservoir on a cubic yardage basis; raised the water company's estimate 50 cents per cubic yard.

Witness' estimate on the concrete in the bottom of Capitol Hill reservoir would be $1.42; the item of $1.42 per square yard is an average for the bottom and sides. Refigures and says it would be worth $1.30 in the bottom and $1.50 on the sides; there are larger quantities than in a sidewalk, and it covers more territory.

886 Estimates $1.25 per cubic yard for handling material, $1.30 per cubic yard for hauling gravel or sand, and 20 cents per ton-mile for cement; that makes cement cost per barrel $1.87; original cost $1.62.

Will leave his estimate at $1.50 per square yard for bottom and sides; got $4 per square yard for laying the sidewalk around the Federal Building, but the top two inches is granite screenings, very fine. Cement cost was $4.25 per barrel.

Has prepared a tabulation showing his bid upon the assumption that the water company has prepared plans and specifications to reproduce the work and submitted the matter for competitive bidding, which is read into the record; the total, including deduction for reduced labor cost, is $8,341,995; this assumed bid starts with a basic figure of $8,178,046; adds to that items which he would include as a contractor, being the same as those on page 143 of Exhibit 57. To make this bid comparable with Metcalfe and Anderson's, necessary to add Ashland Avenue reservoir lining, $49,424; service connections, $249,960, making an aggregate of $8,773,623, as against the Metcalfe and Anderson estimate of $9,413,049, or an estimate of 93.3 per cent of the Metcalfe and Anderson estimate, the difference being $639,426. To this should be added the omitted excavation of the trench at the Platte Canon filter beds.

This bid would include only contractor's overhead; incidentals and contingencies represented by the sum of $408,902, appearing on page 143 of Exhibit 57, must be taken care of by the company on the theory of the submitted bid.

Any incidentals and contingenices that contractor might need must be covered by his five per cent profit. If the work could not be carried out in accordance with the plans and specifications, they would have to be changed and the company stand the cost; if quantities were increased or decreased, price to contractor would vary accordingly.

Assumes that there will be a certain amount of rock excavation, dry excavation, wet excavation, etc. If the contractor has not properly estimated different classes of work, it is his gamble. Would be willing to take this assumed job at the price given, and stake all he has got on it.

Has not made any provision for contractor's contingencies; the contract is safe at the figure given. Has figured on timbering forty per cent of the distribution system; does not think it will require forty per cent.

The twelve and one-half per cent contractor's profit covers the minor incidentals, and not contingencies of the work itself. If con-

tingencies are to be taken care of at all, it is in the basic figures.

887 Allowance of five per cent at the bottom of page 143 of Exhibit 57 is left the same as incidentals and contingencies—that is, supervision is covered by the two per cent.

Still thinks there would be no engineering expense for the contractor; could carry out the contract without engineering assistance; that is a different thing from having engineering assistance to make up figures; Mr. Kelsey, an engineer, of Portland, has worked with the witness during all the time he has been engaged in making the estimate; all technical figures were made by him; thinks the bid could be made without any technical assistance; if any is needed, the two per cent out of the twelve and one-half per cent contractor's profit will take care of it. This two per cent covers contingent expenses, headquarters expense, superintendence, transportation, every incidental expense, auditing department, bookkeeping, paymaster, purchasing department, telephone expense, for the full period of four years. Would have three or four jobs going at the same time.

The five per cent estimate for incidentals on page 143 of Exhibit 57 was for the company's incidentals and contingencies. Thinks now that five per cent for incidentals and contingencies should be figured on the base of $8,474,238, increasing the allowance by $423,717. Item of one per cent for inspection should be computed on the same base; engineering and supervision computed at five per cent, should now be computed on the base of $8,598,846; the $408,902 item for incidentals and contingencies must be added to $8,474,238, and to the sum so obtained must apply percentage of one per cent for testing materials, five per cent for engineering and supervision, etc.

On an extensive job like the one in question, contractor would require a large plant, whose total cost would be approximately $150,000 to $175,000. The estimate of $50,000 for the contractor's plant at Cheesman is plenty; figured on doing the drilling at Cheesman by hand. Estimate covers drills, but not compressing machinery; does not include automatic drills; takes care of the interest during construction on the contractor's plant.

Witness JOHN GAFFEY resumed the stands for further

Cross-examination by Mr. Dorsey:

Company's overhead and interest during construction would be arrived at by deducting from the total overhead and interest during construction on page 143 of Exhibit 57 the items of contractor's overhead and interest during construction set forth in the proposed bid on page 3,698 of the testimony; the item of $200,000 appear-

888 ing on page 143 of Exhibit 57, as administration and legal expense is arrived at by approximation, and is not the application of a percentage to a base; witness made the approximation. Have had no experience in financing, managing and operating a public utility company; does not know what costs such a company has to meet; the company's interest during construction would be $510,719. The note on page 112 of Exhibit 58 shows the details of figuring interest during construction and the basis was 6 per cent

for one and one-half years on dam, administration and legal expenses, and 6 per cent for one year on balance; interest during construction on Cheesman dam amounts to $112,021, which is arrived at by adding $200,000 legal expense and administration to the total cost of the dam, and taking 6 per cent of the total.

There would be a year's preliminary work on Lake Cheesman and three years for construction, making in all four years. There would be a considerable investment in engineering before construction was begun. At the end of the first year of construction, would receive payment from the company for one-third of the contract price, and one-third each year thereafter; the rest of the plant would be begun a year later, and actual construction would be preceded by preliminary investigations, engineering work, etc., and would require an investment before the beginning of the two years' period of construction.

This preliminary work would take several months, during which all rights of way for the conduits would have to be acquired; must first determine where the pipes are to be laid, and get the rights of way; a year would be all the time necessary for this. Would have all the plant come to final completion at the same time. During the first year of construction of the rest of the plant would receive one-half of the contract price, and would receive the balance at the end of the second year. Thinks two years is ample time for the construction of Lake Cheesman; has not constructed a reservoir as large as Lake Cheesman, but constructed the Granite Springs dam for the government at Fort Russell; that is the same character of construction; it is plug and feather work; it is same kind of masonry except the face of the dam; it was 97 feet high, 72 feet on the base and 408 feet on the crest; it cost $200,000; did not lay any masonry the first year; put in the masonry the second year; seven or eight months of actual work; the bids were opened and the contracts awarded on September 16, 1902, and the dam completed on the 4th of July, 1904; had no other experience in constructing dams comparable to Lake Cheesman. Went into the time for constructing Lake Cheesman and the rest of the plant very thoroughly, and is satisfied he can do it in that time. It is only a question of
889 organization; thinks has taken care of all costs due to the speed.

Has paid no attention to what other people have done; makes own calculations; never has produced such a work in the time, but is satisfied he can do it; can put enough sub-contractors on it to clean it up in one year; thinks he could get a delivery of the cast iron pipe required in two years at the prices mentioned. People want to sell pipe; do not want to hold it; that is why they manufacture it. There are a large number of plants in the United States that are not doing much today; does not rely on temporary conditions in such plants; has spent practically all of his active life in contracting business; has spent 24 years in Denver and approximately 12 years on railroad construction work and bridge building; before coming to Denver was manager and estimator on railroad construction and bridges work; built the Homestake line from Piedmont to Lead

City in 1888; that was one of the first contracts witness took for himself. Has been engaged in business on his own account ever since coming to Denver; a great deal of the work done since coming to Denver has been right in the city; does a great deal of grading and curbing; has handled several billion yards of such work; has never had any experience in the carrying out of contracts for laying cast-iron pipe, in large conduits; sewer contracts include the construction of the sewer conduits; mostly vitrified pipe and some concrete; the largest contract witness has had involved about four hundred and some add thousand dollars; have had several contracts that aggregate over $500,000 to a million dollars on the books at once; the large contract spoken of was the Capitol Hill storm sewer; has worked under every engineer that has been at the Board of Public Works since the witness has been in Denver; work done under Commissioner Hunter has been within the last ten years; don't agree with Mr. Hunter on the labor proposition; has figured $2.50 for eight-hour day, which is above current labor; $5 a day for teams, which is above contract price; such labor prices have never prevailed; the fact that the city pays such prices does not fix the market. Witness made his supplementary estimate on the basis of $2.25 for 10 hours work, common labor, instead of $2.50 for eight hours work. Knows he can get common labor at that low a price, and can get a team and driver for $5 a day, 10 hours work; could have done that during the last three years of five years; $2 would have been the standard wages for that class of labor for ten hours; outside the city, do not pretend to work less than ten hours; the men are not unionized; teamsters are not unionized outside of the city. Great deal of the work that witness has done before the 8-hour and $2.25
890 schedule was introduced was paid for as low at $1.80 for ten hours; that was three or four years ago. None of the utilities companies in the city are paying $2.25 for 10 hours' work; they may be paying $5 for teams; used to pay $1.75; twelve years ago paid $1.60; paid $1.60 on the Capitol Hill storm sewer, and the estimate of $2.25 is a substantial increase.

Would venture to enter into a ten million dollar contract on the assumption of $2.25 a day for 10 hours, and $5 for a team, 10-hour day, contractor's profit estimated at 10 per cent, and two per cent added to cover incidentals and contingencies; that ten per cent is computed on the basic cost, without including in the base an item on account of contractor's overhead. Those figures are for the distribution system, and are not low for such a job. The estimate on Cheesman dam is fifteen per cent, and out of that fifteen per cent two per cent is for incidentals and contingencies. The incidentals are included in overhead expenses; the two per cent is for contingencies, leaving 13 per cent for profit; increases the profit on Cheesman because of being away from the base of supplies, and are entitled to a little more profit; has estimated large jobs on less than 10 per cent profit, and did not then get the job. For several years in Denver have not estimated on more than 10 per cent profit. Five years ago did not dare go over fifteen per cent; twelve years ago contractor's prices were about what they are now.

Speaking of the period of time between ten years ago and five years ago, might have expected to get fifteen per cent in some instances, but, as a general rule, would not; lately has not pretended to figure over 10 per cent; does not think that the work that has been let in Denver has netted contractors five per cent; would not feel like taking a job without ten per cent profit.

General contracting work in the vicinity is done for less profit; the average grading contractor in the last five or six years has gone broke digging dirt at from 9 to 13 cents a yard; has let a good deal of it to sub-contractors on street grading that had to be levelled off and finished for fourteen cents; would not want any such work at 14 cents. Unit prices for such work are lower now than they have been for some time; for the last ten years the tendency here has been low.

Competition between contractors has had something to do with it; there are several contracting firms in Denver having a large investment in plants; the ten per cent profit is not ordinarily figured on the cost of all the material; for instance, on sewer pipe and brick profit would not be figured; on the Capitol Hill storm sewer, figured four or five per cent on material, including cement, pipe and
891 brick; figured ten per cent profit as applied to the rest of the job; wanted it and figured low; that job was let in 1890; it took two or three years to finish it.

Redirect examination by Mr. Stevens:

Referring to the estimate read into the record on page 3698, witness would be willing to make a contract to build a plant similar to the present plant of The Denver Union Water Company for the total price of $8,341,995 plus a possible addition of $18,480 for omitted excavation.

As to the incidentals and engineering which the employing company would have to pay, the figures are just approximate. On all matters that concern the contractor, figures show what witness would take the job for. Left out the Ashland Avenue reservoir lining, because there was none there—that is, there is one there, but it was deteriorated and rotted and of no benefit to the reservoir; left out taps, because Mr. Hunter said they were paid for by the people and not the water company; left out the estimate of the excess cost of laying pipes parallel with the street railways, for the same reason; they could be put where there were no street railways; many were laid before the tracks were put there; would not now lay them under the tracks. Witness increased the water company's estimate on the Buffalo road from $15,000 to $25,610, in order to put it in first-class shape for motor trucks; road is not in good condition at the present time, but could be put in first-class condition for those figures.

Witness was interrogated about specific items in his Exhibits 57 and 58 wherein his estimate was higher than that of Metcalfe and Anderson, and the details of the differences with reference to the pages in Exhibits 57 and 58 were testified to by him, and he stated that all his estimates were arrived at by the same basic figures. Witness has gone over every item in Exhibit C and compared those with items valued by him, and examined them fully; has placed his

own estimates without regard to whether they were higher or lower than the estimates in Exhibit C; in doing this work went over the whole system; saw the exposed pipe lines on the road to Platte canon; it was a 24- or 36-inch wood-stave pipe line, in rather poor condition; understood it had been in 24 years; possibly good for the age of the pipe, but was in poor condition. Witness keeps cost of other construction in detail, and in bidding on subsequent work uses it in a general way. Keeps gangs for different kinds of work that he is doing, when there is work for them to do. The two per cent included in the contractor's profit is to cover administration, office expenses, and such as that. Figured it out to one and one-eighth per
892 cent; that item would amount to about $160,000 in this estimate; made allowance for all possible risk in performing the contract. Bids a unit price for each class of excavation, and would be paid that price for the total amount of any class of excavation encountered.

Submitted original figures more as an estimate by which the city might do the work, through witness as a contractor, than through a private employer, and as to all matters outside of those particularly concerning witness as a contractor, they were estimates made for the employer and intended to be ample to cover all contingencies of the employer.

On page 134 of Exhibit 57 it appears that there would be 527,907 cubic yards of machine excavation, and 508,896 cubic yards of hand excavation; it appears from Exhibit 58, page 104, that witness allowed $40,000 more for timbering trenches than was allowed by Metcalfe and Anderson. Witness was asked whether he would actually do the work at less than the estimated figure, to which objection was made and overruled; would be willing to take the contract at the figure fixed, or less, if he had to; made no provision for cutting ice; put in a diversion dam to take care of the water; that appears on page 12 of Exhibit 57; the amount is $1,361—just a temporary dam.

Omitted the estimate for excess cost of laying pipes under car tracks or parallel with car tracks, because Mr. Hunter stated it was not necessary to lay any of the pipe under any car line; that the car line was built after the pipes were laid. Would just as soon have bonds as cash.

Recross-examination by Mr. Dorsey:

The pipes that are in the streets now actually exist under car tracks. Pipes could be laid elsewhere in the street, but if actually reproducing the identical plant, they would be under the tracks. Messrs. Metcalfe and Anderson figured on building the same diverting dam. Witness simply omitted the item of ice cutting.

Has not made any actual investigation of the cost to the water company of its works. Referring to the items on the last page of Exhibit 57, which are additional to witness' bid as a contractor, says they are intended to cover the additional cost *of* the owner of the property, whether a city or private individual; does not know whether those costs would be the same in the case of the city as in the case of a private corporation; thinks they would be fully as cheap; thinks

a corporation could get the money at 6 per cent; that is what the city pays for it. Keeps a permanent gang at work when he has
893 work for them; has a permanent office force, a permanent shop or warehouse, requiring permanent expense. The amount allowed for overhead includes the expense going on while the contract is being carried out, and also the overhead during intervening periods. The piece of bad wood-stave pipe seen by witness was being repaired; about six feet exposed; conduit is a good many miles long; witness saw 50 feet of it, and knows nothing about the condition of the rest of it; it was opened near Chatfield, close by the road. In making estimates, had Exhibit C before him; did not have the reports of the Public Utilities Commission; took Metcalfe and Anderson's figures for quantities of different materials; used a basic figure for common labor of $2.50 for eight hour day, figuring that if the city was doing the work it would have to pay that under the ordinance; for same reason, used $5 a day for team for eight hours.

After making figures, talked it over with Mr. Hunter, and witness stuck to $2.50, 8-hours, for men; when it was too late to go back again and change figures. Hunter insisted that the figures be made for current wages; witness could not go into it thoroughly, but made an approximate estimate. Hunter thought that witness should use the current wages. If the work was being done by the city, the ordinary scale of wages would have to be employed. Is not positive that any excavation was omitted at the Platte Canon filter beds; if it was omitted, the figure would be $18,400.

Witness cannot tell whether the 67,000 yards used is all in the crib, or whether it takes the crib and the other excavation to make it up. If it should be added, all the necessary overhead charges should be applied to it.

Considers that the Ashland Avenue reservoir asphalt lining is a detriment and can give no credit for it; estimated building a very much better road from Buffalo to Cheesman than is now there, which made the cost somewhat larger. That extra road cost reduced the haulage cost; on cement this reduction would be 2 cents per barrel; from any point of view, witness' estimate is considerably less than that of Metcalfe and Anderson; there are several thousand items in Exhibit 57; on 90 of the items witness is higher than Metcalfe and Anderson, and on the rest he is lower; the large difference is in the excavation on supply lines and in the distribution system. By the words "same basic figures apply" used by witness in answer to Mr. Stevens' questions, pages 3744 to 3753, witness meant that in specials, cast iron pipe or wood pipe, in arriving at basic figures, he took first the cost of the wood-stave, the cost of the band, loading, unloading and hauling, labor, construction and additional profit added to it; they were all figured on the same basis, and the result was
894 a basic figure, which was applied to all the items referred to in Mr. Stevens questions; used the same unit prices, and applied the same figures for overhead.

Started the latter part of July to do the preliminary work; the estimates were completed about November 5th. Reference notes were not completed then; they were compiled afterwards; was assisted by Mr.

Frank Kelsey of Portland, Oregon, whose duties were generally the compiling of data; Mr. Hiram Phillips did not cooperate. Investigation was independent of any suggestions from Mr. Phillips; every figure in the estimate is witness', with the exception of the supplemental estimate, which was arrived at on a basis different from what witness wanted to adopt; permitted no one to make use of records, maps, plans or other data which he used for getting at the estimates; got a great deal of information from the water company by way of original maps and plans; did not have all he wanted, but had a great many.

JOHN GAFFY, a witness for the defendants, recalled for further

Redirect examination by Mr. Stevens:

Witness omitted excavation on the perforated pipe line, and has added $18,480.

Covers excavation and backfilling; has added the substructure which had been omitted from one of the buildings, amounting to $1,862. As to the sub-structure referred to in Exhibit 57, page 52, there was no omission; the sub-structure was estimated, but it was typewritten "Super-structure."

After adding these corrections, the contractor's estimate is $8,361,406, after deducting $132,243 on account of the difference in labor costs; made the corrections in the proper subdivisions, and was enabled to make proper allowance of percentage on buildings and contractor's bond; the proper allowance as shown by memorandum marked Exhibit 66 would be $8,066,146 before making any allowance for profit on buildings, contractor's bond, liability and public insurance and interest charges. Memorandum, Exhibit 65, contains resume of estimate.

The measurements of the architects covered all the houses that are in Exhibit C; there is one measuring house listed in Exhibit C which cannot be found.

895 Recross-examination by Mr. Dorsey:

Can say nothing about the Littleton flour mill except what is already in the testimony; has not had time to go into it, and knows nothing more of it than he did when on the stand originally.

THOMAS F. WALSH, a witness for the defendants.

Direct examination by Mr. Stevens:

Architect, engaged in business 24 years; practiced in Denver 20 years; made an estimate on buildings of The Denver Union Water Company at the instance of Mr. John Gaffy. Measured all the buildings for which drawings could be obtained from the water company; laid them out and figured them; made drawings outside of those furnished by the company; covered the buildings; the houses at the different sub-stations, from Cheesman dam on down through Platte Canon and in the city here. Was first taken over the ground by Mr. Gaffy and shown all the buildings that were to be measured

and estimated. Has the drawings of all the buildings owned by the water company at Cheesman, Canon Spur, Willard filters, Marston lake and Littleton; those witness measured. In the city the company furnished drawings of the different buildings, pumping stations and so forth. Those drawings were taken and checked at the buildings. Took the company's drawings and checked and verified them. Furnished the estimates to Gaffy & Keefe Construction Company. Witness produced Exhibit 57, which was a list furnished by Mr. Gaffy, copied by Mr. Gaffy in his estimate.

Exhibit 61 offered, identified by witness, as a detailed statement and summary of the estimates of The Denver Union Water Company, and contains all the figures used in making up that estimate.

Some drawings were obained from the water company and the balance were made by the witness. Received all the Capitol Hill station, West Denver station, Ashland Avenue station drawings from the company; all the rest were measured. The details set forth in Exhibit 61 were full enough to comprehend exactly what witness based his estimates on. Exhibit 62 identified and offered in evidence. It is a book of photographs of the buildings belonging to The Denver Union Water Company.

From summary on page 31 of Exhibit 61 witness shows all detailed estimates and the total estimate. The column marked
896 "Inventory" is taken from Exhibit C of the water company estimate, and witness' estimate is in column marked "Estimate." Understood that the figures furnished by Gaffy & Keefe were from Exhibit C. The total estimate on buildings was $252,257. Detailed and fully set forth in Exhibit 61.

Cross-examination by Mr. Dorsey:

Witness got the figures designated "Total as per Inventory of Exhibit C", on page 37 of Exhibit 61, from Gaffy and Keefe. Did not personally examine Exhibit C. The figures designated "Total as per Walsh and Willison's Estimate" are those made by Messrs. Walsh and Willison. Would not include additions made by Mr. Gaffy of five per cent for contractor's profit, or interest during construction on payments to be made to sub-contractors. Does not include company's overhead, interest during construction or like overhead. Walsh and Willison's estimates cover estimates of profit to the building contractor. Referring to page 3 of Exhibit 61, and detailed figures thereon, the contractor's profit is included in each item. The figures are for work in place, including contractor's profit, labor and so forth. Taking item of 820 linear feet of 10-inch logs, at 10 cents per linear foot, $82; that is the price in the building; the contractor's profit varies usually ten to fifteen per cent. Figured the lumber at so much per thousand, in the building, including the contractor's profit, nails, etc. On the next item, flooring: The dealer would be paid $34 a thousand; it would cost $8 to $10 to lay it, and the difference between $34 and $50 per thousand covers transportation charge. It would cost $6 per thousand to transport it to Cheesman from Denver. Does not think it amounts to that, including

the wagon haul from the railroad. $8 or $10 would include the contractor's profit and laying.

Cannot tell whether contractor would get any profit on the lumber. In Denver they figure on so much per thousand for lumber in place, including contractor's profit, nails. Thinks the contractor would undertake the job at Lake Cheesman on the same basis as at Denver. Did not estimate the number of carloads of material that would be required in the cottages. Thinks 7,500 feet of rough lumber can be cut within a mile of the cottage, and that would cut down the freight rate. There is no mill there now. Would have to build another mill or bring it from Denver.

Mexican rough lumber in Denver is $20 to $22 per thousand. Estimates on the logs covers foundation. There is an item of $105 for walks, retaining walls, fence, steps, and so forth, on page 5, that includes digging for the foundations for all the structures at
897 Cheesman. Whatever excavation is done is done by a little scraper and most of it is on a sidehill; would not have to be excavated by dynamite. Mostly shale or float; not very much excavation. Hillside houses have foundation in front or toward lake of ten or twelve feet, and at the rear they rest directly in the hillside. The detail on page 10 of Exhibit 61 covers the buildings at the filters except that the gate-valve vault and house is on page 9; although page 9 relates to subdivision *e*, but that is the way it was received from Gaffy and Keefe; there is one at Marston; does not belong there, but was in the inventory. On page 10 of Exhibit 61, the third item in reference to office or administration buildings, common brick, 36,000 at $11, includes laying. Brick cost $7.50 to $8 per thousand. Brick has to be purchased in Denver, transported on the railroad and hauled in wagons for a short haul. $11 will put the brick in the wall at Waterton, and include a profit to the contractor. Did not make a specific allowance for laying brick. Contractor will put it in the wall at so much. Figured the wall measurement at so much per cubic foot, including all the openings, and the contractor will gain in laying the brick. Figures 22½ brick to the foot, and there is a gain of five and a half brick to the foot; that goes as his profit. There is less in the building by 17 per cent than the wall measurement. The 40-inch measuring chamber at Waterton is page 13 at the top. At page 14, valve-house at reservoir, is the reservoir gate house at Platte canon.

Flour mill at Littleton is on page 22. Estimate of $5,500 covers all the mechanical equipment for an 80-barrel mill. Got the figures from Mr. Johnson of the Hungarian Mill. Witness knew nothing of such things. Made no list of the machinery. Mr. Johnson was familiar with the machinery and made the estimate of $5,500; seemed familiar with what was in the mill.

Knows that Exhibit C contained a detailed schedule of the machinery in the mill. Witness did not see it. Was not aware that the Stearns-Roger Company of Denver and Pueblo had made an actual inspection of the machinery and placed their estimate at $25,715. Stearns-Roger Mfg. Company is a machinery house. The difference between the estimate on the Littleton mill in Exhibit

C and witness' estimate, accounts for a large part of the difference in the total between Metcalfe and Anderson's estimate and witness' estimate. Cannot say that allowance of $5,500 for the Littleton Mill is accurate. Witness' figures include contractors' or sub-contractors' profit. The general contract has a five per cent overhead charge on it. If the estimates in Exhibit C cover all of the overhead, they would not be comparable with witness' estimate. Does not know whether Johnson ever in-
898 ventoried and listed the machinery at the Littleton mill. Supposed his estimate contemplated the mill installed. Mr. Willison asked Mr. Johnson over the telephone, and the question was answered immediately. Referring to page 14 of Exhibit 61, witness does not remember whether he could measure the sub-structure. Did not examine Exhibit C to get the quantity of excavation and concrete actually used in that sub-structure. Does not believe that valve house at Waterton was actually measured. Does not know that the sub-structure goes down 30 feet. If water company had furnished the drawings in the first place, would have estimated it right. Would not state that the drawings in question were not among the drawings furnished when witness went out.

Was asked by Mr. Gaffy to omit the sub-structure on most of the valve houses. Gaffy did not ask witness to omit that particular one, but does not recollect measuring it. Had access to Exhibit C, but took his own figures. Referring to page 13 of Exhibit 61, did not actually measure the item of excavation, 181½ cubic yards. Did not have the plans. Asked the foreman at Waterton whether he had the plans. Asked for the plans through Gaffy and Keefe. Couple of months later Mr. Gaffy saw Mr. Hughes and Mr. Hughes obtained quite a number of drawings. Did not observe the statement in Exhibit C as to the quantity of excavation. Does not know where 315 cubic yards shown on Exhibit C comes in. Price of 50 cents per cubic yard for excavation includes backfill. Measured the concrete in the building and assumed the bottom; made it two feet. Measured all the concrete we could see, and were told by one of the men that the walls were two feet thick, and so figured it. He had the depth of 17 and 19 feet; determined by the sounding. Sounded from the finished floor to the floor of the chamber, and then assumed that the depth below was two feet. On page 14 of Exhibit 61, double valve house at Watertown, figured superstructure only. Assumed that Mr. Gaffy was going to figure on the rest of the things. Does not know whether Mr. Gaffy put in the sub-structures, on Exhibit C, page 176, item *h*-6, sub-items *a*, *b*, *c*, *d*, *f*, and *g*, but he requested witness to omit them.

The inclusion of these items would add considerably to the structure. On page 12 of Exhibit 61 the item one brick bunkhouse, includes the whole building, the footings under the building; assumed three feet for excavation and concrete. Figured the buildings by the cubic foot.

Took the outer dimensions and average height. Building was not as good as some of the rest, so the cubic foot price was reduced. Was not finished like the rest. Took the office building and the

superintendent's buildings and residence and itemized them. Figured the cost of cubic measurement of the house, and estab-
899 lished a cubic foot price for a similar house. That is a fair average method. There are no ways of measuring the foundation; it was filled up inside; there was no basement; we used the unit price; standard price per cubic foot was 11 1/3 cents, reduced to 10 cents on the bunkhouse; measured from grade level to roof to get cubical contents. With this method did not use different standard for houses with basements. Only apply the standard to houses that are similar. Page 31 refers to group of buildings at Platte Canon. Sub-item, excavating, 181½ cubic yards, was reached by actual measurement. Walls were solid concrete; assumed a thickness of two feet. In Exhibit C it is 345 cubic yards. Witness did not have the map. Was not aware that in the stone and brick power house the fourth sub-item is estimated by witness at 480 cubic yards, while Exhibit C states it to be 530 cubic yards; got the figures by measuring the building; had no plans and specifications; could not be measured exactly at the completion of the structure.

Next item, 203 cubic yards of concrete. Exhibit C states the concrete foundation requires 210 cubic yards, and floor and foundation, 15.2 cubic yards. Witness thinks he hit that pretty close, his estimate being 203 cubic yards as against 225.2; assumed a thickness of the wall which witness, as an architect, would construct.

Redirect examination by Mr. Stevens:

When a difference in quantity appears between witness' estimates and those in Exhibit C, witness took his own measurements. On page 15 of Exhibit 61, it appears that there is added to the Walsh and Willison estimate of $36,368, the sum of $5,632, for necessary sub-structures, stacks, foundations, bridges, and so forth. Witness assumes that that addition refers to property omitted by witness. In Exhibit 61, at the end of every distinct estimate, there is an addition by Mr. Gaffy for things not estimated by the witness. Witness does not think he measured the depth of the foundation of the valve house at reservoir, Watertown. The estimate for reproducing the buildings is with absolutely new material. Made no allowances for depreciation on account of age or wear.

Recross-examination by Mr. Dorsey:

More accurate estimates could be made by taking the plans and specifications; one gets a better detailed estimate; and that is true of sub-structures and underground things, which cannot be seen. Witness is not sure what items Mr. Gaffy added. Does not believe that Mr. Gaffy's estimates covered the sub-foundations that were omitted by witness.

900 Did not mean to say on redirect-examination that Mr. Gaffy had included foundations, to which witness' attention was called on cross-examination. Is not aware of the fact that the grade of work in foundations of gatehouses and sub-structures in water works structures is different from the ordinary house-wall

work by reason of the necessity for making it water-tight, on account of bacterial considerations. Whether that would make greater expense or not, depends on what kind of a house is meant. Made no additional allowance for such consideration. Has had no experience with water works structures.

Redirect examination by Mr. Stevens:

Referring to page 15 at the bottom of the page, the word "sub-structures" does not include the sub-structures for the valve house; includes stacks, foundations, which witness did not value. There are a number of items on the list furnished the witness by Mr. Gaffy which were not included in the estimate. Witness was instructed to omit the stack foundations where an iron stack was used —stone or brick foundation; that to be included in his chimney estimate. Fences and bridges were so omitted. Gave a price on the fences per foot, but did not figure the length of them.

T. F. Walsh, a witness for the defendants, recalled.

Direct examination by Mr. Stevens:

Witness made more investigation concerning foundations at Waterton; cannot find one measuring house listed on Exhibit C; did not find item 5 on page 176 of Exhibit C.

Was there yesterday afternoon to see if he could find it; measured the sub-structure of the valve house at Platte Canon reservoir; found a depth from the floor to the floor of the sub-structure of 34 feet, and on account of that we had to add to estimate; the addition is $1,862. On page 176, Exhibit C, item 8, H-5, is measuring chamber which cannot be found.

Cross-examination by Mr. Dorsey:

274 cubic yards on the valve house; measured the top of the wall at the floor line; measured the depth of the wall by sounding; got the measurement from the floor of the super-structure to the bottom of the sub-structure; assumed that the wall was 40 feet high, and allowed 34 feet as the average height of the wall; took the average thickness of the wall to a total height of 34 feet, and added that to the face of the floor; assumed the floor 6 feet thick. Did not see the company's plans on file in its engineering office; took an average thickness of 2 feet and 9 inches for the wall.

901 Robert Willison, a witness for the defendants.

Direct examination by Mr. Stevens:

Architect, 25 years in Denver; built the Auditorium, Municipal Bath House, assisted on the Ideal Building and Oxford Hotel, West Hotel, and many residences; is familiar with the prevailing prices for building material of all kinds in Denver and vicinity. Undertook to estimate cost of reproducing buildings of The Denver Union Water Company; started in August, 1914, and ended November 4th; worked with Mr. Walsh. Exhibit 61 correctly sets forth in detail

the results of the estimates of witness and Walsh. Was requested by Gaffy to get out the estimate; visited different subdivisions of the water company's property as described in Exhibit C; measured every building, outside heights, etc.; made complete specifications of materials, classified the buildings and computed a standard cost per foot of cubical contents for application to certain classes; in other cases, several buildings are valued on basis of itemized materials, cost of freight, workmanship. These prices include contractors' profit.

Proceeded just as would proceed for any employer who desires an estimate made on certain work in the building line. Considered that the cost set forth in Exhibit 61 was sufficient to cover all contingences; thinks estimates are liberal for both work and material and giving the contractor a good profit on the work.

Cross-examination by Mr. Dorsey:

Prices do not include architect's fee; did not include anything for general contractor's overhead or profit; interest during construction would be included in the contractor's profit; covered only sub-contractor's profit; architect's fees would be about five per cent, regardless of the size of the structure; in figuring lumber at Cheesman, presumed that the logs and rough lumber could be gotten in the vicinity of the lake; finished and dressed lumber would have to — shipped from Denver.

The freight from Denver would be 13 or 14 cents a hundred; this would be about $2 a thousand to Buffalo, and haulage would be $3 a thousand from Buffalo to Cheesman; in arriving at $2 a thousand for freight from Denver to Buffalo, eight cubic feet represents a thousand feet of lumber, board measure; weighs 26 pounds per cubic foot, giving 2,080 pounds; you would pay $4 a thousand feet of lumber, and the total cost of freight and haulage to Cheesman would be $7.

Refigures estimates, and concludes that the freight would be $2.70½.

902 Figures on hauling lumber from Buffalo to Cheesman by automobile trucks; cost would be $3 per thousand feet of lumber for the hauling.

Distance from Buffalo to Cheesman is 20 miles; contractor could not do the work without changing the road.

Did not go specifically into the question of how many tons could be carried at a load. Was building inspector in Denver between 1904 and 1912, and is now engaged in the general practice of the profession. Made the plans for the Auditorium; made the estimate of its cost; made no definite estimate of its cost based upon the plans, when the question of issuing bonds came up; had several engineers go over the different items; does not remember making an estimate that it would cost $300,000 to build the Auditorium; made a great many figures; plans and specifications were changed many times; did not make an estimate of $300,000 on the final plans and specifications; bonds were not issued on witness' estimates; bond issue was passed before the plans were thought of; does not remember estimat-

ing cost of Auditorium as it stands today to be $300,000. The actual cost of the building, outside of the ground, was $418,500. The final cost of the building was $635,000. Knows that the actual cost, including the ground, was not $765,000.

Redirect examination by Mr. Stevens:

The deficit in estimate on the Auditorium was by the contractor, and not by the architect.

DAVID G. GORDON, a witness for the defendants.

Direct examination by Mr. Stevens:

Has resided in Denver 20 years; is engineer and contractor; does water works and sewers only; has been so engaged since 1908; took mechanical engineering course at Cornell University; is associated with Percy J. Taylor, under the name of Gordon & Taylor Construction Company, with headquarters in Denver; during the past six years has had about eight contracts on sewer work in Denver—water works and water mains in different parts of the city; did sewer work in University Park, Park Hill, parts of the North Side, Washington Park district, Overland Park district and 24th and Walnut; laid water mains around Washington Park, near Overland Park, for the Public Utilities Commission, consisting of about 3,000 feet of 6-inch cast-iron pipe; has put in most of the water works that have been put in in the states of Colorado and Wyoming for the last two or three years—at Canon City, Montrose, Alamosa, Grand Valley, Olathe, Minturn, Fowler, Fort Logan, Johnstown,
903 Fort Lupton; Goodland, Kansas; Sidney, Nebraska, and Scotts Bluff, Nebraska; Casper, Wyoming, and Raton, New Mexico; is working on the last two at the present time.

Some of the enumerated work was on sewer systems and some on water works and sewers; about half of those named were water works; has made an estimate on the reproduction of the present distributing plant of The Denver Union Water Company; covers distributing system only, and the finished result is $3,331,552.09; this is made up as follows: For furnishing and installing 427½ miles of cast-iron water mains and specials, complete, $2,309,502.29, to which is added extra expense of shoring, pumping, blasting, $25,000; valves and hydrants, complete, in place, $289,771; wood-stave pipe and steel pipe, $21,447.80; cutting and restoring paved streets, $258,831; river crossings, ditches, railroads' crossings and other obstructions, $102,000; tools, $28,000; interest, $21,000; liability, insurance and contractor's bond, $32,000; unlooked for conditions, miscellaneous expense, $20,000; profit and office expense, $215,000; last item is estimated at 7 per cent; used current prices on material and cost data on jobs of similar nature; took the quantities and character of material from the estimates of Metcalfe and Anderson, in Exhibit C.

Three-inch pipe weighs 16½ pounds to the foot, and cost per ton delivered on job is $30.50; this includes fifty to sixty cents for hauling the pipe; present market price is $1.50 under this estimate; that

would cut the estimate down $80,000 on the one item. Cost of lead and jute per foot is 1.3 cents, lead at 41½ cents a pound, jute 5 cents a pound; trenching and backfilling, 7 cents per foot; pipe-laying and testing, 2 cents per foot; extra lead and specials, special castings, 3 per cent of the cost of the pipe, being three-quarters of a cent per foot, making a total cost for the three-inch pipe, per foot, of .3627.

Exhibits 59, 59-*a* and 59-*b* were marked for identification; the two tables attached to Exhibit 59 cover the various sizes of cast iron pipe set forth in Exhibit C, and the laying thereof.

Arrived at the second item in Exhibit 59, "Extra expense of shoring, pumping, blasting," etc. on an assumed basis of fifteen per cent of the total pipe laid; listed all the valves and hydrants as shown in Exhibit C; estimated the cost at $283,771; the hauling, placing and extra lead, $15,000; ordinarily, the cost of laying would include the setting of the extra valves.

Witness then reads list of extra valves.

Document marked Exhibit 60 embodies all the tables used in making estimates, introduced in evidence; figured on hand labor for forty per cent of the excavation, and trenching machines for 60 per cent; has been using trenching machines for the last six
904 years; has three at the present time; they do the work cheaper than the hand labor.

At Goodland, Kansas, averaged 2400 feet per day with one machine; on other jobs has averaged 1900 to 2200 feet; 1500 feet would not be difficult average on any job, as far as machines are concerned; this average is on a trench five feet deep, 28 inches wide, and would be sufficient for 60 to 70 per cent of work; has used the Buckeye machine, made at Findley, Ohio, and the Austin, made in Chicago; has used both these machines on trenching work in the city of Denver, from five to sixteen feet deep and 28 inches wide.

Figured on removing pavement three to six inches on each side of the trench; has figured the cost of the material and labor; does not figure excavation by the cubic yard; figures it by the lineal foot; trenching for three-inch pipe is based on seven cents per foot; machine cutting 1,500 feet per day, would cost $25; that covers labor, running the machine, coal, oil, repairs and depreciation; that price is ample to take care of obstructions; took the sizes and weight of pipe used from Exhibit C.

$30.50 per ton is the common price on cast-iron pipe and has been for the last year, f. o. b. cars, Denver; today the price is lower; railroad would deliver at any siding on their line without extra charge; if put on another railroad siding, there would be a switching charge.

On page 8 of Exhibit 60 is a tabulation of lead and jute required per joint; this is considerably higher than all tables give, but experience shows that more is needed; bases estimates on all jobs on the same amount used in this estimate, and it works out in good shape; has made ample allowance.

Arrived at result on page 2, Exhibit 60, for trenching and backfilling per foot, from experience; cost is sufficient to cover the digging by hand; has sub-contracted work many times to contractors at that price; they did it by hand and made wages; at the present

time doing the same class of work, at Casper, Wyoming, at lower prices and more difficult digging; could get better prices in Denver, but prices for pipe-laying and testing per foot is arrived at from experience, and is what this class of work has been done for in other cases; in all of witness' jobs the specials and extra lead has been about three per cent of the cost of the pipe.

The soil and working conditions in Denver are very much the same as the conditions on the work done by witness outside of Denver; it would be cheaper working in Denver, and better ground conditions and better labor conditions.

905 Cross-examination by Mr. Dorsey:

Twenty-nine years old; did not graduate from Cornell; left Cornell in June, 1910; has been out of college four years; has been engaged in the contracting business before he left college; attended college for three years; before going to college was with his father, John R. Gordon, for several years, contracting; headquarters, Pueblo; before going to college, had been engaged in contracting business for three years; began at about the age of nineteen; was estimator and engineer; had had training as an engineer at that time; was with the Colorado Fuel & Iron Company from about 15 to 18, during the vacations; during part of the time went to a technical school in Chicago; experience with C. F. & I. was in vacation time, sometimes carrying a chain, sometimes working as draftman; does not think that experience would fit him to make an estimate upon a distribution system such as that of The Denver Union Water Company; was going to school while doing business with his father, at Lewis Institute in Chicago; would work at times, then go to school; was with his father not only during vacations, but a year at a time; then go to school a year; about half the time during the three years preceding 1907 was with his father; pursued a course of mechanical engineering at Cornell; on coming out of college, settled at Pueblo; headquarters now in Denver; went in business for himself in July, 1910; was only in Pueblo a month and then moved to Western Slope, over in the Grand Junction country; closed office in Pueblo; stayed in Grand Junction until March, 1911.

Was executing a water works contract at the town of Grand Valley; that was witness' first contract; that is a town of 500 people; never had a water plant before; wood pipe gravity system; entire system is 30,000 feet; part of it a conduit line; no cast iron pipe laid; total amount of contract price $30,000; did 30,000 feet of trenching with trenching machines, no obstructions.

Shortly after that stopped a little while in Pueblo, then came to Denver; came to Denver in the spring of 1911; at once opened an office here; engaged in business on own account; would not say that he had done all the waterworks construction which has occurred in Colorado and surrounding states during that time, but a great deal of it—more than any other one; thinks he has done practically all of it in Colorado.

Beginning with the spring of 1911, witness has had following contracts: Fort Logan, Colorado, in May, 1912; sub-contracted at

Milliken, Colorado, and Johnstown, Colorado, in July, 1912; sub-contracted on some Denver work in July, 1912; water works at Minturn, Colorado, in fall of 1912; pipe line for Public
906 Utilities Commission in fall of 1912; Scotts Bluff, Nebraska, February, 1914; from November, 1912 to February, 1914, did no water works construction; worked on sewers; at Goodland, Kansas, May, 1914; Simla, Colorado, July, 1914; Mead, Colorado, July, 1914; Raton, New Mexico, assignee of contract, June, 1914; Casper, Wyoming, September, 1914. Grand Valley has a population of 500; total contract price was $30,000; Fort Logan contract price, $2,500; laying water mains; furnished some of the material; town furnished some material, six-inch cast iron pipe; some smaller galvanized pipe; total length of trench was 7,500 feet; trench was five feet deep, two feet wide; no obstructions; laid some supply pipe from small reservoir down to the center of the Post; pipe was from two to six inches; bought less than a carload of pipe; paid $35 to $40 a ton f. o. b. Fort Logan; sub-contract at Milliken covered digging and trenching. Contract price about $2,500. 32,000 feet; five feet deep, two feet wide; had nothing to do with backfilling; paid 6 cents per lineal foot; used machines entirely; no obstructions encountered.

On the work for the Public Utilities Commission O'Brien was the contractor, and witness sub-contracted; covered trenching only; no laying or backfilling; very few obstructions, but went parallel with them; did 5,000 feet at 7 cents a foot; price $350; used machines; about five feet deep by 28 inches wide.

At Fort Logan the work included backfilling and laying of the pipe; does not know the total cost of the material furnished at Fort Logan by the witness.

Minturn has about 500 people; constructed entire water works; pipe system; short gravity line of wood pipe, four to eighteen inches; 15,000 feet of trench; contract price, $20,000; included a small reservoir, which cost $1,000; conduit was about two miles long; part of it was 18-inch; about six or seven thousand feet of distribution system; practically all rock work; no trenching machines.

Contract for the Public Utilities Commission in November, 1912; covered the whole job of excavation, laying and backfilling, and furnishing material; total price, $2,600; trench between three and four thousand feet long, five feet deep by 28 inches wide, of six-inch cast iron pipe; purchased and supplied the pipe for $33, f. o. b. Denver, and paid cost of unloading from the cars, additional handling and conveying; hauled the pipe from siding down by Overland Park; had to haul to the other side of Washington Park; did not pay the freight; covered one or two carloads of pipe; freight paid by Hendrie & Bolthoff Company; pipe came from C. F.
907 & I. Company at Pueblo; did the trenching with excavating machine, No. O Austin; did no more hand work than is customary with the machine; where one must raise up for pipe, cross-work and street-car tracks, hand work is customary; had a gang of four or five pick and shovel men to get the machine over obstructions, and dig bell holes and clean the trench after the machine; the pipe was six-inch, Class B, cast iron, American standard; weight,

33 1-3 pounds to the foot; made $300 on the job, after taking out all overhead, including office, administration and other expenses; divided the overhead up with other jobs; might have stated that he lost money on the job; probably stated that he would not figure on another job at the same figure; really made a sufficient profit for the size of the job; after a job is over, generally states that he lost money on it; thinks that is correct policy; don't know how long the job took.

At Scotts Bluff there are about three or four thousand people; had contracts for extensions of distribution system, for a lump price of $15,000; about 22,000 feet; extensions to be made in the outlying parts of the city; contracts covered excavation, furnishing material, laying of the same and back-filling; pipe was from four to eight inches; major part was four-inch; trench five feet deep by 28 inches wide; work done entirely with trenching machines; not many obstructions. Very sandy and cavey digging; had to sheet about half of the trenches; it was bracing, not tight sheeting; in some place would not hold long enough to let the machine go through.

On the contract of November, 1912, with the Public Utilities Commission, encountered eight or ten obstructions in the total length of three to four thousand feet.

Goodland is on the prairie, in the western part of Kansas; has 2,500 people; job was replacing old system; took the job at price of $26,000; laid four or five thousand feet of water pipe, putting in small booster pump. No supply pipe or conduit; pipes were from four to ten inches; Mathewson joint, steel pipe; did the trenching with trenching machines entirely; five feet deep by 28 inches wide; great many old pipes to be encountered; laid the pipe in trenches parallel to the old pipe; only encountered old pipe in crossing; encountered service pipes; cannot say what is material cost, or allowance for overhead and profit; $22,000 is as near as he can remember it. There were 45,000 feet of trenching; made 10 per cent on the whole job; did not figure that much; that profit was made after providing for overhead; considers that an unusual profit; engaged about 25 to 30 days.

Simla, Colorado, is east of Colorado Springs, on the Rock Island; has 200 people; furnished all the labor connected with the
908 pipe work; laid the pipe, dug and back-filled the trenches; material was furnished at the car; total contract price, $850; there was some extra work; trench was five feet deep by 28 inches wide; total length 11,000 feet; did work with trenching machine; pipe was four to six-inch cast iron pipe; contract covered hauling from the car to the job; average haul about 2000 feet; there was no obstruction to the trenching machine; made about 1,400 feet a day; kept machines there about 12 or 14 days; five or six men in a gang with a machine; in doing work in a place where obstructions were encountered, would need more men.

Mead is near Greeley, on the Sugar Belt line; has about 300 people, water works consisting of single reservoir and pipe line to town and distribution system; did work for lump price of $8,500; reservoir 80 feet square; earth embankment, lined with concrete; mile

and a half of six-inch wooden pipe conduit; trench five feet by 28 inches; 5,000 feet of distribution pipe; same size trench; distribution pipe of wood, varying from four to six inches; no cast iron pipe or iron pipe used on the job; used a trenching machine; machine arrived August 1 and left 10th or 13th of September; took about three months to do the job; cannot remember the total bill for materials; it was between five and six thousand dollars. Made a profit of $1000 on the job; overhead had to come out of that; after taking out overhead, interest during construction, maintenance of permanent organization, thinks he made about $700 net profit; figured on 10 per cent net profit; is not customary to figure 10 per cent profit on material; figures on profit based on time to complete a job and the risk involved; in buying material merely acts as purchasing agent for the city, and has not seen fit to put large profits on; never adds any fixed percentage in buying material; profit is figured on the work.

Four-fifths of the job at Mead was material; figured on making 10 per cent on the whole job. On that assumption, the profit on the work at Mead would be about fifty per cent.

Casper is in the central part of Wyoming, on the C. B. & Q. and Northwestern railroads; has about 6,000 people; witness' contract was for extensions to the present system, and a gravity flow-line to town; bid a lump price of $73,000, and is now engaged on the work; had two contracts there; began on the sewer on October 12, 1914; completed the sewer and then went on the water works; $73,000 was bid on the water works. Has practically completed all the pipe work; conduit was 16,000 feet of 12-inch Mathewson joint steel pipe; trench was five feet deep, 28 inches wide; contract included the laying of the pipe, trenching, supplying the material and back-
909 filling; no obstructions; about 35,000 feet of distribution system; pipe 15,000 feet of 8-inch and 15,000 feet of 4-inch, the balance 6-inch; no extras included to date; has met obstructions in the ground and sidewalk; no obstructions except where old pipes were replaced with new; a few private lines and service pipes from the old system; had railway crossings and telephone conduits to cross; no paved streets or street railroads; no gas works; will encounter steam heating pipes; used excavating machines to a great extent; used a machine on the conduit line, but it required considerable hand labor, owing to sandy nature of the soil, which is like wheat and has no moisture in it; has used machines on the distribution system, practically all of it to date—at least 30,000 feet out of the 35,000; had one machine at work; began about the middle of November; does not excavate any faster than can lay pipe; machine is still there at work; will finish before Christmas.

It was called to the witness' attention that all the work he had done aggregated $181,300, and he was asked whether that justified a fair foundation for his statement that he had done practically all of the water works construction in Colorado and neighboring states within the time specified, to which the answered, "The greater part of it." Knows that the water company is now engaged in an addition to its plant, involving twice that sum of money; witness' work has been

done for municipalities, not private companies; water company would not consider his bid on its work.

The Raton contract was let in January or February, 1914; witness became connected with it in June, 1914; original contractor is witness' father, J. R. Gordon. Raton has between five and six thousand inhabitants, on the Santa Fe railroad; is a water plant there already; witness' contract was with the city; the object is to construct a competing plant, to compete with the city. Mr. Hiram Phillips is the consulting engineer on the work; witness' contract is mostly for the distribution pipe system, and contemplates a lump sum; price is somewhere over $100,000; covers 10 miles of cast iron pipe, from 6 to 12 inches, sub-contractor furnishes the material; Mr. Taylor has been handling that job; helped Mr. Taylor prepare the bid for it from the estimated prices given by J. R. Gordon; conduit from the reservoir to the city is not covered in the $100,000 price; trench would be five feet deep; total length of pipe and trench is fifty odd thousand feet; contract is practically completed; has put in about three miles of 12-inch cast iron pipe, balance mostly 6-inch, American water works standard; very little 4-inch pipe, except the hydrant connections; has a copy of the original, and is asked to bring it in.

910 In Raton, paralleled the pipes of the privately owned pipes in practically all cases, and laid some pipes in new parts of the city; used trenching machines on some of the work, but not all; there are no paved streets in Raton. There are a great many underground conduits or obstructions in the streets, shallow sewers, above the bottom of the water pipe trench; that is an unusual condition; encountered house connections; sent trench machine to Raton about the middle of June; it is still there; has worked continuously there since June; temporarily suspended upon the distribution system. Mr. Taylor is looking after another part of the work; the machine is not working; has been lying idle for a month or two months; practically all men are away from there. Mr. Taylor is looking after the conduit line from the reservoir of the old company; assumes that the town has seized the old reservoir; paid $30 or $31 per ton to the C. F. & I. for the cast iron pipe used on the Raton job, f. o. b. Raton. The work now being done at Raton is as a sort of associate with J. R. Gordon.

Has had several sewer contracts in Denver.

Witness describes some sewer jobs; the amounts involved in the sewer jobs are as follows: Olathe, $16,000; Fort Lupton, $15,000; Sidney, Nebraska, $22,000; Scotts Bluff, $17,000; Fowler, $18,000; Montrose, $35,000; Casper, $14,000; that the aggregate of those is greater than the amount of sewer work done in the city and county of Denver; did the University Park sewer job in July, 1912; total length of sewer, 17,000 feet; trench varied from 5 to 14 feet in depth, 28 inches wide; vitrified clay pipe was used; contract covered excavation, material, laying of pipe and backfilling; total contract price between $10,000 and $15,000; an 8-inch sewer was 42 to 43 cents a foot, including everything; does not remember what part of the price for the sewer represented material.

In September, 1912, built Park Hill sewer, 4,000 feet; total price, $3,000; 8-inch vitrified clay pipe used; trench 7 feet to 17 feet in depth, 28 inches wide; unit price 48 cents per foot, including everything.

In November, 1912, built a private sewer for the Clayton College; total price was $400; unit price 42 cents; trench 7 feet deep, 28 inches wide; pipe 8-inch vitrified clay pipe; next built a sewer for the House of Good Shepherd, on private contract; total price, $2,000; 4,000 feet; unit price 42 cents a foot; 8-inch sewer pipe; trench was 7 feet deep and 28 inches wide.

Next was city work, on a sewer in University Park, in April, 1913; total contract price, $13,000; 17,000 feet; unit price
911 44 cents per lineal foot; trench 14 feet deep, 28 inches wide, mostly 8-inch vitrified clay sewer pipe.

Next work was in north Denver; around Manhattan Beach; 40,000 lineal feet of mostly 8-inch vitrified clay pipe, some 10-inch and 12-inch; total price $26,000; unit price 46 cents per foot.

Built small pieces of sewer, from two blocks up to two miles, in several different places on the north side. Put in 1,200 feet of sewer for the Pinhorn warehouse; $500 total price of the sewer; total price of the sewer work done in Denver by the witness is $59,400.

The North Side district was fairly well built up, but the major part was around Manhattan Beach, which is not built up; encountered a 30-inch pipe of the water company on some of the work; ran parallel to it for some ways, about 20 feet away; did not disturb the work; thinks it was leaking, and that the water bothered a good deal. Is not sure that water was coming from the water pipe; was in the neighborhood of the lake and the underground drainage is toward the lake; might have been that drainage; encountered gas pipes.

Most of the other work was done on wide and unobstructed roads; no paving or street car line to any great extent; no underground conduits or pipes to be met with. The vitrified sewer pipe is much less expensive than the cast-iron pipe; figures on a trench narrower than 28 inches for the most part in reproducing the distribution system.

Witness' total work in Denver is $62,850, about fifty per cent of which represents material; this leaves $30,000 to cover actual trenching, laying and backfilling.

Witness first took up the question of making his estimate on The Denver Union Water Company plant last July; worked at it about two or three weeks, and had a man on it constantly working under witness' direction; witness gave about half his time; witness had before him the quantities listed in Exhibit C; had access to Class S, distribution pipe system, pages 365 to 390 in Exhibit C; had also the exhibits in the back of the book relating to Class S; witness' estimates cover all the items so shown in Exhibit C; did not assume that the pipe would be put in the same location as the present pipes of the water company; assumed that the reproduced plant would parallel the present plant; pipes would be to one side of the car line; would not put pipes under the street car tracks; added nothing to

estimate on account of difficulty of placing the pipes in those locations; knows that Metcalf and Anderson included such an item; witness excluded it; included nothing for service connection, and knows that Metcalfe and Anderson estimated them; did not
912 take the property listed and described in Class S in Exhibit C, but made some changes in it for the purposes of valuation; knows of no other changes than those mentioned; had no maps, plans or cross-sections before him; knew that full and detailed plans were in the water company office; did not think it was necessary to have recourse to them to prepare an estimate; estimate is based on laying that amount of pipe in the streets of Denver, paralleling the water company's lines.

Witness did not take the specials listed in Exhibit C, but estimated the quantity, which he thought would be sufficient.

The exact length of the work done for the Utilities Commission was 2,692 feet of 6-inch cast-iron pipe, and the total contract price was $2,610, and at the end of the contract there were $128 in extras added; that makes an average price of that work for trenching, furnishing the pipe, laying and backfilling, for 6-inch pipe, 82.2 cents per foot; witness states that he lost money on the contract, and afterwards, when bidding on the Mississippi Street job, witness may have stated that because of his experience he would not take another job at the same price, but the Mississippi Street job was a more difficult job—crossed under several railroad tracks and street car tracks, and there was rock.

The unit price for the 6-inch pipe on the Public Utilities job was 88.2 cents per lineal foot. The unit price placed on 6-inch pipe of like character, per lineal foot, on the same character of work in witness' present estimate is 72 cents, and the obstructions on the reproducing of The Denver Union Water Company's pipes to be encountered in the street are enormously greater than those encountered on the job done for the Public Utilities Commission.

A large part of the estimate embodied in Exhibit 60 is the cast-iron pipe; witness assumed the cost of the pipe, f. o. b. Denver, to be $30, and added 50 cents for hauling to the trench and handling out of the cars; $30 per ton f. o. b. Denver was the price of pipe during all the summer. The price is lower now. The basic price is $16 per ton at Birmingham; the freight is $12.50 per ton; the price has gone down since estimate was made; used the figure that witness would have to pay for the pipe; thinks could make a contract for 60,000 tons to be delivered within the next two years, f. o. b. Denver, at $30 per ton. Has never bought pipe in that quantity; does not know whether an order of that size would have a disturbing effect on the market; cast-iron pipe fluctuates widely in market price; his schedule, or his Exhibit 60, contains prices from 1904 to 1914, f. o. b. Denver; all except the last one secured from the C. F. & I. The C. F. & I. makes about 9000 tons of cast-iron pipe
913 a year; would not expect to get 60,000 tons from the C. F. & I. unless they increased their facilities; thinks could get the same price from distant factories.

The average price, on page 9 of Exhibit 60, from year 1904 to

1914, inclusive, would be $32.70 per ton f. o. b. Denver; asked Mr. Chilberg of the C. F. & I., and he stated that The Denver Union Water Company got a reduction from the regular prices; witness does not think that the average price paid by The Denver Union Water Company for the last ten years has been $33.40; is not aware that Mr. Gaffy made an estimate, and used a unit price of $32.55 per ton f. o. b. Denver on three to four-inch pipe, and $31.50 per ton on 6 to 20-inch pipe, and $32.50 per ton on 24-inch pipe and larger; does not consider cost to The Denver Union Water Company in the past; about three-quarters of witness' estimate consists of cast-iron pipe; does not think any error was made in taking present-day prices; does not think the prevailing high price of labor would offset the prevailing low price of materials; has estimated an average haul of two and a half miles; did not go into the points from which it would be hauled, very carefully; there are several sidings; assumes that the railroads will set the cars on various sidings; thought of using siding by Zang's brewery, on the C. & S. or Santa Fe, one at Overland Park, on the Santa Fe or D. & R. G., and one at 36th and Walnut, on the Union Pacific—Union Pacific roundhouse and shops; siding at University Park, on the C. & S., and Globeville, on the C. & S.; regular wagon tracks at the depot; has taken it up with the railroads, and they will deliver the cars to sidings, at a distance from the depot, on their own trackage property; at points indicated by witness; got the information from Mr. Morehouse of the freight department of the Santa Fe, and he said it would be the policy of the other roads; witness has gotten cars set in that way himself; has not included any estimate for switching the pipe to various parts of Denver; has only added the line haul freight rate; would handle the pipe from the car to the trench by wagon; unload it directly from the car into the wagon; would hold the car until the pipe was needed; would store the pipe by unloading it along the trench; would have a great deal laid out along the trenches; estimates a period of two years for the construction work; eight or ten months per year; figures on three-quarters of mile a day, or 24 miles a month; does not think could get 25 miles of pipe on hand; thinks a margin of twelve and a half miles of pipe could be arranged, and that the city would permit it to be strung out; has never heard of it done in that magnitude; has never heard of a job of that magnitude.

914 The rate of progress is smaller on larger sizes. Most of the pipe is small, and would travel at a greater speed with that to make the average.

If witness had to store pipe, could store it on lots without expense; does not think it would be necessary to store the pipe.

In opinion of witness, it is not necessary to provide for handling pipe from the car to the store yard and from the store yard to the wagon or other means of transportation; has allowed 50 cents per ton for hauling pipe; that is the price witness pays wherever he has contracts; has never had a job on which the average haul would be two and a half miles; coal people get 50 cents per ton for hauling coal in the city, to Colorado Boulevard; they can make money on

the maximum haul of three miles; has talked with people in the hauling business, and is basing his statement on that.

On the Public Utilities Commission job in 1912, hauled pipe from near Overland Park by horses and wagons; did not keep a record of it; cost considerable because it was a small job, and there was no tackle to unload with; average haul was not near two and a half miles; has used a tackle on other jobs; never kept account of what it cost to unload; has based estimate on the use of horses and teams; motor trucks would probably be used; team would haul ten loads, with an average of two and a half miles; made a mistake in that answer; would haul three tons to a load; has not figured how many loads a team would haul in a day; did not figure it in connection with the estimate; witness' judgment is 50 cents per ton; thinks a team would haul four loads—ten miles loaded and ten miles unloaded; allows but a few minutes to load and unload; loading takes longer; when unloading, material is distributed along the trenches; two men could unload on the average all the way through—driver and helper; would have the helper at the ditch to help unload; the larger sizes would require more men; man who drives the team would help loading and unloading.

On the smaller sizes would have to have two men; on the larger sizes would have a derrick, but would have another man. The two men that would be necessary all the time would cost $5 per day, and the team would cost $5 per day; one horse to operate skip would cost $1.25 a day, which would be $11.25 a day for each wagon; did not go into any of these details in making up estimates; all depends on the kind of material to be loaded and unloaded; does not know the cost per ton-mile of hauling iron pipe; estimated 18 cents per ton-mile; on the average haul, this would make 45 cents per ton for hauling, and would have five cents left at either end, and thinks that is adequate.

915 When witness was asked if he knows what Mr. Gaffy's estimates are for handling material, and per ton-mile of haulage, (counsel objected and objection was sustained.)

Witness thinks fair allowance for specials would be three per cent of the total cost of materials; was not aware that the specials were all listed in Exhibit C; did not pay any attention to it; specials are not a hard matter to figure. In attempting to reproduce the property, it would be necessary to reproduce the items listed; specials estimated by witness are sufficient for that amount of pipe; did not make any effort to determine the sizes, quantity or character of the specials actually in the system; on witness' basis, the specials, with the addition of profit, amounted to $58,895; estimated $50 a ton, which is the present-day quotation on such articles; that is the price quoted by Hendrie & Bolthoff and the C. F. & I. Company; has not talked with Mr. Chilberg on this estimate; had prices on other jobs recently.

On December 1, got an estimate on water works job in Wyoming; that estimate was $60 per ton; witness thinks he has quotations f. o. b. Denver, gotten for the Raton works; witness was asked whether he had not talked with Mr. Chilberg with regard to the price on special castings of $50 per ton, and whether Mr. Chilberg did not say that that price was an abnormal one, growing out of the unusual con-

ditions at the mills; that it must not be used in the Denver rating case, because it was not a normal price or a fair price for the cast-iron specials, (to which counsel objected.)

Witness indicates a desire to answer the question. Says Mr. Chilberg did not give any quotation on special castings; had such a conversation on pipe only, and made such a remark as counsel indicated. When witness asked Mr. Chilberg for the price on the pipe, and was given $30 f. o. b. Denver, the conversation such as indicated by counsel took place over the phone—that is, that the price was abnormal, growing out of the unusual conditions; must not be used in the Denver rating case, because it was not a fair indication of the normal price, or fair price for cast iron pipe f. o. b. Denver; in other words, was not a price under which the mill could do business and continue in business; witness increased the price. The conversation of Mr. Chilberg was the Birmingham price; the price of $30 may have been the price mentioned to Mr. Chilberg, and Chilberg made the remark in question with respect to that price. Notwithstanding that, witness has used it as a basis. The price on specials bears a definite relation to the price on pipe, and when pipe is below $30, the specials are $50. For the purposes of this estimate, the pipe ought to be higher than $30 per ton, and the specials higher than
916 $50 per ton; is not aware of the actual price that the water company has paid for specials.

(When witness was asked if he did not know that the water company had never paid less than $60 per ton, and that the price varies from $60 to $80 per ton, counsel objected, and the objection was sustained.)

If witness had known that the water company during the last ten years, has been obliged to pay not less than $60 per ton for specials, and from that to as high as $86, it would not affect his judgment; admits that he takes the present-day prices on the present depressed market as his basis for the estimate.

Intends to do about sixty per cent of the trenching by machine and forty per cent by hand; would employ both Buckeye and Austin types of machines; thinks machines would dig up to 42 inches; the trench would vary in accordance with the size of the pipe; the ditch would have about six inches on each side, making a 24-inch trench for a 10-inch pipe; those machines cost $6,500 for a No. 0 trencher and $5,000 for the 2-0, at the factory. The freight would be $300 on the small one and $500 on the large one; would have the labor of setting up after it arrived here, and transporting it to the point where it was to be worked; the rate of progress would be a thousand feet per day, on the average, equal to about 500 cubic yards; would have an engineer and fireman; pay the engineer $5 a day and the fireman $3 a day; it would cost $5 a day for fuel; repairs would be $2 a day; the cost of running the machines is estimated all over the country at $25 a day; machine is good for ten years; used $5 a day for depreciation but has not segregated interest on the investment; $5 a day would not write off the machine in two years; would keep on using the machine; would use six machines on the job; witness now has three, and would add three more; would require an additional gang with the machine; usually run along about eight or

ten men, in addition to the engineer and fireman; pay the additional men $3.50 per day each; that would add about $25 to the daily cost of the machine; the items given aggregate $45.50 per day. The $25 for the eight men cannot be added to the machine cost; the forty per cent of hand work would be the part that the machine never passed over, and the part that the machine passes over would cost $45 per day; estimates 60 per cent of the work could be cut with a trenching machine; forty per cent would be by hand work, but one-third of the forty per cent would be done by a machine.

Wishes to correct impression of previous testimony as to the gang with the machine: there are only two men with the machine—the engineer and the fireman; the other men are for digging bell holes, shoring and other work in back of the engine—mostly on the
917 pipe gang—and were additional expenses that witness has allowed for shoring and crossings, digging out crossings where the machines are raised over. The gang bringing up the pipe in back of the machine takes care of the hand digging, cleaning out bell holes, caving, and like matters; don't charge all of that work to the pipe; charges it to the producing of the ditch; and that is what estimate allows; if allowed only the estimate of digging the ditch with the engine, it would be about two and a half cents a foot for the machine part of it. The expense of the hand laborers following up the machine is charged to the cost of digging and backfilling the trench, and part of it is assigned to the machine expense and part to the hand work; would have eight men in the gang, close up to the engine at all times; the pipe-laying gang would be about six to eight men, and there would be about eight diggers, making sixteen men; one calker has made 2,100 feet per day on the Casper water works, and stood pressure of 200 pounds, with no leakage; that was Mathewson joint pipe; requires a little less lead. On 12-inch cast iron pipe a thousand feet would be easy throughout the season, every day in the year; calkers' pay is $4 a day; yarning man gets $3 a day.

The two men lowering pipe would be paid $2.50 per day; lead men, $2.50; jointers, $2.50, and the same wage for two additional men; the trenching machine fuel would cost $4 or $5 a day; figures that one-third of the estimated machine trenching will have to be done by hand, and that one-third of the estimated hand-trenching would be done by machine; a gang would make progress of about a thousand feet a day; on the hand excavation would have about 34 men in his gang; this would be on the estimated hand work where the machine would be used; on the estimated hand work where no machine would be used, there would be 30 laborers in addition to the pipe gang; they would make about 1,000 feet a day in the congested district; all these men would be paid $2.50 a day; would have a foreman with a complete crew, which would cover the men working on the trenching machine and the men working on the pipe; figures on six crews; would have six trenching machines, but part of them would be idle part of the time; in estimate, assumed that six trenching machines would work constantly two seasons or a total of 440 days; has not estimated the time it would take to do the trenching machine work; would probably have hand work going on concurrently with the machine work; there would then be more than six

gangs at work concurrently, would get through sooner; assumed that 6,000 feet would be completed per day; would use six foremen, at $5 a day; timekeeper and three superintendents, and office force of three clerks, who would be bookkeepers and stenographers,
918 and one telephone, and have a watchman at the material yard; would not need a force there; would not have a telephone and office there; would pay the clerks $150 a month; witness and his partner would do most of the purchasing; the profits on the job would cover that; would not charge the job with the partners' time; to that extent, the so-called profit would be wages.

The superintendents would get $175 a month; would have no engineering assistance; has made allowance for contingencies in Exhibit 60; would do backfilling with teams and scrapers; one team and driver can fill 750 feet a day; would have one team for small errands; would have two teams following up each of the six gangs, and have two men to do the necessary hand work on the backfilling; afterwards the trench has to be leveled off; about three-quarters of the distance would have to be flushed with water; would pump the water out of the river and put it into the system; would maintain a pumping plant for that purpose; would have to pump part of it against considerable head; has not made a separate estimate of the pumping outfit; the owner furnishes the water; usually the owner hasn't any water until his plant is finished.

Knows of no case where the owner has furnished the water except in case of extensions of old systems; would test it before it is backfilled, and would have to leave trench open between gate valves which occur every three blocks; would have the hydrants set before back-filling, and put the hose onto the hydrants; would have to keep the pumping plant operating continuously; the main pump would only be sufficient to put water into the mains; would require a small additional pump to test the pressure; would have to furnish water to make the tests, and would have to have a continuous supply for backfilling; cannot say how much was allowed for this pumping system; two laborers, two scraper men with their teams will do the backfilling; don't tamp when water is used; tamping is not as good as water for putting in backfilling; does not know what the city requires in that respect in the congested district.

In Exhibit 60, page 1, there is an item "Extra expense of shoring, pumping and blasting, $25,000", and this covers lumber in the shoring and the additional expense of blasting and the pumping of water encountered in the trench; in some parts of town there would be blasting; the blasting would be a small item; there is some soft shale and sandstone. That statement is based on witness' observation in built-up sections. Figured on a total of 340,000 feet of blasting, shoring and pumping; did not divide it into separate items; allowed 7½ cents a foot on fifteen per cent of the total trenching to cover those items; it costs 80 cents per lineal foot to handle the rock; it would cost 5 cents per lineal foot for bracing or
919 timbering; in the congested part of the city would use upright braces, spaced at intervals; some of it would be tight; would make a trench on 16th or 17th Streets that way.

Witness considers his allowance adequate. On Exhibit 60, page 1, the item of $258,831 for cutting and restoring paved streets should be increased by an allowance of seven per cent for profit and office expenses; has given the details of the cutting and restoring pavements on page 6 of Exhibit 60.

Exhibit C sets forth in detail the exact character and quantity of the pavement to be cut; followed Exhibit C as to the lineal feet of pavement to be cut, but does not know whether he followed it as to the width; aimed to make the cut sufficient to install the pipe; assumed that the cut in the pavement would be 12 inches wider; page 6 of Exhibit 60, column headed "Width of trench" is intended to specify the width of the cut in the pavement; in each instance the cut for the trench would be 6 inches to 12 inches narrower; on using the first item on page 6 of Exhibit 60, as an example, it appears that the outside diameter of a 12-inch pipe is 14 inches; adding 12 inches for extra width makes 26 inches; the cut in the pavement specified is 30 inches, thus allowing four inches extra width of pavement cut; there would be an excess on the smaller sizes, and the average would be right.

Six-inch pipe is the predominant pipe in the distribution system; figuring the width for that pipe, it would be 8 inches in outside diameter, plus one foot for trench room. Deducting the 20 inches so obtained from the 30 inch estimated width of pavement cut, would leave 10 inches. Most of the downtown district would be cavey, and the width of the trenches would have to be increased as a margin of safety. In good ground the trench would not need to be 12 inches in excess of the pipe diameter, so that witness' average allowance of 12 inches would average up; has never done any work where it was necessary to cut and relay the pavement; in Exhibit 60, page 1, item of tools, $28,000, covers cost of trenching machines, pumps, wagons and scrapers, and hand tools, and plants of every description furnished by the contractor; the actual cost of six machines would be $36,000, but witness has three machines of his own; would not charge the full cost of the machines to this particular job; thinks the machines will be worth half their value at the end of the job; has one machine which has done as much work as any one machine would do on this job; has had that machine two years, and has dug close to 75 miles of trenches; most of it was deep digging and harder than this job would be; on this job the pipe to be reproduced would lie in nearly every street of the city; witness' knowledge of the city was such that he did not need
920 to dig test holes. A stranger bidding on the job might have the expense of making the tests, and that would be a considerable expense. Could get a good knowledge of conditions with an expenditure of $1,500, but could spend more. A few hundred dollars would be sufficient to buy loading and unloading apparatus. Thinks between $500 and $1,000 would cover that expense. Had in mind a new machine called the Beaumont, worth $1200, which could be used for backfilling and unloading; would not need one of these machines with each gang; could move it around, unloading the pipe from wagons into the bottoms of the trenches by rolling

it down ropes; tripods for lowering pipe into the trench would be inexpensive; would have some small hand pumps; $2,500 would be sufficient for pumping station; $4,000 would cover all the small tools; did not figure on motor trucks or horses and wagons; would have stuff transported by local teams; would sub-contract the transportation; does not expect to make anything on the transportation part of it; would use a Ford automobile for his own transportation; would not use road rollers; has mentioned all contractor's equipment that would be necessary.

On page 1 of Exhibit 60 appears item $53,000, made up of interest $20,000, liability and bond, $32,000; witness estimates it will require $150,000 cash capital to carry on the work for a period of two years; does not know what part payments would amount to each month on the average; would be paid eighty-five or ninety-five per cent of contract each month in installments; does not know that the statute requires the withholding of fifteen per cent; thinks the monthly payments would include not only work done, but pipe on hand; made no provision for possible delays in payment, or that ten or fifteen per cent of the entire contract price would be withheld until thirty-five days after the completion of the whole work; would expect to get full payment ten days after the work was completed.

The interest on contractor's equipment is taken care of in the price per foot; interest on equipment would be taken care of in the estimate of $28,000 for tools; the interest on contractor's borrowed capital is figured at 7 per cent for two years; the interest on the amount invested in tools would be a small item; $3,000 would cover the interest on money invested in equipment, and that is covered in the $28,000 item, so that actually the real cost of tools and equipment is $25,000. Computes the interest on investment of $14,000 in equipment. Now has three trenching machines and would buy three more. Proposes to allow interest on the capital now
921 invested in machines. The old machines and the new ones would represent $35,000 capital today; would compute fourteen per cent on that; the witness meant to say that the interest would be $3,000 on present equipment; has not figured the interest on the entire equipment which would be used or provided during the two-year period; would expect to receive monthly payments on pipe laid and pipe purchased and delivered but not laid; that is customary, and has been done on all the witness' contracts except the one with the Public Utilities Commission. Referring to Subitem "Liability and Bond $32,000," it includes bond given by the contractor to the water company; that would be one-half of one per cent of the contract, or a little over $15,000.

Would carry employer's liability insurance policy and a public liability insurance policy; these two together would amount to three per cent of the total payroll for the whole period; the labor item would be $450,000 on the whole job. Has estimated $16,000 for the premium on those two bonds. Such policies are limited liability policies. Has made no provision for damage claims in excess of that liability, except in the item of contingencies; the $20,000 in that item covers possible loss; does not know whether the insured

company would need an attorney to defend damage claims; the contingency item is about six-tenths of one per cent. on the whole job, and covers all unlooked for conditions and contingencies. The item of seven per cent. profit and office expense equals $215,000; it is, in fact, 6.92 per cent; would expect a profit of at least $200,000 for the contract, and total office expense would be $15,000, covering office rent, compensation of office employes, time keepers, auditors, telephone expense, yard expense; thinks that is ample.

The contractor continuously maintains an office and is under expense; this must be paid out of the contracts which he gets, and the $15,000 estimate covers that; would take this contract for a lump sum of $3,331,000.

The contingency item would cover any additional expense in encountering unexpected character of ground and unexpected obstructions; thinks such things may be so definitely anticipated that six-tenths of one per cent of the whole job will cover them.

Redirect examination by Mr. Stevens.

Witness stands ready to take the contract at the lump sum price indicated. Experience is that when one is ready to make a contract to buy cast iron pipe, it can be secured at fifty to seventy-five cents under the quoted price.

A quotation holds good for thirty days. In talking with Mr. Chilberg, witness had the Birmingham quotations and was
922 talking with him about them; was discussing with him the $28.75 quotation; Chilberg did not give a quotation; witness raised the Birmingham quotation $1.25. At Raton the system of pipe being put in was parallel to the old water works system, and the city has sewers and cross-walks, and the old pipes go into every house and sewer; these were encountered; the sewers were shallow and caused great annoyance, all of which he has allowed for in this case.

One of the witness' trenching machines has dug approximately 75 miles, mostly sewer ditch, quite deep; is in very good condition and will dig several times that. At Casper the city put in a temporary pumping plant which pumped 200 gallons per minute and cost $600; it is a direct connected engine to a four-stage centrifugal pump, pumping against a head of 300 feet; 200 gallons a minute is more than would be required on the Denver job. The difference between that sum of $600 and estimate of $2,500 covers operation of the pump.

If this work were done for the City of Denver it would furnish the water; witness' bid for 2600 feet of trenching for the utilities commission was higher than the present estimate, because that work was done in three different places, the ground conditions were bad, and there was water; this condition was known when the bid was made; 3 street car tracks to cross, and the organization expense was greater for the small job; based present estimate on a wage of $2.50 per eight-hour day for common labor; at this wage can get the pick of men, and it works out better in the long run. The hazard on this job would be small compared to other work, and considering the fact that a

larger part of the bid would be for material, $200,000 would be ample profit, and all the job would allow on competitive bidding. The large quantity of material needed would have a tendency to permit purchase at lower price than for smaller amounts. Expense of moving machinery is heavier in proportion on a smaller job than on a large job; has estimated on an average haul of two miles and a half. If the average haul was shorter, witness' estimate would be too large. Exhibit C does not go deeply into condition of soil, but witness has taken the same quantities as shown in Exhibit C.

The item of $25,000 for shoring, pumping and blasting is an estimate of possible costs in addition to the unit prices. This estimate is based on the statement in Exhibit C that there would be a certain number of linear feet that would require extra work.

Recross-examination by Mr. Dorsey:

Witness omitted some of the work involved in reproducing distribution system as given in exhibit C.

923 Made his own estimate in respect to specials and in other respects appearing in the cross-examination; did not follow Exhibit C. Attention is called to page 369 of Exhibit C, item 16-*a* and item 16-*b*, trench requiring sheeting, 340,096 linear feet, trench in hard ground, containing sale, 316,600 linear feet; did not use those figures in making up item "extra expense of shoring, pumping and blasting" on page 1 of Exhibit 60; witness was guided by the statements as to the character of soils to be encountered as it appears in Exhibit C, but used his own figure of 15 per cent, which is less than the amount stated in Exhibit C.

Figures in witness' Raton contract are as follows:

On 4-inch cast iron pipe, $0.62 per linear foot.
On 6-inch cast iron pipe, 0.88 per linear foot.
On 12-inch cast iron pipe, 2.00 per linear foot.

These prices cover the whole work, including the furnishing of the pipe.

Prices of material at Raton are as follows:

4-inch pipe	$31.25 per ton
6-inch pipe	30.25 per ton
12-inch pipe	30.00 per ton

Has not the figures on 24-inch pipe.

Thinks price on specials f. o. b. Raton was $60 per ton, and was paid in addition to that the same price that would be paid for straight pipe of like size. Have laid eleven miles of pipe in Raton to date; the Raton work is not completed; does not know whether it has shown any profit to date. On four-inch pipe Raton price is 62 cents per linear foot, as compared with 46.97 cents per linear foot on the Denver job, or a percentage of 75.7 per cent. On 6-inch pipe, the Raton price is 88 cents per linear foot, the Denver price 67.16 cents, or 72.6 per cent. On 12-inch pipe the Raton price is $2, Denver price $1.527, or 76.3 per cent. On 24-inch pipe the Raton price is $5.60 per linear foot, Denver price $4.1908; the Denver price is about

75 per cent of the Raton price. Applying Raton prices to Denver job, would increase the bid to $4,441,000.

The Raton prices are the estimates for the entire job, made by witness' firm, and includes the profit. On the Denver job the unit price also includes everything; in Exhibit 60, page 2, under "cost of lead and jute, per foot," there is estimated 2.62 cents for 10-inch pipe; in view of the estimate on 8-inch pipe and 12-inch pipe, there would appear to be an error in typewriting. The Mr. Chilberg referred to is the general sales manager of the Colorado Fuel
924 & Iron Company. In the conversation referred to with Mr. Chilberg, witness stated he would use $30 as a fair estimate for the cost of pipe, and Mr. Chilberg told him it was too low; Chilberg was just giving witness advice as a friend of his father's; the conversation with Chilberg was in substance as quoted to witness by counsel in previous cross-examination.

Only has one trenching machine, which has done as much as 75 miles of trenching; the other two are equally as good; leased one machine at one time, but it was not in good condition, and the rental was high, and witness turned it back; the rent on that machine was $20 a day; did not have to make many repairs in addition to the rental.

One of the other machines is seven or eight years old; just used for water works trenches, and is idle a good part of the time. This machine has paid for itself and been charged off; the larger machine for sewer work was second hand when purchased about four years ago; paid $3,400 for it, and it has trenched six miles; has been idle most of the time; doesn't think it is proper to charge off the entire cost of the trenching machines to one Denver job; it would be used in future jobs and included in future estimates; has not added any interest accruing on machines now owned by him in his Denver estimates; thinks the 200 gallon a minute pump would be adequate; thinks the hydrant running wide open would supply about 200 gallons a minute; city would gets its water on its presents ditch rights; witness would do the pumping; does not include anything for cost of the water; private company would have to supply the water; it would not make any difference with the bid whether it was made for the city or private corporation.

Redirect examination by Mr. Stevens:

Raton contract is a sub-contract for a lump sum, around $100,000; involves considerable trenching and pipe work; the original estimate was surely worked out on unit prices, and then made a lump sum; on the main contract with the city of Raton there was a lump price; no unit price used. J. R. Gordon obtained the contract without making any estimates, and witness obtained the sub-contract on basis of estimates; receiving pay for Raton work in water bonds bearing five per cent interest; cannot say that made any difference in estimate; Raton job is very unsatisfactory owing to local conditions, and is assuming a risk there with the present existing water plant and the bond market. It is a family affair; took the bonds at par in place of so much cash; counted on more

profit in Raton than in Denver. With regard to the extra expense of shoring, pumping and blasting, Exhibit C contains prac-
925 tically the same item, but it is a larger estimate. Witness has made his own estimate on that; in estimating the specials at $50 a ton, have added to that the price for laying it; that is a separate item, which appears on page 2 of Exhibit 60, under "Extra lead and specials, 3 per cent of pipe cost." Did not obtain quotations from Mr. Chilberg at the time of conversation with him.

Discussed with Mr. Chilberg the Birmingham quotation of $28.75 a ton; told him witness would use $30 a ton and Chilberg did not agree ; thinks there is no great hazard in this work, because the trenches are shallow, five to six feet deep. In a sewer system the excavation would be very deep, costly and treacherous. Exhibit C does not give very definite information bearing on the question of hazard. In estimating on contracts, does not make any difference whether the specifications are specific or general; the work would be done in workmanlike manner.

Got no illumination from the data set forth in Exhibit C; on each job witness charges a proportionate amount of interest for investment in machinery, tools, etc.; that interest is a small item; has neglected it in a great many cases.

Recross-examination by Mr. Dorsey:

Witness' statement that the hazard in this job would be very small is based upon the experience in other work which he has detailed, and has made a very small allowance on account of any hazard; does not think that an item for profit should be added on top of the Raton estimates, but is not positive; the greater part of the Raton contract is complete. The Raton contract is a family affair, bu thinks it represents a fair contract; it is not a competive job; witness thinks he will do it at the same figure as father estimated; cannot say whether it is a fair contract to the city of Raton; witness paid his father $2,400 for the sub-contract.

FREMONT HILL, a witness for the defendants.

Direct examination by Mr. Stevens:

Have been a contracting engineer for 33 years; built the South Dakota Central Railroad, 100 miles long; water power plant in Michigan, complete, for $200,000; sewer system and water system for Wilmette, Illinois, agregating $400,000; put in a water-works system at Maywood, Illinois, about $125,000; put in a number of sewers and paved a few streets; did all the improving in Auburn, a suburb of Chicago, aggregating possibly a cost of $75,000;
926 put in paving, water system, sewer system, water pipes and eleven miles of sidewalk, 3 miles of outlet sewer at West Pullman, and has done all kinds of little work. Has resided in Denver two years; has been over the distribution system of The Denver Union Water Company for the purpose of trying to fix a reproduction value; examined specifically the river crossings of the distribution system; took the quantities of pipe, valves, hydrants,

specials and similar items from exhibit C, and based an estimate of quantity and material thereon, and estimates the cost of the reproduction of the distribution system of The Denver Union Water Company, similar in construction to the existing plant, at $3,495,742, and stands ready to take a contract therefor. The general details of this estimate are set forth in exhibit 63; eliminated from consideration the service taps; figured that pipes under street car tracks would be laid on the side of the street; took the length of pipe shown in exhibit C, and figured it would be laid in the ordinary way; used a labor cost of $2.50 a day for common labor, on a 8-hour day, most labor in Denver is higher than that; had a proposition from Hendrie & Bolthoff covering all the materials in the bid; covered everything that could properly be charged against that kind of a job, and figured on it as a contractor.

The total of the bid should be $3,395,742.06. Witness also calls attention to corrections which are made on the exhibit.

Cross-exaination by Mr. Dorsey:

Started to learn engineering in 1881; learned it gradually and practiced it all the time; has lived in Denver two years, and has done no contracting here. After leaving the Cincinnati high school ,worked on the Cincinnati Northern, at Lebanon, Ohio; got $30 a month as an axeman, and was finally promoted to $75 a month running levels and transits; was then made resident engineer of the New Orleans and Northeastern, having charge of the construction of a bridge through the swamp; worked on the Tampico division of the Mexican Central as a levelman; ran a transit on the Florida Transit and Peninsula Railroad; came to Colorado and worked between Cash Creek and Aspen with a freighting outfit; was later made inspector of surveys on the Southwestern District of the United States, with headquarters in the field; then bought a sawmill between Montrose and Telluride; went back to Cincinnati, and was made locating engineer on the Chesapeake and Ohio; was made a division engineer of 20 miles between Kinnikinick and Portsmouth; located about 50 miles; located from Gallipolis to Portsmouth, Ohio; locating engineer picks out the most feasible routes; a detailed survey is made by later parties of engineers; was track engineer on
927 the Atchison Topeka & Santa Fe from Chicago south through Illinois, about 250 miles; worked for Miller, Loomis & Gill, contractors on the Rock Island railroad as an arbitrator; returned to Chicago and was appointed division engineer in charge of streets for what is known as the down-town districts; was in charge of new paving; opened his own office in about 1892 for engineering and contracting; from 1891 to 1898 designed the sewer and water system for Wilmette, and constructed it on a percentage; was really in charge of the engineering and construction features, and supervised the carrying out of the contract; that sewer cost the town $250,000, and the water pipes cost about $125,000; there were about 5,000 people in Wilmette; there were no paved streets in that town; there were no underground pipes or street railroads. Work at Maywood, Illinois, aggregated $125,000—all water pipes, pumps, etc.; no ob-

structions to the streets or pavements in Maywood; the pipes crossed under the Northwestern road at a number of places; that involved a total cost of $125,000, including sources of supply, and so on; does not remember how much pipe was laid in the street; it was an outlet sewer, and a sewer system embracing the north part of town. Did work at West Auburn which was an addition to Chicago; put in sewers, water pipes, street paving, sidewalks, curbing, and set up a row of trees; laid out a new addition; did the construction on this work; does not remember the totals on this job; there were no improvements of any kind in the way; the work at West Pullman was similar in character to that at West Auburn; put in a sewer system as Crossdale, Illinois, small town of twelve or fifteen hundred people; no obstructions or pavements there; did a great many other small jobs between 1891 and 1898, but has recited the principal ones; was one year in the United States Army as captain of engineers, during the Spanish War; during that time built water plant at Montauk Point and one at Huntsville, Alabama, for camp service; these were laid in a trench and covered, but not a deep trench; after leaving the army, did some railroad work for Cincinnati, Louisville & Chicago Railroad; then was locator on the Copper Range Railroad in Michigan; afterwards resigned and built a hydro-electric plant at Constantine, Michigan, on the St. Joe river, which cost about $200,000; there was no trenching or pipe laying involved in that; the details of the electric designing were done by The General Electric Company; witness is not an electrical engineer. Witness organized South Dakota Central railroad in about 1905; located it and put in his outfit; some other fellows put in the money, and bonds were issued and sold; had three engines—two freights and a pas-
928 senger. The bondholders afterwards bought the stock; the road is now owned by Mr. Erb; was interested in the Yankton Southern Railroad, which is not built yet; the Yankton Southern road is 1002 miles long; runs from Yankton to Galveston, Texas. Sold the bonds to a French banker on a firm commitment, waiting for the war to end; located a road about 100 miles long from Arkansas City through Wellington to Hutchinson, Kansas. In 1910 went to Cincinnati, and made a plan for union depot and terminal system there; made the plan for myself; did not carry it through.

Witness' activities relate principally to railroad construction. Witness' experience between 1891 and 1898 referred to sewers and water-works, but a relatively small proportion was with reference to laying pipe; is not now interested in a project to bring water from the Fraser river, on the Western Slope, over to this side, for the domestic supply of Denver, but has been interested in that since he was in Denver, and submitted it to the Public Utilities Commission; his proposition was not acted upon; was employed to make the present estimate of the distribution system of The Denver Union Water Company by Mr. J. B. Hunter, Commissioner of Public Improvements.

Did not cooperate or consult with Hiram Phillips in making the estimate; took ten or fifteen days all together; had no engineering assistance; at one time maintained an office in the First National Bank Building, but discontinued that two or three months ago;

has not bid on any of the city work; tried to get to build the water-works for the Utilities Board last summer; that proposition would have included the whole water-works, furnishing the water supply and the piping and the reservoirs, and everything necessary for a proper system; has not progressed far with that proposition; a large item in the distribution system is the cast-iron pipe; took the lengths of pipe, as specified in exhibit C, but did not take the weights; took the standard weights of the pipe manufacturers for class B pipe; did not allow 1½ to 2 per cent excess in listed weights; the total tonnage of cast-iron pipe listed by witness is 60,286, estimated at $30 a ton f. o. b. Denver; have such quotations from Hendrie & Bolthoff; did not tell Hendrie & Bolthoff that he wished 60,286 tons of the various sizes indicated; gave them the mileage of the pipe; had the conference mentioned with Mr. Heckendorf, general manager; did not state how soon pipe would have to be delivered or over what period the delivery would extend; did not look into the quotations on castiron pipe for the period of ten years last past; prices on such pipe fluctuate; has made no effort to ascertain average price for any period of time preceeding the estimate; did not make any in-
929 vestigation to determine the average price f. o. b. Denver paid by the water company for castiron pipe.

(Witness was asked whether he was aware that the water company paid in excess of $30 per ton, on an average, and on objection the question was ruled out.) Past history is not considered in estimate of future costs; has not had any experience in valuing property for rating purposes.

Does not know what the practice of other engineers of public utilities commissions may be with respect to the matter; has based estimate for specials on price of $50 per ton f. o. b. Denver; got that quotation from Hendrie & Bolthoff; specials consisted of crosses, tees, elbows, etc., and are of castiron material; the price varies from time to time.

Running back over 25 years, there has been a variation of 100 per cent in price of specials; in 1905 bid on a water-works system for Sioux City and used $38 per ton; also has known pipe to sell in Chicago at $19.65 per ton.

Did not investigate the average price of specials for any period of years last past, or as to what the water company had actually paid on the average for the same; figured on 1387 tons of specials; intended to take the quantities in Exhibit C. Witness is then referred to correction in class S, item 2, page 110-b, whereon there is a correction for page 365, making a total of 1522 tons, and says a correction should be made on account of that difference.

Exhibit 64 marked and introduced in evidence by defendants.

The pencil figures on the first sheet of exhibit 64 are no part of the letter, but the pencil figures on the second sheet are a part of the letter. One letter is dated January 27, 1914, the other October 5, 1914, and they were delivered to witness respectively on those dates; the two letters mentioned constitute exhibit 64.

The fourth sheet of exhibit 64 belongs to the first letter. The letter of January 27, 1914, was received from Hendrie & Bolthoff when witness was making his own confidential bid to the Public

Utilities Commission, and at the time of the second letter witness asked if the previous quotations would stand, and was told that they would, but was given a quotation on Gaskill hydrants; witness did not accept the quotations; thinks that it would be the custom of Hendrie & Bolthoff, notwithstanding notations on their letterheads, to let quotations stand until notice is given to the contrary. Witness is satisfied that he can go down to Hendrie & Bolthoff and close a contract for all materials on the quotations; if the market went way above the quotations, they would not do it. The quotation is
930 not a contract; either party may ignore it. Made some figures in January, 1914, to be submitted to the Public Utilities Commission, covering an entire water plant, but not an exact duplicate; the prices used are the same on pipe and lead and all material like that; did not make a written statement to the Utilities Commission, but made a confidential personal statement, with the understanding that it should not be repeated by any member of the board; used the same unit prices that he has used in the present estimate; used a larger percentage of profit; does not remember percentage. Witness was asked if, on his proposition to the Utilities Commission, he figured on a profit as large as 15 per cent, to which counsel objected; objection was overruled. Witness cannot state what the percentage of profit was. He proposed a lump sum to construct the whole work and take the bonds; made up an estimate for the purpose of making that proposition, but does not remember the percentage of profit; says it was a larger percentage; did not make an estimate for unforeseen contingencies; did not go into detail on points of delivery of the pipe, but thinks they would be shipped by the railroads and delivered to all the different side-tracks around the city.

Each railroad has its own yardage side-tracks and places of delivery; has not added anything to estimate for switching charges; thinks Hendie & Bolthoff estimate means any place in Denver where it may be delivered; has never done any carload freight business in Denver; after unloading material from the cars it must be conveyed in some way to the trench. Figured a haul of a mile and a half at a cost of $1 a ton; took a map of the city of Denver which had circles on it, showing the different distances from the union depot; saw that there were side-tracks all around at different places, and figured on an average haul of a mile and a half.

Would use teams for haulage; delivery from the mills to Denver in the railroad cars in such quantities and so steadily that it could be hauled directly from the car to the trench without delays and interruptions would be an ideal condition; does not think that can be entirely accomplished, but can be approximated.

Would not provide a storage yard; would haul the material as fast as it arrived and lay it in the streets; would provide in the contract for the privilege of stringing pipe in the streets; has seen possibly five or six miles of it strung in Chicago, and it was permited to remain there until the contractor could get in. Whether five or six miles of pipe strung out in advance of construction be a sufficient margin would depend on how fast the work progressed; cannot ex-

pect a steady stream of delivery; would sub-contract it to a
931 teamster to deliver at a fixed price of 55 or 60 cents per ton;
has not calculated the amount of pipe that would be necessary to assure constant and uninterrupted progress; assumed two years time for the completion of the work, or a progress of 212 miles a year; would not have to have on a hand a quantity in excess of five or six miles of pipe in order to ensure the estimated progress of the work; that would depend on how much material was in the yard and how many teams; there might be 50 teams delivering one day, and then they would be shut off for a day or two.

Would be delivering from the cars; would unload the pipe as it arrived and distribute it; might have more than five or six miles of pipe strung along the streets. If witness made a contract with the city, it would have to permit the use of the streets as a storage yard for the pipes; would use a derrick to load the wagons; figures on six derricks—two men with a derrick; the driver would not touch the pipes; he drives the wagon; would unload the pipe by pulling it off the back of the wagon; would have an unloading apparatus for the big pipe; would employ two to six men for unloading; does not make any separate allowance for loading the wagons; did not calculate so finely as to estimate the ton miles for the haul; in railroad experience has figured ton miles, but not on this job; did not make any specific allowance for unloading the wagons; bases his estimates for haulage on work going on around Denver; coal is delivered at 60 cents a ton up to Colorado Boulevard, and the hauler loads and unloads his wagon; it is much harder to unload coal; thinks the coal hauled around town would be about the same as the average pipe haul; thinks the greatest amount of coal is delivered to residences; proposed to handle all the trenching by machine; has never used trenching machines; has used a steam shovel; thinks it would be possible to use a trenching machine in the streets of Denver; they have been used 15 or 20 years in New York and other big cities and in the congested districts.

The catalogues of the machines show all kind of that stuff. Witness gets his information about trenching machines from the catalogues; all the information is right there.

Figures on 3.8 cents per cubic yard for excavation, using either a Parsons or Austin machine; took the figures in the catalogue for what the machines will do, and added the price of coal, water, etc. Figured on $4.50 a day for an engineer, $2.50 a day for a fireman, $4.50 for coal, $1 for repairs, and $1 for water and oil, making a total of $13.50; figured on 360 yards in 8 hours; for example, 22-inch trench, 6 inches deep, would run half a yard to the foot, and the estimated yardage would be 720 linear feet; the greatest length of
trench would be 22 inches wide; that would be the size for all
932 pipes up to 15 inches; figured an average depth of 6 feet;
trenching machines would cost $5,500 delivered in Denver, for size O Austin machines, or size K Parsons machine; machine would move itself from the railroad to the trench; might not finish in two years; that would depend on circumstances.

Forty-seven per cent of the present system was completed in one

year by the old company; it so states in some of the testimony. Would advise a client that the distribution system could be economically and properly completed in the space of two years. Forty-one per cent of the present system was laid in 1890; it may be that that is the amount that was laid from 1871 to 1890. A construction of such a plant could not be done at less cost if the work covered a period of four years; it could be done as cheaply in two years; would be very glad to get the job to complete it in two years. Lots of times there would be interruptions, but did not think about that at all. The proposition submitted to the Utilities Commission involved the construction of a tunnel, that would take about four years; considers that all tools would depreciate 75 per cent, and that depreciation is figured into the costs per cubic yard.

There would be 440 working days, over which the 75 per cent depreciation would be distributed; does not know how much that would be per day. The contractor is supposed to have interest on his equipment, but did not figure it that close. Allows a dollar a day for repairs, and that is ample. The machinemen guarantee that the machine will last a certain length of time. They guarantee that nothing will break; that guarantee does not cover ordinary repairs; the item of three hundred and some odd thousand dollars on the last sheet, designated "ten per cent profit" will take care of interest on the investment; all of this item is not profit.

Would have a gang of men go along with the trenching machine; the machine completes the trench where there are no obstructions; the pipe-laying gang digs the bell holes; the trench does not have to be cleaned out if the machine is working right; it says so in the catalogue; never had any experience with one. The gang of men looks after the caving; did not make test pits to determine the character of the soil through which the machine would progress; has never done any excavating in Denver; would encounter obstructions about every 25 feet, and these would be multiplied when the center of the city is reached.

Cannot tell what the average size of the gang of men would be; if there were no obstructions the machine would get part of the work of a wagon that was hauling water, and of the sheeting gang, and a gang to clean out the caves; that is provided for in the estimate of cost in the item four and one-half tools, 3.8 for actual excavation, 3 for the digging, 3.7 added, which totals 25 per cent, for overcoming the difficulties of obstructions, digging out pipes, and things that would be met, etc. Witness' estimate is a lump sum at which he would take the job; did not have working plans, maps, cross-sections or other engineering data, according to which the distribution system was originally built; did not go to the water company office for the purpose of examining any such plans; simply had Exhibit C, showing the quantities of pipe that had to be put in; nobody could have information concerning the obstructions that would be encountered or the character of soil to work through or the depth of the trench necessary to avoid obstructions, or the wet work that would be encountered; witness did not have such information.

933

The allowance for sheeting, pumping, bailing, etc., outside of the cost of excavation and backfilling, was estimated at 2.7 per cubic yard over the whole job; made a liberal allowance for it, and did not estimate what part was for sheeting and what for pumping, etc.; knows it is liberal from general experience; there are many things that a man who has followed the business for 30 years knows instinctively. Every kind of construction that witness has undertaken has a bearing on the subject.

Witness' judgment would not be influenced by the fact that Mr. Gaffy allowed $116,000 for the same items that are covered by witness' allowance of $29,600. The fact that Mr. Gaffy's allowance is 18.46 cents per lineal foot, as against witness' allowance of 6½ cents per lineal foot, would not affect his judgment. Would backfill the trenches with a machine throughout all the city; would use a dragline scraper, operated by an engine and moving all by its own power; the cost of backfilling by that method is 3 cents per cubic yard. Would pay an engineer for the machine $3.50, the scraper handler, $3; $3 for coal and $1 for water and oil; it would make the same yardage per day as the trenching machine.

Might have to have a little hand labor in connection with backfilling; would have to tamp and wet; has not been able to get the cost of tamping and wetting; the item of profit would cover that; don't know how much would have to be deducted from profit on that account; it might amount to a cent or a cent and a half a yard; would depend upon what the water company would charge for water; does not know what the water company usually charges; it would be two cents for water alone; would not have to tamp if water was used.

Does not know what the city requires in this respect, but thinks flooding would be better than tamping; cannot know about all these things; they have to be set forth in the contract. Knows
934 what the city's requirements with regard to trenching are; it is usual to require trenches to stand for a time after they have been backfilled before the surface is relaid; never knew that planking would have to be placed over the top of the trench at the expense of the contractor; does not know that there is such a requirement in Denver; has included nothing on account of that item.

Figures $95 per ton for lead; figures on cutting pavement 36 inches wide, or a foot wider than the trench; figured on $2 for removing and replacing; the materials that would be taken out would pay for the cost of taking them out; in replacing them the same stone would be used over again.

The material would have to be broken up to take it out, and has to be broken more in order to make concrete, and it costs to do it. Some of the asphalt could be melted up and used again, but it would have to be carried back to the yard and treated. The cost in Denver for laying new asphalt pavement is $2 a yard; would save all the material in digging out the pavement; thinks he could get the repairing done as cheaply as the price for laying pavement per yard; would do the repairing himself; has had charge of more paving than there is in Denver. Did not see the contractor's books in Chicago.

The item in Exhibit 63, designated "10 per cent profit $308,-

703.82", does not really represent profit. That covers some costs of construction, such as part of the backfilling and like things; would not know what was profit until the job was finished; has made no separate allowance for contractor's overhead or interest during construction. The contractor's bond for faithful performance can be secured for one-half of one per cent; could not tell whether the bond would be for $50,000 or $500,000; no separate allowance for contingencies or administration expense, or office expense, or contractor's bond, or liability insurance or damage claims. All those items with the addition of interest on contractor's capital invested, are included in the 10 per cent. On the contractor's bond could either pay half of one per cent or pay on the liability two and one-half a thousand—about half that much, does not know what kind of a bond would be required; it would depend upon the attorney of the party letting the job; it would be one-half of one per cent of the total cost of the entire work. A bond for the total cost of the work would be an absurd bond, and it would figure one-half of one per cent on that, or $16,500; don't know what the premium on a liability policy would be; would take out a liability bond and public liability bond; suppose they would both cost around eight or ten thousand dollars; has not inquired; does not know that the
935 premium on an employer's liability bond is 4½ per cent of the labor cost; don't know what that would amount to; it would take a good deal of figuring; can't give an approximate estimate; a sub-contractor for the hauling would protect his own men; knows there are limited liability policies; never has had any experience with such insurance.

The contingency of judgments in excess of the insurance company's liability is taken care of out of the profits; has not figured it; would not expect to be subject to accidents; is not a dangerous job; encountering of unexpected obstructions and character of soil would be called contingencies; they would be taken care of out of the ten per cent allowance, which is ten per cent on the entire contract, and seventy-five per cent on the contract price would be for material, and the ten per cent profit on the whole job would be nearly fifty per cent on the labor items; the contingency would come out of the item for profit.

Witness' attention is called to the fact that Mr. Gaffy allows $116,000 for obstructions, and witness allows $25,000, a difference of $90,000; and assuming Mr. Gaffy's figures to be right, the difference of $90,000 would have to come out of the witness' item of profit.

Contractor would have to have an office, bookkeeper, timekeeper, auditor; would not need a purchasing agent or a superintendent. Each foreman on the job would make a daily report as to the pipe laid, trench dug, classes of pipe laid, coal used, and each night the contractor would know where he stood; would have six foremen for his six gangs; would have the trenching machine gang in front, pipe-laying gang just behind it, and backfilling gang immediately behind that; the three parts would constitute one gang.

Would expect that procession to march up and down the streets constantly and continuously, proceeding without interruption and when the parade got by the pipe would be laid and backfilled, and

the pavement put on top of it. Whatever office expense and administration expense would amount to would come out of the 10 per cent profit; figures this job would take two years, working two hundred and twenty-days in each year; would be paid in monthly estimates each thirty days to pay for the working material of the previous thirty days; the contractor would want to be paid for material delivered, although not in place; he can't always get it. If witness was doing the job he would stick out for payment for material delivered; that is the assumption on which the estimate is made; by delivery means delivery on the trench; it is customary for the company to retain 15 per cent, but does not know whether the law requires
936 this or not; it would not be unusual to have 15 per cent on the total work retained for at least thirty-five days after final completion and acceptance of the work; would be paid one-half of the entire contract, less 15 per cent on that one-half at the end of the first year, and the same amount the second year; final settlement might be 30 or 60 days after the work was completed.

Water works usually go through a considerable process of testing before they are turned over; if the pressure could be put on the pipes all at once it is a short job; it is necessary to start with a working capital and maintain it; thinks $25,000 cash would be ample working capital; monthly payroll would be in the neighborhood of $10,000; figures an excavator $13.50 a day; back filler, $10.50; $25.50 for the laying gang—gives $49.50 a day; he calls it $50, multiplies it by 30 days instead of 22; that would be $1,500, and figures on six gangs, or a total of $9,000. Thinks $10,000 would take care of the whole thing. $10,000 does not take into account the hauling. Dividing the $752,000, the total labor cost, by 20 months, the time involved, would be about $37,000 per month for labor; has to pay for large quantities of material. The material man is glad to sell materials, and takes money as the purchaser gets his money; don't think the quotations are for cash; quotations are usually on 30 days' time; would not want to say whether the contractor would have to have $50,000 or $75,000 in capital, besides the 15 per cent which the company would hold out of the estimate; has not gone into that question, but does not think it would take that much; did not go into that question in making up the estimate; would have to furnish considerable equipment at a cost of $55,000. There would be 6 trenching machines, aggregating $33,000; six backfilling machines aggregating $15,000; six sets of tools and lead pots, $1,500; six unloading derricks, $6,000; six trench derricks, $1,500; boxes, lamps and such stuff, $1,000; tools for six gangs, $1500; that makes up witness' $55,000 estimate; would be out the interest on that altogether; that is taken care of in the cost of excavation. Witness figured a 75 per cent depreciation on his equipment and charged that in as part of the cost; that is a depreciation charge, but the interest on the investment would be taken care of by the 10 per cent item of profit; figured on taking out of the profit the cost of the water to back-fill the trench; that would be a considerable cost, but thinks it can be gotten cheaper on a wholesale rate. A charge of one cent per linear foot of trench would be equivalent to one cent for fifteen gallons of water to wash the trench

down; that would be an absurd charge; that water would all be used in settlement; it would leach through the material in the
937 trench before it reached the side; two cubic feet of water to every foot of trench would be adequate; has seen lots of that kind of work done; had one experience in Chicago; public utilities in that city had dug up tracks and not properly back-filled them; went through all the entire subject and made a special report to Mr. McGann, superintendent of construction.

In Chicago the soil is clay, principally; in Denver it is mostly gravel and stuff that would settle readily with water. Sandy soil would not require near as much water as clay; made no estimate whatever for the water; if it is gotten, it is gotten from the water company; if there was no water company in Denver that would be a different proposition, but there is one; is figuring on reproducing a plant in Denver, with the old company present; that is the only way that it could be reproduced; thinks that the pipes should be properly laid on certain sides of the street, adopting, for example, the north and west sides of the street. If witness were undertaking to reproduce the plant of the water company, just as it is to-day, would have to lay miles of pipe underneath street railroad tracks, and parallel therewith, but did not consider that at all; figured on placing the pipes at one side of the railroad tracks. No one would be foolish enough to put a water pipe under a street car track, when there was an open place to put it in; did not figure on reproducting the pipes in their present location. Whatever cost was involved in tamping and flooding the trench, and planking it after it had been back-filled, before repaving or resurfacing, was to be covered by the ten per cent profit item. Nobody would know how much profit would be left until they got through.

Witness is in the habit of figuring on contracts in that way. In figuring the proposed system for the public utilities commission, witness figured his own way; don't remember anything about the percentages on that estimate.

Redirect examination by Mr. Stevens:

In arriving at conclusions, witness relied considerably upon experience he has had with handling men, money and material in general contract work. If Mr. Gaffy is right in his estimate of $116,000 for sheeting and pumping in the trenches, that is fully covered by witness' item of ten per cent for profit. If this item of $116,000, testified to by Mr. Gaffy, was intended to cover sheeting and pumping, instead of obstructions, it would be taken care of in the profit item. The payment for material is determined by the contract, but most any material man is willing to sell material and allow you to pay for it out of each estimate paid by the build-
938 ing party. Bills would be discounted considerably for cash; 30 days is considered as good as cash.

At Maywood, Illinois, it took about a week to make the final tests. At Wilmette, it was done in a different way, and it took about a month; thinks the Denver job should be separated off into units and tested with a separate pump; ought to be done as the work progressed; has figured the difference in price for specials, due to the correction

in Exhibit C, and the difference of 135 tons makes a total difference of $6,750, to be added to the total of the estimate. Adding the profit, this correction would make the total $3,403,167.06. Witness then adds $5 a ton for hauling and setting them, and gives a final total of $3,403,909.56.

From experience in Chicago, on various inspections, and work with which witness became acquainted, he became familiar with obstructions and their effect on work similar to this; took those matters into consideration in making this estimate. The heaviest tonnage in the present estimate would be laid in the heart of the city.

Witness is asked what has been his experience with regard to the actual price on materials when one is ready to close a contract with a supply house. (Objected to. Objection overruled.) As a rule, the actual price is considerably lower than the quoted price.

Recross-examination by Mr. Dorsey:

Has heard indirectly that the prices have dropped some in the last few days; has had no further conference with Hendrie & Bolthoff. Witness' statement as to discount is a statement of what is ordinarily the practice. Hendrie & Bolthoff are not the only pipe men in the world.

FREMONT HILL, called as a witness for the defendant, recalled.

Direct examination by Mr. Stevens:

Has made a computation to arrive at the depreciated value of the estimates offered by various parties in the case; has undertaken to figure the depreciated value upon all estimates submitted, including those by The Denver Union Water Company, by Gaffy & Keef, Mr. Bickel, himself and Mr. Gordon. Exhibit 68 contains the correct computations; it is marked for identification; has taken the life recommended by the Census Bureau, and the two and one-
939 half per cent interest on the sinking fund; has estimated it upon two plans; each plan figures on the same basis; has used Robinson's tables for both methods where the interest is considered; used Robinson's tables for what is entitled on the table "Annuity Sinking Fund Method." The method entitled "Straight-line Depreciation" does not need any tables; Exhibit 68 correctly sets forth witness' computations.

(Objected to on the ground that the computation is "not evidence which is at all informing in relation to the actual depreciation which has in reality occurred up to the date of valuation on the property involved.")

Witness states he has made computations in exhibit 68 on each method of depreciation, according to the tables which are considered standard.

Objected to because there can be no such thing as standard tables to inform anybody as to what depreciation has actually occurred in an existing piece of property.

"Mr. Stevens: I understood the ruling of the master yesterday was that this was purely a matter of computation, which I think it is, and I desire to offer this as the computation made by this wit-

ness upon the two methods, which of course we desire to submit together to the master in this case, for purposes of argument. I noticed that some of the witnesses who preceded this witness upon the stand estimated the value of the property without depreciation and the value of the property with depreciation. According to Mr. Dorsey's theory, and of course according to the theory of all of us, that can be nothing more nor less than their computation; and these tables certainly might be useful to the master, at least in arriving at the computation of the various items set forth here and as embodying our viewpoint as to the proper depreciation which should be made. I don't know of any other way of getting at it.

Mr. Dorsey: We take the view, if your Honor please, that the matter of the actual depreciation which has really occurred in a piece of physical property up to the date when one makes an effort to value it is not a matter of computation or theory, but a matter of fact. It cannot be ascertained by sitting down in your office with a pencil and a piece of paper and a book of rules and working out sums in arithmetic. Mr. Stevens is right in stating that other witnesses who have preceded Mr. Hill, both for the plaintiff and for the defendants, have deducted accrued depreciation from the total gross reproduction of the physical structures of this plant, but without any exception they have all testified that they did so by reason of forming a judgment upon that subject after actual inspection, carefully made, of each and every part of the plant. Now, if Mr. Stevens is
940 willing to crystalize this question by stating that what he presents here is a mere computation,——

Mr. Stevens (interrupting): I have not gone beyond that.

Mr. Dorsey (continuing): —and does not represent in any degree, nor purport to represent, the judgment of Mr. Hill, or anybody else, about what depreciation has actually occurred in the property which constitutes this plant, that is one thing. If he presents it here as evidence of what has actually occurred in this plant in respect to the real depreciation here, that is another thing. Which is this, Mr. Stevens?

Mr. Stevens: I told you very frankly in the beginning I have not tried to qualify this witness in any other way than as making these computations, that is all.

Mr. Dorsey: Then you state for the record, do you, that this is a mere computation, based upon certain life tables of the kinds of property embraced in this plant, and arrived at merely as a process of arithmetic, first, on the basis of the straight-line method of deducting so much for each year, and, second, on the sinking fund method, the sinking fund being computed on the basis of two and one-half per cent.

Mr. Stevens: Yes sir; that is all.

Mr. Dorsey: Both as interpreted by Mr. Hill on each of these.

Mr. Stevens: Yes.

Mr. Dorsey: Then I renew my objection that this is a mere computation and not evidence.

The Master: I will admit it for what it is offered, as the computation of Mr. Hill on these theories.

Mr. Stevens: That is all I want to offer it for."

Cross-examination by Mr. Dorsey:

It is agreed between counsel that the note at the top left-hand corner of exhibit 68 should be stricken off, and that the stenographer may paste a piece of paper over it.

"Mr. Stevens: Certainly. One reason I had the master make the ruling yesterday that I did, I wanted to know just how much of this he would permit by way of argument, and how much of it we should identify in advance, because, of course, unless there is a lot of liberality about it, we have no right to use miscellaneous reports, or reports of miscellaneous commissions. As I understand it, these are all matters of argument. I desire to have it go off, and the stenographer may paste a piece of paper over it, and strike it off the copies."

Witness was asked what he meant by certain theories being "accepted." Witness has looked into the authorities on the subject, and the authorities have given the two plans as those accepted and used by various commissions.

941 (It was then agreed that the witness' statement that the two plans submitted by him are accepted by certain authorities should be stricken from his direct examination.)

Discussion ensued between counsel as to Mr. Hill's testimony.

"Mr. Stevens: I think, Mr. Dorsey, we will strike all of this out, where we started out with the record; we can arrive at it in a very simple way. I am perfectly willing to grant your motion by having the stenographer read the question which I asked him on offering Exhibit 68. I believe that embodies everything. Read that offer.

(Thereupon the stenographer read the following offer made by Mr. Stevens: "Then, if the court please, to shorten the examination, I will offer Exhibit 68 as though the witness had been asked in relation to the several items set forth in Exhibit 68 and had answered according to the computations contained in that exhibit.")

Mr. Stevens: I am perfectly willing to stipulate that every question relating to Mr. Hill attempting to do anything except to compute this upon the basis about which I asked him in offering the exhibit shall go out of the record.

Mr. Dorsey: That is satisfactory to me, if you include in your statement that there is no element of personal judgment on the part of Mr. Hill as to the actual depreciation which has occurred here involved.

Mr. Stevens: Surely.

The Master: It will be so understood.

Mr. Stevens: Then, in order that the record need not have a lot of other things in it, suppose we agree that from the place where we started there in making the offer may all go out of the record.

Mr. Dorsey: I think you have to leave it all in to make the final result understood, unless you start all over again.

Mr. Stevens: I have no objection.

The life tables referred to by the witness are found in a pamphlet bearing on the title page the following: "Department of Commerce and Labor. Bureau of the Census. E. Dana Durand, Director," and so forth, issued in 1911. The life tables begin on page 28.

Exhibits 57 to 68 offered.

942 FREMONT HILL, a witness for the defendant, recalled.

Cross-examination by Mr. Dorsey:

Referring to Exhibit 68, and the legend "Per Cent of Pipe Laid," in the lower left-hand corner of the exhibit, followed by percentage of pipe laid, beginning in the year 1878, witness determined that percentage from the summary in exhibit C; multiplied that summary by the weights of the pipe to get the tonnage laid, and added it, and got the total tonnage, and calculated what each year's amount was in per cent of the whole, and the percentages set down are those arrived at in that way.

With regard to the headline "Value of Sinking Fund at End of Years of Life Consumed, or Depreciation amount," under the general heading "Annuity Sinking Fund Method," witness took Robinson's tables, which show how much is required to be set aside each year for 100 years, at two and one-half percent, to amount to any given sum; that sum, multiplied by the amount in the preceding column, gives the amount that is to be set aside each year to cover the original amount expended in the life of the property. By the same set of tables would arrive at a calculation as to how much that amount, set aside each year, at two and one-half per cent, compound interest, will amount to in the ten years of life consumed. That gives you the value of the sinking fund at the end of the first ten years; that is item of $30,487, in the first column.

Witness takes Robinson's tables and applies them to the first item in class C, Lake Cheesman Reservoir; it requires .002255 to be deposited at the beginning of each year, at two and one-half per cent interest, to amount to one dollar in ten years.

Table 5 in Robinson's tables gives the amount, and table 2 gives the value of the money at the end of ten years; adopted that rate of interest because the city now receives two and one-half per cent on its sinking fund amounts; that is the rule of the bankers; cannot specify what sinking funds the city has on hand, but got the information direct from the treasurer's office; believes those funds are on deposit for 15 years; it is an annual rate of two and a half per cent, not compound rate; they receive it monthly and draw it out to the credit of some other fund; they do not redeposit it; if they did, it would draw interest again; presumes they use the money; that is the city's business.

The depreciation of the plant is arrived at before a calculation such as this can be made; it is assumed to have been arrived at by absolute examination.

943 (The statement of the witness that he has taken the general consensus of opinion of those who know about those things, as the life of an ordinary water-works property, is stricken out.)

Used two and a half per cent, because he did not consider that anybody could receive or make an arrangement with any bank whereby they were to receive a greater rate than two and a half per cent, compound interest, on such a fund; has had no experience in banking business in Denver, but spent a year among the bankers of Europe on this question, and did not do anything else but calculate financial matters; that experience, in connection with the fact that

the city is only receiving two and a half per cent annual interest, would be a good indication as to what could be gotten; knows that anyone can get a certificate of deposit under the clearing house rules in Denver, which draws three per cent; that on a long time deposit can get four per cent, with all kinds of strings tied to it; it is not obligatory upon the utility to invest its money in the bank; it might invest it in funds of various kinds and try to make six or seven per cent, and sometimes might fall down on it.

In figuring at two and one-half per cent, on a million dollars, the annual deposit would be $2255, and at four per cent would be $777; a slight increase in the rate of interest would make a very marked decrease in the annual amount of depreciation; figured by the straight-line method and by the annuity plan, so as to make a comparison between the two methods, starting with the estimate of Metcalfe & Anderson. The estimate by the various contractors for the city are comparable with Metcalfe & Anderson's figures; took the figures just as they were given to the witness in court as being the correct figures to figure from; did not consider that Metcalfe & Anderson's figures included all the overhead cost to the company, and other similar items, and the estimates of Gaffy & Keefe and Bickel do not.

The figures of witness and Mr. Gordon related to the contractor's bid on the distribution system, without the addition of anything else.

Redirect examination by Mr. Stevens:

Discussion between counsel and the master.

In arriving at sum of $30,487, referred to in cross-examination, the factors are the amount of money expended, the years of life given by the rule applied to that particular character of property, and the years of life consumed. By Robinson's tables, the amount to be deposited each year, to equal a dollar, at two and a half per
944 cent, interest compounded annually, is arrived at; that decimal multiplied by the amount expended, equals the annual payment required; then take table number two in Robinson's tables and find what $2655, which is the annual payment, will amount to at two and a half per cent interest, at the end of the ten-year period, and that is $30,487, and the assumed annual payment will yield $30,487 in hand at the end of the ten year period, to off-set the depreciation in that time.

(It is understood between counsel that when Mr. Gordon gets his Raton figures, and Mr. Allen gets figures on the excavation of the Capitol Hill reservoir, they may be examined as under cross-examination.)

ACHERT BICKEL, a witness on behalf of the defendant.

Direct examination by Mr. Stevens.

General contractor residing in Kansas City, Missouri; water-works, electric lights, manufacturing establishments, and various things of that sort; been in business about eight years; was in engineering business along the same line; chief part of business is as contractor

for water-works systems. The present company has constructed 30 or 35 plants; name of the company is the Commercial Construction Company, with headquarters at Kansas City, Missouri.

Witness has made an estimate of the reproduction cost of the system of The Denver Union Water Company, employed by Mr. J. B. Hunter, commissioner of improvements of the city and county of Denver; report is fully embodied in book marked exhibit 65; has set forth on pages 66, 67 and 67-a the details of his estimate; figured on two assumptions: one as contractor and one as though building a plant for himself; where employed as contractors, furnished plans by the owners, taking no promotion or executive expense; the estimate is $8,576,560.41; the cost to the owner would be $9,915,388.

Figures on reproducing the present plant of The Denver Union Water Company as nearly as possible; took the quantities from Exhibit C; has not used the yardage set forth in exhibit C in excavation and back-fill for pipe lines; has not included the service taps or extra costs of laying mains under tracks or conduits paralleling water mains; has not included lands or water rights. The price on building materials was furnished by Messrs. Willison & Walsh; the wood-stave pipe prices furnished by Gaffy & Keefe; all figures written in red, and followed by a star, are identical with the
945 Water Company estimates; the report, exhibit 65, shows a detailed statement of the values of the several items; has not explanatory notes and tables in shape to furnish; part of them are on paper; part in office in Kansas City and part in the witness' head.

Exhibit 65 admitted in evidence.

Cross-examination by Mr. Dorsey:

From Exhibit 65 one can take any particular item and find the cost of that item as estimated by witness. The prices by which such items are arrived at are not stated. The quantities set forth in exhibit C are not again stated. Witness can give the unit price on any particular quantities; cannot at the present time furnish a statement of all unit prices.

Has been engaged in the general contracting business for approximately eight years; all of that time in Kansas City; prior to that time was employed by The W. K. Palmer Company, engineers; studied electrical engineering at the University of Arkansas; left that institution in 1900; did not graduate; believes he went to Kansas City; don't remember; that was more or less of a nightmare; there are some things that we would like to forget; is not at liberty to tell. The truth is he was hungry and broke; went home to Cleveland, Missouri; did not engage in business there, and did not stay very long; came to Denver in 1901; stayed here about six months; worked for the Tramway Company, holding the ends of wires for an armature winder; then went to Telluride Transmission Company, at Telluride; remained there about a year as operator of their station at Vance; was not in charge of the station; worked as an operator; did not have any work after that for a considerable length of time; was out of a job six months; went back to Kansas City

and worked for The General Electric Company about six months in erecting switch-boards in the power plant of The Kansas City Electric Light Company; then worked for the Metropolitan Street Railway Company; installed rotary converters for the street railway company at so much per day; next job was with the W. K. Palmer Engineering Company; remained there two years as electrical engineer and designing, electric light, water works, sewer construction, railway service; was in the field principally; didn't have anything to do with water works construction for the W. K. Palmer Company; afterwards employed by The Hodge Electric & Manufacturing Company of Kansas City as sales manager, in the office and on the road; installed a combination water, coal and ice-handling apparatus for the Burlington Company in the Kansas City yards; not really a water works system; next job was with the Freeborn Engineering & Construction Company of Kansas City
946 in capacity of contracting manager; remained with them about three years—until about 1910; built cement mills, water works, electric light and sewerage systems, some dams and general construction; during that time built a plant at Hartshorn, Oklahoma.

Witness secured the contract, employed the men, acted in a supervisory capacity; Hartshorn has a population of three or four thousand; that was witness' first water works installation; there were no paved streets, but there were gas pipes; the contract price was $105,000 for dam, pumping plant, cast-iron distribution system, steel tank and tower. The dam was reinforced concrete, to cross the bed of a dry stream; about a mile and a half of cast iron supply pipe, 12-inch size; don't remember the sizes of the pipe in the distribution system; trench was cut with a trenching machine; does not know positively whether there were gas pipes in the street; made the estimate for the Hartshorn job.

Next job was at Osage City, Kansas; made the estimates, prepared bids and secured the contracts; Osage City has a population of about 3500 people; there was a private water plant and a gas plant; no pavements or street car tracks; does not remember the price of the Osage City job; built there a reinforced concrete dam across a dry stream; about a mile and a half of ten-inch supply pipe; does not recollect the mileage of the distribution system, but the pipe was from four inches up to and including ten-inch pipe; built a plant at Augusta, Kansas; made the estimates, prepared the bids, and supervised the construction; Burns & MacDonald designed the plants; witness did not design any of them; population of Augusta about 500 people; put down four wells with a common suction line between the wells to a small pump house, two triplex pumps, which pumped water out of the wells into the distribution system; don't know what is meant by gravity system; there are so many different kinds; the pumps and the tanks afforded the pressure.

Built an extension at Dodge City, Kansas, covering pumping plant and some distribution mains; does not recollect the mileage; don't know the population of Dodge City; there were no paved streets where the pipes were put in; encountered no obstructions; crossed the Santa Fe tracks; no street railway; built a dam for the

city of Wichita; it had nothing to do with water works; witness assisted in the designing of it; the engineers were Burns & MacDonald of Kansas City; the dam was to afford water for boating and pleasure purposes, in a park called Riverside; contract price was $23,000.

947 Built a water works system for the Jackson County home for the aged and infirm, in Jackson County, Missouri, consisted of a lake, earthen dam, small pumping station and a pipe line; about a mile and a half of pipe; contract price was $30,000.

Built a sewer system at Centralia, Missouri; does not remember of any more water works systems.

Mr. Hiram Phillips was not the engineer on any of these projects; has never done any work for Mr. Phillips yet.

As witness recalls it, he has now detailed all the important water works; left the Freeborn people in 1910 and went into business for himself; witness' company is The Commercial Construction Company, with headquarters at Kansas City; build water works, electric light and sewer systems; has designed some; is president of the company.

Witness' company constructed water works for Altoona, Kansas; about a thousand people; constructed an intake well, pumping station, pipe line to the town, and distribution system; pipe line was about a mile and a half; either six or eight-inch pipe; about three and a half miles of distribution system four to six-inch pipe; great many obstructions; gas pipe for natural gas; contract was not to exceed $10,000; city furnished the plans, designs and some of the materials; witness furnished the cast iron pipe, pumps, erected the pumping station, and set up the engines.

Moberly, Missouri, is a city of 15,000; witness rebuilt pumping station, made new connections between reservoirs and pumps; built electric transmission line; installed street lights; did not involve any distribution system; the supply line was a duplicate line; 16-inch cast iron pipe; total contract price for water and electrical work, $40,000.

At Sylvan Grove, Kansas, town of 700 population, built water works and electric light, consisting of a pumping station and distribution system; supply line pipe was eight inches; don't recollect the length; the total contract for water and electric light was $35,000; there were no paved streets or underground conduits.

At Luray, Kansas, built a water works plant, a little pumping station, steel tank in town and distribution system of approximately three miles, of four and six-inch cast iron pipe; total contract price $20,000; no paved streets or underground conduits; built a pumping station for the Kaw Valley Drainage District, for the drainage of flooded lands; that was an 18-inch pump and supplied 10,000 gallons a minute.

At Lyndon, Kansas, population approximately 2,000, built small dam and flow-line, pumping station, distribution system, town
948 tank, filtration plant and settling basin; dam was built of steel piling, filled with concrete; wasn't very much; was a dam across a small stream; flow-line about a mile of ten-inch cast iron

pipe; there were motor-driven centrifugal pumps; don't recall the capacity of the pumps; there was a mechanical filter, and approximately six miles of distribution line of four and six-inch cast iron pipe; total contract price about $40,000; some macadam streets, very few in comparison with the entire system; no underground conduits.

At North Kansas City, Missouri, built pumping plant, filtration plant and distribution system; at the time it was built there was practically nothing there; it was a piece of property owned by the Armour-Swift interests, laid out for a manufacturing settlement; no paved streets or underground conduits; it was about 50 feet from the point of supply to the distribution; the entire area of the town covers 4,000 acres; pipes run from 20-inch to 4-inch cast iron; total contract price $200,000, but this covers small electric lighting system and small sewerage pumping station; water plant would approximate $144,000.

At Monroe City, Missouri, city of approximately 5,000, built reservoir, two pumping stations, filtration plant and distribution system; built an earthen dam, taking care of run-off water; this dam was about 1,500 feet long, 25 or 30 feet at its highest point; flow-line mile long, of 8 or 10-inch cast iron pipe; built a mechanical gravity filler of capacity of half million gallons; 4, 6 and 8-inch cast iron pipes in distribution system; total contract price is approximately $35,000; pipes were purchased by the city; some macadam pavement; met with electric light conduits in the main part of the city, but not a great deal.

At Berryville, Arkansas, a town of 2,500 people, built a pumping station, distribution system, tower and tank; about 15 feet from the point of supply to the city distribution system; about four miles of distribution system; 4, 6 and 8-inch cast iron pipe; 2-inch wrought iron pipe; no pavements, street railroads or underground conduits; total contract price $18,000.

At Bolivar, Missouri, a town of 5,000, remodeled electric light and pumping station, and extended pipe lines and cross-connections; put in new pumping machinery; added 15,000 feet of 4-inch cast iron pipe to the distribution system; total contract price $25,000; don't think there were any paved streets; might have been some underground conduits; no street railways.

Witness has been intimately associated with all the work done by the company at Knoxville, Iowa, town of 5,000 people; two pumping stations, a flow-line and a reservoir; reservoir was reinforced concrete, containing about half-million gallons; motor-driven
949 centrifugal pump, furnishing 700 gallons a minute; one flow-line, six miles long, ten-inch cast iron pipe; total contract price $35,000, exclusive of cast iron pipes, which were furnished by the city; about 1,000 feet of macadam road; no underground obstructions.

At Armour, Kansas, a town close to Pittsburg, Kansas, a city of 1500 people, built water works and electric light, combination plant; deep well, deep well pump, concrete settling basin, motor-driven centrifugal pump, steel tank and tower, pipe line; distribution system; flow-line was 30 to 40 feet; pump capacity 200 gallons per

minute; two miles of distribution system; from 4 to 8-inch cast iron pipe; total contract price $28,000; no paved streets or underground conduits.

At Auxvasse, Missouri, a city of 1,000 people, put in pumping station and distribution system; three miles of 4 and 6-inch pipe; don't remember the contract price; there were no paved streets or underground conduits.

When with the Freeborn Company put in plant at Santa Rosa, New Mexico; population 500; total contract price $25,000; covered flow-line, distribution system and intake; flow line four miles long; 4-inch pipe; two miles of distribution system; 6 and 4-inch pipe of cast iron; no paved streets or street car lines, or underground conduits. Witness cannot think of any more.

At Neosho, Missouri, a city of 6,000 inhabitants, put in intake flow-line, reinforced concrete reservoir, distribution system, and took up and replaced a lot of old wooden pipe with cast iron pipe; total contract price $60,000; source of supply was a spring; concrete reservoir held 500,000 gallons; flow-line, five miles, of 10-inch cast iron pipe; 50,000 feet of distribution system; macadam paving for about 15,000 feet, which had to be trenched; encountered water pipes and house connections; there were no street car lines; were some sewers.

During the Freeborn period, at Nevada, Missouri, remodelled power house and installed new boilers; erected new engine and generator; made some extensions to pipe lines; overhauled air compressors, and did some work upon the gas plant and street railway system; there were about 10,000 feet of distribution pipe; entire contract amounted to $26,500; Nevada, Missouri, has a population of 8,000.

During the Freeborn period that company built a great number of structures that ran from $30,000 to $700,000 in price, and of type and character of construction that entered into the class of construction that is general, such as reinforced concrete, building mills for making cement and handling stuff from quarries.

950 A great many things enter into that class of construction that enter into similar construction.

Has now mentioned all the instances of every type that witness has been connected with in the way of construction. Did some work in Kansas City for private corporation, that involved a pipe line connected to the city water works system; that involved some street work, and laid a fire protection line for The American Radiator Company, and connection was made with the city main, which came from under a paved street; that was about 2,000 feet of 4-inch cast iron pipe; only a part of it was located in the street; about half of it was under paving; paving was concrete base, with creosoted wooden blocks; was located in the manufacturing district, not in the residence or business or congested district; encountered some sewers; total contract price was $2,500.

Put in another small pipe line for Montgomery Ward & Co. of Kansas City, laying about 1,000 feet of six-inch cast iron pipe; total contract price $1,200.

Has now mentioned all the work in which he has been engaged, involving trenching in city streets.

Was engaged two and a half months in getting up present estimate; had assistance, but was not assisted by Mr. Hiram Phillips, except that Mr. Phillips went with the witness in a motor car over property; so far as the estimate or prices or figuring was concerned, Mr. Phillips knows nothing about it; work was done partially in the office in Kansas City and partially here.

Witness' exhibit 65 covers classes C to S, inclusive, bearing corresponding letters in plaintiff's exhibit C; had exhibit C before him in preparing the estimate; did not include lands, rights of way, water rights or stock on hand.

The price of $8,576,560.41, appearing near the top of page 67, is the price at which witness would undertake to reproduce the structures in classes C to S, from plans and specifications furnished, and includes the amount computed on Classes C to S, both inclusive, plus an item of general overhead and contingencies, amounting to $370,000.

On page 67-*a* of exhibit 65 there are additional costs which should be borne by the water company. They are costs that come under the head of promotion and executive expense to owner of plant, and were put in for the reason that if witness were reproducing the plant for himself, not as a contractor, he would have that additional expense.

Witness had excluded service taps and the extra cost of laying mains under conduits or tracks paralleling same. Exhibit C also contains the cost of the dam, which was excluded from wit-
951 ness' estimate; excluded nothing else except what is called for in the letter; included the Ashland Avenue reservoir lining; in getting up exhibit 65 had exhibit C before him, and supplemented that by looking at the property; had the plans and specification for Cheesman Dam, and looked at quite a number of plans and profiles in the Water company's office, together with the plans shown in exhibit C; in the Water Company's office inspected the drawings of the water tanks, profiles of conduits plan of steel stack, and several others, which he does not recollect; went to the office twice. On the first visit to the office, did not have access to them. The second time had several hours there.

The occasion on which witness did not have access to the plans was six weeks ago. Prior to that time, had completed the investigation and the typewriting of a good deal of it, but had not completed final figures.

On the second visit to the company's office, arrived there about 8:30 in the morning and staved until noon. One of witness' men made some copies and visited the office a number of times; did not make copies of all of them; witness did not inspect all of them; inspected quite a few of them; had no plans, cross-sections or specifications, or other data relative to the distribution system, except what was contained in Exhibit C; travelled completely over the town a good many times, looking over the general character of the work

on which expected to make an estimate; spent about seven weeks' time in Denver.

On the first visit to Denver witness stayed at the Brown Palace Hotel; that was about two and a half months ago; was employed by John B. Hunter, city commissioner of improvements; stayed a little over a week on the first visit; two weeks later returned to Denver; stayed at the Erhard Hotel on Broadway; stayed about two weeks that time; came back a week or ten days later; stayed at the same place; remained about two and a half weeks; returned thirty days later, just prior to going on the stand; about six weeks was the total time in Denver devoted to the matter.

Referring to Class S, distribution pipe system, a very large item is material, and the largest part of it is cast iron pipe; there were 60,271 tons, and witness has given the total figure but cannot give the unit price; that figure covers delivery at the trench; saw Mr. Metcalfe's unit prices in Exhibit C; assumed the pipe would cost $29.60 f. o. b. Denver; that was a Birmingham quotation, made October 7th.

If witness could place an order for the pipe, it would be delivered over a period of two years; did not make any investigation of the variations in the price of cast iron pipe during the last ten
952 years. The fluctuation in the price of that article depends upon the location of the delivery point; cannot say whether there has been a wide fluctuation in price of cast iron pipe at the foundry in the last ten years; has never investigated the question; does not know what the fluctuation has been in Denver; used the momentary quotation of October 7, 1914; has bought pipe cheaper since the time of quotation.

(Witness was asked whether he thought it was fair to apply momentary unit price, as a fair measure of the value of a water works system, for the purpose of rating, to which objection was made and sustained.)

The price on cast iron pipe was quoted f. o. b. Denver expected to route pipe over different lines which would give setting facilities; figured on seven or eight different unloading points; expected that the railroads would set them on their own switches; only recollects the Union Pacific and the Colorado & Southern; assumed that the railroad would set the pipe on sidings four or five miles from the usual point of delivery; assumed an average two-mile haul to the trenches; expected to transport by teams or business motors; allowed 25 cents per ton-mile, or 50 cents a ton on the average; that price is made up from witness' cost records of previous transportation of pipe; did not make any assumption as to the number of handlings from car to trench; 50 cents covers all costs from railroad to trench; the number of handlings would vary considerably, due to the conditions under which it was handled; it would possibly be handled directly from the railroad to the trench; did not assume it would be; witness' cost records were on handling in different ways.

The total of the jobs testified to by the witness would, as a whole, make a job of the magnitude of the Denver contract; no comparison between the quantity of cast iron pipe handled on any of those jobs

and the quantity on the Denver job; the largest handled by witness on any one job heretofore is approximately 1200 tons; thinks it would make a considerable difference in the case whether material was unloaded direct from the railroad to the trench or had to be unloaded into a yard, and reloaded from there; does not think it would be necessary to unload in a yard on this job; heretofore witness has been able to get railroad deliveries at a rate exactly in pace with the excavation. There is no job that compares with this one, in the country; thinks railroad, with 60,000 tons in sight, would operate with more efficiency than with 1000 tons. There is no difference based on the capacity of the foundry to turn out a thousand tons or 60,000 tons. The estimate of 50 cents per ton is based on handling direct from railroad to trench; would unload the cars
953 with block and fall derricks; would have eight unloading stations, each one equipped with necessary apparatus; don't know how many men would be required at each station; makes figures from cost figures on other jobs; would have to have men at each place to unload, but the number would vary with the different types of labor. The driver on the wagon would not do the unloading by himself; figures on paying men 20 cents per hour for a 10-hour day, but would pay more, depending upon the efficiency of the men; the maximum for unskilled labor would be $3.50. Unskilled labor is lower; that is not classed with any particular trade.

Pays $3.50 per day to some common laborers handling pipe in the trenches; they are men that are with witness all the time; these men would be detained at the unloading stations all the time; would pay teamsters $5 per day, including wagon and team; would handle heavier pipe by derricks, and lighter pipe would be handled by hand; would have men at the trench to help unload; on the smaller pipe would have two or three men; would figure on having excavation proceed in the usual way, that the pipe could be laid without interruption, and the pipe would be delivered at a rate just sufficient to keep up with the excavating gang, but such conditions seldom occur.

Figures on the average condition, and the unusual condition is taken care of in the contingent fund. Witness thinks the pipe would come with fair regularity along the line indicated, and that would be average condition; if the pipe did not happen to come as fast as wanted, would find work for the men to do; if the pipe came faster than wanted, it could be strung along the streets; don't know how much he would have on hand, but has provided warehouses for taking care of the surplus stuff; expects to find them along the railroad and rent them, and unload from the cars to the warehouses, and then haul from the warehouses by wagons; that cost is covered in the contingent fund.

As to the cast iron pipe, takes the quotation $29.60 f. o. b. Denver, and adds 50 cents per ton for handling, making $30.10; this does not include overhead and profit; recollection is that the overhead and profit covering entire section of Class S is figured at 16 per cent of the cost; can segregate the overhead from the profit, but it will take time; will also have to figure whether he added the profit as a per-

centage to the cost, plus overhead; item of 16 per cent was evenly distributed over each item in Class S, including cast iron pipe, specials and other things. Figured on $55 per ton f. o. b. Denver for specials; assumed that it would be delivered around the city in the same way; assumed $1 per ton for haulage on specials,
954 making $56 at the trench, and to that added overhead and profit of 16 per cent, making the total per ton at the trench; made no investigation to learn what the water company has had to pay on an average for its pipe and specials during any period of time past. Specials fluctuate in cost, like pipe. The quotation on specials was secured on October 7th from Birmingham; obtained by correspondence from different foundries; all obtained about the same time; used those quotations as the basic figures f. o. b. Denver.

On page 6 of Exhibit 65 the figures under the item "Laying cast iron pipe," covered trenching, laying and backfilling, included lead and yarn. Under the column "Quantity," as it relates to item 12, has put down the length of each size of pipe. The aggregate length of that would be the length of the trench; changed the width of the trenches as assumed in Exhibit C; gives width of trench and pipe as follows:

Pipe.	Width.	Depth.
30-inch	4 feet	7 feet 2 inches
24-inch	3 feet	6 feet 8 inches
20-inch	3 feet	6 feet 4 inches
18-inch	3 feet	6 feet 2 inches
16-inch	2 feet 4 inches	6 feet
15-inch	2 feet 4 inches	5 feet 11 inches
14-inch	2 feet 4 inches	5 feet 10 inches
12-inch	2 feet	5 feet 8 inches
10-inch	2 feet	5 feet 6 inches
8-inch	1 foot 6 inches	5 feet 4 inches
6-inch	1 foot 6 inches	5 feet 2 inches
4-inch	1 foot 6 inches	5 feet
3-inch	1 foot 6 inches	4 feet 11 inches

Would do the excavation by machine and hand—approximately 75 per cent by machine and 25 per cent by hand, outside of river and ditch crossings. Those percentages apply to yardage, and not linear feet; would not know how to figure it by linear feet because on meeting obstructions it would be necessary to raise the boom over, and that would necessitate hand work; has not estimated the total cubic yards of excavation for each size of pipe; prices are figured on price per foot of trench work; has figures showing the yardage for each class of pipe, as follows:

Pipe.	Yardage.
30-inch	1.06
24-inch	.74
20-inch	.704

955

Pipe.	Yardage.
18-inch	.685
16-inch	.518
15-inch	.51
14-inch	.507
12-inch	.42
10-inch	.393
8-inch	.296
6-inch	.286
4-inch	.278
3-inch	.273

Should like to check the last two; has not the total yardage for each class. The basis price for trench is:

Pipe.	Price.
30-inch	20 cents
24-inch	24 cents
20-inch	13 cents
18-inch	13 cents
16-inch	10 cents
15-inch	10 cents
14-inch	10 cents
12-inch	8 cents
10-inch	7 cents
8-inch	6 cents
6-inch	5 cents
4-inch	5 cents
3-inch	5 cents

That is the basic price for excavation per linear foot. To that is added overhead and profit. Figured the basic price for laying the pipe, including lead and jute, as follows: For 30-inch pipe figured the number of linear feet of excavation, yards of backfill, laying and calking of the pipe, the lead, the jute, and the bell holes, which gave a total figure for that particular size pipe, and that goes into the estimate to make up the total. The totals for each class are as follows:

Pipe.	Price.
30-inch	$4,824.20
24-inch	39,725.37
20-inch	6,876.63
18-inch	8,688.82
16-inch	25,682.62
15-inch	22,022.04
14-inch	11,939.69
12-inch	89,874.31

956

Pipe.	Price.
10-inch	19,878.96
8-inch	35,040.71
6-inch	185,875.74
4-inch	33,134.79
3-inch	1,436.42
Sum total is	$465,198.30

That is the basic cost of labor and material without the addition of overhead and profit; to that, added approximately 16 per cent. Witness will figure up and give the basic cost of laying, including lead and yarn, on each class of pipe, giving the lead, yarn and the laying in separate items, and the basic cost per linear foot for the backfill on each class of pipe.

Witness' figures can be reduced to cost per linear foot; used a basic price of 18 cents per cubic yard for excavation; that was an average allowance.

Witness has averaged unit costs over different classes of construction work. In this instance has taken the average cost per yard over the period of time through which he has been operating, for the machine work, and has added to that 30 cents per cubic yard for hand work; has taken the combination as a whole and increased it 25 per cent above average cost, and used that figure as a basis for the entire excavation; took an average cost of 9.2 cents per cubic yard for machine work, and added 25 cents to it; arrived at the 9.2 cents by complete cost records and data on each job that he has done; uses an Austin trenching machine. The Denver job would take a number 001; has forgotten what they cost; would use little ones and big ones; No. 0 machine cost $7200; little one costs $5500, f. o. b. Denver; they arrive ready for operation.

Figures on making an average of 700 feet per day with a machine and the work; two hundred days in each calendar year; would finish the distribution system in two years; could accomplish that footage with each machine.

Witness' cost records included daily operating expense of the machine and the basic price for excavation is based on those cost records; segregates in his records the cost of trenching by machines; includes in those records labor, repairs and fuel; has operated the machines without an engineer and fireman; has a gasoline-driven machine, run by one man. They use an engineer and fireman on a steam machine; witness has used both.

Cost records do not include anything on account of depreciation in the machine; expects to write off machines in five years;
957 on this job assumed to write off machines at twenty per cent per year; that goes into the overhead and profit; that is part of the 16 per cent as a charge for interest during construction, but must look up in detail before he can say that that covers the investment in trenching machines; each particular section in the estimate

is figured as a job by itself, and the whole is combined in one contract, and covered in a general fund.

Interest during construction is embraced in the 16 per cent; figured on using eight machines; has one machine on hand now; has had two; one was bought new; cannot tell how much trenching that one machine has done; would have to buy seven or eight new machines; would have them on hand at the end of the job; it would be some time before another job would be secured that would require that many machines; interest on investment on the machines after this job was ended would have nothing to do with the contract; contractors seldom get back the money which is lost on account of interest in fixed equipment during idleness; overhead costs, office expenses, and the figuring and estimating on jobs which a contractor don't get, must come out of the profit of actual operations over an extended period. In this case figured that in the general over-head and contingent fund of $370,000. Witness corrects that: Says that the general overhead and contingent fund is to furnish a general office for the construction of the property in Denver alone, and confined to this particular job. Does not include in the Denver contract anything to cover expenses of his company between jobs, although he has such an expense; made a general investigation of the materials that would be encountered, the same as he would on any contract; did not sink any test holes; saw quite a number of open excavations in Denver distributed over the entire town; did not know who was making them; saw two or three in the congested district; don't recall how many others; there were places where streets had been cut down, and there were excavations in basements, just showing the general character of the soil; has used trenching machines in the various towns concerning which he has testified; has never used one in any town the size of Denver; has never used one where street car tracks, underground obstructions and pavements are encountered to the extent that they are in Denver; has never done any trenching in Denver or Colorado, but thinks his cost figures afford a reliable foundation for the Denver estimate, because they have operated over a great variation in soil, and because 25 per cent was added to his cost records. The character of the soil is very similar to the character in which witness has
958 operated machines in other places—for example, the western part of Kansas.

It is upon cost data gathered from those excavations that witness makes his estimate; did not expect to operate the trenching machines in the downtown district of Denver; there are 263,000 feet of the work under pavements, which is 11.7 per cent of the total trench. This leaves 33 1-3% of the hand work, after including the creek, river, ditch and railroad crossings, so the pavements are practically eliminated. By pavements, means everything but surfacing. There will be hand labor in restoring the pavement; would have to have very little hand labor where no obstructions are encountered; would not clean the trench after the machine, unless it was caved. The machine does not dig bell holes; they must be dug by hand; does not class the bell holes with the excavation at all.

So far as excavation is concerned, the Denver job is more difficult than any one that witness has undertaken; does not think it would have been fair to take his cost records on the most difficult job he has ever undertaken; started with a basic figure of 30 cents per cubic yard for hand work, and added 25 per cent to make the basic figure, and the 30 cents is higher than witness' average cost record.

A good portion of the hand work will be under obstructions, pipes, conduits and other things, and cost more money on account of it. The machine work would be increased because of moving over obstacles.

Witness' figure of 30 cents per cubic yard for hand work is higher than his averages, and to that he added 25 per cent. His figure of 9.2 per cent for machine excavation is his average on his own cost records, and to that he added 25 per cent; made a mistake in saying that 30 cents was higher than his average cost figures for hand labor, as prices on hand labor vary from 12 cents per cubic yard up; it is the difficult part of the Denver job which would be done by hand labor; thinks he has estimated enough for it.

Item 16, Exhibit 65, page 62, subdivision S, designated "Sheeting," covers that item only. Pumping, bailing and trenching hard ground, shoring, work in shale, and things of that sort, is covered in the excavation cost; the trenching cost will take care of the shale; pumping and bailing will be taken care of in the contingent item on the last page of Exhibit 65; shoring is taken care of in the sheeting; means the same thing.

The allowance for asphalt pavement is $163,146.17; uses the unit price of $2.75 per square yard for taking out and replacing; used a cut for the asphalt approximately the same as the size of the trench; has made a 2-foot cut in the pavement for the 12-
959 inch pipe. The trench for the 12-inch pipe would also be two feet. The asphalt cuts are the same width as the trench; was informed by the Parker-Washington Company of Kansas City that that would be adequate; witness has not had enough experience to figure on it; does not know whether the city would permit the pavement to be cut as narrow as the trench.

The unit price used was supplied by someone in Kansas City; item 19, subdivision C, on page 64, was omitted by instruction from the city; does not intend to exclude railroad crossings, but does intend to exclude superposed or parallel tracks; omitted street railway crossings for the same reason, being instructed so to do by Mr. Hunter; thinks the letter was from Mr. Stevens.

Witness compares Exhibit C, page 388, plates 192 to 207, with his item 20, subdivision I, where he appears to have omitted an estimate.

In item 21, subdivision A, relating to telephone conduits there is an omission.

ACHERT BICKEL resumed the stand for —.

Cross-examination by Mr. Dorsey:

Has separate figures for laying the pipe, the lead and jute and the backfilling.

Size of pipe (inch).	Laying and calking (per linear foot).	Backfilling.	Lead and jute.	Bell holes.
[illegible]	30 cents.	16 cents.	18 cents.	20 cents.
[illegible]	20 "	12 "	14.9 "	15 "
20	14 "	11 "	12.25 "	12 "
18	11 "	10 "	10.17 "	12 "

4	2 "	4 "	2.2 "	10 "
3	1½ "	4 "	1.49 "	10 "

Lead and jute may vary one per cent one way or the other. To these figures witness adds the cost of bell holes, hauling, and
960 storing lead and jute. The figures for bell holes are per bell hole; and assumed that there would be one every 24 feet. There is also added a dollar a ton for hauling and storing jute and lead; the items which enter into witness' unit price per lineal foot for laying the cast iron pipe is shown in item 12 Class S, page 62, of Exhibit 65, as follows: Excavation, bell holes, laying, backfill, lead, jute, hauling and storing lead and jute; item of $1 per pound on lead and jute does not cover the cost of lead and jute, which was $3.45 per hundred pounds on lead and $4.24 on hundred pounds on jute, f. o. b. Denver. After figuring the number of bell holes that would result from dividing the total linear feet of pipe by 12, witness added a factor of ten per cent to the result; figured the backfilling by hand labor, backfilling machines and puddling; in the downtown district would backfill by hand; would get the water for puddling out of hydrants attached to the main which he is laying; would get it by pumping or gravity. The owner of the plant would do the pumping; does not know what the water service would cost; witness' estimate on backfilling is taken from his cost records under similar conditions where dirt was tamped around the pipe and puddled, and for this estimate has increased the basic cost shown by his records. He pays 15 cents per thousand gallons for water; figured the backfilling on this job at fifteen cents per cubic yard; cannot give the average cost of backfilling as shown by witness through cost records; cost of backfilling, trenching and pipe-laying in the congested district would be much greater than in other parts of the city; the care of street traffic, bridging trenches at cross streets, is taken care of in the contingent fund, and would depend entirely on the number of streets that were opened at once. The rate of speed assumed by witness would require a large number of open trenches existing simultaneously, which would make a cost; cannot answer what that cost would be. The cost of taking care of street car tracks is provided for in street car crossings; has not estimated anything for taking

care of parallel street car tracks; if pipes are laid near a street car track, even though they be not under it, the tracks must be taken care of, and that involves an additional expense. The additional expense connected with the excavation is taken care of in the contingent fund. Has provided a general contingency of $370,000, but there is another item of contingent fund of $10,000 applied to the item S, and is distributed through the various items.

In Kansas City they permit the street to be occupied with material, apparatus and debris during the progress of the work; material might have to be rehandled more in the congested district, but that cost is taken care of in the increased price of the average
961 cost of excavation. The item of $10,000 referred to is in addition to the percentage of increase on the average cost used by witness. The street intersections in the congested district would be open for traffic as soon as possible; that would not increase the expense. Excess material would have to be hauled away at an added expense, but that is taken care of in the basic price per yard; the average price covers the entire district; will advise later what the average cost figures were and what percentage was added for purposes of this estimate. Would only puddle in certain places, probably only under pavement; includes surfacing; that would cover practically the entire distribution system. Assumed that water would not cost more than 15 cents per thousand gallons; has not figured that on a lineal foot basis; does not know what the price of water for that purpose is in Denver; does not know that the price in Denver is one cent per lineal foot; would not be interested in what the present water company would charge for the water; the construction would be so arranged that water would be in the pipes; would tamp the backfilling under macadam and asphalt pavement, which would aggregate about 300,000 feet; would not tamp the entire backfilling on the other streets. The usual practice is to tamp around the side of the pipe up to the top of it; if a trench is merely backfilling, it will sustain horses and other traffic; that would be true if water was used, as soon as the water dried out; the length of time for drying out the water would vary with the season and temperature. While it was drying it would be necessary to protect the trench by red lights at night and barriers by day; does not know whether it would take a week or a month to dry out.

Has done work in towns where traffic had to be maintained, and has never had any trouble with it; did not assume that the trench would have to be temporarily planked; would leave the trench naked until the paving was done. The expense of planking the trench would have to be taken care of either out of profit or contingent fund; made no allowance for it. Has not allowed anything for re-excavating the surface of the trench to allow for pavement. (Defendants object to the last testimony. Objection overruled.) Did not figure on replacing in the trench all of the excavating; had to provide for hauling away some of it; the cost of that is covered in the backfilling; has a miscellaneous hauling account, which is distributed to each item as a portion of the overhead cost. Witness' estimate of 16 per cent for overhead and profit covers the smaller

sum of $10,000 for contingencies and the sum of $10,000 for miscellaneous hauling; the sixteen per cent allowance covered supervision, amounting to $4800; the items of the sixteen per
962 cent allowance are: Foreman, $30,000; timekeepers, $4800; material, $7200; warehouse, $4320; insurance, $21,000; bond, $18,000; warehouse rental, $9600; transportation, superintendents and timekeepers, $3840; tool depreciation, $28,000; interest during construction, $24,000, making a total of $181,320. That includes the extra hauling account and the $10,000 contingency account, and the balance of the sixteen per cent was figured as profit. The figures given refer to Class S, and the component parts of the plant were figured separately in that way. Considers the aggregate of $181,320 as a fair allowance for contractor's overhead on the distribution system alone.

The general overhead and contingencies on page 67-*a*, amounting to $370,000, relate to the whole job, and would be distributed proportionately as called for; cannot apply any percentage of that to the distribution system; some part of it should be applied to the distribution system, but witness has not figured it; whatever that percentage is, it would be in addition to the overhead; would be glad to get the overhead profit and estimates which he has made; puts them forward as being fair.

Incorporated the figures on building furnished by Messrs. Willison and Walsh to Mr. Gaffy; they are distributed throughout the different classes; as to them, assumed that the prices given were the prices that the main contractor would have to pay a sub-contractor. Witness thinks his office checked over the quantities used by Willison and Walsh to see if they corresponded with the quantities under the same items in Exhibit C; does not recall whether there were any discrepancies; believes that in some instances there was a confusion, and he used the water company's figures. Witness refers to the Lake Cheesman division, Class C, Exhibit 5; started with item No. 3; has entirely excluded Metcalf and Anderson's estimate of $84,784 for preliminary dam expense, sub-item 6-*a*.

Does not know what Metcalf and Anderson's preliminary expenses include. There would be a water hazard involved in the construction of Cheesman dam; has considered that and included it in the total of each item; although the expenses incurred in a water hazard would be actual cost, witness carries it as a contingency, together with other things that he actually does not and cannot accurately in an overhead charge. It would be essential to build a flume to carry the water, and has covered that in the overhead charges; that is merely witness' individual custom. Witness has an item of $25,000 for contingency and water control; if the material originally in the dam that was destroyed is actually incorporated in the present dam, it should be included in the cost. Witness' information was
963 such that he could not determine the fact as to that; he excluded from the cost of the Cheesman dam all the material that might have been in the old dam and was afterwards incorporated in the new one; the basic figure on the masonry was $2.85 per cubic yard, and covers 102,897 cubic yards; did not deal with

all the masonry as being of the same class; did not use the classification appearing in Exhibit C, but adopted one of his own. Estimated the square feet of facing of the dam on both sides and that gave the cubic yards of faced stone, and added the estimate of dressed stone in the parapet wall, 553 cubic yards, as estimated in Exhibit C; then deducted the quantity of faced and dressed stone from the total quantity, and arrived at the masonry in the balance of the dam. After arriving at the quantities of rubble masonry, figured on quarrying the quantity of stone necessary to do the work; the total of the masonry required, including the mortar, would equal the total cubic yards of masonry in the structure. Witness and his associates determined the quantities of the different kinds of masonry; in the parapet wall the dressed stone is 553 cubic yards, the same as in Exhibit C; 11,305 cubic yards of stone in the face wall, 61,044 cubic yards of rubble stone, making a total of 72,902 cubic yards of quarried stone. Figured the cubic yards of mortar and deducted that from the total cubical contents of the dam, and the resulting figure gave the cubic yards of quarried stone; assumed a total of 103,897 cubic yards in the entire structure; there were 119,670 square feet of faced surface; figuring 3 feet thick, gave 13,300 cubic yards of masonry in the face; adding to that 553 cubic yards specified in parapet wall, gave a total of 13,853 cubic yards, leaving a total of masonry on the back of the dam of 89,044 cubic yards; then assumed fifteen per cent proportion of one to two mortar in the face, which figured 1995 cubic yards of mortar; deducting that from the total faced stone, gave 11,305 cubic yards of faced stone; assumed that 75,700 barrels of cement were used in the dam structure, making a total yardage of 28,000 yards; that amount was deducted from the total of 89,044 cubic yards of masonry, leaving a total yardage of rubble masonry to be quarried of 61,044 cubic yards; adding this to the dressed stone, gave a total of 72,902 cubic yards. Estimated $6500 for opening the quarry, 40 cents per yard for quarrying and breaking up 72,902 yards of stone, 35 cents a yard for transporting it, $1.30 a yard for putting 102,897 cubic yards of masonry in place, $3.10 for plug and feather, facing up stone on the face work, $6.20 for shaping and placing 553 yards in the parapet, 75 cents a yard for the mortar in place, and added $37,523, all of this going to make up the total of $293,256; those are the aggregate figures on the labor and material, excluding
964 the cement; to that is added a total of 26 per cent overhead and profit consisting of superintendence for four years, $9600; bond, $3000; insurance, $18,000; timekeepers and clerks, $9600; utility commission, $3600, contingencies, $25,000; water control, $5000; watchmen, $6000 interest during construction $18,000; temporary diversion dam, $7200; profit, $55,000; total, about $160,000. Added 26 per cent for overhead and profit to each item, going to make up Lake Cheesman, except on those where witness' figures were the same as those in Exhibit C, outside of the item of cement.

Considers 26 per cent a fair and proper allowance for overhead and profit on a job like Lake Cheesman; assumed that the masonry on the

outer face of the dam was exactly the same as that on the inner or upper face, and that it is plug and feather work; did not see the upper face of the dam; it was covered with water.

If the upper side of the dam is faced from top to bottom with stone, having cut face and laid with closer joints than the downstream side, that would not be plug and feather work; it would be more expensive to produce. Has been at Lake Cheesman twice, and stayed about three or four hours each time. On the first visit went through the tunnels and looked at the weirs and bottom portions of the dam; did not check the measurements of the dam; the mixture for the mortar was specified in the specifications for the dam; did not assume that all of the 83,000 barrels of cement went into the dam; deducted 550 barrels for roadway and miscellaneous; after deducting the yardage of mortar in the dam from the total cubical contents, arrived at what witness deemed to be the actual cubic yardage of stone; the unit prices for transportation and quarrying are applied to that difference.

Assumed about 7 per cent waste in opening and flooring the quarry. Figures $6500 for opening a quarry; estimates 72902 yards would be quarried, and that is the rock that actually goes into the dam. Takes care of the waste in the unit price for quarrying the estimated yardage; thinks that there would be added to the unit price of quarrying 7.4 per cent per cubic yard for waste; does not know whether that is the customary percentage or not, or whether 25 or 30 per cent is customary. Has had no experience in building masonry dams except the Hartshorne, Oklahoma, dam, which was built of rubble masonry, called Cyclopean masonry; that was a small dam, quite insignificant as compared with Lake Cheesman. Cheesman dam is constructed of granite; has had no experience in quarrying granite rock. Did not use Walsh and Willison's figures for the buildings at Cheesman, but used the company's figures of $11,-
315. Walsh and Willison's figures were not ready when
965 witness wanted them. Item 5, sub-item D, page 136 of Exhibit C, and page 4 of Exhibit 65, shows an item of $1200 for abating ice in river at dam site; that was allowed by witness on the assumption that such an expense was actually met in the construction. The allowance for overhead and contractor's profit on Class D is 25 per cent, and was added to each item; considered that a fair allowance for that purpose.

Class E, in Exhibit 65 corresponds with same class in Exhibit C; allowed 25 per cent for overhead and profit; in all classes in witness' estimate allowed 25 per cent for contractor's overhead and profit, except Class C, Cheesman, where the allowance was 26 per cent, and class S, distribution system, where the allowance was 16 per cent, and regards that as a proper allowance for each class; at the end of the estimate there is added $370,000 for general overhead and general contingencies. Class F, in Exhibit 65, corresponds with the same Class in Exhibit C, and relates to the South Platte Canon division.

Item 8, sub-item I, refers to material in filter beds; that estimate was made by Mr. Hamilton, and witness has not the details;

is sure that the same quantities were used as are stated in Exhibit C. The rate per cubic yard figures $1.11 as compared with Metcalfe and Anderson's $1.50.

Does not know how the figures on this item were arrived at, but is prepared to vouch for them by depositing a certified check. Witness has confidence in the man who figured them, and is willing to back his estimate with money. Has had no experience with that particular item. Mr. Hamilton has had no experience in such construction since working for witness, but before that time was with the Kansas City water works system awhile; that system uses a slow-sand filter, and the filter designed by Mr. Keirsted; Kansas City plant is strictly mechanical filtration; they use local sand at Kansas City, instead of the more expensive said from Red Wing Minnesota. There would be a marked difference between the Kansas City filter and the one at Platte Canon. The handling of the sand at Kansas City would be an expensive job; it is dropped into the tank; does not know how the sand has to be spread over the Platte Canon filters.

Conduits are distributed among the several classes; conduit No. 1 allowed $19,658.06 for excavation, as compared with Metcalfe and Anderson's item of $43,584.50; conduit No. 1 is a 30-inch wood-stave pipe; figured 83,543 cubic yards of excavation, which is a different quantity than the one shown in Exhibit C; used a unit price of 15 cents per cubic yard for excavation alone; there is some tunnel work on the line, but exclusive of the tunnel work,
966 witness' estimate of yardage is 83,543 cubic yards, as against the estimate of 156,918 cubic yards in Exhibit C, which is also exclusive of tunnel work. Figures on a trench 58 inches wide, 61 inches deep, and a yardage of .912 per cubic yard of trench; that allows one foot on each side of the pipe. In fixing the depth, aimed to get a cover of 27 inches. Mr. George checked up the estimates of yardage with the profiles, and witness thinks they check with his estimate.

Would make eighty-five per cent of the conduit lines with a trenching machine, and fifteen per cent by hand; allowed the company price for the 60-inch intake at South Platte; has either figured that as hand trenching or allowed the company price on it.

As to Class II, figured that eighty-five per cent of the conduit could be done by trenching machines and fifteen per cent by hand, at a cost of 15 cents per cubic yard; will take up the other conduits when they are reached.

The estimate of 15 cents per cubic yard is an amalgamation of the cost of hand and machine trenching; cannot state what the unit price for the machine trenching was; does not know whether he has the figures with him, but will figure it; applied the same unit cost for machine trenching on all the conduits; took the Gaffy estimate on the cost of wood-stave conduits in place, but made his own estimates on excavation and backfilling; has not laid any wood-stave pipe, has never done any trenching in Colorado. If the trenches are cut with machines, they will have to be vertical walls, and figures on making vertical walls in the hand work. Witness himself looked over the profiles of the trenches, on file in the water

company's engineering department; did not figure the quantities from the profiles; believe that his figures show that his ratio of excavation to the excavation of the water company corresponds comparably with the width of trench used by the different men. In Class H, item 4, subdivision E, witness omitted through mistake 17,325 linear feet or 15,700 cubic yards of excavation; witness' figures or eighty-three thousand and some hundred cubic yards for trenching in Class H, would compare with Metcalfe and Anderson's figure of 137,500. There is also 1065 of tunnel excavation, on which the unit price of $3 per yard was applied; the yardage for the cast iron pipe trench should be added; did not figure on the sloping side trenches; was not aware that that was the standard form of construction used by the water company; figured on trenches which would allow one foot on each side of the pipe. The water company sections allow one and one-half feet on each side; the people
967 who gave the price of wood-stave pipe in place said that all the room that would be required for making it would be one foot on each side of the pipe. Exhibit C shows excavation of wood-stave conduit done by machine with vertical sides. Mr. Gaffy gave the figures on wood-stave pipe; did not know that Gaffy figured on using a trenching machine and subsequently sloping the sides of the trench. Trenching machine would not cut the full size of the trench on the bigger pipes, and some slope would have to be put on the trenches. If the trenches were made with a slope of "one on four" it would increase the excavation.

Witness ACHERT BICKEL on the stand.

Cross-examination continued by Mr. Dorsey:

Is not able to give the details about the cost of the excavation and backfilling on the conduits; witness finds he made a mistake in saying that he had omitted excavation for cast iron pipe in Class H; made figures on each class from C to S, as if each one was a separate job, figured overhead and profit on that class, and distributed it among the items.

The overhead and profit for each class was 25 per cent, except Cheesman, which was 26 per cent, and the distribution system, which was 16 per cent; the overhead included in that percentage is designated "Field overhead" as distinguished from general overhead and contingencies; the percentage of profit and overhead is based on the cost.

Whenever Willison and Walsh's figures have been used in making up Exhibit 65, they are the identical figures set down in Walsh and Willison's Exhibit 61, and no contractor's overhead or profit has been added to them; would think it would be fair to add that item. Would apply not to exceed five per cent to the Willison and Walsh estimate. Accepted Mr. Gaffy's figures on the cost of the wood-stave pipe and the cost of laying it. Witness had estimated that Gaffy's figures given to witness included contractor's profit and overhead; as to most of the items in witness' estimate, he assumes that he would do the work himself; that is true as to excava-

tion and backfilling, and as to those items adds 25 per cent to cover overhead and profit. If the figure for wood-stave pipe and laying is a mere basic cost price, then there should be added a percentage for overhead and profit. If Mr. Gaffy's figures include a contractor's overhead and profit less than witness' estimate of 25 per cent, witness should either add the difference or treat Gaffy as a sub-contractor and add a general contractor's profit. Would not add to exceed five per cent. Witness referred to page 52 of Exhibit
968 65, Class O, item 4, sub-item G, corresponding to the same item on page 334 of Exhibit C, concrete lining for reservoir No. 1, Capitol Hill; assumed 1520 cubic yards of concrete, the same as in Exhibit C; allowed $10,564 for laying it and hauling it. The unit price of hauling and laying that material was $7 per cubic yard; the cement would cost $1.55 per barrel, delivered at the work, which would be $1.37 f. o. b. Denver. The hauling would be 18 cents per barrel; storage and handling is included in the general overhead charges on the job; the price on the cement is the October 14th quotation.

Is not interested in average prices; assumed that gravel would cost $1.95 a cubic yard at the work, and sand would cost 75 cents; labor was figured at $1.50 a yard; figured the sloping sides and the bottom of the reservoir on the same basis; allowed 23 cents a cubic yard for water; 35 cents a yard for scaffold and incidentals; the total cost units would be $5.56 per cubic yard; the bid price is $7; assumed a mixture of 1-3-5; would require 1.17 barrels of cement to the yard; cement would cost $1.82 a yard. Does not want to do any more figuring under forced pressure. Refers to Exhibit 65, page 53, Class O, item 5, sub-item B, corresponding to Exhibit C, page 335, excavation for Capitol Hill reservoir; estimated 90,700 yards of earth and 10,000 yards of shale; 16 cents per cubic yard for excavating the earth, and 30 cents per cubic yard for the shale; the actual cost unit for this work figured out 20 cents and 37½ cents on the two classes of material. On the embankment, uses the 20,800 cubic yards as given in Exhibit C, and applies unit cost of 3 cents. Assumed a waste haul on 76,300 cubic yards, average haul 1,000 feet, unit price 10 cents per cubic yard, and the bid price would be 25 per cent higher than that; used the yardage of concrete (4,780 cubic yards) appearing in Exhibit C, but made an independent estimate of the hauling. Referring to Ashland Avenue reservoir, page 55 of Exhibit 65, Class P, item 3, sub-item A-1 and A-2, Exhibit C, page 348, witness' estimate includes the roofs; took the figures out of Exhibit C for asphalt paving, $25,830; stone footing, $1,010, and stairs and platform, $25, making a total of $26,865; the items rejected by the witness and estimated for himself are principally the excavation and the roof. The basic cost on excavation was 17 cents, to which was added the percentage for overhead and profit. There is a small item of stripping at 15 cents a cubic yard; on basin two there are 1,650 cubic yards of stripping, and 71,952 cubic yards of excavation; in the roofs estimated on basin No. 1, lumber in roof and framing, 337,000 feet, board measure; that checks with quantity in Exhibit

C. The unit price on the lumber was $19.85 plus $12; to
969 that should be added the percentage; on the east basin, assumed 300,000 feet, board measure, and applied the same price.

As to the Littleton mill, accepted the item of $11,535 under item 5-B, Exhibit C, but omitted freight, $750; erecting machinery, $3,000; contractor's profit $2,350; those figures should be added; is not yet ready to take up conduit matters. Witness has omitted from his estimate the crossings under street car tracks; there should be an addition on that account of $12,000, which is the estimate in Exhibit C.

Referring again to Class H, item 4-E, page 26 of Exhibit 65, and page 215 of Exhibit C, witness' estimate is $19,658.06 as compared with Metcalfe and Anderson's estimate of $43,484. Witness took care of the excavation for the cast iron pipe in his estimate for laying the cast iron pipe, item 4-B, $41,221; the total of item 4-B is $141,221.50. That item excludes excavation.

In regard to conduits, witness used the vertical-side design, and figured his excavation quantities on that theory, but they maintain a definite ratio throughout to the quantities in Exhibit C; for example, on the 30-inch pipe, witness estimates .912 cubic yard per foot of trench, which is 79.3 per cent of the yardage per foot of trench used by Metcalfe; on the 34-inch pipe the yardage is 1.37 for a depth of 5.6 feet, in Exhibit C, but witness estimates 1.105 or a ratio of 80.7 per cent; 40-inch pipe, Metcalfe and Anderson have 1.52 cubic yards per linear foot, and witness has 1.3243, or a ratio of 81.7 per cent; 48-inch pipe, Metcalfe and Anderson yardage is 1.87, witness' 1.54 ratio 82.5; 24-inch pipe, Metcalfe and Anderson's 1.031; witness', .78, ratio 78.5. This covers all the sizes except the trench in which the witness used the company's figures. In multiplying Metcalfe and Anderson's total excavation by witness' ratios, it gives the figure based on witness' assumed width of trench. In conduit No. 1, found a discrepancy of 2,500 yards; in conduit No. 2, a discrepancy of 3,208 yards; in conduit No. 3, a discrepancy of 2,800 yards; and, among other things, found that there is a discrepancy of 2,400 yards between the company's checking and the backfill on conduit No. 3; that is Class H, item 9-*a* and 9-*j*, pages 238 and 240 of Exhibit C, where it appears that there are 2,474 yards more of excavation than there is of backfill, and on checking, witness finds there is a total of 23,368 cubic yards to be added to his estimate of yardage on the conduit system. Conduit No. 1 is figured at 15 cents, for 85,534 yards; conduit No. 2, in Class G, 15 cents for 11,431 yards; conduit No. 2, 30-inch branch, Class G, 1,643 yards at 15 cents; conduit No. 2, 30-inch branch in Class G, 30 cents, for 2,233
970 yards; conduit No. 2, 34-inch, Class H, 94,353 yards, the same as water company's 114,603 yards; and then there is an item of 34-inch conduit, 12,705 yards at 23 cents, for excavation and backfilling; the other is excess cuts, 16,135 yards at 15 cents; conduit No. 2, 20-inch branch, in Class H, 6,302 yards at 15 cents; conduit No. 3, Class H, 118,017 yards at 15 cents; conduit No. 3 extension, Class H, 30-inch, 10,097 yards at 25 cents, and 67,037

yards at 20 cents extra fill, branch conduits; conduit No. 3, 7,704 yards at 25 cents; conduit No. 3 cross-section, in Class H, 1,250 yards at 25 cents; conduit No. 4, clear water conduit, in Class M, 48-inch pipe, 14,800 yards at 18 cents; 40-inch pipe, 10,500 yards at 18 cents; 440 yards of rock at $1.50; conduit No. 5, in Class L, 62,600 yards at 18 cents, 1,556 yards at 75 cents; 1,415 yards of rock at $1.75; conduit No. 6 extension, Class K, 1,738 yards at 18 cents; No. 6 clear water extension, Class K, 10,620 yards at 18 cents; No. 6, clear water, Class K, 40-inch, 7,830 yards at 18 cents; 48-inch, 90,000 yards at 18 cents; 4,697 yards of rock at $1.75; conduit No. 7, in Class E, 48-inch, 81,000 yards at 15 cents; 48-inch cast iron, 1,077 yards at 15 cents; 4,200 yards of burrow at 18 cents; conduit No. 8 in class H, the same figures as in Exhibit C; conduit No. 8, 34-inch, from Bear Creek to Harriman ditch, 1,940 yards at 25 cents; 984 yards loose rock at 85 cents; 312 yards solid rock at $1.50; prices given are for excavation only, except in the one case where 22 cents was given for excavation and backfill. On top of this unit cost there was 25 per cent added for profit and field overhead.

Cannot separate the price per cubic yard for trenching machines. Prices given represent the average cost per cubic yard; cannot state how much would be hand work and how much machine work. The costs were made up by Mr. George, witness' general superintendent of construction, and witness cannot find the notes and cannot state the basis for the different classes of work.

Witness has confidence in Mr. George's estimates, and is ready to back them. The backfill is estimated at 10 cents and 6 cents; does not know how it is applied, except that 10 cents applies to that portion of the trench which is backfilled or tamped to the spring line. Thinks Mr. George took the requirements of Exhibit C for tamping to the spring line, and therefore made a difference in prices.

The yardage of backfill was determined in each case by the same process that was used in determining excavation, and the backfill estimates will have to be corrected exactly in proportion to the corrections in the amounts of excavation. Does not know how Mr. George expected to do the backfilling. Witness makes any corrections in his estimates of buildings that Walsh and Willison
971 make, and calls attention to one correction of $1,850.

Figured on reproducing Lake Cheesman in four years; that would be the period of time that the contractor would be at work.

(Witness was then asked as to the period of time the company would be required to spend prior to the beginning of construction work, to which objection was made. Objection was overruled.)

The period of four years would begin when the contractor begins his work; the company would have to acquire the land and prepare the plans and specifications before the contractor would begin his work; did not assume that the contractor would have anything to do with acquiring the lands; assumed a period of two years' construction on the distribution plant, and that would be the period of actual construction; does not know what the period of actual construction would be on Marston lake.

Witness ACHERT BICKEL resumed the stand for further

Redirect examination by Mr. Stevens:

Before adding the prices on the buildings to the total estimate, witness included all overhead, interest and other charges which would properly attach to those items. Has corrected his estimate to include all omissions, and is willing to reproduce the plant for $8,662,440. Has added five per cent on the buildings estimated by the architects, $9,648; on Lake Cheesman buildings, accepted the company's figures; increase in conduit excavation, $6,150; on street-crossings, Class S, item 21-I, accepted the company's figures of $12,000; accepted the company's figures on Class J, Littleton mill, and added $6,100, which was previously omitted, making a total of $85,880 added to the first estimate.

Recoss-examination by Mr. Dorsey:

Has not added anything because of increased width of cuts in pavement; has not added anything because of constructing the trenches with sloping sides; the correction in excavation relates to quantities which witness spoke of in cross-examination before; does not include any estimate on account of material in the old dam that was included in the new Cheesman dam. Class O, item 8, sub-item G, page 52 of Exhibit 65, and Class O, item 5, sub-item G, page 53 of Exhibit 65, relating to the concrete linings of the two Capitol Hill reservoirs, witness undertakes to make the tabulation and bring it in.

972 Witness ACHERT BICKEL resumed the stand for further

Recross-examination by Mr. Dorsey:

Witness produces a tabulation which shows Capitol hill concrete costs to be $5.56 per cubic yard, to which is added a profit and field overhead of 25 per cent, making a unit cost of $7; the figures are tabulated and set forth on pages 4,317 and 4,318.

JOHN F. VALLERY, a witness for the defendants.

Direct examination by Mr. Stevens:

General agent of the C., B. & Q., for ten years; in charge of freight department in Colorado.

Rule of the company is to absorb the switching on competitive business in carload lots. If a carload of iron, steel, or manufactured goods was to be sent from Chicago or Pittsburgh to Denver for delivery on the switch of some other line, would make that switch and absorb the switching—that is, pay for the switching. If desired, would set the car for unloading on any of Burlington's own team tracks.

Cross-examination by Mr. Dorsey:

Have a number of team tracks between 14th, 15th and 23rd Streets, and one at the Stock Yards, which is used to some extent.

Would set cars on a track of the Burlington at any convenient location. Have published a schedule of rates covering such service, under general switching schedules; it is approved by Colorado Utilities Commission and Interstate Commerce Commission; it specifies Denver, or within switching limits; deliver to the Stock Yard tracks and on new Market Street line; would have to secure permission from the city to have merchandise unloaded from car on the Market Street line; the company has some property of its own on Market Street line, where it could set the cars and unload them.

Would set cars at a distance from terminal, on the outskirts of the city, if they came in over Burlington; if they came over some other road, would not set them except on team tracks; connecting line would pay the switching charge. If the consignee did not have his own team track, it would be set on the company's team tracks. The absorption by the line-haul carrier of charges made by connecting switch carriers is a matter of convenience between the railroads, and obtains on carload business only. There is a published
973 switching tariff in Denver calling for payment of 20 cents a ton, with a minimum of $2 per car; that is a reciprocal switching tariff. On very low-rate commodities from non-competitive points, would not absorb the switching, but would set it to a team track. If a carload of some commodity arrived in Denver at an ordinary point of delivery in the yards, and the consignee desired to have it switched at a distance from that point of delivery on the Burlington's own track, that would be done without charge.

Does not regard all side tracks in the switching limits of Denver as team tracks, except for own use. Would furnish a shipper with what would amount to a private spur, at the company's cost, and make the switching to that spur without an extra cost. That practice has been indulged in by the Burlington to a considerable extent.

Redirect examination by Mr. Stevens:

Thinks that is the general custom.

JOHN H. BRADBURY, a witness for the defendants.

Direct examination by Mr. Stevens:

General auditor of the Colorado & Southern about nine years; is familiar with the methods of accounting described by the Interstate Commerce Commission with regard to depreciation of property. (Rest of page devoted to discussion between Mr. Dorsey, Mr. Stevens and the master.)

Discussion continued.

WILLIAM W. BARNETT, a witness for the defendants.

Direct examination by Mr. Stevens:

In the automobile business since May, 1906, selling, garaging and repairing; handles the Federal, Standard, Sternberg and G. B. trucks; keeps them repaired; a five-ton Sternberg truck could be laid down in Denver in lots of two or more at $4,850 each, with an ordinary body; life of five to ten years.

Use of trucks for 10 months in the year, 22 days in the month, for hauling water mains of various sizes and building material, would not be different from the usual service for a truck, and a truck in that service should last five to ten years. If used 7 months in the year, and 22 days in the month, life would be prolonged in proportion. Most truck operators figure a life of ten years; trucks are governed to a speed of 8 miles per hour. Has an esti-
974 mate of the cost per ton-mile for the operation of a five-ton Sternberg truck, on the basis of 7 months a year and 22 days per month; the total cost per ton mile of five tons over 40-mile route, 20 miles each way, is practically 10 cents.

On 10 months basis, it would be 8.16 cents per ton mile, and the items upon which the estimate is based are contained in Exhibit 67.

Cross-examination by Mr. Dorsey:

Witness is automobile dealer; his business is to sell automobiles and trucks; does not operate them. Since 1908 has been engaged in the commercial end of the business, handled the American Locomotive goods until they discontinued manufacture of trucks, and afterwards adopted the Sternberg and Standard. There are no large trucks in Denver that have been operating for five years. The Hungarian Flour Mills truck was put into service January 1, 1913, and has been in service two years; the Denver Fire Clay truck went into service three or four months before that, and the Woodman of America truck at Colorado Springs went into service three years ago.

The life of a truck is determined from what is known of actual conditions elsewhere and personal observation of what witness has been able to see here. The witness has an estimate of the cost to operate the Hungarian Mills truck for practically two years' time; the truck has been in witness' garage; has had his men drive it; has done all the repairing on it; furnished all the gasoline and oil; is interested in the success of the truck business in Denver, and has watched the Hungarian Mills truck very closely. Witness' statement here is based on the operation of the Hungarian mills truck, but cannot say that it is based exclusively on that; there is a similarity between all. Hungarian mills truck has been kept for two years at witness' garage, and witness' mechanics have had charge of it; has been interested in keeping it in good condition and showing a good result. It is used for delivery of flour and grain; practically used for the delivery of flour only, from the mills to grocery stores about the city; truck never gets off the city streets.

Has never sold any to contractors; does not think there will be any worse conditions in delivering pipe and conduits than the city streets

were last winter; down on 8th Street, where the mill is, in the Highlands, where there is adobe, it is bad; the truck delivered through such streets both winters; were tied up for three days only during the snow of December, 1913, but their radius of delivery was lessened, and when it was impossible to get wagons through.

Is advised that the road from Buffalo to Cheesman dam can be put in good condition, and that there is an estimated allowance
975 of $25,000 to construct the road, also an allowance for keeping the road in condition. After this expenditure, it would be a fifteen per cent grade; was told that the truck would be for delivery in the city of Denver, and none of the deliveries would be over two miles from the distributing station, of which there would be eight; was not advised that the average haul would be two miles; truck will work wherever it has a bottom. The conditions are different wherever there is adobe, or it is impossible to get traction; thinks it is pretty sandy along the Platte Valley; there is some adobe, pretty sandy when you get to the river bottom; sand and adobe make a good road bed for a truck; never calculated how long it would take to get a road in condition for trucks.

It doesn't take long to make new natural roads on the prairies; has not operated trucks on the prairies where there are no roads; repairs increase with age of truck, but not materially; trucks are made with bushings, and the bushings that are replaced at 5000 miles would be the same that are replaced at 20,000 or 50,000 miles; there is a governor on the motor which will regulate the speed to 8 miles per hour.

A five-ton truck would maintain that speed regularly under all normal conditions. A truck is different from a pleasure car; they are geared to handle loads with a motor; they may slow down a bit on the hills, but not perceptibly.

The conditions in the city and loading and unloading would reduce the average speed.

In arriving at ton-miles, divide the entire cost of one day's service into the entire mileage that the truck has made; witness takes one-half of the miles covered in a day by the truck when the trucks are traveling with a five-ton load, and the other half when the truck was traveling back empty to get another load; and is asked if it is not necessary to divide the total cost for the day by one-half of the miles traveled in the day, to which he answers that his estimates have always been based on the fact that the trucks have to travel one way loaded and in some instances loaded both ways.

If the total cost per day is divided by the total number of miles traveled, the figure arrived at would show a doubled cost per ton-mile. In the water works job, would have to go empty one way and loaded another; there would be a slightly greater cost operating at a higher altitude.

Sixteen cents a gallon for gasoline is a very conservative price at Buffalo, if bought in quantities; considers estimates conservative; figured interest at 6 per cent on the entire time, regardless of fact that 20 per cent of the cost of the truck is written off each year. The item of $400 for tires means that new tires are put on for
976 every 7920 miles, but tires will last ten to twelve thousand miles; expects to have a highway without rocks. On the

Cheesman work there is a little over 6000 miles for the trucks to go; these same tires would last two years, but figure they would be replaced every year; figure two and a half miles to a gallon of gasoline, and thinks service will do better than that.

FRANK O'RYAN, a witness for the defendants.

Direct examination by Mr. Stevens:

Salesman for the Allis-Chalmers Manufacturing Company, for pretty nearly five years; handles flour-mill machinery, mining, electrical, and so forth; is familiar with the price of flour-mill machinery laid down in Littleton; examined the machinery in the Littleton flour mill last month, and made a detailed estatement of the cost laid down in Littleton, and the installation.

Identifies Exhibit 69; compared the items in Exhibit 69 with similar items in Exhibit C. The following items in Exhibit 69 are not in Exhibit C: Two bins, a couple of spiral scoop conveyors, an Alsop bleacher; the prices put opposite these items would have to be deducted to make Exhibit 69 correspond with Exhibit C. The total deduction on account of these items would be $585.75. The value of the machinery new, f. o. b. cars Littleton, would be $9741.89. Allowed forty per cent depreciation, which was arrived at by an inspection of the conditions of the machinery. On a basis of five per cent depreciation each year, the forty per cent is a liberal allowance, in view of the 20 years' service of the machinery. Figured $2000 for spouting, conveyor boxes and hardware.

Total value after deducting depreciation and adding $2000 mentioned would be $7845.13. Material was estimated at regular selling prices without competition. If the business was needed real bad, it could be reduced fifteen to twenty per cent. Recently lost a bid on a mill where competitors bid five per cent below witness' figures; witness used the same discounts that he uses on his present estimate.

Cross-examination by Mr. Dorsey:

In very close competition it is usual to shave our present estimates fiifteen or twenty per cent; sometimes lose money; all companies that carry on business lose money on some jobs in order to keep the organization together. In case of shaving price fifteen or twenty per cent, would get authority from headquarters; does not do that in the majority of business done; did not mean to say that it was
977 the custom to sell goods on a basis of fifteen to twenty per cent less than list price and list discounts. The system of regular discounts is customary. The catalog contains base prices, but from time to time cost of raw material changes, so the discount is varied. If the conditions should so change that the list price is low, the bulletin is revised. The reader of the catalog knows that the list price is a base price, and then he writes for a discount.

In preparing Exhibit 69, various discounts were applied to different articles; on iron pulleys, up to 12 inches, there is a discount of 50 per cent from list price; from 13 to 24 inches, a discount of 25 per cent, and so on. The net prices so arrived at are f. o. b. factory, Milwaukee. $600 is estimated for freight, being 60,000 pounds at $1 a

hundred. To be accurate, the tariff rates is 80½ cents. The item of $2000 covers hauling from railroad to mill. There is about $1800 of that for erecting machinery and testing it. Witness has had no experience in erecting flour mills, but he has as salesman and estimator. Has made sales of flour-milling machinery; has sold from $100,000 to $125,000 worth of such machinery in the last three or four years, some of it the Littleton mill type; mostly additions to existing mills; 100 different sales; the largest customer is the Colorado Milling and Elevator Company. There is not a great fluctuation in prices. The price on the Sampson-Leffel water turbine is the price at which we would be glad to take an order today. Has had the same price sheet for five years; does not know that the discount has been changed for five years. After taking off discount, there is still left an agent's profit. The change in discount has been in belting, transmission machinery and so forth. The range in variation has been from five to ten per cent up and down; these changes occur with some frequency. The prices used in witness' estimate are present-day prices, that do not vary very much. Belting is worth more than it was two years ago, transmission machinery, pulleys, etc., are selling five per cent lower.

Witness makes estimate for furnishing machinery and the erection and installing of it. There would be a profit to the company of ten per cent in the gross estimate of $9141.89; this profit includes all the Allis-Chalmers Company's overhead expenses and everything of that sort. This is true as to purchased items, but not as to other items. The figures given are those at which the material would be sold to somebody else. Do not figure on making anything on installation; do that at actual cost. The only profit is that on the sale of the material; the Allis-Chalmers people will erect a mill, adding merely the cost of erection to the sale price of the materials purchased from them; do this as a regular practice. There is nothing listed
978 on Exhibit C which is not in Exhibit 69. Checked list as shown in Exhibit 69 with Exhibit C, but did not take Exhibit C for inventory; made his own inventory.

On the first floor there is a Great Western roller mill, and witness took the price of the same size Allis-Chalmers mill and of the Nordyke-Marmon machine; the Great Western is a much cheaper machine than the Allis-Chalmers; has not the list price on four double-stand roller mills, appearing on his list, nor can he state what discount he applies.

There are other instances where a substitute article has been figured upon. Made deductions on account of depreciation. When speaking of depreciation of five per cent a year, means that is customary as a matter of accounting. The Littleton mill machinery is over 20 years old. According to that theory, it would not be there at all, but it has received good attention; is in good conditions, with the exception of a few belts or bearings.

The depreciation depends upon the care the machinery has had and the work it has had to do and the local conditions. Figured the forty per cent depreciation from inspection. Machinery would be worth estimate as it is now; mill ready to run. It is in efficient operating condition. When witness was there the feed mill was run-

ning. Was not water enough to run the flour mill. Spent day and a half at the mill.

Redirect examination by Mr. Stevens:

If the mill was dismantled and machinery sold, it would bring about twenty per cent of the original purchase price, at which witness estimated it.

Exhibit 69 introduced in evidence.

979 In the District Court of the United States for the District of Colorado.

In Equity. No. 6274.

THE DENVER UNION WATER COMPANY, Plaintiff,
vs.
THE CITY AND COUNTY OF DENVER et al., Defendants.

Witness HOWARD C. MALONEY.

Direct examination by Mr. Dorsey:

Am in charge of the service department of the D. U. W. Co. It is the department through which the relations between the company and consumers are initiated. The company rarely comes in contact with the actual consumer. It meets the plumber representing the consumer. Applications for service are filed and recorded in my department.

Have recently made an investigation to ascertain the cause of alleged poor service received by certain consumers, who gave testimony in this case on behalf of the defendants, for the purpose of determining the cause of service defects, if such existed.

In the case of Chas. J. Munz, 1192 So. Gaylord St. Since 1911 Mr. Munz service has been under the South Denver Pumping station and should be very good. His premises are located on South Gaylord St. between Mississippi Avenue and Arizona Avenue.

In the Case of Michael Finnerty, 1417 Gaylord St. Service was applied for in 1891 by W. L. Hallett. Original application was for a ½ inch tap, size of service pipe and size of building not given, but called for two lots of ground. A ½ inch service
980 pipe was attached to ½ inch tap. Service now supplies 16 room house, 1 bath, 2 closets, 66 2/3 feet of irrigation. Service was inadequate for the duty when installed. Dec. 2, 1914, I made a test of the pressures inside the house with certain of the fixtures open for the purpose of ascertaining the effect of draught of water on the service. Pressure on the service pipe in the street, with no draft being made, was 85 pounds and in the bathroom on the second floor of the house was 77½ pounds. With one faucet open in the laundry tub the pressure on the service pipe in the street was 83½ pounds and there was no water on the second floor of the house, indicating that the plumbing was too small to supply water

and maintain pressure. After this test I flushed the service, cleaning out the pipe, and with the same pressure on the service pipe in the street and the same draft in the basement, maintained a pressure of 12½ pounds on the second floor. The pipes that caused the deficiency in the service are the property of Mr. Finnerty.

In the case of J. P. Donley, 1922 E. 14th Ave., and 3035-37 Julian Street. Application for 14th Avenue premises filed in June 1892, by T. F. Kane, for 5/8 inch tap for builders use. Size of service pipe or premises not given. Installation made as applied for and an eleven room house, one bath, one closet, and 33 feet of irrigation supplied. Later in 1892 Mr. Kane built another house at 1928 E. 14th Avenue, the water supply for which was taken from the service pipe supplying the original house at 1922. This service pipe was only ⅝ of an inch in diameter, being the same size as the tap. The service now supplies 2 eleven room houses, 2 baths, 3 closets, and 83 feet of irrigation. The service pipe is too small for the demand made upon it. Installation was made in that way to avoid the few dollars additional expenditure that would have been necessary to install separate service for the second house which would have been allowed by the company at any time upon application.

A similar situation exists in the case of Mr. Donley's Julian Street houses. In June, 1895, Mr. Donley applied for a ½ inch tap to serve one 9 room house, 1 bath, 1 closet, on three lots. April, 1902, there was added six rooms, 1 bath, 1 closet, and 69 x 75 feet of additional irrigation, all of which is served through the original service pipe, without increase in its size. The service is simply overloaded by the additions placed upon it.

In the Case of J. F. Steadley. 642 High Street. Service applied for July 9, 1909. ½ inch tap, ⅝ inch service pipe for seven rooms, 1 bath and 1 closet, 1-1/10 lots. Pressure test on these premises showed 31 pounds where the service pipe enters the base-
981 ment and 29 pounds at the laundry tubs in the rear of the basement. With one faucet open in the laundry tubs the pressure at the tubs dropped to 3¼ pounds and remained at 27 pounds where the service pipe entered the basement. With one faucet open in the laundry and one faucet open on the second floor, water would not reach the second floor though the pressure on the service pipe remained at 19 pounds, sufficient to raise the water 40 feet. The second floor is not more than 18 feet above the basement, showing that the defect is in the plumbing in the house where excessive lengths of ½ inch pipe are used together with an excessive number of fittings. The pressure being lost in overcoming frictional loss in these excessive lengths of small pipe

In the case of the Kensington Apartments, 1671-75 Logan Street. Service applied for July 11, 1907 for 1½ inch tap, 2½ inch service to supply 125 rooms, 19 baths, 19 closets. Service now supplies 125 rooms, 24 baths, 24 closets, 93 feet of irrigation, in the apartment building, also supplies hot water and heat to an adjoining rooming house containing 22 rooms, 2 baths, 3 closets. An increase of about 33 1/3 per cent on the original service demands. I made pressure tests

there to determine the cause of inability to get water on the third floor of the building. Found a pressure of 43 pounds on the service pipe where it entered the building. With four faucets out of 24 in the basement laundry tubs, open, there was a pressure of only two pounds in the bathroom on the third floor while a pressure of 39 pounds was maintained on the service pipe, or sufficient to raise water about 87 feet. The bath room fixtures on the third floor are from 25 to 27 feet higher than the service pipe, indicating that the defect is in the reduction in the size of the pipes inside the building, which are too small to supply the demand made upon them. The complaint is confined to the flats on the East side of the building farthest from the service pipe.

In the case of M. E. Rumery, 1912 Logan. Application made June 15, 1891, for ⅝ inch tap, size of service and use not stated. The house as originally constructed contained 7 rooms, 1 bath, and 1 water closet, no irrigation. In 1893 this was increased to 9 rooms, 1 bath, 2 water closets, 25 feet of irrigation. Later the premises at 1918 Logan street were attached to the same service, which now supplies two nine room houses, two baths, 4 water closets, 50 feet of irrigation. The service pipe is only ⅝ inch in diameter, the same size as the tap. Proper practice requires the installation of a service pipe larger than the tap. I made a test at these premises to ascertain the cause of the service defects. The pressure on the service
982 pipe in the street was 56 pounds. With on faucet open on the 1st floor at 1912 Logan the pressure on the service pipe remained stationary at 56 pounds and a gauge in the bath room on the second floor showed a pressure of only 2 pounds. Opening one faucet in the kitchen at 1918 Logan street shut off the water on the second floor of 1912, while the pressure on the service pipe in the street still remained at 56 pounds, indicating that the defect was in the size of the service pipe and the plumbing in the buildings.

In the case of J. S. Whitside. 1625 Clarkson St. Application filed June, 18, 1906 for a ¾ inch tap and 1 inch service pipe to supply 24 rooms, 6 baths, 6 closets. Made a pressure test at these premises to determine the cause of irrigation service defect. Pressure on the service pipe in the street was 50 pounds and in the bath room on the second floor, 42 pounds. With three faucets open, one in the basement, one on the first floor, one on the second floor, the pressure on the second floor showed 6¼ pounds and on the service pipe 46 pounds, indicating no trouble on the service in this portion of the building. I then made a test of the irrigation service which is attached to the pipes supplying the janitor's apartments. This being the service regarding which complaint was really made. With one faucet open in the kitchen sink, one in a bath and one in the laundry, the pressure at the sill cock where hose for sprinkling is connected, was only 2 pounds, while the pressure on the service pipe remained at 46 pounds, indicating that the irrigation difficulties arise from taking the irrigation connection from ½ inch pipes supplying other service in the building, instead of directly from the service pipe. The pressure being lost in frictional resistance in long runs of small pipe.

In the case of Micheal and Thomas McGovern. 530 19th Ave. Application filed August 21, 1897 for a private pipe connection to supply a new building. A ⅝ inch tap was made to which was attached a ¾ inch service pipe which ran across the street and branched two ways to supply six, eight room terraces, 6 baths, 6 water closets, and 200 feet of irrigation. November 28, 1914. I made a pressure test at these premises to determine the cause of the service defects complained of. Found the pressure on the service pipe in the street to be 49½ pounds and with no water being drawn there was a pressure of 42 pounds in the bathroom of the second floor of 530 19th Ave. With one faucet open on the first floor the water ceased to run on the second floor though the gauge on the pipe in the street still showed 49½ pounds. After cleaning the service there was a pressure of 2 pounds in the bath room on the second floor with the same faucet open. While this test was being made the other five houses on the private pipe were shut off. A number of other tests on houses nearer the point where the private pipe comes in from the main showed considerably better results than in the house occupied by the McGoverns themselves which is farthest away from the mains. In all the tests the pressure on the private pipe remained constant at 49½ pounds. Trouble is caused by the fact that the demands of the service to the individual houses are about 4 times the capacity of the private pipe supplying them. The trouble could be remedied by instaling a separate service pipe direct from the main to each of the houses. There is no reason except the cost of such installation to prevent its being done. Mr. Donley complained to me about the service at his Julian street residence. I told him he had made a mistake in connecting the second house there to the original service and advised either enlarging that service or installing a separate one for that house, which if done would have remedied the trouble. He did not do it. Mr. McGovern also complained and I advised him to enlarge his service but he did not do it. None of the others have made complaint to me.

983

Cross-examination by Mr. Stevens:

I have in the office of the D. U. W. Co. probably the most complete testing plant in the United States for determining discharge capacity of pipes in connection with water service. Under the rules of the D. U. W. Co. no connections can be made with its pipes without written permission from the company. The tapping of the mains is under the exclusive control of the company. Under the rules of the company the manager of the company is empowered to determine the size of the tap to be inserted in the main, that rule is not enforced however. We do not make a test to determine the size of pipe required in the case of every service application. Tests are general for the purpose of obtaining information as to average conditions.

We do not prescribe the size of tap to be used. We advise the size. In the earlier history of the company we permitted any installation that was requested and only began to advise in the matter of size of service when we discovered service troubles due to the failure

of plumbers to install proper sized pipes. The practice of advising size of service began in 1902 or 1903. In each of the cases complained of here where installation was made subsequent to that time, the size of the service pipes were ample and the deficiencies occurred in the plumbing inside the houses. We do not attempt to exercise any control over the plumbing within the house. We instruct the plumbers that in figuring their connections they should figure a certain size tap and a certain size pipe for a given size house and grounds. We do this to avoid their putting in too small a service. These instructions are general in character. If a plumber insists on
984 installing a service that we do not think is proper we require the owner to sign in connection with his application an agreement as follows: "I hereby agree if permitted to lay a certain size pipe (that was specified) in case of leak or failure of pressure I will make no complaint to The Denver Union Water Company."

It is not to the interest of the Water company to have the service pipes and taps as small as possible. It is the business of the company to furnish good service and more to its benefit to furnish good than poor service. It is, of course, our purpose to hold the plumbers to the smallest pipe that will furnish an adequate amount of water. If the main in the street is inadequate to supply the water demanded of it the pressure will not be maintained. We have a rule that requires separate stop boxes on branch pipes where more than one building is supplied by a single service. That rule is simply for the purpose of providing means of shutting off the water from the individual houses, in case of necessity, without shutting it off at the main service pipe that supplies the several houses. This rule requires additional fittings on the pipes and unless the pipe size is proportioned to these they would affect the carrying capacity of the pipe. The fittings necessary to connect the company's mains and to shut off or turn on the water through the service pipe are purchased from the company by the consumer. Prices varying according to size. The purchase price of the tap includes also the labor of making the connection with the main.

When complaints of inadequate service are made we send a man out to examine and ascertain the cause of the trouble and make such recommendations as are necessary to remedy it. The rule of the company under which it requires bond of plumbers for proper performance of street work, is no longer enforced by the company, it having been taken out of its hands by the city. Our tappers do see that the plumber installs a service pipe in conformity with the size stated in his application. We do not permit the plumbers to make their own taps. The portion of the rule stating that the size of the tap shall be determined by the manager of the company has not been enforced, except occasionally and in an advisory manner. If it had been enforced and the company had gone farther and supervised the plumbing within the houses it would have materially affected the conditions of service. The company has a rule requiring plumbers before disconnecting, adding to or making changes in fixtures, to take out a permit for the change. As a matter of fact the plumbers usually make the change first and request the permit

after the work is done, and it is too late for the company to recommend additionally supply- facilities to provide for additional service required. We have on occasions assessed a penalty against plumbers for installing new fixtures without reporting the same and required them to pay the water rent on those fixtures from the time they were installed until thy were discovered by the company's inspectors. The rule requiring 24 hours notice in advance of making the tap is to enable the tapper to reach the place designated at the appointed time. The rule requiring "extra strong" lead service pipes is a requirement of the city of Denver.

985

Redirect examination by Mr. Dorsey:

Our efforts to control the size of the service pipes began about 1902 when we found that it was common practice on the part of the plumbers to lay service pipes the same size as the taps. Such a pipe 50 feet in length will not carry the quantity of water discharged by a tap of the same size. We made demonstrations to the plumbers, showing them how much more water they could get through a tap of given size by installing a service pipe of larger diameter than the tap. The usual practice of the plumber has been to install the small service pipe because it costs less, and the efforts of the company have been to induce the plumbers to install larger service pipes. In all cases of inadequate service here complained of, installed since 1902, the size of the tap and service pipes has been adequate for the service applied for, and any inadequacy has developed either from increased demands upon the service or from defects in the plumbing. The company considers, for the purpose of its jurisdiction, that the service pipe is that part of the pipe lying in the street and extending to the house, although in cases where requests were made to enlarge old service pipes because of inadequate service we have required the enlargement to extend to the point of distribution within the cellar in order that such benefit as might be derived from enlargement of the service pipe would actually reach the fixtures. We have never considered that in the case of original installation we had any right to prescribe the plumbing to be used inside the premises. In a case such as the McGovern brothers they owned and controlled all of the pipe after it reached their premises and the company could not say what should or should not be attached to that private pipe.

Recross-examination by Mr. Stevens.

One of the rules of the company requires that air chambers be attached to the outlets or risers from the service pipe to serve as cushions against water hammer, which if not protected against would tear out the fixtures. These chambers are located inside of the premises of the consumer. I consider that all the pipe in the house is service pipe, but the plumber usually calls the risers supply pipes.

986

Witness EDWARD T. LEACH.

Direct examination by Mr. Dorsey:

Is managing Editor of the Denver Express. Identifies Exhibit A-70 as an article that appeared in the Denver Express of September 29, 1914, calling for volunteer witnesses to testify to inadequate water service. States that the circulation of the Express is from 20,000 to 23,000. Objection to introduction of article, sustained.

Witness GEORGE W. SKOULAND.

Direct examination by Mr. Dorsey:

I heard the testimony of Chief Healy of the Fire Department and Mr. Chas. Allen, relating to pressure tests on the system of the D. U. W. Co. The tests made by the fire department began in the first week of June, and ended in the second last week in June. The last test I think was made June 19. Tests by Mr. Allen, on behalf of the Public Utilities Commission, began on June 16. The last test regarding which he testified was made about July 15. During the period involved in the tests the operating conditions on the system of the D. U. W. Co. were abnormal, due to the effect of breaks which occurred on two of the conduits June 4, as a result of flood. Temporary repairs were not made until June 21st, and permanent repairs were made only a few weeks ago, after the heavy load of the summer season was off the system. As a result of these breaks the carrying capacity of the conduit system was reduced below the maximum summer season demands, making it impossible to maintain normal pressure conditions in the city. This condition continued until the permanent repairs were made because with the temporary repairs the head on the conduits was reduced below the normal head, so that at no time from the date of the rupture up to the date of the permanent repairs were the conduits capable of delivering their normal supply. The result being a reduced pressure throughout the system during heavy draft.

Am familiar with the reports of the National Board of Fire Underwriters containing statistics of fire losses in various cities in the United States. Objections by Mr. Stevens to the introduc-
987 tion of comparative table of fire losses. Sustained. Master in ruling calling attention that Fire Chief Healey testified that the losses in Denver were remarkably low.

Exhibit A-71 contains tabulation of fire losses in Denver compared with other cities as set forth in the reports on those cities by the National Board of Fire Underwriters. Objection to introduction of Exhibit sustained. Exception. I heard the testimony of Mr. McGilvray and Mr. Gaffy relating to certain repairs that were being made on one of the conduits of the company last summer and from which certain pieces of staves marked defendants' exhibits 48-A 48-B 48-C were said to have been taken. The conduit referred to is conduit No. 1, constructed in 1889 and except for a short length of conduit No. 4 is the oldest conduit in the system of the company.

Conduit extends from mouth of Platte Canon to the Ashland Avenue Reservoir, something over 21 miles. The openings concerning which Messrs. Gaffy and McGilvray testified were made for the purpose of making repairs. The point designated was about a quarter of a mile north of Chatfield siding on the Colo. and Southern Ry. The pipe line parallels the public road for a long distance north of the Platte Canon works. The conduit is on the left hand side of the road at this point. The openings for repairs occurred near where the Nevada ditch crosses and re-crosses the road and where the ground is saturated with water and sour. Different characters of soil have different effects upon both the wood and bands of pipe. The public Utilities Commission Engineers in connection with their report to the Public Utilities Commission made examinations of the different conduits of the company to determine their present condition at 54 locations designated by themselves. I accompanied them on all except six of these examinations. The pipes were exposed in such a manner as to make the most complete examination possible. One of these openings was made right at the location where repairs were being made at the time that Exhibits 48-A 48-B 48-C were obtained. There were present at this inspection Mr. C. P. Allen, Mr. Van Diest, Mr. Barnes, and myself. I am not certain whether Mr. Fellows was there or not. The inspection was made Friday, Oct. 3, 1913. The soil was black, oozy, and sour and the staves were in bad condition. The condition shown there was so bad compared with the very good condition generally of all of the pipes that had been examined up to that time that I caused additional excavation to be made at 500 feet on either side of that one and still others 500 feet further on to determine how far this soil condition affected the pipe. The excavations at 500 feet on either side showed the pipe to be in much better condition but still showing some
988 effects from that soil; while the excavations at 1000 feet on either side showed the pipe to be in very good condition, about the same as the whole line, indicating that the condition first discovered was purely local. When the other holes were opened I communicated either with Mr. Van Diest or Mr. Allen, and they were examined by the Utilities Commission engineers when another inspection trip was made, so they saw the changed condition in the pipe within that comparatively short distance of 1000 feet.

Conduit No. 3, which is eleven years younger than conduit No. 1, was examined within about 1500 or 2000 feet of one of these additional openings and it would have been difficult from the appearance of this line to have determined from comparison with the additional opening on Conduit No. 1, which was the older line. The sour ground found at the first spot is the only place on the line where that character of soil occurs. No such conditions were disclosed elsewhere by the inspections made in conjunction with the Public Utilities Engineers. Generally the condition of the pipe lines was very good, showing less evidence of decay of wood and pitting of bands than we expected to find. I am familiar with the pumping station maintained at Platte Canon. It was constructed as an emergency plant to pump water, filtered by the slow sand filter plant,

to the city through the pipe line that ordinarily conveys the water from the Willard Mechanical filters to the city in order to maintain this supply in the territory served by that line in the event of a break down of the mechanical filters. The last construction work on the slow sand filter plant was done in 1906 and the pumping station was installed early in 1907. If a break down occurred at the mechanical filters and these pumping units were not installed, a considerable portion of the southerly and easterly part of Denver would be out of water during the time that repairs were being made at the filters. I am familiar with the pumping installations at the West Denver pump station and with the operation of that plant. There are three pumps normally operated by water power but equipped with steam auxiliary connections and two units operated solely by steam. The total capacity of the station is approximately 18,000,000 gallons daily. If the water power units were eliminated the capacity of the station would be 12,000,000 gallons daily. During the summer season we frequently pump 14,000,000 gallons daily from that station and during the peak load hours operate all the pumps in the station, pumping at the rate of 18,000,000 gallons. If the water driven pumps were eliminated the water service to the city would be much less efficient than it is, because we would be short during the hours of maximum draft, the 6,000,000
989 gallons which those pumps deliver into the system. These water power pumps contribute very markedly to the pressure which is maintained on the distribution system.

The D. U. W. Co. now supplies practically everyone who is available as a consumer of water, in the city. Objection by Mr. Nye to interrogation as to effect likely to be produced by a reduction in rate upon the paid consumption of water in the city. Mr. Nye and Mr. Stevens concede that no contention is made or will be made that a reduction of the schedule of rates would cause an additional consumption of water and a larger income even at the lower rates. On this understanding, objection is sustained.

Exhibit A-72 shows the amount of taxes paid by the D. U. W. Co. upon each parcel of property owned by it or the S. P. C. & R. Co. in Douglas, Jefferson, and Arapahoe counties and in the City and County of Denver, for the years 1911, 1912, 1913. The taxes for 1911 were paid on original assessments by the assessors of the several counties, and in 1912 and 1913, on assesments made by the State Tax Commission and apportioned by it to the several counties in a unit total which was distributed by the assessors of the several counties for the purpose of collection. These taxes cover only the property taxes. The several parcels in the different counties are identified by the same numbers as identify the property in Exhibit C. Objection to the introduction of Exhibit A-72 overruled. Exception.

Cross-examination by Mr. Stevens:

There is approximately 500,000 feet of wood stave pipe in the system from 2 years to 32 years old. About a mile and a half of this being 32 years old. The Utilities Commission Engineers actually

examined about 324 feet of this pipe in the 54 excavations that were made. In these excavations the pipe was examined about a mile or two apart and naturally judgment of the condition of that which was not seen was based upon the condition of that which was seen.

Pipe staves like all other wood used for construction sometimes appear perfectly sound to the eye but contain something that produces decay like it in the same structure. Sometimes the stave will decay on the outside and sometimes on the inside. Depending upon where the decay-producing medium affects the stave. When those conditions occur in a stave, that one stave fails in the pipe, causes a leak, and is replaced. And the balance of the pipe is as good as new again. Exhibits 48A, 48B, 48C, did not come from the pipes that were broken by the flood last summer. They came from a
990 point that we saw fit to repair because of the evidence of decay disclosed by the examination in conjunction with the Public Utilities Commission Engineers. One of the breaks occurred on Conduit No. 1, below Platte Canon where the river washed out 300 feet of pipe in one place and 200 feet in another. The other occurred just north of Mississippi Street where the river broke through a dike that we were building to keep out the flood and collapsed 2 sections of pipe one 30 feet and the other 50 feet long. There are four other conduits leading to the city besides the two that were broken. These conduits were capable of carrying a given quantity of water but not sufficient to supply the total demand upon the system. There is some emergency capacity in the conduits but not sufficient to meet a reduction of 25% in the total carrying capacity. All the other conduits are wooden conduits also. One has been installed 21 years, another 12, another 7, and another 4, years. We had to operate one of these remaining lines carefully while the two lines were out of service on account of the flood, because the river was over it also. The cover was washed off the line and we were afraid to crowd that while the river was running over it. That was the line that is 12 years old. We operated it up to its normal capacity but did not crowd it beyond. The other lines that were not affected by the flood, we crowded to the limit.

The emergency pumps at Platte Canon were of no use in that situation, they were installed to provide against breakdowns in the filter plant, not in the conduits. We had another break on a wood pipe conduit on the north side last fall due to the failure of one stave, as frequently occurs in wood pipe, because every once in a while a stave gets in that does not stand up as well as the remainder. It is just a question of constant maintenance as is also true of joints on cast iron pipe. My personal knowledge of the condition of the wood pipe lines is based upon the inspections regarding which I testified. But we have more detailed knowledge from a constant check on these lines. Water from the Platte Canon pumps is supplied to the east side of the city through the 34 inch conduit when those pumps are operated. We do not supply any water in Littleton except to two or three consumers along Littleton Broadway outside the limits served by the Littleton system. We supply water outside the city of Denver in Englewood, Aurora, Sheridan, Edgewater

and Mountainview. The rates charged are exactly the same as in the city of Denver, except that in the town of Aurora we charge $40 per year for the hydrants and in Denver $22.50 a year. We have no fire hydrants in any of the other towns except one in Littleton, which was installed free as a consideration for a right of way for the conduit through the town.

991 The repairs on Conduit No. 1, regarding which I testified, were north of Chatfield and not south. About the same time we installed an air valve on the hill south of Chatfield, where we had been having trouble with air pockets. We may have put in some new staves on top of that pipe when we put in the air valve, the probabilities are that the staves were in trouble as a result of those air pockets. Roughly speaking the total capacity of all the conduits in full operation is 85 million gallons daily. The average daily consumption of water in Denver for the year is about 45 million gallons and the average daily consumption during the irrigating season about 65 million gallons.

The total capacity of the four conduits that were in a working condition in June, was about 62½ or 63 millions. The actual draft on the system at the time the breaks occurred was in excess of 71 million gallons daily and had been for several days. That explains why the pressure over the system was lowered materially during the time those conduits were out of service. We were delivering about 62 millions and for nearly two weeks had been using 71 million so the reserve stored in the city reservoirs had been depleted. Permanent repairs on these conduits were completed late in the fall. General repairs were made on the system as is usual between the last of September and the 1st of the year. The water level in the city reservoirs at the time of the break was somewhere between 18 and 22 feet above the bottom of the reservoir, that is the level usually maintained.

It is not true that the wood removed at the time of the conduit breaks was burned within a day or two after it was taken out. It could not be burned. It is not true that it was all consumed before the city officials went out there to inspect the breaks, because Mr. Fellows and Mr. Anderson and somebody else representing the Public Utilities Commission found a large quantity of it at the Bean ranch house. It took us from June 4, the date of the break to about June 21st, to get the temporary repairs made. It was over a week after the break before the flood receded enough to allow us to locate the damage, then when we had the temporary repairs partly finished another flood heavier than the first came down and washed out all of the work that had been done, necessitating doing it over again. Normal conditions were not resumed on the system until the permanent repairs were made late in the fall, though normal pressure was resumed along in August or September when it began to rain and irrigation tapered off and even though we were short on capacity we maintained normal pressure. After the temporary repairs were completed it is my recollection that conduit No. 1 carried about 3½ million gallons and conduit No. 4 somewhere in the

992 neighborhood of 8 or 9 millions, making the total capacity for the system about 73 millions. The pressure was not

restored immediately because we had to gain back what we had lost in the reservoirs, also the fact that all the conduits cannot be operated all of the time up to their maximum capacity. You must take into consideration the extent to which that capacity is affected by filter cleaning operations and work of that kind.

So that while a conduit will carry a certain quantity that does not signify that you will get that quantity through it every day and every month. It would take practically 30 days to catch up the depleted reservoir supply in the city.

The extent to which pressure was reduced during the time of the break varied in different sections of the city. In some places when the reservoirs were drained there was no pressure at all. In other places the reduction varied from 15 to 25 per cent possibly. It was nowhere normal except in the two high services served by pumps where it was maintained practically at normal. In the business district it was away below normal. The West Denver Station did not get back into normal service until the permanent repairs were completed late in the fall.

Cross-examination by Mr. Nye:

I stated that an examination had been made on conduit No. 3, near the place where exhibits 48A, B and C came from, and that in that location the pipe was in first class condition. Also, that comparing the condition of conduit No. 3, at this point with the extra openings made on conduit No. 1, on either side of the bad spot in the conduit, that conduit No. 1 appeared to be in as good condition as Conduit No. 3 at the adjacent opening. The pump station at Platte Canon was completed in 1907. Commenced either early in 1907 or late in 1906. The said washer pump at the slow sand filters is installed in the same building but has nothing to do with the centrifugal pumps installed to pump filtered water. The capacity of these pumps is 16 million gallons daily and the capacity of the Willard mechanical filters about 14 million gallons.

Conduit No. 3, is the only conduit that normally carries water from the slow sand filter plant. Conduit No. 2, is connected with it through the medium of these pumps and physically it is a through conduit from the slow sand filters to Denver, though in normal operation it is divided at the Willard filters, the upper end being used as a settled water line carrying water to the filters and the lower as a filtered water line carrying water from the filters to the city. It is the upper end of No. 2, to which the Platte Canon pumps are connected. Though they also are connected to conduit No. 7
993 so it can be used to the Willard filters in case of necessity, temporarily shutting off the raw water supply to Marston Lake.

The maximum daily supply heretofore furnished the city has been nearly 73 million gallons, the maximum carrying capacity of the clear water conduits is about 85 million gallons. That is not the capacity at which it would be good practice to operate them normally. The normal capacity of the slow sand filters is about 20 million gallons. They can be operated with all of the filters in

service up to 35 million gallons. The capacity of Conduit No. 3 is about 22 million gallons. The capacity to carry water direct from these slow sand filters is limited by the direct connection of conduit No. 3 with the filters.

The pumps at Platte Canon have been used for the emergency purpose for which they were installed I believe twice, since my connection with the company. I do not know how much water they pumped daily at those times. I should say somewhere in the neighborhood of 10 million gallons, because the repair work at the Willard filters that necessitated their use was done at a time of the year when the full capacity of the plant was not required. So far as I know these are the only times when these pumps were used. They then served the purpose for which they were installed, an emergency purpose. The West Denver Pumping Station is operated to its maximum capacity every day in summer during the peak load hours. I believe the record will show that 35 per cent of all water pumped at the West Denver Station during the last ten years was pumped by the water power pumps.

The peak load is maintained usually from 6 to 8 hours a day, or from 1-3 to ¼ of the total of the 24 hour period. During those peak load hours the station will furnish from 4½ to 6 million gallons. On a good many occasions when the draft of water is unusually heavy over an entire day, as frequently occurs, it is necessary to operate the station at peak load capacity for more than 8 hours a day. I personally know of instances when it has operated constantly during the daylight hours and until 9 or ten o'clock at night, drawing down the reserve in West Denver reservoir to the extent that the output exceeded the supply. Obviously the station must be operated to its maximum capacity during a considerable number of hours in the day during the summer in order to pump from 13 to 14 million gallons daily which have frequently been pumped for many days in succession. I know that Mr. Metcalf estimated the safe yield for domestic purposes at 5.85 million gallons daily from that source, but I apprehend that he took into consideration winter conditions and frost that effect the supply from that source. We need the maximum capacity in summer when the flow of water is free and when in actual practice it has
994 been called upon and has delivered day after day, 12 and 13 million gallons. The auxiliary steam power for the water power pumps was installed within a year or two after the water power itself was installed, along in 1883 or 1884. The double source of power has been constantly maintained ever since. I have no idea what the coal consumption is per month by the turbines when they are driven by steam power. They never have been so driven except when the rest of the station is in operation. The steam power being auxiliary, its method of connection to the water power pumps is less economical than the direct use of steam on the pumps that are operated by steam only, so it is only used when greater capacity is necessary than can be furnished by the regular steam units.

The coal consumption for the water power pumps, therefore, cannot be segregated, nor can the coal consumption for any par-

ticular unit in the station be segregated. The cost of coal for the entire station can be ascertained, but not for any particular unit. Whether the coal cost for any particular month can be segregated I do not know. It is our custom to buy coal in large quantities for the station and I will have to ascertain whether it is possible to segregate it by months.

Cross-examination by Mr. Stevens:

I cannot furnish mesurements of the amount of water delivered by the D. U. W. Co. to consumers outside the city of Denver, because no such measurements are made. The only information available is the relationship between the tap area and revenue inside and outside the city limits. It is my opinion that the consumption outside the city will not exceed 1,200,000 gallons daily. I am confident that it wouldn't exceed 1½ million gallons daily. The service to these outlying towns was affected during the breaks last summer in exactly the same manner that adjoining territory in Denver furnished from the same sources of supply was affected.

Water for the irrigation of the ranches is obtained from the Platte Canon Ditch. The water company doesn't even furnish water for domestic supply on the ranches. That is furnsihed separately from the supply system of the company.

Redirect examination by Mr. Dorsey:

The various openings made for examination of the conduits designated by the engineers of the Public Utilities Commission were so located and distributed over the line as to give a fair idea of the general condition of each of these conduits. Wood stave pipe is so constructed that one stave may be taken out at any time during the life of the pipe and another stave substituted without
995 disturbing the rest of the pipe. That is one of the advantages possessed by wood stave conduits over iron or similar material. The flood of last summer was a very unusual occurrence on the Platte River. The stage of water was about 50% higher than any previously recorded stage, and the flood conditions prevailed for about 2 months. The water company had never in its history experienced trouble with its pipe lines similar to the trouble experienced last summer. The break on the conduit on the North Side to which Mr. Stevens referred was, as I understand it, a break on the extension of Conduit No. 3, which was constructed within the last two or three years, caused by the failure of one stave. I did not personally visit the location of the break. I do not remember the exact distance from Chatfield Station at which the air valve was being installed on Conduit No. 1 at the time that the other repair work was being done that was testified to by Messrs. Gaffy and McGilvary. Air valves are installed to bleed out accumulations of air on pipe lines to prevent water hammer. They are as necessary for that purpose on iron or other pipe as on wood. Though on wood pipe they serve the additional purpose of preventing the drying out of staves at the top of the pipe due to constant presence of air at a given point. It is possible that staves in the top of the pipe were

found to be defective when the air valve was installed, if so they were removed and replaced. I was there right after the installation of the air valve but do not know whether or not any staves were replaced.

The average yield of water from the Mississippi Street galleries, as shown by the tables at pages 34 and 35 Exhibit C, greatly exceed in many months the safe yield estimated by Mr. Metcalf at page 13 Exhibit C. The tables at pages 34 and 35, show that the yield during the summer season greatly exceeds the yield during the winter season.

Recross-examination by Mr. Nye:

The company is now engaged in building a new wood stave conduit, 48" in diameter, from Marston Lake to the City, which will have a capacity of 33 million gallons daily, and necessitate the construction of an additional filtration plant at the north end of Marston Lake, the initial installation of which will be about 10 million gallons to be increased up to the capacity of the line as necessary.

Recross-examination by Mr. Stevens:

There were three excavations on Conduit No. 1, concerning which Messrs. Gaffy and McGilvray testified, one of which, was for the installation of the air valve and two were for repairs.

996 Redirect examination by Mr. Dorsey:

The new conduit will be completed about May 1st. The portion that is being built now from Marston Lake to Alameda Avenue and Boulevard F, will cost about $250,000. The total cost of the line when completed to the Ashland Avenue Reservoir will be about $500,000.

The first installation of the filter plant will cost somewhere in the neighborhood of $125,000. The contract has not yet been let. By May 1, the total expenditure in connection with this work will have been from $350,000 to $375,000.

Witness THOMAS CHEYNE.

Direct examination by Mr. Dorsey:

Objection by Mr. Nye to introduction of evidence based upon results of operations for the six months period ending Oct. 31, 1914. Overruled.

Exhibit A-73, is a statement of the earnings and operating expenses of the D. U. W. Co. for the six months, May 1, to Oct. 31, 1914, under the Leaflet Schedule, with a comparison showing what the results would have been had the rate reduction ordinance been in effect. Also a comparison with the six months ending Oct. 31, 1913. The gross earnings under the leaflet schedule were $794,335.65. Had the rate reduction ordinance been in effect

the gross earnings would have been $630,872.55. The figures in red in this statement are credits or deductions from the figures appearing in black. On Oct. 31, 1914, there were uncollected delinquent licenses to the amount of $37,619.70. On Oct. 31, 1913, the uncollected delinquent licenses amounted to $6,152.55. The items under operating expenses noted B. C. D. & E. refer to extraordinary expenses incurred during the period which would have been chargeable to a depreciation or contingent reserve fund, had such a fund been in existence. To ascertain the normal operating expenses for the period I have eliminated these amounts from the operating expenses shown.

Item B covers the expense of replacement of the roof of the Ashland Avenue reservoir, necessitated by snow damage. Item C the repairs to conduits necessitated by flood damage from the South Platte River. Item D covers the expenses of the present rate litigation. Item E the expense of removal of the reservoir roofs broken by the snow. With these items deducted the net normal operating expenses are $186,134.32. I have deducted also from the gross earnings, $85,000 for depreciation and contingencies, being one-
half of the allowance of $170,000 estimated for the year
997 by the engineers for this purpose. The operating expenses for the period ending Oct. 31, 1914, are about $8500 less than actual and those for the period ending Oct. 31, 1913, about $8800 less than actual, because charges for material used during those periods are not distributed to the accounts, due to the fact that inventories are made for the fiscal year and not for the semi-annual divisions.

Information contained in Exhibit A73 is taken from the records of the company. The items, Water Licenses, and Builders Licenses, are based on receipts shown on cash book. Meter rates and Hydrant Rentals are the amounts charged during the period, though possibly not collected within the limits of the period. The figures are based on the leaflet schedule. The column setting forth the estimated reduction under the rate reducing ordinance was calculated by applying the specific reduction provided by the ordinance to the items to which it is applicable. The estimate is based upon the actual collections during the period, excluding the uncollected delinquencies. If the amounts uncollected were included the estimated reduction would be greater. The amount of the gross earnings for the period under the reduction ordinance would also be increased by an amount equal to the difference between the uncollected delinquencies and the amount of the reduction that the new rates would apply to that sum. Amounts charged as operating expenses and taxes, are obtained from the vouchers, payrolls, material reports, etc., in the company's office. In my judgment they constitute fair and proper charges for operating expenses and taxes. The gross amount charged for operating expenses for the six months ending Oct. 31, 1914, is $285,147.03, from which is deducted for extraordinary expenses the sum of $99,012.71, leaving the net operating expenses of $186,134.32. The fact that I have deducted these extraordinary expenses does not indicate that they are not proper operat-

ing expenses. They are proper operating expenses but of such a character that it would seem advisable to have the burden of them distributed over a period of years instead of falling in one year.

To the net operating expenses is added the sum of $60,089.87 for taxes paid, making a total charge for operating expenses and taxes for that six months period of $246,224.19. Exhibit A74 is a statement of the earnings and operating expenses of the D. U. W. Co. for the fiscal year ending Oct. 31, 1914, compared with the fiscal year ending Oct. 31, 1913. It is prepared from the same data and information as Exhibit A73. The same deductions from gross operating expenses are made for the extraordinary expenses as were made in Exhibit A73. The net operating expenses for the fiscal
998 year ending Oct. 31, 1914, were $358,525.84. In Exhibit A57 I estimated the operating expenses for the year ending April 30, 1915, at $333,045.06. Adding the amount of taxes for the fiscal year ending Oct. 31, 1914, to the operating expenses shown by Exhibit A74 makes the total for operating expenses and taxes for the period, $477,195.17. In Exhibit A57 the estimate for operating expenses and taxes was $453,045.06. Comparing the effect of the application of the rate reducing ordinance to the actual result for the fiscal year ending Oct. 31, 1914, with the estimate of the results for the year ending April 30, 1915, the gross revenue for water under the actual year would have been lower than was estimated in the forecast.

On the same basis, the net earnings also would be lower than indicated by the estimate in Exhibit A57.

Cross-examination by Mr. Stevens:

The data set forth in Exhibits A73 and A74 is not only correctly transcribed from the records of the company but it is checked from the original vouchers, requisitions, etc., to ascertain the accuracy of the book figures. The figures as to the effect of the application of the rate reduction ordinance were obtained by applying the 20% general reduction to the revenues of the company and then correcting for such items as were reduced more or less than 20 per cent. The corrections being applied on the basis of the number of each of the items on which the reduction varied from 20 per cent that was in use in 1913. These items being actually counted from the company's books. From this check it develops that the actual reduction provided by the ordinance, applied to the business for the six months ending Oct. 31, 1914, was 20.33%. I obtained my information concerning operating expenses and taxes from the books and vouchers of the company and some information from officers and employes. Am satisfied that the charges are correct and proper, though of course I did not actually see the men do the work for which they were paid. The amount $37,619.70 delinquent licenses uncollected Oct. 31, 1914 was an extraordinary amount, some of which has since been paid. The sum $6,152.55 carried over as delinquent Oct. 31, 1913, is about the normal amount.

The net earnings of the company for the fiscal year 1914, without deduction for depreciation, amount to $858,440.92. If there were

added to this the difference between the extraordinary and ordinary delinquencies the net earnings would be increased $31,467.15 and would amount to $889,908.07. The deductions that I have made for depreciation are based entirely upon the estimate of the engineers employed by the company. They are not based on my judgment at all.

999 The item charged as legal expenses in Exhibit A.74, is entirely separate and distinct from the item charged as expenses of rate litigation in the same exhibit under the heading "Extraordinary Expenses".

The items that were deducted from operating expenses in Exhibit A.57 were such items as in my judgment the company would not have to meet if operating under ordinary conditions, that is, they represented the best that the company could expect in the way of operating expenses. Agreement by counsel that the Master may appoint an accountant to check the items set forth in the exhibits introduced by Witness Cheyne.

Cross-examination by Mr. Nye:

The deduction of $170,000 for depreciation was made by me on the estimate of Mr. Metcalf. $140,000 of the amount is for depreciation and $30,000 for contingencies. I have made no calculation to determine the ideal conditions of a contingent reserve fund, assuming that such a fund had been provided for and maintained since the commencement of operations by the D. U. W. Co. The purpose of preparing Exhibit A.57 which is an estimate for the year ending April 30, 1915, was to have it based on a year extending from the date when the rate reduction ordinance would have been effective. I have not brought Exhibit A.57 down to date based upon the experience of the half years operation since the ordinance would have gone into effect. I see no reason why it is not proper to divide the depreciation allowance into two equal semi-annual amounts instead of pro rating according to the difference in the earnings of the company in the summer and winter seasons. There is just as much depreciation occurring in one season as in another.

If the increases and decreases under the various classifications of the company's earnings are taken into consideration, as well as the amounts earned but not collected in the fiscal year ending Oct. 31, 1914, the gross earnings of the company for 1914 are practically the same as for 1913. The increase in operating expenses under pumping expenses is due principally to the increased cost of coal amounting to approximately $3100. Also an increase in the cost of labor of $1500, and water power operation about $1500. The charges to this account are, in my judgment, proper charges. I could not say whether the increases applied to one station or to all of the stations. The increase of $11,000 in the cost of filtration is due principally to the extraordinary amount of chemicals made necessary by the muddy condition of the river. The decrease in the credit for the tap department is due to the fact that the tap department must be carried regardless of the number of taps made, and if the business is

1000 not sufficient to support the department it becomes a charge against operating expenses.

The increase in service repairs is due to increased number of repairs made by the company to consumers services which are not paid for by the consumers. Legal expenses have decreased in one branch and increased in another. The decrease in ranch revenues in 1914 is due to the fact that a considerable amount of the land was flooded, due to high water in the river.

I consider the increased cost of chemicals for filtration a proper operating charge and not an extraordinary expense charge, just as I consider the increased cost of coal in pumping a proper operating charge. I think that the only direct cost of accident or such occurrences should be considered extraordinary expenses and provided for out of contingent reserve.

In Exhibit A.57 the gross earnings for the year ending April 30, 1915, after deductions for the effect of the rate reduction ordinance, are estimated at $1,093,387.71. That would not be materially changed if the estimate were based on the business of the fiscal year ending Oct. 31, 1914, with the deduction applied and plus the earned but uncollected item of $31,000. The item "net earnings" shown in Exhibit A.57 as $640,342.65 would be comparable with the item "net earnings" without deductions for depreciation or contingencies in Exhibit A.74 plus the sum $31,467.15 of earned but uncollected rates.

Cross-examination by Mr. Stevens:

Office expenses include all items incidental to the operation of the main office of the company. The charge to the account fluctuates from year to year, partly on account of the difference in the number of inspectors employed during the irrigation season and partly because of the varying amounts charged to construction, which are determined by the extent of construction from year to year. When the construction charge is heavy a more favorable showing is made in the operating accounts than would otherwise appear. About $36,000 would be a fair average charge to filtration under present conditions, though in 1912 filtration expense amounted to $51,552.80. I am positive that no new construction is charged into the account of filter operation, not even any part of the $51,000 in 1912.

Redirect examination by Mr. Dorsey:

There are a considerable number of items under the rate reduction ordinance on which the reduction exceeds 20 per cent and a number of other items on which the reduction is less than 20 per cent. There also is a total elimination of emergency charges under both schedule rates and meter rates. On the schedule rates based on the
1001 business of the fiscal year 1914, and without consideration of the emergency charges, the net reduction by the ordinance is $4,417.24 in excess of a 20% reduction per year. The ordinance also requires that water be furnished free to the County Court House, resulting in an additional reduction of $880 per year in the estimate. I did not arrive at this estimated reduction by the application of any general percentage but by applying the reduction specifically indicated by the ordinance in each case. My judgment that the amounts charged to the operating expense were proper charges is based upon an examination of the charges themselves, and the items entering upon

the different amounts and a determination that they related to the operations of the company and not to additions to the plant. They are all shown by original vouchers and supporting papers. It is my understanding that the allotments set aside yearly as a reserve for depreciation and contingencies are theoretical contributions to a fund which is to be used with its accretions to meet these matters as they come up in the operation of the property, and not that the sum set aside each year is going to exactly equal the contingencies or unusual expenses for that particular year.

I will prepare another tabulation similar to Exhibit A.57 to show the results under the rate reduction ordinance for the year May 1, 1914, to April 30, 1915, based upon the actual results of operation from May 1, 1914, to Oct. 31, 1914, and estimated for the second six months period. Mr. Nye objects to showing what would be the result for the six months ending Oct. 31, 1914, of apportioning the depreciation allowance on the basis of the gross earnings of the company in the winter and summer seasons, declaring that that would not be a proper method of accounting. The price of coal has been higher during the fiscal year 1914 than in the previous year. I could not state whether additional labor is necessary as well as additional chemicals in connection with the filtration operations of the company because of the installation of new hypo plants.

Recross-examination by Mr. Stevens:

The charge for the Court House shown by the company's books is a flat charge of $1,100 per year, divided into two equal installments.

Re statement of the method of arriving at the actual reduction made by the rate reducing ordinance.

1002 Witness L. F. BARTELS.

Direct examination by Mr. Hodges:

Have resided in Denver since 1863, been engaged in the real estate business 29 years. Am familiar with the lands shown on Exhibit A.4 extending from the West Denver pumping plant to the Mississippi Street galleries and am interested in lands lying east of parcel 17 and west of parcel 18, south of the pumping plant and east of the canal, and with prices and sales of land adjacent thereto.

I have kept track of the more important sales in that territory for the last 20 years. Argument over the admissibility of testimony of the Witness Bartels and offer by Mr. Hodges of what he expected to prove by the witness as tending to show lack of inquiry by defendants' witness Armour C. Anderson, as to the value of the West Denver lands.

Specific objection by Mr. Nye, to testimony as to the price at which the Bartel's estate sold certain lands in West Denver to the D. U. W. Co. on the ground that the question involved is a question of value and not a question of the price at which the land was sold.

Master rules that the Bartels testimony may be admitted. Not on the ground that it is proper rebuttal testimony but on the broad ground that it may be helpful to the case.

Am familiar with the lands included in item 25, West Denver

pump station lands, and with the adjoining lands owned by Holme and Allen, which are listed with me for sale. About two years ago they were willing to sell the lands at $8,000 an acre. Motion to strike denied. Exception. Within the past 90 days they raised their price to $10,000 an acre. They own between three and four acres. Am familiar with the lands in item No. 27, the Lake Archer and Mississippi street gallery lands. 10 or 11 years ago the D. U. W. Co. purchased parcel 18 from the Bartels' estate. It contains one acre and the price paid by the company was $3,000. Have recently negotiated for the sale of our land lying west of there at $3,500 per acre and east of there at $5,000 per acre. Parcels 20-23 were sold to the Water company by Asa Middaugh and the Del Norte Company of which he was president, for $5,000 per acre. Have had negotiations within the past year for property lying adjacent to parcel No. 24, Item 27, in what is known as Bailey's addition. The owner is Phillip A. Ryan. He asked me $250 a lot for 200 lots. With the streets platted, we figure 10 lots to the acre. 4 acres of land adjoining parcel No. 25 were sold within the last two years by the Western Chemical Company at $1,000 per acre. I sold part of Block 2, Rich-
1003 tofens Addition to Lake Archer, part of it to Sylvester A. Snyder and part of it to the Colorado and Southern R. R.

6 lots were sold to Snyder at $150 or at the rate of $1,500 an acre, and 4 lots at $200 at the rate of $2,000 an acre. I sold a fraction of 3 lots to the Colorado and Southern Railroad at the rate of $200 a lot. The Colorado and Southern sale was made in the fall of 1913, the Snyder sale in the spring of 1914. Objection to testimony concerning the Jason St. and Alameda Avenue condemnation proceedings sustained. Exception. Have negotiated with a party named Eastman for the sale of his land on West Alameda Avenue a little east of Parcel No. 27, Item 27 for which he asks $4,000 an acre. In Oct. 1912, I sold a tract of about 3 acres adjacent to parcel 30, item 27 to the Sutton, Steele and Steele Co. at the rate of $2,000 an acre. Also obtained for that company from the Colorado and Southern Railroad a strip of land 30 feet wide by 293 feet long to give it an outlet to Jason Street, for which I paid 32½c a square foot or at the rate of $14,000 an acre.

In February, 1913, I sold 8 lots in Block 42, Byers' Subdivision, to the Sundquist Lumber Company at $400 a lot, approximately $4,000 an acre. About 8 years ago I sold Block 5 Manchester, which lies south and west of Parcel 33, containing 5 acres, for $3,500.

Cross-examination by Mr. Nye:

The Holme and Allen tract lies just east of the West Denver pump station. There is no street between the pump station and the lands. The street runs to the line of Parcel 16 of the D. U. W. Co., but does not reach the Holme and Allen land at all. The land of the Water company adjoining the Holme and Allen land is used for storing water and a pump station site. I consider the Holme and Allen land worth $5,000 an acre the same as our land that adjoins it and consider that the water company's land adjoining it, is equally as valuable and saleable. Parcel No. 17 is used by the water company as a right of way for the canal connecting Lake Archer with the pump-

ing plant. If abandoned for that purpose it is as valuable as our land, except for the cost of leveling the canal excavation. West 8th Ave. crosses that strip at the south end. It would be valuable for trackage and manufacturing property. The Denver and Rio Grande Railroad is on the east and the Santa Fe on the west. Rights of way would have to be obtained through other property for outlets to the railroad. Parcel 18, which we sold to the water company is a strip of land 35 feet wide along the canal, containing 1 acre, which is used for a pipe line. It is valuable to the company for that purpose. I do not think they paid a very good price for it, in fact Mr.
1004 Middaugh objected a good deal because we would not raise our price to $5,000 an acre. We did not sell our lands east of the canal, which were negotiated at $5,000 an acre, because the party also wanted the Holme and Allen land but would not pay their price for it. In the case of the land west of the canal we were offered $3,500 an acre for 5 acres, but would not sell unless they would take the whole sixteen acres. Parcels 21-23 lie almost entirely in Lake Archer. I do not regard them as valuable as land immediately east, but they are as good as the land lying west. The bulk of it is higher than the land lying west of it. The Colorado and Southern Railroad track lies across the street from the land I sold to Sylvester A. Snyder, and Snyder after purchasing the land obtained a permit to get a spur track onto his ground that he uses for a coal yard. Parcel 25 is a portion of a 25 acre tract. It varies considerably in width. The Colorado and Southern right of way extends through it and part of it is in the river bed.

The portion lying in the river bed is valuable for gravel land and the gravel can be taken right up to the Colorado and Southern right of way. I would consider the land in parcel No. 25, worth about half as much as the land adjoining the Western Chemical Company about which I testified. The land that I sold the Colorado and Southern Railroad out of Block 2, Richtofen's addition, was sold prior to the sale of the other lots in the same block which were sold to Sylvester A. Snyder. The Colorado and Southern wanted the land to straighten out a crossing. The Eastman tract along Alameda Avenue is trackage property. It has no opening to Alameda Avenue because the wall of the subway shuts it off. Access to it is from Jason St. The land that I sold to the Sutton, Steele and Steele Co. immediately adjoins the south-east corner of parcel No. 30. The sale was made to W. S. Myers, President to the Company. Before he made the purchase I showed him a number of other sites in the vicinity, but this one evidently suited his purpose best for he bought it. Afterwards I purchased from the Colorado and Southern Railroad the strip to give him an outlet to Jason St. I considered the price of that strip exorbitant but it has been my experience that when someone has a reason to believe that you need a strip like that they get a better price for it than they do ordinarily. The land sold to the Sundquist Lumber Company is on Cherokee Street, about 2,000 feet from Broadway. There is no track on it. The nearest tracks are the Santa Fe tracks across Cherokee St. That sold at the rate of about $4,000 an acre for platted ground. I consider parcel No. 30 worth about ½ as much as that.

1005 The land that I sold south and west of Parcel No. 33, is used for truck garden purposes. Parcel No. 33 is not available for that purpose, nor is parcel 34 adjoining it. The Platte River runs along close to the east side of parcel No. 33.

Cross-examination by Mr. Stevens:

I would not accept as a measure of value of property an award by an arbitration board in a condemnation proceeding without knowing who constituted the board. It is my understanding that when Mr. Middaugh sold the three triangular strips to the water company he also sold them the narrow strip, colored in red, with the rest of those parcels. At least he fixed the price on all of them at the same time.

Redirect examination by Mr. Hodges:

(Comparisonof relative utility of D. U. W. Co. lands with adjoining lands.) The pumping station lands are all trackage property. The Colorado and Southern tracks running along the west line. Tract No. 24 has similar access to the Colorado and Southern and Santa Fe tracks. Tract 28 is not trackage property but can be made so at small expense. The Colorado and Southern has spur tracks on the ground adjacent to it. Parcel No. 30 is trackage from the fact that the Colorado and Southern Railroad has spurs running across the land to the Sutton, Steele and Steele Company's tract and also a track on the ground leading to the old Colorado Zinc plant. Parcel 31 is not trackage but could be made so by connecting with the Colorado and Southern, South Park branch, about 300 feet to the south. Tracts 32 and 33 are not trackage. Tracts 17 and 18 if the canal was abandoned could be leveled to the same level as our land to the east, which we hold at $5,000 an acre, and would be higher than the land to the west. Tracts 20 to 23, comprising Lake Archer, could not be filled except at great expense but it is higher than the ground to the west and not as high as the ground to the east. Tracts 24, 25, and 26, are gravel lands the same as the land that the Western Chemical Company is using for that purpose at the present time. Part of tract 27 is also in the river bed and useful as gravel land. The balance of it and tract 28 is good soil and treated as Valverde lots.

Parcel No. 30 is the same character of land as that of the Sutton, Steele and Steele Manufacturing Company but not quite so high. Part of parcel 31, is on the same level as the truck garden and lying west of it, part of it is timbered and has gravel deposits on it. It is not as good gravel land as some of the other parcels. Parcel No. 33, lying south of Mississippi Street is also gravel land.

1006 It would not be desirable to have the lands in the neighborhood of the pumping station platted. They are more effectively controlled for manufacturing purposes without having streets cut through them.

There is a railroad grade constructed across the land to the east of parcels 30 and 31.

Recross-examination by Mr. Nye:

The river channel runs through Parcel No. 28 and cuts the southwest corner of parcel No. 30.

Witness ARTHUR D. WALL.

Direct examination by Mr. Dorsey:

Exhibit A 75 is a tabular comparison of the valuations fixed upon the lands of the D. U. W. Co. by the several witnesses representing the company and the city, who have testified as to land values, with computations showing the difference between the valuations fixed by witnesses on behalf of the company and witnesses on behalf of the city. The compilation is made from the figures already part of the record in this case, as a result of testimony given, or exhibits introduced by the several witnesses. The land values found by the Public Utilities Commission engineers are approximately $340,000 less than the values given by Metcalf & Anderson in Exhibit C. The stars opposite certain figures in the different columns refer to foot notes at the bottom of pages and particularly to instances where valuations of several parcels are grouped by some of the appraisers. Parcel No. 15, Arapahoe, known as the Woodbury land, is not valued twice. Its valuation is shown at page 113, where it is designated as the Woodbury land. It is not valued in connection with the 40 inch conduit lands at page 115. The valuation given by Messrs. Metcalf and Anderson for the conduit rights of way, owned in fee by the D. U. W. Co., is $22,028, as enumerated under items 34, 35, 36, except parcel 15, of Arapahoe County. Practically all of item 34 was purchased by the water company in 1901, and items 35 and 36, were purchased in the past 4 or 5 years. The actual purchase price paid by the company for these various items was $19,116.55. There has been a marked increase in the market value of land since the purchase in 1901, but not since the purchases in the last 4 or 5 years.

In making this compilation of comparative valuations, I discovered that many rights of way within the City and County of Denver had been omitted from the list in item No. 37 valued by Mr.
1007 Bowles and myself as rights of way for conduit lines. Objection sustained to testimony as to these omissions tending to show that contingencies developed even in estimating the duplication cost of an established plant. Exception.

During the past 20 years I have had experience in operating and leasing farms, in this neighborhood. I am familiar with the system of operation of the farms owned by the D. U. W. Co. They are operated under a foreman who employs all labor necessary, and are supplied with such water as is not needed by the company for the city of Denver. Under this system the operation is less profitable than if the farms had a full water supply so they could be leased to good tenants on shares.

The result of the company's farming operations has been more satisfactory since the Harriman Ranch was sold, because it was al-

ways operated at a loss. In valuing these ranches Mr. Bowles and myself did not value them as ranches with adequate water rights. When Mr. J. I. Carper, a witness on behalf of the defendants, testified concerning a uniform valuation of $5 per acre for grazing land and stated that he had purchased such land at that price east of Denver, in a transaction with me, he referred to a parcel of 150 acres which was part of a 4,600 acre deal and which was listed in a deferred payment contract at a price of $750. The contract price for the 4,600 acres was $276,000. A down payment of $50,000 was made and prices were fixed, upon the various tracts comprising the whole, at which these tracts would be deeded as they were sold by the purchaser. That is how the price of $750 was attached to this 150 acres. Mr. Carper's company sold the 150 acres for $10 an acre. I do not think it could really be said that he purchased that particular tract for $5 an acre. About ¼ of the 4,600 acres was dry land.

Cross-examination by Mr. Stevens:

I do not know how much water is used for irrigation on the farms owned by the company. Whenever there is a shortage of water it is taken from the farms. The management of the water company is the judge as to the necessity for taking the water from the farms and using it for the city. My understanding is that the farms are kept for the protection of the water rights. There are many times when all of the water purchased with the farms is taken for domestic purposes. There may be times when it would all be used on the farms, but that would not occur so frequently because the periods of shortage exceed the periods of plenty, during the irrigation season. I do not know that I have seen crop failures on these ranches, but I have seen crop shortages, particularly in 1902.

1902 was an exceptional year from the view point of water shortage.

Cross-examination by Mr. Nye:

1008 The net difference in valuation of lands between Metcalf & Anderson and the Public Utilities Engineers was $341,038. The principal difference occurs on six items. On certain other items the valuation fixed by the Public Utilities Commission engineers was higher than the valuation fixed by Metcalf and Anderson. I obtained the price paid for the conduit lines, $19,116.55 from the consideration stated in the various deeds and from the records of the company. I had nothing to do with the acquisition of these lands by the company. About two-thirds of these conduit lands were purchased in 1901. I think it is generally true that the market value of these lands has practically doubled since that time. I do not think it is true that the Platte Valley ranches of the water company are regarded as the best irrigated and most productive farms in the neighborhood. There are many other farms where the gross and net revenues are greater in that immediate vicinity. Off hand I would mention the Patterson farm, the Skelton farm, and the farm formerly owned by Peter Magnus, as examples.

Redirect examination by Mr. Dorsey:

The price paid by the water company for the approximately ⅔ of the conduit land acreage, purchased in 1901, was practically $12,000.

Witness ARTHUR D. WALL, recalled.

Direct examination by Mr. Dorsey:

Have been in active charge of one or more irrigation systems on the South Platte River for about 20 years. Have owned or represented stock in many other irrigation companies. Have been connected with and been an officer in The Consolidated Ditches Company, of Water District No. 2, for about 10 years, was secretary for several years of a state organization known as The Colorado Irrigators' Association. Have been interested in litigation affecting ditches, reservoirs, and water rights, and am familiar with stream flows and the operation of ditches and reservoirs. From inspection am familiar with the structures of all of the ditches in Districts No. 8 and No. 2, and with the character of land under most of them and with every reservoir or reservoir site upon which a filing has been made, on the Platte River, either above or below Denver. I had active charge of the High Line Ditch for 12 or 13 years, and was secretary of The Antero and Lost Park Reservoir Company
1009 from 1907 to 1914. This connection was during the period of construction of the works of this company. Am still a stockholder and director, of this company. The Antero Reservoir is located on the South fork of the South Platte River about 65 or 70 miles above Lake Cheesman, and derives its water supply from the same source that in part supplies Lake Cheesman. The High Line ditch and the Antero Reservoir are owned by the same company. Records have been kept that make it possible to ascertain how much water has been stored by the Antero Reservoir.

In the year 1909 there was stored in the Antero Reservoir a total of 12,000 acre feet; in 1910, 3500 acre feet; in 1911, 11,000 acre feet; in 1912, 29,000 acre feet; in 1913, 10,000 acre feet. Making a total storage from 1909 to 1913 inclusive, of 65,500 acre feet. The decree of Antero reservoir is subsequent to Lake Cheesman. The water commissioner for District No. 8, 1913, was a new man inexperienced in the work. I have examined the field book of the water commissioner for District No. 8, for the year 1913, this book is supposed to contain a daily or at least a frequent record of the diversions by the various ditches in the district but contains no such records for the Nevada, or Last Chance ditches, or for some other small ditches in the district. In the portion of the book provided for a recapitulation of the year's operations of the district, the book contains statements of the date when the ditches began to use water and when they shut down, the total number of days for which water was carried, and a statement that in the case of the Nevada ditch it carried 55 second feet for every day it was in operation, and the Last Chance, 28 second feet for every day it was in operation. This field book is supposed to be carried by the water commissioner

and the information is supposed to be noted when he visits the ditches.

It is the custom in the operation of the Nevada and Last Chance ditches to take at the headgates practically all of the water that their decree entitles them to take and then return to the stream through waste gates and tail ditches so much of this water as is not immediately required for irrigation of the lands under the ditches. This is generally true of all of the ditches in the district, more particularly of these two, because they don't get very far away from the river. The same conditions apply to the ditches in District No. 2, and particularly in the cases of the Brantner and Brighton ditches, which are particularly well equipped with waste gates where they cross Big Dry creek; in the case of the Brantner, 8 or 9 miles from the headgates, and in the case of the Brighton, 6 or 7 miles from the headgates. Both of these ditches have old priorities and their practice is to divert a good volume at the head gates
1010 and regulate the supply at Big Dry creek. For some years I operated the Lupton Bottom Ditch which occupies the channel of Big Dry creek for about a mile below the waste gates of the Brantner and Brighton ditches, there were often periods for 2 or 3 weeks when we derived our entire supply of water from Big Dry creek and most of it was waste water from the Brantner and Brighton Ditches. During these periods we did not draw a drop of water from the headquarters of the Platte River. We obtained approximately 50 second feet of water from the waste from these two ditches. Most of the other ditches in District No. 2 operate in a similar manner. Water that is diverted in that manner and returned to the stream through waste ways and tail ditches is immediately available for diversion by ditches lower down.

Any water diverted by the Nevada and Last Chance ditches in this manner and returned to the stream, that was not taken by ditches in District No. 8, would be available for ditches in district No. 2. I do not believe that there will in the future be any material increase in the quantity of water diverted by the ditches in these districts. Exhibit A.76. is a sectional map of Northeastern Colorado published by Williamson & Haffner, copyrighted in 1910, which shows the lands irrigated and irrigable under the ditches in these districts. There are something like 24,000 acres under cultivation under the High Line Ditch and about 110,000 acres irrigable from its ditches and laterals now constructed. It diverts about 40,000 acre feet per annum or 1¾ acre feet per acre, water being taken usually in the early part of the season. In my opinion there is no possibility of any material increase in the acreage irrigated under its present rights. That acreage has remained practically stationary for 15 or 20 years, except for a slight increase in recent years due to a reservoir supply having been added to its direct flow rights. Should this reservoir supply be increased there is little likelihood of an increased demand from the direct flow rights.

Experience indicates that an ample reservoir supply available for delivery late in the season may increase the acreage without increasing the demands from the direct flow rights that are available

for use only early in the season. As a matter of fact, such a supply is more likely to decrease the demand from the direct flow rights because a farmer operating under a flood water ditch whose supply is available only in the early part of the season will probably take all the water available then, whereas, if he has a suppplemental reservoir supply available later in the season he will take only what he needs. This is demonstrated in district No. 3. on the Cache La Poudre river where the acreage irrigated 25 years ago was about
125,000 to 135,000. There are now irrigated in the district
1011 about 245,000 acres and the Poudre river carries no more
water now, than it did 25 years ago. The additional acreage is made possible by irrigation from stored water and by the increased seepage and return flow developed from the application of that water.

The Last Chance Ditch which is next below the High Line now irrigates all of the land capable of being irrigated under it. That is also true of the Nevada ditch which extends three or four miles farther down the river than the Last Chance. All of the land under it is cultivated and there is no feasible way of extending it. The City Ditch now irrigates all the land that can be irrigated under it between its headgate and the park lakes in the City of Denver, and in my opinion there is no possibility of the ditch ever being extended beyond the City Park lakes. The same conditions are true of all of the smaller ditches in District No. 8. which irrigate small areas practically in the river bottoms. The Platte Canon Ditch owned by the water company now diverts the full amount of its decree and its demands cannot be extended. The same conditions are generally true in District No. 2. The Brantner ditch has its headgates 11 or 12 miles below the city of Denver and irrigates perhaps 5,000 acres of land west of the river. It ends in rough country now supplied by ditches from Clear Creek or Boulder Creek. The Brighton ditch irrigates probably 2500 acres under similar conditions. The Lupton Bottom Ditch irrigates a narrow strip of land along the west side of the river and it terminates where the ditches from Boulder creek supply the land. There are several smaller ditches on the west side of the river similarly situated. On the east side of the river the Burlington Ditch is situated very much like the High Line Ditch. There are about 20,000 acres irrigated under it and the area cannot be increased with the direct supply. They are supplementing the supply by reservoir water which will develop the same conditions as described under the High Line and make no increased demands upon the river from the direct flow rights. The Fulton ditch, the next one on the east side of the river, is in exactly the same situation. The land under it is in the river bottom, and while there is some uncultivated land at the lower end of the ditch, the area cannot be increased except by a supplemental reservoir supply which will develop the same conditions as under the High Line and the Burlington. The Platteville, the next ditch, irrigates a small area in the river bottom and all available land is irrigated. The next ditch, the Platte Valley Ditch or Evans No. 2., now irrigates all the land that it can irrigate because its works terminate at

a ridge between the Beebee draw and Box Elder creek. The land on the other side of which cannot be feasibly reached.

1012 The same is true of the Buckers, Farmers Independent, the Western, or Hews and Cook Ditch, The Union and the Godfrey Ditches, all of which have their final limit at this ridge. All of the land under these ditches is now irrigated. The Lower Latham Ditch passes around the north end of this ridge and could be extended, but as a matter of fact the area under it is ample to use its full water supply, and it is all in cultivation. It is my opinion that there will be, or can be, little, if any, enlarged use of water during the irrigation season by any of the ditches in Districts No. 2 and 8, which have priorities earlier than Lake Cheesman, under their existing decrees. I am familiar with adjudicated rights and rights in process of adjudication following the decreed rights of Lake Cheesman. (By Mr. Dorsey, "Such rights as have a bearing upon the claims made by Mr. Fields, and Mr. Fellows, as to a water supply available for the Bates reservoir after the rights of Lake Cheesman and all other rights were satisfied.") Information as to these rights is obtained either from the decrees entered by the courts, where decrees have been entered, or from proceedings pending in the courts, where decrees have not been entered.

In District No. 23, there are three reservoir decrees subsequent to Lake Cheesman and prior in time to July 3, 1910, for 207,550 acre feet, excluding a number of small reservoirs, the rights of which are for purposes other than irrigation. All of these reservoirs, except one, the Geneva creek reservoir, with a decree for 1,500 second feet, are on the south fork of the South Platte or its tributaries above Lake Cheesman. Four of them aggregating 135,980 acre feet are constructed. The others are in process of construction. Those under construction are given conditional decrees. Objected to unless decree is produced.

I am personally acquainted with these reservoirs and have inspected them. There are no reservoirs of any consequence in District No. 8. The reservoirs in District No. 2, are now having their claims adjudicated but the decree has not yet been entered. The aggregate of the claims in process of adjudication in District No. 2, is 94,807 acre feet. As secretary of The Consolidated Ditches Company of District No. 2, I am familiar with this proceeding. Objections have been filed as to the dates of priority of some of these reservoirs but there have been no objections filed as to their capacities. In addition to the reservoir claims adjudicated and in the process of adjudication, there are a large number of ditches in Districts No. 3 and No. 2, subsequent in time to Lake Cheesman whose claims are involved in the same proceeding. I have made no effort to investigate the statute in this respect in ditches tributary to District No. 2 and No. 8. Many of these claims that are

1013 subsequent to Lake Cheesman are prior in point of time to April, 1908, and to July, 1910. In Districts No. 1 and 64, lying below District No. 2 on the South Platte River, there are reservoir claims aggregating, I should say, 300,000 acre feet subse-

quent in point of time to Lake Cheesman and prior to April, 1908, or July, 1910.

Direct flow rights are not at all comparable with stored rights. Water supply under direct flow rights is limited by the extent of the decree and the capacity of the stream to supply water to that decree, and at no time can draft be made in excess of the amount decreed. A reservoir supply may be delivered in any volume and at any time desired by the owner of the rights. It is customary to value direct flow rights on the basis of cubic feet per second or statutory inches, units of measurements of flowing water, and stored rights by cubic feet or acre feet, units of measure of water that is not in motion. As an example of the difference in value between direct flow rights and stored rights, take the High Line Ditch under which the direct flow diversions represent a value of about $15 per acre foot, the Antero reservoir delivering water through part of the same system sells storage rights on the basis of the total capacity of the reservoir, 85,000 acre feet, at $30 to $35 per acre foot.

(Comments on testimony of Messrs. Taylor and Patten, witnesses for the defendants in regard to certain ditches in District No. 2, and the value of stock or water rights under said ditches.) As to the Brantner ditch, there are 300 shares of stock in the company, the holders of which are entitled to their pro rata share of the water subject to the prior right of nine farms owned by the original builders of the ditch to about 18 second feet of water.

There is a sort of general understanding that the value of the stock is $300 a share, though I do not believe that one share of stock could be bought apart from land. The testimony of Messrs. Taylor and Patten would indicate that the whole Brantner ditch and its water rights could be bought in that way for $90,000. It would not be possible to purchase the Brantner ditch and its water rights without buying the farms under it.

Objection overruled. Exception.

Messrs. Taylor and Patten also referred to the Brighton Ditch. I never have heard of the sale of Brighton Ditch stock apart from land. It is a close corporation. All of these ditches in District No. 2 are members of The Consolidated Ditches Company of which I am secretary. Messrs. Taylor and Patten also referred to the Fulton ditch which irrigated about 11,000 acres and has outstanding 7,200 shares of stock, each representing about 1½ acres. A small quantity of this stock is from time to time handled on the market at from $75
1014 to $90 per share subject to the indebtedness of the company which adds about $9 per share. This ditch unlike the Brantner and Brighton, does not have enough water for its needs. I have either owned or represented stock in the ditch for many years.

The ditch is and for many years has been seeking a supplemental reservoir supply to take care of its needs during the critical crop growing season. Messrs. Taylor and Patten also referred to the Farmers Independent ditch which irrigates about 9,000 acres and has outstanding about 800 shares of stock. A small quantity of that stock is handled from time to time on the market at about $300 a share. But like the Fulton, its water supply in the latter part of the season

is insufficient, being limited to its first decree which yields approximately 3 statutory inches of water. The Farmers Independent has doubled the acreage under cultivation during the last few years, but it has not increased its diversion of water.

Objection sustained to interrogation as to whether these ditches and their water rights could be purchased in their entirety at the rate of the prices per share quoted by Messrs. Taylor and Patten. Exception.

No considerable number of shares could be purchaased in any of the companies at the prices stated by Messrs. Taylor and Patten. Messrs. Taylor and Patten also referred to the Farmers High Line Canal, in District No. 7, supplied from Clear Creek.

I have owned or had charge of land under the system and owned or represented stock in the company. The system irrigates about 30,000 acres of land. There are outstanding approximately 1,000 shares of stock. The company has an outstanding indebtedness of about $60,000. The stockholders do not participate in all of the water diverted by the ditch. There are in the ditch what are called schedule rights for 825 statutory inches or 22 or 23 second feet that must first be supplied. There are also what are known as statutory rights for 800 inches, approximately 21 second feet, which pro rate with the stockholders. There are two small reservoirs connected with the system, the Broad reservoir with a capacity of something like 1,800 acre feet and the Leyden reservoir with a capacity of approximately 1,500 acre feet. The ditch diverts an average of 40,000 acre feet a year or about 1¼ acre feet per acre for the 30,000 acres. That includes the water diverted to the two reservoirs. The diversions are made principally in the early part of the season. After about July 10, the ditch has available only about 46 second feet under its early appropriation.

The Farmers under this system have constructed about 200 private reservoirs, in which they store the water received on the direct
1015 flow rights until they need it. No considerable number of shares of the stock of the Farmers High Line Canal and Reservoir Company could be purchased at the price indicated by Messrs. Taylor and Patten as the market price. Very little of the stock is on the market. The lands in the lower part of the district irrigated by the Farmers High Line adjoin the upper part of the lands irrigated by the Brantner ditch. The fact that Messrs. Taylor and Patten place a much higher market value on the water rights under the Farmers High Line than on the rights under the Brantner ditch is explained by the law of supply and demand. There is no demand whatever for stock under the Brantner ditch and little, if any, is ever sold except in connection with lands, because there is no land unirrigated to which the water can be applied. Under the Farmers High Line there is a limited area not yet cultivated and its stock is frequently handled on the market separate and apart from the land in small quantities. The Antero Reservoir in 1913 supplied approximately 24,000 acre feet of stored water through the High Line Ditch, of which somewhere between 21,000 and 22,000 acre feet were actually diverted by the ditch after deductions were made for loss in

transit under the rules of the state engineer's office. I am familiar with the J. Thomas Ditch in District No. 2. In a recent abandonment proceedings its decree was reduced from 104 and a fraction second feet to 18 second feet. The abandonment decree reciting that only a fraction over 11 second feet had ever been applied to beneficial use. The ditch irrigates a triangular shaped tract of land at the junction of the St. Vrain and the South Platte river.

The Union ditch in District No. 2 in addition to diverting water for direct irrigation during the irrigating season also diverts storage water for the Lower Latham reservoir. The Evans Ditch No. 2 in District No. 2 in addition to diverting water for direct irrigation during the irrigating season also diverts storage water for the reservoir known as Milton Lake. The Burlington ditch in District No. 2 in addition to diverting water for direct irrigation during the irrigation season also diverts water for storage in a number of reservoirs, among them, Barr Lake and Horse Creek reservoirs and to a number of smaller reservoirs, the aggregate capacity of all of them being about 75,000 acre feet. There is no storage under the Section No. 3 or Godfrey ditch. In District Nos. 2 and 8 the water commissioner makes his determination of the quantity of water diverted by the ditches from measurements at the headgates of the ditches. These measurements are above the waste gates from which water is returned to the stream. I am acquainted with the ditches and irrigation systems in District No. 3 referred to Messrs. Taylor and Patten,
1016 in their testimony. The irrigable area of District No. 3 extends from Fort Collins and Wellington on the West to Greeley, Eaton and Ault on the east. The district being widest at the eastern end. The center of the district is almost directly north of Denver. The first ditch referred to by Messrs. Taylor and Patten, is the Larimer and Weld Canal. I was employed for a number of years by the company that constructed this system. My employment commencing about the time the water rights were sold and the canal turned over to the purshasers of the rights. It diverts water from the Poudre river about 2 miles above Fort Collins. Irrigates about 50,000 acres of land. Its main canal is about 50 miles long. Its principal appropriation is No. 88 in the district, of September, 1878, for 571 second feet. It has an old priority of about 20 second feet. There are 376 shares of stock outstanding.

All of the users of water under the system are also owners of reservoir water for supplemental supply. Originally the shares were for the irrigation of 80 acres, being now supplemented by reservoir water. About one-half of the owners use one share for 160 acres. The supplemental supply for the stockholders is obtained from six different reservoir systems. The ditch company charging the owners for the carriage of this water. The average annual diversion under the direct flow rights is from 25,000 to 30,000 acre-feet and the supply from storage about the same. Making the total supply a little over an acre foot per acre.

The reservoir water is run only to owners of rights in the ditch. The combined market value of the ditch and reservoir rights is approximately $50 per acre foot. The next system referred to by

Messrs. Taylor and Patten, is the Larimer County canal, owned by The Water Supply and Storage Company. It irrigates about 45,000 acres. There are 600 shares of stock outstanding. Water is diverted from the Poudre river about 10 miles above Fort Collins, and the main canal is about 71 miles long. The shares were originally issued to supply 40 acres. The rights of this ditch are practically the last on the river. Priority No. 100, April 25, 1881, for 463 second feet. The company also owns 9 storage reservoirs with a combined capacity of approximately 23,000 acre feet. In connection with the stored water, the original shares are now used for the irrigation of about 80 acres, instead of for 40 acres. The average annual diversion is from 40,000 to 50,000 acre feet, or practically one acre foot per acre. About half is supplied by direct flow rights early in the season and about half from storage rights.

The market value of the stock is about $50 per acre foot. There is practically no stock of either of these companies on the
1017 market. The reservoir water under these systems is worth at least double the direct flow water. Making the acre foot value of the reservoir water, in round numbers $65. The next system referred to by Messrs. Taylor and Patten is the Larimer County No. 2, diverting water from the Poudre river about 6 miles above Fort Collins. It irrigates about 7,000 acres. Its priority is No. 57, April 1, 1873, for 175 second feet. Water generally is available under its rights up to about July 4th. The ditch extends to Fossil creek, and there is no feasible way of increasing the acreage under it. (This is also true of the Larimer and Weld and the Larimer County systems.) The ditch company owns no reservoirs, but the farmers under it, almost without exception, use reservoir water from Warren Lake or from the North Poudre irrigation system, to supplement the supply. Stored water from Warren Lake is valued at about $70 per acre foot.

The market price of the stored water from the North Poudre system is about $60 per acre foot. There is practically no stock of the Larimer County No. 2 ditch on the market.

The next system referred to by Messrs. Taylor and Patten was the Hillsboro system. Ditch diverts water from the Big Thompson river about 4 miles east of Loveland. Ditch is about 12 miles long, irrigates about 9,000 acres, which acreage cannot be increased. The ditch has two priorities, one dated April 15, 1878, for 99.46 second feet, the second Oct. 6, 1881, for 45.69 second feet. It has also purchased part of the priority of the Big Thompson ditch, which is Number 1 on the river, and furnishes a small volume of water during the whole season. There are 118 shares of stock outstanding and the secretary of the company knows of only two sales of stock separate from land in 20 years. One sale of one share in connection with the settlement of an estate, and another sale of one-half a share.

The next system referred to by Messrs. Taylor and Patten, was the Home Supply Ditch, which practically parallels the Hillsboro on higher ground. It diverts water from the Big Thompson river about 9 miles above Loveland. It is about 25 miles long, irrigates about 20,000 acres, its priority is practically the last on the Big Thompson

river, July 15, 1881, for 278 second feet. It also has contracts, with the Big Thompson ditch and the Big Thompson No. 2, from which it derives a little water up to July 15th. It also owns two reservoirs with a combined capacity of approximately 13,000 acre feet. There are 2,000 shares of stock in that company, under which the owners of rights receive about 11 acre feet per annum per share. About 6 feet from storage and 5 feet from direct flow. The value of the combined supply is about $45 per acre foot. And the value of the
1018 stored water alone about $60 per acre foot. The stored water being worth twice as much as the direct flow water. Am acquainted with the properties of The Denver Reservoir and Irrigation Company, concerning which Messrs. Taylor and Medina, gave testimony. At the time it started to sell water rights, it owned comparatively little property, practically only the site of the Standley Lake Reservoir.

The company proposed to construct a large number of ditches and reservoirs and acquired by purchase some direct flow rights. Its supply was to be combined storage and direct flow, more than half of it being from storage. The rights offered for sale consisted of stock in the company owning the irrigation works. Its construction work proceeded quite rapidly for a time, but the entire system is not yet complete. Portions of it are complete. Their final plans were for the construction of a system with a capacity of 210,000 acre feet, combined storage and direct rights. At the time that Mr. Medina testified, he was engaged in selling stock. The company had just started its operations. Only a small amount of work had been done. As a rule the people carrying on the work were from out of the city and inexperienced in irrigation work. The company fell into financial difficulties. At the time that Mr. Medina says this stock was being offered for sale, I was selling stock in irrigation projects, and water rights in well known and established systems, were selling readily and constantly increasing in value. At the time that a considerable body of shares of The Denver Reservoir and Irrigation Company were sold to the Henrylyn district, the company was in the hands of a receiver. The portion of the water deliverable to the Henrylyn District from Standley lake would have to be delivered by exchange with the river. The Henrylyn District making its diversion through the Burlington Ditch and Standley Lake replenishing the river below to the extent of the diversion. That is the condition today.

The higher the efficiency of a reservoir in relation to the draft under which it is operated, the greater the market price of water. But efficiency alone does not determine the market price.

Q. Directing your attention to Lake Cheesman, are you or are you not familiar with Lake Cheesman?

A. Yes sir.

Q. Various witnesses on behalf of the complainant and the defendant in this case have made various estimates and determinations relative to the possible and actual storages which might be made at Lake Cheesman over a period of years, and the efficiency of the reservoir relative to certain assumed drafts. I call your attention first to

the estimates as made by Mr. Field, a witness for the defend-
1019 ants, and as shown finally by his Exhibit 45 as amended by his Exhibit 46. From that it appears that, according to his assumptions relative to possible storage and actual storages which can be made at Lake Cheesman, and for the period of years from 1902 to 1913, inclusive, upon an assumed draft of 40,000 acre-feet per annum, the efficiency of the reservoir was for all those years, except the year 1904, one hundred per cent, and for the year 1904 eighty-one per cent, making an average efficiency for that period of 98.4 per cent; and his determination further was, upon his assumptions as to possible storage and actual storage which could be made by Lake Cheesman, for the period of years 1901 to 1913, inclusive, upon an assumed draft of 50,000 acre-feet per annum, that the efficiency would have been in ten of those years 100 per cent, and in three out of the thirteen years less than 100 per cent as follows: In the year 1903, 61.5 per cent; in the year 1904, 45.9 per cent, and in the year 1911, 89.71 per cent. I will ask you to state, from your experience in and knowledge of such matters, whether the difference in efficiency exhibited by the operation of Lake Cheesman upon each of those assumed drafts is such—the average efficiency on the 40,000 acre-foot draft being 98.4 per cent, and upon the 50,000 acre-foot draft 92.08 per cent, made up as I have stated—whether the difference is such as to make the market price or value per acre-foot of the water rights under Lake Cheesman less upon the assumed draft of 50,000 acre-feet than upon the assumed draft of 40,000 acre-feet annually.

Objection overruled. Exception.

A. There would be no material difference in the market value of the rights on the two drafts mentioned, with the efficiencies as assumed there. It will be noted that the main deficiency occurs at the same time in each case.

Q. Just what do you mean by the statement that "there would be no material difference" in that respect? What is the material difference in your judgment?

A. I can hardly state any percentages. My thought is this: That with so slight a difference in efficiency, and occurring at the same period in each case, there could be practically no difference in the price.

Q. I call your attention to the fact that the deficiency which occurred on the 40,000 acre-foot draft was a deficiency in the year 1904 caused, as Mr. Field's exhibit showed, by the short supply in the year 1902, and that the largest deficiency which occurred on the 50,000 acre-foot draft was in the year 1904, also caused by the short supply of 1902, as Mr. Field's exhibit shows. Have you taken them into consideration?

A. Yes sir.

1020 Q. What consideration have you given to that?

A. Well, I look upon the season of 1902, with such an abnormally small supply of water, just as I would upon any other calamity to the farmer, such as a hail storm or anything else. Such years do come, and they affect all reservoirs.

Q. On Mr. Field's assumed draft of 40,000 acre-feet, it appears from his exhibit that at the end of each year he had left in his reservoir with which he began the new year a reserve supply bearing the following percentages—or, being the following percentages of his assumed draft of 40,000 acre-feet, to-wit: In the year 1902, 91 per cent; in the year 1903, 33 per cent; in the year 1904, 10.9 per cent; in the year 1905, 100.4 per cent; in the year 1906, 168.6 per cent; in the year 1907, 191.1 per cent; 1908, 102.3 per cent; 1909, 190.95 per cent; 1910, 121.24 per cent; 1911, 38.66 per cent; 1912, 124.16 per cent; 1913, 135.31 per cent; and that in addition to that, upon that 40,000 acre-foot draft, he was obliged to waste over his spillway out of the water available under the appropriation the following percentages of the assumed draft, to-wit: In the year 1902, 29.7 per cent; in the year 1907, 62.39 per cent; equal to 24,957 acre feet in that year; in the year 1908, 9.44 per cent; in the year 1909, 93.76 per cent, equal in that year to 37,505 acre-feet; in the year 1910, 77.96 per cent, equal in that year to 31,183 acre feet. I will ask you to state whether, in your judgment when such results as that are shown in respect to the quantity left in the reservoir at the end of the season, after furnishing the assumed draft, and in respect to the quantity necessarily wasted over the spillway, because of full reservoir, that is a proper and economic method and draft upon which that reservoir ought to be operated?

A. No sir, I don't think it is.

Q. Upon the assumed draft of 50,000 acre-feet, according to Mr. Field's estimates, after furnishing the yearly quota of 50,000 acre-feet, or such percentage as I have already indicated to you, he had at the end of each year the following percentage of his assumed annual draft left in the reservoir: 1901, 114.24 per cent; 1902, 31.64 per cent; 1903, 6.57 per cent; 1904, 8.77 per cent; 1905, 60.75 per cent; 1906, 96.60 per cent; 1907, 140.54 per cent; 1908, 56.14 per cent; 1909, 108.46 per cent; 1910, 77.33 per cent; 1911, 3.13 per cent; 1912, 53.79 per cent; 1913, 45.02 per cent; and in addition to that, out of the appropriation wasted certain quantities over the spillway, the exact amounts of which have not been computed. Considering the reserves left in the reservoir on the 50,000 acre-foot draft at the end of each year, would the reservoir stand an annual draft of 50,000 acre-feet according to Mr. Field's estimate?

A. Undoubtedly would, for irrigation purposes.

1021 Q. That is what I mean.

A. Yes sir.

Q. And in proper and economic irrigation practice, would you leave reserves in the irrigation reservoir to that extent at the end of each season?

A. No sir; not in actual practice.

The Master: Mr. Dorsey, does your question mean that the percentages named were in the reservoir at the end of the irrigation season, or at the end of the calendar year?

Mr. Dorsey: At the end of the calendar year is what I meant, if I did not state it.

Q. State whether or not the end of the calendar year or the beginning of the calendar year, which is the same thing, is in advance of the ordinary period in which irrigation reservoirs are filled?

A. It is in advance of the period where they get the major portion of the water. Ordinarily, there is a comparatively small volume of water for storage in the fall. The floods come in the spring.

Q. Mr. Fellows, also a witness for the defendants, made some estimates of the same sort. The periods which he chose, as I understand his exhibit, practically corresponded with what is ordinarily termed the irrigation season—that is to say, from November 1st to November 1st. According to the testimony and the exhibit of Mr. Fellows upon that subject, which is Exhibit 44, by his estimates of possible and actual storages in Lake Cheesman upon an assumed draft of 40,000 acre-feet, for a period of fourteen years, beginning in the year 1900, so far as the facts which he gathered were concerned, he got these results in respect to efficiency. In twelve of those years an efficiency of 100 per cent, and in two of those years, or irrigation seasons, as it was in his case, namely, that of 1903 and 1904, he got an efficiency of 77 per cent and 62 per cent, or an average efficiency for the 14-year period of 95.6 per cent. Also, upon his estimates as to possible and actual storage in Lake Cheesman and upon the assumption of a 50,000 acre-foot draft, he got these results as to percentages of efficiency in the fourteen-season period. In ten of those seasons, 100 per cent efficiency; in one of them, corresponding to 1903, 28 per cent; in another, corresponding to 1904, 51 per cent; in another, corresponding to 1909, 98 per cent; and in another, corresponding to 1911, 97 per cent, making an average efficiency on the 50,000 acre-foot draft of 91 per cent. State whether or not, in your judgment, there is a sufficient difference in the percentages of efficiency shown upon the 40,000 acre-foot draft and the 50,000 acre-foot draft, respectively, to make any difference in the market price or value per acre-foot of the water rights?

A. No sir; I don't think there is sufficient difference in the efficiency to make any difference in the market value of the water rights.

1022 Q. I call your attention to the fact that upon the 40,000 acre-foot draft, as estimated and testified to by Mr. Fellows, and as shown by his Exhibit 44 for this period of fourteen years beginning in 1900—fourteen seasons—he had left at the end of each irrigation season—that is to say, on November 1st of each year—the following percentages of his assumed draft in his reservoir before he began to store for the following season, to-wit: In the first year 133.68 per cent; the second year, 107.83 per cent; the third year, 58.79 per cent; the fourth year, nothing; the fifth year, 1.78 per cent; the fourth and fifth years corresponding with the calendar seasons of 1903 and 1904; in the sixth year, 64.90 per cent; the seventh year, 89.93 per cent; the eighth year, 177. per cent; the ninth year, 92.24 per cent; the tenth year, 181.67 per cent; the eleventh year, 107.83 per cent; the twelfth year, 40.25 per cent; the thirteenth year, 131 per cent; the fourteenth year, 154 per cent; and in addition to that, in each of those seasons, out of the waters avail-

able under the appropriation of Lake Cheesman, he wasted over the spillway the following percentages of his total assumed draft, to-wit; In the first year, 157.5 per cent, equivalent to 63,005 acre-feet; the second year, 23.4 per cent, equipment to 9,359 acre-feet; the eighth year, 25.9 per cent, equivalent to 10,360 acre-feet; the ninth year, 18.4 per cent, equivalent to 7,367 acre-feet; the eleventh year, 118.8 per cent, equivalent to 47,516 acre-feet; and the fourteenth year 4.5 per cent, equivalent to 1,825 acre-feet. In your judgment, considering the quantity left in the reservoir at the end of each irrigation season, as so indicated, and the quantity necessarily wasted over the spillway because of a full reservoir, upon the assumed draft of 40,000 acre-feet, is a draft of 40,000 acre-feet the proper and economic draft annually at which to operate that reservoir in proper irrigation practice?

A. No sir; it is not.

Q. Why not?

A. Too much water wasted; too much held over.

Q. Just what do you mean by that? That the draft could be properly and economically increased, and that it could be operated at a higher draft in a manner satisfactory to the consumer?

A. Yes sir. It could be operated at a higher draft, with equal satisfaction to the consumers, and with a good deal less waste of water.

Q. Is that also what you meant in respect to Mr. Field's estimates of operation at a 40,000 acre-foot draft, in the same regard?

A. Yes.

Q. Mr. Fellows also has figured, according to his estimates upon operating the reservoir at an annual draft of 50,00 acre-feet, and he covers the same period with his figures—fourteen irrigation
1023 seasons, beginning with that of 1900. Operating according to his figures, as shown by his Exhibit 44, on the 50,000 acre-foot draft, he has left in the reservoir at the end of each irrigation season and before commencing to store for the next, the following percentages of his annual draft: The first year or season, 95 per cent; the second year, 69.5 per cent; the third year, 11.2 per cent; the fourth year, corresponding to 1903, nothing; the fifth year, corresponding to 1904, nothing; the sixth year, 31.4 per cent; the seventh year, 32.8 per cent; the eighth year, 84.3 per cent; the ninth year, 13.3 per cent; the tenth year, 70 per cent; the eleventh year, 69.5 per cent; the twelfth year, corresponding to 1911, nothing; the thirteenth year, 54.7 per cent; the fourteenth year, 59.4 per cent; and at the same time, under those conditions, was obliged to waste over the spillway, because of full reservoir, the following quantities in percentages of the assumed annual draft: The first year, 118 per cent, equivalent to 59,005 acre-feet; the second year, 4 per cent, equivalent to 2,024 acre-feet; and the eleventh year, 15.3 per cent, equivalent to 7,630 acre-feet. Considering the reserve or the quantity held in the reservoir at the end of each irrigation season and the quantities necessarily wasted over the spillway upon the 50,-000 acre-foot draft, as estimated by Mr. Fellows, what do you say as to whether or not the 50,000 acre-foot draft annually is as high a

draft as, according to his estimates, the reservoir could be operated at, properly, economically, and to the satisfaction of consumers?

A. According to his estimates, I think it could be operated at a slightly higher draft—not much higher.

Q. Mr. Bull also made estimates upon this subject, as shown by his Exhibit 39. Mr. Bull, in his Exhibit 39, sets forth his testimony upon the subject, according to his estimates of total possible storage and of actual storage in Lake Cheesman, determined what the results would be upon an assumed draft as follows: 40,000 acre-feet annually, 50,000 acre-feet annually and 60,000 acre-feet annually for the period 1901 to 1913, inclusive. On the 40,000 acre-foot annual draft he showed an efficiency of 100 per cent in each of the thirteen years; on the 50,000 acre-foot draft he showed an average efficiency of 93.2 per cent for the period of thirteen years, made up as follows: Ten years of 100 per cent efficiency, one year of 57.98 per cent efficiency, one year of 70.38 per cent of efficiency and one year of 82.99 per cent of efficiency; the low year being caused, as his exhibit shows, by the slight supply of 1902.

A. Pardon me, what was the percentage in the low year?

Q. 57.98. And on the 60,000 acre-foot draft, as estimated by him, according to his assumptions for the same period of
1024 thirteen years, he showed an average efficiency of 84.8 per cent, made up as follows: Eight years out of the thirteen, 100 per cent; and of the other years, 1902, 95.2 per cent; 1903, 19.5 per cent; 1904, 58.6 per cent; 1911, 42.9 per cent; 1913, 86.6 per cent. I will ask you to state whether or not, in your judgment, there is a sufficient difference in efficiency, according to Mr. Bull's estimates and upon those various assumptions of annual draft, to make any difference in the market price or value per acre-foot of a water right under the lake ?

A. As between the 40,000 and 50,000 acre-foot drafts, no difference. As between the 50,000 and 60,000 acre-foot drafts, there might be a slight difference, but not enough to justify the operating on the lower draft. I might say, if you will permit, that giving an estimate on these high percentages of efficiency is to me a little absurd, because, while I know the reservoirs of Colorado pretty well, I don't know of any that actually give an efficiency like many of these mentioned. I would like to, therefore, qualify my statemnt.

Q. When you say that you don't know of any reservoirs which give an efficiency like these estimated here, you mean that you don't know of any so high, or that you don't know of any so low?

A. I don't know of any so high as most of the figures you have called.

Q. About what percentage of difference would there be in the unit price as between the 50,000 and the 60,000 acre-foot annual draft as estimated by Mr. Bull?

A. Not to exceed five per cent.

Q. Mr. Anderson also made an estimate on behalf of the complainant for the years corresponding with those estimated by Mr. Bull, and upon an assumed draft of 60,000 acre feet, and Mr. Bull in his Exhibit 39 set forth the figures found by Mr. Anderson, as he under-

stood them, and upon that assumption of 60,000 acre-feet Mr. Anderson's results, as shown by Mr. Bull, gave a percentage of efficiency for Lake Cheesman of 100 per cent for ten years out of the thirteen years, from 1901 to 1913, inclusive and for the other years the following percentages of efficiency: In 1903, 27 per cent; in 1904, 59.2 per cent; and in 1911, 84.2 per cent, giving an average efficiency for the entire 13-year period of 90 per cent. As between the efficiencies shown by Mr. Bull upon his estimate and assumed draft of 50,000 acre feet per annum of 93.2 per cent, and Mr. Anderson's efficiency as determined by Mr. Bull on the 60,000 acre-foot draft (not Mr. Anderson's efficiency but that of Lake Cheesman, according to Mr. Anderson's exhibit), of 90 per cent, what do you say as to whether or not there is a sufficient difference in efficiency to cause any dif-
1025 ference in the market price or value per acre-foot?

A. There isn't a sufficient difference in efficiency to cause any difference in the market price on those two bases.

Q. As between Mr. Bull's estimate, according to his figures, and upon his assumed draft of 60,000 acre-feet per annum, yielding an average efficiency of 84.8 per cent, as before stated, and Mr. Bull's figures in respect to the estimates of Mr. Anderson, upon an assumed draft of 60,000 acre-feet annually, yielding an average efficiency of 90 per cent, made up in the manner described awhile ago, is there enough difference between those two estimates and efficiencies to create any difference in price or value per acre-foot?

A. I think there would be a slight difference in favor of Mr. Anderson's efficiency, as to value.

Cross-examination by Mr. Nye:

Have lived in Colorado 27 years. For seven years prior to 1894 was employed in a real estate office, the principal business of which was making loans. In 1894 I entered the employ of The Colorado Mortgage and Investment Company. Remained with them about 12 years in charge of their outside lands and ditches. At first only a portion of them. After a few years all of them. It controlled the High Line, Evans No. 2, Larimer a nd Weld, Loveland and Greeley, ditches, and was interested in the Lower Latham and some ditches on Boulder creek.

It controlled the Loveland and Greeley Reservoir with a capacity of about 15,000 acre feet. I kept the record of water run from that reservoir but did not have personal charge of operation. I managed the High Line, Evans No. 2, and Loveland and Greeley Ditches. Since leaving the employ of The Colorado Mortgage and Investment Company, I have had personal charge of the Lupton Bottom, Meadow Island and Ellwood ditches, during 1907, 1908. And since then have been connected with ditches in District No. 2, as secretary of The Consolidated Ditches Company. As secretary of that organization have had charge of the observation of the distribution of water on the river above and below District No. 2, in all districts tributary to the river. Have been a director in the Antero and Lost Park Reservoir Company. Have not had direct personal charge in the management of any reservoir property except the Greeley and Loveland and

the Antero and Lost Park, but have represented large stockholders in other systems. Have sold something like 10,000 acre feet of water rights from the Antero and Lost Park Systems. The prices ranging from $25 to $35 per acre foot capacity. The average delivery under the rights so sold has been from one-half to three-quarters of an acre foot.

1026 The last sale I made was about June 1st, 1914. It was for a private individual. The price I think was $27.50 per acre foot. I became associated with the Antero and Lost Park Reservoir Company at its organization in 1907. Was elected director at its first annual meeting, am now a director. Am also a director in The Tarryall Canal and Reservoir Company and The Interstate Irrigation and Land Company. Am not connected with any irrigation company except those drawing water from the Platte river or tributaries above Denver. My connections with companies in the Poudre, Big Thompson, and St. Vrain districts, ceased from 7 to 9 years ago.

Was actively engaged for the Colorado Mortgage and Investment Company in selling land and water in the Poudre valley for a period starting 15 years ago and ending 9 or 10 years ago. This company was largely interested in the ownership of lands, ditches and reservoirs and in the construction of reservoirs there. The company also had under cultivation in that district from 4,000 to 5,000 acres of land. It was during the progress of that work that I became intimately acquainted with the irrigation systems in Northern Colorado. Have made investigations of the value of water in that section during the last year. I think the information is just as explicit as the information I had years ago, except that it is more dependent upon information received from others. Have never been regularly employed by the D. U. W. Co. Am employed in connection with this case and was employed during the 1907 appraisal in connection with water right matters. Part of my work in connection with The Consolidated Ditches Company consists of ascertaining what infringements are being made by other districts or ditches upon the rights of those ditches. I have probably participated in 25 suits relating to such questions. No such suits have been brought by the Consolidated Ditches Company against the D. U. W. Co. Matters have come up from time to time which have been discussed and adjusted. As to the waste gates of the ditches, regarding which I testified, I know that the law provides that proper waste gates and waste ways shall be provided for conveying all surplus water back to the river. I do not know that any of these do not comply with the law, but in my judgment there are a good many of them that are not made necessary by the law. The Lupton Bottom Ditch, which I testified obtained a portion of its supply from waste water in Big Dry creek, has no decree from Big Dry creek. All of its decrees are from the Platte river. It was not my intention in calling attention to the manner in which some of the water records in District No. 8 were kept for the

1027 year 1913 to discredit all the testimony in this case on account of the deficiencies in those records.

There are many ditches on the river that do not make a practice of diverting a full volume of water at the headgate and regulating

at waste gates. One of them is the High Line, which frequently, except in dry seasons, does not divert its capacity, though the water is available for it at Platte Canon. Others are the Platteville, and the Brantner. When I said that the Last Chance and these other ditches were accustomed to draw rather a full volume of water and regulate it at the waste gates, I meant a good volume of water to work with, not necessarily the full capacity of the ditch. I did not intend to intimate that these ditches in diverting a rather full volume were diverting more than their decrees or even the amount of their decrees. But I intended to be understood that in my judgment they were diverting more than they were entitled to divert because they were not applying the water to a beneficial use. I think I was justified in that conclusion if they wasted it back into the river or if they applied it wastefully.

The water that is wasted back into the stream by these several ditches is available for use by other ditches below. There has been an increase in the acreage irrigated under the High Line ditch of 10 or 15 per cent as a result of the application of the supplementary reservoir supply. Those acres were not irrigated at all before the additional supply was provided. The original direct supply has been used as an early season supply on this additional acreage but there has been no enlarged use of water in the sense that the direct flow diversion has been increased. About 12,000 acre feet of stored water has been sold under the Antero and Lost Park system and the remainder of the capacity contracted for sale under the Doherty contract, which will expire the 15th of this month unless it is taken up or extended. The present capacity of Antero Reservoir is 58,000 acre feet. The state engineer has never permitted, nor has the company asked for permission to store more than 40,000 acre feet because of the condition of the riprapping and concrete face of the dam. Personally I would not feel justified in storing that much with the riprapping in its present condition. My statement of opinion that there was no possibility of material increase in the acreage irrigated under the High Line referred to the possibility of increase under its direct rights. It is my opinion that the acreage will be increased by the use of additional stored water. The rights sold out of the Antero reservoir are all supplemental rights. There have been no rights sold out of the Lost Park reservoir which is not yet completed.

1028 Exhibit A.57, is a true copy of the provisions of the decree relating to certain reservoirs about which I testified on direct examination. Offered and admitted. The decree was entered about a year ago. The proceedings in relation to this adjudication had not been commenced in May, 1908, and I rather think had not been commenced in July, 1910. The decree of Jefferson Lake, June 25, 1888, is prior to Lake Cheesman, and that of the Michigan Reservoir, Sept. 21, 1891, is prior to the second priority of Lake Cheesman. Aside from these there are only two other priorities prior in time to July 1, 1908, namely, The Lost Park Reservoir and the Antero Reservoir. When I testified to the 207,550 acre feet of decreed capacities under this decree, I did not mean that those figures represented demand upon the stream under existing construction, which would be far less than the decreed capacity. The present capacity

of the Antero, being about 50% of its decreed capacity. That of the Lost Park reservoir, less, and the Link-Slater reservoir under its present construction has no storage capacity. It is my opinion that an increase in the acreage under the High Line Ditch due to the use of stored water will not increase the demand for direct flow water.

Any additional direct supply that the High Line might obtain would be very spasmodic and would not justify an extension in acreage that would increase the demand for direct flow water. The increase in the Poudre valley practically doubling the acreage irrigated there was due entirely to the addition of stored water. I don't know as to every one of the hundred or more ditches taking the water out of the Poudre river. I testified about three or four specifically. That is not the limit of my knowledge of ditches in the Poudre valley, but I do not know about all of them. I am at present farming two or three thousand acres of land under irrigation, partly on my own account, partly for others. Most of them under the High Line Ditch. Most of the lands have both direct and storage rights, some only direct rights. Last year I farmed some lands under the Rocky Mountain ditch. And up to three or four years ago under a number of other ditches, concerning which I have testified.

In general, the only ditches that have any considerable amount of land irrigable but not irrigated under them are the ditches that I call flood water ditches. Under the ditches having rights capable of an increased use, little or no land is available that is not now irrigated. Until it is actually worked out it is impossible to say how many of the 110,000 acres capable of irrigation under the High Line will take reservoir water, either as a sole or supplemental supply. Both the Lower Latham and the Evans No. 2 ditches have their intakes above the ridge that I mentioned between Beebee draw and
1029 Box Elder creek. The Lower Latham is located about 20 miles down stream from the Evans No. 2 and goes around the north end of the ridge without touching it. Milton Lake is located in Beebee draw and is supplied from the South Platte River and from such floods as come down the draw. The Horse Creek reservoir has been operated for two or three years, serving lands under the Henrylyn system. I stated that direct flow rights are not comparable with storage rights, because the diversion is limited by the decree. If an irrigator under a direct flow system has a right to 1 second foot of water, which is available at any time at any year, he diverts under that a certain volume of water. If he had a reservoir supply he could divert that same volume of water at the rate of 5 cubic feet per second with better results.

A man who has a storage right may take 5 second feet one day instead of one second foot for five days. In ditches where a reservoir supply has been used for a number of years they maintain a sufficient head of water in the ditch, which can be regulated day by day on short notice, so that the consumers, subject to reasonable rules, can get the water whenever they want it and in such volume as they want it. The reservoirs do not maintain a greater head than the users want. The users notify the company when they wish the water. The volume turned into the ditches is regulated every day at the respective reservoirs according to the needs of the owners of

storage rights under the system. In other words, the regulation of the reservoir is on the demand of the consumer. In case of shortages in the supply each man gets his proportionate share so long as the water lasts. The method of operation is the same. Water is run in practically continuous flow in the latter part of the irrigating season after the direct flow supply ceases. There are cases like the Antero reservoir, where the stored water is discharged in periodical runs for a certain number of days, and the irrigators take their water during these runs.

So far as the individual irrigator is concerned, there is no difference between a direct flow right that furnishes him all the water he needs when he wants it and a reservoir right that does the same. But volume for volume, stored water is worth twice as much as direct flow water, because of the season in which it comes. An acre-foot of water available in August is worth more than an acre-foot available in May, if it is available only in May. It is my judgment that reservoir water used as a sole supply and required at all times in the irrigating season is not as valuable as such water used as a supplemental supply. So as a sole source of supply, reservoir water is measured in its value by the period at which it is used, just
1030 the same as if it were part direct and part reservoir. In the case of the Home Supply Ditch, I stated that the value of the combined direct flow and storage rights was $45 per acre-foot and that the stored water was worth twice as much as the direct flow water, making the value of the stored water, in round numbers, $60 per acre-foot and the direct flow water $30 per acre foot.

I do not think that the variations in efficiency of Lake Cheesman, as estimated by the several witnesses, concerning whose estimates I was interrogated on direct, are of sufficient moment to materially vary the market value of the water from the reservoir. I understand that in the cases of witnesses Field and Bull, that the amounts of water carried over from year to year were based on the conditions at the end of the calendar year, also considered that the period at the end of the irrigation season, November 1 to January 1, is usually a period of small stream flow and little storage.

In my opinion, the market value of storage water capable of equally efficient service, is generally the same without regard to the reservoir from which it is obtained. I do not know of any reservoir giving so high an efficiency as that covered by most of the figures for Lake Cheesman. I know the efficiency of a number of reservoirs in addition to those in which I have been directly interested; among them Lake Loveland, The Seven Lakes and the Lower Latham reservoir.

Lake Loveland is recognized as one of the most efficient reservoirs in the whole Greeley district. I operated it in 1902, when it stored less than 5% of its capacity, and I think I am justified in saying that all the reservoirs in the Big Thompson District stored no water that year. I see no engineering difficulties in the way of figuring out reservoir efficiency if you have accurate records.

Redirect examination by Mr. Dorsey:

The Colorado Mortgage and Investment Company was commonly

known as the English company. Its operations were along the line of construction, development and operation of irrigation enterprises, purchase and sale of lands, and making of loans. It owned and farmed large bodies of land. It owned in Northern Colorado 75,000 or 80,000 acres. Its principal irrigation construction was the Larimer and Weld, Loveland and Greeley, Evans No. 2 and the High Line Ditches. Lands lying behind the ridge, which I have described as obstructing the Evans No. 2 and other ditches, cannot be irrigated from the Lower Latham Ditch, which passes north of the ridge, because they lie above it. If the Evans No. 2 were extended to go around the ridge it would reach only a small portion of them
1031 because of the loss of elevation in going around. Plans have been made to irrigate these lands through the Burlington Ditch, which lies above the ridge. Storage rights out of the Antero reservoir have been sold on the basis of the ultimate capacity of the reservoir, 85,600 acre-feet.

When I stated that the acreage under the High Line might be increased through the use of supplemental storage supply, I referred to the acreage now irrigated, about 24,000 acres. Not to the 110,000 acres capable of being irrigated under the ditch. In mentioning the ditches under which I had carried on farming operations I omitted the Farmers High Line, under which I farmed 320 acres for 10 or 12 years up to six or seven years ago. I have been familiar with the farm since and sold a portion of it within the last three months. Objection sustained as to interrogation in re how much of the 100,000 acre-feet of the D. U. W. Co.'s supply might be absorbed by the remainder of the 110,000 acres capable of irrigation under the High Line Ditch. Exception. The limitations of decrees are the same in the case of direct flow rights under a ditch of early priority, as under flood water ditches. In the operation of reservoirs maintaining a reasonably constant discharge, the flow is regulated in accordance with requisitions from water consumers stating their needs in quantity and desires as to time of delivery of water.

In my opinion, the failures of supply that have occurred in Lake Cheesman, on the estimate of a 60,000 acre-foot annual draft, are not sufficient to affect the price or value per acre-foot of yield.

Recross-examination by Mr. Nye:

The sale of water rights by the Antero and Lost Park Reservoir Company has been confined to the Antero Reservoir. No rights have yet been sold from the Lost Park Reservoir. The only canal that the company owns through which these rights can be applied is the High Line. About 12,000 acre-feet out of the total capacity of 85,000 acre-feet of the Antero Reservoir rights have been sold to private owners independently of the Doherty contract. The Doherty contract included the sale of both the High Line Ditch and the Antero Reservoir, so that whatever direct flow rights were available were included in the contracted purchase.

I cannot state to what extent the acreage under that system may be increased under the combined supply, without passing upon the efficiency of both the High Line ditch and the Antero reservoir.

1032 Witness CHARLES W. COMSTOCK.

Direct examination by Mr. Dorsey:

Have made a study of the duty, in acre-feet per acre, of the original water flowing out of Platte Canon at the head of District No. 8, with respect to the acreage irrigated in Districts Nos. 8 and 2, combined, as compared with the duty of like original water of the Poudre river at the head of District No. 3, as testified to by defendants' witness, John E. Field, in the case of the State of Wyoming against the State of Colorado. Transcript of which is Exhibit A.65 in this case. Mr. Field stated the total discharge of the Poudre river at the head of District No. 3 to be 1.35 acre-feet per annum per acre irrigated in the district. He stated that a discharge of 254,000 acre-feet was necessary at Platte Canon in the seven months from April to October, inclusive, to supply the acreage irrigated in Districts 8 and 2, under ditches prior in right to Lake Cheesman. The largest acreage reported in these districts is 120,000 in 1912, making the original water duty 2.12 acre-feet per acre at Platte Canon. The average acreage for four years, 1909 to 1912, is 112,000, on which the original water duty, according to his estimate, is 2.25 acre-feet per annum per acre. These duties are based upon the entire acreage irrigated in the district without regard to whether they are irrigated from rights prior to, or subsequent to, Lake Cheesman. Exhibit A.78 is a map taken from the 14th Biennial Report of the State Engineer of Colorado, showing the boundaries of the various water districts. Offered and admitted. (Statement of the boundaries of Districts 2, 3 and 8.) Map marked to indicate the mouth of Poudre canon with reference to irrigated area in District No. 3, and Platte Canon with reference to irrigated area in Districts 2 and 8. Water District No. 1 lies immediately below districts 2 and 3, and water from both 2 and 3 is discharged into District No. 1, which extends east to the east line of Morgan County.

The accretions to the Poudre river between the canon and the mouth of the river, where it discharges into the Platte, are very small. With possibly one exception its tributaries discharge water only at flood periods. District No. 3 embraces the entire watershed of the Poudre from the canon to its mouth. The accretion to the South Platte in Districts Nos. 2 and 8, between Platte Canon and the junction of the Platte and Poudre at the lower end of District No. 2 is very considerable. Its principal tributaries being Plum creek, Bear creek, Cherry creek, Clear creek, and the St. Vrain and Big Thompson rivers. A number of other creeks contribute a good deal of water at flood periods. In Exhibit A.65 Mr. Field stated
1033 that the total accretions to the Poudre river between the mouth of the canon and the lower end of District No. 3 amounted to 10,000 acre-feet annually. The accretions to the South Platte in Districts 8 and 2 exceed that many times.

I do not know how much because there are no gauging stations. The distance from the mouth of Poudre canon to the lower end of District No. 3 is from 35 to 40 miles. The distance from Platte Canon to the lower end of District No. 2 is about 75 miles. The irrigated area in Districts 2 and 8 is much narower and longer

than in District No. 3, and the seepage and return flow is greater. Topographically, and in a general way, geologically, all of these districts are alike. Mr. Fellows, making an estimate similar to that of Mr. Field, stated a requirement in original water at the mouth of Platte Canon for Districts 8 and 2 to be 223,467 acre-feet during the seven months, April to October, equivalent to a duty of 2 acre-feet per acre on the average acreage irrigated in the period 1909 to 1912, or 1.86 acre-feet per acre on the acreage irrigated in these districts in the year 1912. The estimates of both Mr. Field and Mr. Fellows are on the amount of original water required at the head of the districts, entirely disregarding accretions from tributary streams. Mr. Fellows in determining storage available at Lake Cheesman took the total discharge of the stream, month by month, at Platte Canon, and from each month's discharge deducted his estimate of the amount required for irrigation in that month, without regard to how the flow occurred. It frequently happens that a month's record will be made up of a large number of days of very low flow and a few days of very high flow, during which storage would be permitted because of the inability of ditches to take all the water. This condition received no consideration under Mr. Fellows' method, because the average result for the month, expressed in total acre-feet, may show insufficient water for his demand, though in fact the few days of very high water might afford a considerable amount of legitimate and proper storage. I have examined the daily records of stream flow and find variations of as much as several hundred second feet from one day to the next.

The average annual discharge of the South Platte river at Platte Canon shown by all the records that are available, from 1887 to 1913, is 242,270 acre feet. And the average discharge per year for the seven months, April to October, is 201,826 acre feet.

Mr. Field's estimate of 254,000 acre feet, required for irrigation during those seven months, is 52,000 acre feet more than the average yield of the river.

1034 Mr. Fellows' requirement of 223,467 acre feet is about 22,000 acre feet more than the average yield of the river, and those requirements are only for ditches prior to Lake Cheesman.

Mr. Field's requirements for the seven months, are approximately 12,000 acre feet more than the average yield of the river for an entire year. The actual average monthly discharge of the Platte river at the mouth of the canon for the period 1887 to 1913, is insufficient to meet the requirements of either Mr. Field or Mr. Fellows except in two months of the seven which they include in the irrigation period. Those two months being April and May. Measurements are not available for all of the months in all of the years. Different months being missing in different years.

In two years out of eighteen available the discharge of the river in the month of April was insufficient to meet the requirements of Mr. Field.

In ten years out of 21 years available it was insufficient in the month of May.

In 13 years out of a total of 21 available it was insufficient in the month of June.

In 19 years out of a total of 22 available it was insufficient in the months of July and August.

In 21 years out of a total of 22 available it was insufficient in the month of September.

In 15 years out of a total of 21 available it was insufficient in the month of October. I will prepare a similar comparison of stream flow available to meet the demands on the canon by the ditches below as specified by Mr. Fellows.

According to the annual report of the division engineer for Division No. 1. The following are the acreages irrigated under the Nevada and Last Chance ditches and the duty of water for the years 1909 to 1913, inclusive. The Nevada ditch, 1909, 1,701 acres, duty, 4.94 acre feet per acre; 1910, 1,425 acres, duty, 6.28 acre feet per acre; 1911, 1,640 acres, duty 7.84 acre feet; 1912, 1,778 acres, duty, 4.68 acre feet; 1913, 1,640 acres, duty, 12.27 acre feet per acre. Last Chance ditch 1909, 960 acres, duty 4.34 acre feet; 1910, 1,017 acres, duty, 4.69 acre feet; 1911, 1,065 acres, duty, 4.72 acre feet; 1912, 1,115 acres, duty, 6.52 acre feet; 1913, 1,100 acres, duty, 7.88 acre feet.

The average diversion of water in Districts 2 and 8, for the years 1909 to 1912 inclusive, is 3.58 acre feet per acre. In districts Nos. 3, 4, 5, 6, and 7, the average diversion of water in the years 1909 to 1912, inclusive, is 1.31 acre feet per acre. Shown by Exhibit A-799. Offered and admitted. These are the districts that adjoin Districts Nos. 2 and 8. The irrigated area in District No. 3 is
1035 approximately double the area in Districts 2 and 8. District No. 4 approximately 100,000 acres. No. 5, 90,000 to 100,000 acres. No. 6, approximately 90,000 acres. No. 7, approximately 90,000 acres. The four years' average for Districts 2 and 8 was 112,000 acres. As to topography, soil and climate, Districts, 3, 4, 5, 6, & 7, are as nearly like Districts 2 and 8 as two areas can be. In making my computations of available storage in Lake Cheesman, I took into consideration the requirements of the Platte Canon ditch, basing my estimates on the daily stream flow in the river at Platte Canon. Exhibit A-80, shows the shortages of supply to the Platte Canon ditch based on daily records of stream flow to the extent that they are available, after I had deducted from the stream flow the quantities available for storage in Lake Cheesman and also taking into consideration the shortages occasioned by actual deficiencies in the stream which were not affected by storage allowed for Lake Cheesman, and the demands of ditches prior in time to the Platte Canon Ditch.

Omitting the year 1902, the year of lowest stream flow, the average efficiency of the Platte Canon Ditch after making these deductions is in excess of 94%. Exhibit A-81 shows the quantities of water that would be available in the river for other uses after I have made deductions for the storage allowed for Lake Cheesman in my estimate. The table is based upon the record of daily stream flow to the extent that such record is available. It shows an average annual discharge after storage is deducted of 187,186 acre feet, and an average discharge per year for the months of the irrigation season, May to October, of 144,213 acre feet. In estimating storage for

Lake Cheesman, I allowed no storage in excess of the capacity of the lake, 79,064 acre feet, in any one year. Whenever the possible storage exceeded that I took out only the capacity.

The exhibit covers the years from 1900 to 1913, inclusive, and is based upon all of the records of stream flow that are available. The total annual discharge at Platte Canon, shown by Exhibit A-81, after deducting my estimate of available storage, is equivalent to 1.56 acre feet per acre on the 120,000 acres reported in Districts 8 and 2 for 1912, at 1.67 acre feet per acre for the average acreage for the years 1909 to 1912. These figures being comparable with the 1.35 acre feet stated by Mr. Field as available in District No. 3 as shown by Exhibit A-65. In arriving at his figures, 1.35 acre feet per acre in District No. 3, Mr. Field included the entire annual flow of the Poudre river. Making the computation on the basis of the supply available at Platte Canon in the months of May to October, after deducting estimated storage, the quantity is equivalent to 1.2 acre feet per acre for the acreage reported in Districts No. 2 and 8 for the year 1912, and 1.3 acre feet for the average acreage for the years 1909 to 1912 inclusive. The use of these acreages in Districts 2 and 8 disregard whether they are irrigated under priorities antedating, or subsequent to, the priority of Lake Cheesman. Exhibit A-81 offered (not admitted).

1036

Exhibit A-82, is a record of precipitation and temperatures from United States Weather Bureau stations located in the neighborhood of water districts 2, 3, 4, 5, 6, 7 and 8. The statement of altitude at the several stations, is also from the Weather Bureau records. Offered and admitted. Objection. Exception.

Denver is located on the line between districts 8 and 2, south of the geopraphical center of the districts, from north to south, and about in the center of the districts from east to west. Fort Lupton is located in District No. 2 north of the geographical center of the district, from north to south, and about in the center from east to west.

The average of the precipitation between Fort Lupton and Denver would be a fair average on the irrigated lands in Districts 2 and 8. Longmont is in Water District No. 5. Loveland is in District No. 4. Fort Collins and Greeley in District No. 3. The average of the precipitation between Fort Collins and Greeley would fairly represent the average on the irrigated land in District No. 3. Cheyenne is located from 30 to 35 miles north of the North boundary of District No. 3, and 107 miles north of Denver. Much farther away from any important mountains than Denver. The average of the precipitation at Denver, Greeley and Cheyenne would not be a fair average of the precipitation on the irrigated lands in Districts 8 and 2. Its distance from the district as compared with stations at Greeley and Denver should exclude it from consideration. The record of precipitation at Boulder, Longmont, Boothroyd's ranch, and Fort Collins, would not fairly represent the average precipitation upon the irrigated lands in Districts 3, 4, 5, 6 and 7. All of the stations, except Longmont, are well to the west of the irrigated area and well in the foot hills and the precipitation is not fairly indicative of the pre-

cipitation on the irrigated lands in the districts named. Exhibit A-83 shows from all available records the discharge of the South Platte River at South Platte or Platte Canon in each month of each year since the record has been kept. Offered and admitted.

The record is without any deductions on account of storage at Lake Cheesman, and shows the discharges on which I based my statement concerning the ability of the river to satisfy the requirements set forth by Mr. Field. I have made a determination of the ability of the average monthly discharge of the South Platte
1037 river at Platte Canon to meet the demands specified by Mr. Fellows as necessary to satisfy the requirements of the ditches below, prior in point of time to Lake Cheesman. There is no record in April of any year in which the supply would have been insufficient.

In five years out of 21, where records are available, the supply would have been insufficient in May.

In 14 years out of 21 available, it would have been insufficient in June.

In 18 years out of 22 available, it would have been insufficient in July.

In 14 years out of 22 available, it would have been insufficient in August.

In 19 out of 22 years available, it would have been insufficient in September.

And in 18 years out of 21 available, it would have been insufficient in October.

The requirements specified by Messrs. Field and Fellows are for rights prior in time to Lake Cheesman and do not take into account the requirements of rights subsequent to Lake Cheesman. Exhibits A-84 and A-85, are hydrographs showing the daily flows in the South Platte River for each day during all the years that records have been kept. The red line indicates the flow of the river as shown by the reports from gauging stations in Platte Canon. The green line represents my estimate of the water available for storage in Lake Cheesman. The yellow line represents my estimate of the quantity of water required at Platte Canon to supply rights prior to Lake Cheesman in Districts Nos. 2 and 8. The horizontal scale of the hydrograph is one millimeter for each day, the vertical scale one millimeter for 10 cubic feet per second. Whenever monthly averages were given and daily records were not available I have used the monthly averages, whenever there is nothing platted on the exhibit it indicates that neither daily nor monthly records were available.

The red line for the years since the construction of Lake Cheesman and the Antero reservoir represents the actual flow of the stream after these reservoirs had taken from the stream such quantities as they actually stored, or after they had added to the stream such quantities as they had discharged. Except where the stream flow is affected by either storage or discharge by Lake Cheesman or Antero, the distance from the green line up to the red line, indicates the quantity of water remaining in the stream after my estimated storage is taken out. There are times in the winter months when the green line appears above the red line, this does not indicate that

more water was storable than was in the river, because the red line represents the river after the water stored in Cheesman or
1038 Antero has been taken out. The variations in stream flow indicated by the red line are in chronological order day by day as they occurred. Exhibit A-85, is prepared in the same general way as Exhibit A-84, but the vertical scale is twice as large. The red line shows the quantity of water left in the river after taking out my estimate for storage in Lake Cheesman, in other words, it indicates my estimate of the actual storage which could occur, limited by the capacity of the reservoir each year. This was prepared from the stream flow tables showing the daily flow of the river corrected for storage or discharge at Lake Cheesman to indicate the conditions that would exist if Lake Cheesman had not been constructed. It was not corrected for the operations of Antero reservoir because no records are available from which such corrections could be made.

The yellow line indicates my estimate of the amount of water required to satisfy rights in Districts 2 and 8, prior to Lake Cheesman. Where the red line falls below the yellow line it indicates that the river was not sufficient to meet my estimate of the demand on it by rights prior to Lake Cheesman. Those shortages would have occurred if Lake Cheesman had not existed. In a general way the distance from the yellow line up to the red line represents the excess of water over and above my estimate of the requirements after storage for Lake Cheesman has been taken out.

It probably would have been better if Exhibit A-84 had been prepared from the tables of corrected stream flow rather than from the recorded stream flows, but work was started on it before the tables of corrected stream flow were worked up. The result of the preparation of A-84, from the recorded stream flow is to show over the period of years, one less filling for Lake Cheesman than could have actually been accomplished, plus whatever water was stored in Antero Reservoir at the close of 1913. In other words, Lake Cheesman was full at the close of 1913 and there was some water stored in Antero Reservoir. The aggregate of the storage in the two reservoirs is not accounted for in the stream flow tables, consequently the hydrograph record is short to that extent. Exhibits A-84 and A-85 offered and admitted. I was state engineer for 4 years in the period immediately preceding the present term of Mr. John E. Field. Water commissioners are men local to the districts which they represent. It has been my experience that in demanding water they work in the interest of their own district as much as possible without regard to the requirements or rights of adjoining districts. Their reports as to actual diversion, generally speaking, should be quite accurate. Gauges and rating flumes are provided in all ditches and if the water commissioner attends to his duties he has every
1039 possible facility for acquiring that information. I have examined the reports of the water commissioner of District No. 8 on the Nevada and Last Chance ditches for the year 1913, and I don't believe that those figures are correct. The water commissioner in that district in 1913 was a new man in his first season as commis-

sioner. The measurements of the diversions by the ditches are taken at or near the head gates, and if water is returned to the stream unused through waste gates located below the point of measurement, the water so returned would be included in the figures of diversion for the ditch.

The reports of the water commissioners as to the quantity of water flowing into, and out of, their districts are very frequently inaccurate. Though in some cases there is no excuse for inaccuracy. In the case of District No. 8 there is a gauging station in Platte Canon at the head of the district at which the water commissioner can always determine the amount of water flowing into the district. There is a gauge at Denver at the lower end of the district from which he can always determine the quantity of water flowing out of the district. The State engineer's office furnishes rating tables for these gauging stations for the information of the water commissioner. The gauge in Denver on the river also shows the quantity of water flowing into District No. 2 from District No. 8. There is no gauging station, however, at the lower end of District No. 2 from which the quantity of water flowing out of that district can be determined. No water flows out of either District 8 or District 2 except in the channel of the South Platte River. Exhibit A-86 shows the quantities of water reported by the water commissioner of District No. 8 as flowing out of his district, also the quantities reported by the water commissioner of District No. 2 as flowing into his district in the South Platte River, and a comparison with those reports of the actual gauge readings at Denver, for the same day or the nearest day, to the date of the water commissioner's report. July 3, 1909, the commissioner of District No. 8 reports 645 feet passing out of his district, on the same date the commissioner of District No. 2 reports 453 second feet entering his district. There was no gauge reading at Denver on the 3rd but on July 5, the gauge at Denver indicated 1930 second feet passing into District No. 2. The exhibit covers the period from 1909 to 1913 inclusive and the months of May, June, and July of 1914. The water commissioner of District No. 2 makes a report for every week in the year. The commissioner of District No. 8 for the irrigating season only. The exhibit deals only with the period for which there are simultaneous reports. The Denver gauge
1040 was in constant service throughout that period of years and constantly read and rated by employees of the State engineer's office. Except as indicated by the dates in parentheses the readings by the State engineer's office were on exactly the same dates as reported by the water commissioners. The water commissioner of District No. 2 receives information as to the quantity of water passing out of his district at the lower end from his deputy, who guesses at it. The statutes require, as do the forms of reports, that the water commissioners report the quantity of inflow from the tributaries in their district. There are no gauges where these streams flow into the Platte river, so the commissioners guess at them also. There are no devices in Districts 8 or 2 by which the seepage return can be measured. The commissioners fix the quantity of seepage at whatever may be necessary to balance their sheets. The commis-

sioner reports the amount of water entering his district in the main stream and through tributaries, the amount diverted by his ditches and the amount flowing out *if* his district. He needs something else to make up the quantity diverted plus what is going out, so he calls that seepage.

I do not consider that the actual diversion by the ditches is an indication of the real need of the ditch, or the land under it, in such cases as are presented in Districts 8 and 2 which are only partially developed districts. The total acreage irrigated in them has not exceeded 120,000 acres. I feel certain that the water of the Platte River handled either through reservoirs or directly out of the channel of the stream will ultimately be capable of irrigating satisfactorily double this acreage. The history of other districts has shown that that can be done.

I do not think it is proper to take the diversion of the ditches in District- 8 and 2 for the year 1913 as representing the actual needs for all the years in the future. I have stated that I do not believe the actual diversions are the real measure of the needs and I do not see how it is possible to select any one year and exclude all others unless that year be compared in all respects with the average of all the years of record. And if that comparison is made, that in itself indicates that the average of all of the years of record is the proper standard. The proper way to ascertain the needs for the future is to take a series of years and apply to each year the stream flow, tributary and seepage inflow, and the use, taking into consideration the precipitation, temperature, and all other things, that have a bearing on the problem. The years should be the longest period available. One cannot manufacture records of that kind, and if he cannot get a long series of years he must take what he can get. The flow in the tributary streams in Districts 8 and 2 is variable from year to year and frequently in the same year a large inflow from one
1041 stream is accompanied by a small inflow from a parallel tributary.

I have made no investigation to determine whether or not the year 1913 was a year of average stream flow in the Platte River and its tributaries supplying Districts 8 and 2, or in the accretions to the stream from seepage, or in precipitation, temperature, and diversion of water, by the various ditches.

In respect to the letters written by Mr. Cogswell, Division engineer of Irrigation Division No. 1, running from June 19, 1911, to Dec. 23, 1911, contained in Defendants' Exhibit No. 36 that were presented by Mr. Field. They were written while I was State engineer, at a time when the policy of the State engineer's office was to not recognize undecreed rights until after all decreed rights were satisfied, regardless of whether the decreed rights were of later date than the claim of the undecreed rights. At the time of this correspondence, neither Lake Cheesman nor the Antero Reservoir had decrees.

Under the rule of recognizing the decreed rights first, Lake Cheesman would not be permitted to store while any decreed rights were unsatisfied. The right of storage in a reservoir is regulated according to the conditions existing when the water available for

storage is at the reservoir, and not according to a theoretical condition that might exist along the stream when this water, as in the case of Lake Cheesman, might reach the headgates of any of the numerous ditches between Lake Cheesman and the Nebraska State line, where the South Platte River leaves the state. It takes about two days or more for the water from Lake Cheesman to flow down to the lower end of District No. 2, and from five or six days to flow down to the state line.

(Statement of method of measurement of stream flow at Lake Cheesman by consideration of gauge heights and discharge over spillway or through valves.) Because of the fact that there are tributary supplies to Lake Cheesman which cannot be measured, the final record is based upon the gauge heights, showing the elevation of water surface and the contents of the reservoir, checked against the discharge over the spillway or through the valves. This method of measurement includes in the results obtained whatever deduction there may be for loss due to evaporation or seepage, and in order to ascertain the exact flow of Lake Cheesman it would be necessary to add to this record whatever the loss from seepage and evaporation may be. In making my estimate of storage for Lake Cheesman on the basis of 70,000 acre-feet annual draft, I did not take into account the question of evaporation or seepage at all, because I considered that it would be necessary to add whatever evaporation might be estimated to the stream flow, which
1042 would add to the available storage, then I would deduct the evaporation again, getting back to the starting point, although as a matter of fact the ev-poration of Lake Cheesman operated as an irrigation reservoir, would be less than has been the case as Lake Cheesman has been operated in the past. In my original testimony concerning storage possibilities in Lake Cheesman, I used the stream flow of the South Platte River corrected for such storage as had occurred from June 24, 1908, up to the end of the year 1913. This data I obtained from the State engineer's office and was all the data there available. Prior to June 24, 1908, I used the actual daily record of stream flow as a basis for my storage estimate. Most of the storage that has been made in Lake Cheesman occurred prior to June 24, 1908. I could have obtained the data from which to correct the stream flow prior to June 24, 1908, from the water company, but up to the time that I gave my first testimony I had not gone to the water company's office or officers for any information whatever. The result is that my estimate of storage for the period prior to June 24, 1908, is an estimate of possible storage over and above that which actually took place in Lake Cheesman. Lake Cheesman was full, or practically so, in June, 1908. So my estimate of storage up to the middle of 1908 should be increased by the actual capacity of the reservoir distributed over that period. I did not take into consideration, either the quantity of water actually stored in Antero reservoir, as testified to by Mr. Wall, although that water was available for Lake Cheesman, or would have been had Cheesman been empty, or partly so.

Q. Mr. Comstock, various engineers have presented in this case

estimates relative to Lake Cheesman's possible and actual storages, which, according to their assumptions and estimates might be made there, and the results of the operations of the reservoir upon different assumed annual drafts. Mr. Field, for example, in his testimony and in his final exhibits Nos. 45 and 46, upon an assumed annual draft of 40,000 acre-feet, and for the twelve-year period 1902 to 1913; inclusive, showed an efficiency of the reservoir as follows: In eleven of the twelve years, 100 per cent, and in the other year, which was 1904, 81 per cent; also, according to his estimates of actual and possible storage and upon an assumed annual draft of 50,000 acre-feet, he showed for the reservoir an efficiency expressed in percentages as follows: For the period 1901 to 1913, a thirteen-year period, to-wit: Ten years, 100 per cent efficiency, and in the other three years the following efficiencies: In 1903, 61.5 per cent; in 1904, 45.9 per cent; in 1911, 89.71 per cent, thus arriving at an average efficiency on the 40,000 acre-foot draft and for the twelve-year period of 98.4 per cent, and an average per cent on the 50,000 acre-foot draft
1043 for the thirteen-year period of 92.08 per cent. I will ask you to state whether, in your judgment, there is a sufficient difference in the efficiency of the reservoir, as estimated by Mr. Field, as between the assumed draft of 40,000 acre-feet per annum and the assumed draft of 50,000 acre-feet per annum, to make any difference in the market price or value per acre-foot of water rights under the reservoir or in the reservoir?

A. No sir; I do not believe there would be any difference in the market value or in the market price.

Q. On this estimate of Mr. Field's, on the 40,000 acre-foot draft, he had at the end of each calendar year left in his reservoir the following percentages of his draft, estimated draft or assumed draft of 40,000 acre-feet: At the end of 1902, 91 per cent; 1903, 33 per cent; at the end of 1904, 10.9 per cent; 1905, 100.4 per cent; at the end of 1906, 168.6 per cent; 1907, 191.1 per cent; 1908, 102.2 per cent; 1909, 190.95 per cent; 1910, 121.24 per cent; 1911, 38.66 per cent; 1912, 124.16 per cent; 1913, 135.31 per cent, and at the same time out of the waters available for storage in the reservoir under the decreed appropriation it was necessary to allow to go to waste over the spillway the following percentages of the assumed annual draft of 40,000 acre-feet: in 1902 29.7; 1907, 62.39, equivalent to 24,957 acre-feet; in 1908, 9.44 per cent, equivalent to 3,775 acre-feet; in 1909, 93.76 per cent, equivalent to 37,505 acre-feet, and in 1910, 77.96 per cent, equivalent to 31,383 acre-feet. I will ask you to state whether, considering the quantities left in the reservoir at the end of each calendar year and the quantities necessarily wasted over the spillway on the operation of the reservoir on a 40,000 acre-foot draft, according to Mr. Field's estimate, such an annual draft of 40,000 acre-feet shows a proper and business-like method of operating that reservoir?

A. Do I understand that the percentages left in the reservoir were percentages of the annual draft?

Q. Percentage of the 40,000 acre-feet, yes sir.

A. I should say very emphatically that would not be a businesslike operation of the reservoir.

Q. Would or would not the reservoir—would or would it not be a businesslike procedure to operate it at a higher annual draft than 40,000 acre-feet under these conditions?

A. It certainly would, yes sir.

Q. Now, Mr. Fellows presented some estimates on a like subject and according to Mr. Fellows' estimates of possible and actual storages at Lake Cheesman, on an assumed annual draft of 40,000 acre-feet and for a period of fourteen irrigation seasons, beginning with the season of 1901, Mr. Fellows found that there would be efficiencies on the annual draft as follows: In twelve out of the
1044 fourteen years, 100 per cent; in one year, corresponding to 1903, 77.32 per cent, and in another year, corresponding to 1904, 61.88 per cent, making an average efficiency for the period of 95.6 per cent; Mr. Fellows also, upon his estimate of possible and actual storages at Lake Cheesman, determined what the result would be upon an annual draft of 50,000 acre-feet, those results being as follows: For this same fourteen-year period, ten years of the fourteen, 100 per cent efficiency; of the other four years, in a season corresponding to 1903, 27.8 per cent efficiency; in the season corresponding to 1904, 50.6 per cent, in the season corresponding to 1909, 98.2 per cent, in the season corresponding to 1911, 96.7 per cent, resulting in an average efficiency on the 50,000 acre-foot draft of 90.95 per cent. I will ask you to state whether, in your judgment, there is a sufficient difference in the efficiency, according to Mr. Fellows' estimates of the 40,000 acre-foot draft per annum and the 50,000 acre-foot draft per annum, to make any difference in the market price or value per acre-foot of the water rights?

A. No sir, there is not.

Q. In reading to you the percentages of the years which were less than 100 per cent, I think I read to you the percentages which we have computed. I will now read you the figures as given in Mr. Fellows' own exhibit, and I will ask you if that cause you to change your opinion in any way: On the 40,000 acre-foot draft, the percentages given by Mr. Fellows for the short years, were, 1903, 77 instead of 77.32; 1904, 62 instead of 61.88, and on the 50,000 acre-foot draft the percentages in the short years as given by Mr. Fellows in his Exhibit 44 were in 1903, instead of 27.8, 28 per cent; 1904, instead of 50.6, 51 per cent; 1909, instead of 98.2, 98 per cent; 1911, instead of 96.7, 97 per cent. Would that make any difference?

A. No sir.

Q. Now, Mr. Fellows shows, or his exhibit shows, that in operating the reservoir according to his estimated storage on the annual draft of 40,000 acre-feet, that he would have left in the reservoir at the end of each irrigation season, that is to say at the end of the month of October or November 1st, the following percentages of his assumed annual draft of 40,000 acre-feet, to-wit: At the end of the first season, 133.68 per cent; second season, 107.83 per cent; third season, 58.79 per cent; fourth season, no per cent; fifth season, 1.78 per cent, the fourth and fifth seasons corresponding with the years

1903 and 1904, sixth season, 64.90; seventh season, 89.93 per cent; eighth season, 177 per cent; ninth season, 92.24 per cent; tenth season 181.67 per cent; eleventh season, 107.83 per cent; twelfth season, 40.25 per cent; thirtenth season, 131 per cent; four-
1045 teenth season, 154 per cent, and then in addition to that, during that period of years there was necessarily wasted over the spillway out of the water available the following percentages of the assumed annual draft of 40,000 acre-feet, to-wit: First season, 15.75 per cent, equivalent to 6,305 acre-feet; second season, 23.04, equivalent to 9,359 acre feet; eighth, 25.9 per cent, equivalent to 10,360 acre feet; ninth season, 18.4 per cent, equivalent to 7,367 acre-feet; eleventh season, 118.8 per cent, equivalent to 47,516 acre-feet; fourteenth season, 4.5 per cent, equivalent to 1,825 acre-feet. I will ask you to state, Mr. Comstock, in view of the quantities of water left in the reservoir at the end of each irrigation season and the quantities necessarily wasted over the spillway, whatever the proportion, whether or not in your judgment the operation of that reservoir on Mr. Fellows' estimate of storage on an annual draft of 40,000 acre-feet, was a proper and businesslike method of operation, and a proper and businesslike draft on which to operate?

A. No sir.

Q. Why not?

A. Because of the large quantities of available water which get away for the sake of protecting two or three short years in fourteen. I do not think any man who utilizes water for the growing of crops expects that he will not have an occasional short year, whether he derives his water from an irrigation system or whether he depends on the railfall.

Q. You say every man has that expectation?

A. Every man I ever saw. I think it is probably universal among them.

Q. Then if I correctly get your meaning, you would say that the reservoir, if properly operated and operated in a businesslike way, should be operated at a higher draft than 40,000 acre-feet per annum?

A. Yes, sir, it should.

Q. Mr. Bull has presented in his exhibit 39 results of the operation according to his estimates of possible and actual storages upon various annual draft. Upon that annual draft of 40,000 acre-feet he shows an efficiency of 100 per cent in every year for a period of thirteen years, to-wit, 1901 to 1913. On a draft of 50,000 acre-feet his exhibit shows an efficiency of 100 per cent for the same period in ten years and an efficiency of less than 100 per cent in three years, as follows: One year, 57.98 per cent; one year, 70.38 per cent; one year, 82.99 per cent, producing an average for the period of thirteen years on a 50,000 acre-foot draft of 93.2 per cent. I will ask you to state whether or not in your judgment there is a sufficient difference in the efficiency as shown on Mr. Bull's estimates between the 40,000 acre-foot draft and the 50,000 acre-foot draft to produce any difference in the market price or value per acre-foot of the water right?

A. No sir, I think not.

1046 Q. Mr. Bull also made an estimate on possible and actual storages of the performance of the reservoir on a 60,000 acre-foot annual draft, which showed for the same period, 1901 to 1913, inclusive, an efficiency of 100 per cent for eight years out of the thirteen, and for the other five years, efficiencies as follows: In the year 1902, 95.2 per cent; 1903, 19.5 per cent; 1904, 58.6 per cent; in the year 1911, 42.9 per cent, and in the year 1913, 86.6 per cent, producing an average efficiency for the period of thirteen years of 84.8 per cent. I will ask you to state whether or not there is a sufficient difference in the efficiency between performances of the reservoir on Mr. Bull's estimate on an annual draft of 50,000 acre-feet and that of Mr. Bull's estimate on an annual draft of 60,000 acre-feet to make any difference in the price or market value per acre-foot of water rights?

A. I do not believe so.

Q. Now, Mr. George Anderson made estimates as to possible storages in Lake Cheesman and also as to the operation of the lake upon an assumed annual draft of 60,000 acre-feet. Mr. Bull figured out and presented in his exhibit what he considered to be the results of Mr. Anderson's figures and those showed for that same period of thirteen years, to-wit, 1901 to 1913, upon an annual draft of 60,000 acre-feet, efficiencies of 100 per cent in ten years out of the thirteen and in the other three years efficiencies as follows: In the year 1903, 27 per cent; in the year 1904, 59.2 per cent, and in the year 1911, 84.2 per cent, making an average efficiency for the period of thirteen years mentioned, on the 60,000 acre foot draft, according to Mr. Anderson's estimate as understood by Mr. Bull, of 90 per cent. I will ask you to state whether or not in your judgment there is a sufficient difference in efficiencies between the efficiency of the reservoir on Mr. Anderson's estimates on a 60,000 acre-foot draft as just given and the efficiency on Mr. Bull's estimate of a 50,000 acre foot draft as given to you a few moments ago, to make any difference in the price or market value per acre-foot of the water rights thereunder?

A. No sir, I do not hink so.

Cross-examination by Mr. Nye:

I am familiar with the use of seepage ditches in District No. 3 for catching and using the original water a second or third time. I know that the average distance of the irrigated areas in District No. 3 from the channel of the Poudre river is greater than the average distance of the irrigated areas from the channel of the Platte in Districts 8 and 2. One of the sources of accretion to the Platte is the sewage system of Denver. It is a perennial supply. I don't know that there is more truck gardening immediately adjoining the Platte river in Districts 8 and 2 than there is in the area irrigated

1047 by the Poudre river. I don't think it is true that the average size of the tracts farmed in the Platte valley is smaller than in the Poudre valley. I know there is a good deal of truck gardening under the Fulton Ditch and City ditch. I don't know about the

Brantner, Petersburg, or Brighton ditches. I presume that the quantity diverted by the Nevada and Last Chance ditches from 1909 to 1913 were within the limits of their decrees. The figures given for the duty of water in Exhibit A-79 are obtained by dividing the acreage irrigated into the total acre feet diverted. The report of the Division engineer, from which this information is compiled is made up from reports made to him.

The quantity of water diverted, given in Exhibit A-79 is the quantity diverted during the season through the measuring flumes of the various ditches. It includes such water as may be stored by farmers in small private reservoirs from their direct supply, for use later in the season, but excludes water diverted distinctly for storage, which may be measured subsequently if it is discharged from a reservoir through a natural stream channel and picked up by a ditch in the district.

If it is diverted for use in a storage reservoir and subsequently taken directly to the land, without going through the natural stream, it would not appear in the record. I have not taken into account any loss from seepage and evaporation in the case of water stored either in a small private reservoir or in a recognized storage reservoir. The small reservoir system is in general use in the northern part of the state. I do not recollect any instance in which it is in use in Districts 8 and 2, but I would not say that it is not. In preparing Exhibit A-80, which deals with the supply available in the Platte Canon Ditch, after deduction is made for the storage in Lake Cheesman, I first corrected the flow of the South Platte River in Platte Canon for the actual storage and discharge by Lake Cheesman so that the table represents the stream flow as though Lake Cheesman were not in existence. From this table I deducted my estimate of storage for Lake Cheesman, producing a set of tables representing the discharge of the South Platte river as it would have been were Lake Cheesman operated as an irrigation reservoir, filling and emptying from year to year in accordance with my estimate of storage and draft. In these tables I limited Lake Cheesman to one filling to capacity a year, regardless of the quantity of water that might have been available for storage, instead of allowing it more than one filling as I did in my former Exhibit A-54. After preparing the table showing the stream conditions with Lake Cheesman operated as an irrigation reservoir, I compared the modified discharge in the winter months with the decree of the Platte
1048 Canon ditch, and during the irrigation months took into account the rights which were prior to the Platte Canon ditch. I used the months from May to October inclusive as the irrigation season. In the months from January to April and November and December, I considered that the Platte Canon Ditch might divert all the water available up to 56 second feet, and regarded as a shortage whatever deficiency there might be below 56 second feet. In the months May to October I found that 129 second feet must be flowing in the stream in order to supply the Platte Canon ditch with 56 second feet and regarded as shortage whatever deficiency there might be below the 129 second feet, up to a shortage of 56 second feet, which is all that the Platte Canon ditch could

be short. This 129 second feet is made up as follows: City Ditch 30 feet, Nevada Ditch 28 feet, Petersburg ditch 7.6 feet, Platte valley ditch 4.4 second feet, Brown ditch 3.3 second feet, Platte Canon Ditch 56 second feet, total 129.3 second feet. I am not certain that all that water must come out of Platte Canon, because the Petersburg, Platte valley and Brown ditches are located pretty well down stream, and partly supplied from accretions. However, I took 129 second feet, in round numbers as my factor. I did not take into consideration any ditches having prior rights in districts except District No. 8. I do not know that the total appropriation earlier than the Platte Canon Ditch including other districts are approximately 350 second feet. Using the factor 56 second feet in the months from November to April, and the 129 second feet in the months from May to November, I determined from the stream flow what is available for the Platte Canon ditch. Wherever blanks occur in the table it indicates that there is no record. This process is gone through from day to day on each day for which there is a record. From the final results at the end of each year the percentage of shortage is obtained through a computation, using the mean shortage for the year against the total decree of the ditch. Out of the total periods shown in Exhibit A-80 there are only three years with a record for every day in the year, and one other year with a record for eleven full months.

Exhibits A-87-*a*. Discharge of the South Platte river at South Platte corrected for storage at Lake Cheesman, A-87-*b*, discharge of South Platte river at South Platte after deducting estimated storage of Lake Cheesman and A-87-*c* shortage of supply for Platte Canon Ditch, are tables showing the details from which the summarized tables, Exhibits A-80 and A-81 are prepared. Exhibit A-81 is a summary of the tables in A-87-*b* reduced from cubic feet per second to acre feet. It is intended to show the quantity of water
1049 available for rights prior to Lake Cheesman after taking out the storage estimated and the distribution of that water throughout the year. I did not make any assumptions as to the division of that water between priorities. My former Exhibit A-52 in connection with the oral testimony given concerning it, contains a list of the several ditches showing the decrees, diversions, etc.

In arriving at the demand on the stream at the canon I fixed upon 75,000 acre feet as the amount necessary to be supplied to District No. 8 and upon 30,000 acre feet as the amount to pass Denver to supply the upper portion of District No. 2. In arriving at the first quantity, 75,000 acre feet, I was guided by several things, chiefly, I think, by a consideration of the consumption of water as shown by the difference, between the quantities passing the guaging stations at South Platte and at Denver. In fixing the quantity necessary to supply upper District No. 2, I considered the acreage to be supplied, assigned 2 acre feet of water to each acre and then made an estimate of the required amount of water which might be supplied by seepage and tributary inflow in upper District No. 2, the balance of which I concluded to be 30,000 acre feet I considered must pass Denver. And since I had concluded that 75,000 acre feet would be con-

sumed in District No. 8, I took the sum of the 75,000 and the 30,000 acre feet as the total amount of water which must come from Platte Canon. Only the quantity of water estimated as required for District No. 2 would be affected by an estimate of duty. Exhibit A-81 shows an average annual run-off over and above storage of 187,000 acre feet discharged at Platte Canon, which for the 120,000 acres maximum area irrigated in Districts 2 and 8, would give 1.56 second feet per acre. It shows a run-off discharged at the canon during the irrigating season from May to October inclusive, of 144,000 acre feet, or for the 120,000 acres, maximum area irrigated in Districts 2 and 8, 1.2 acre feet per acre. I made the computation on a total annual run-off merely for the purpose of comparison with the results obtained by Mr. Field on the Poudre river, where he took the entire discharge from the canon during the twelve months, divided it by the acreage irrigated and reached in that case a figure of 1.35 acre feet per acre.

In the preparation of this exhibit I was not considering the distribution of the water at all, the one thing that I wanted to bring out was a comparison of the two districts. My idea was, that what can be done in one district could be done in other, and if with all if the irregularities of discharge which are common to the Poudre and the Platte, a total supply in the course of a year of 1.35 acre feet per acre is adequate in the Poudre, I didn't see any reason why such a total supply of the same or slightly greater amount,
1050 in the course of the year would not be adequate in the Platte Valley. It was that comparison and nothing else that I had in mind.

Exhibit A-83 is simply a table of the mean monthly discharges of the South Platte river at South Platte or Platte Canon, expressed in cubic feet per second for such months as there are records. They are the actual discharges shown by the record, uncorrected for any actual storage and unaltered for any possible storage. It was not constructed particularly for comparison with Mr. Fellows' Exhibit 44, but in connection with a study of that and Mr. Field's Exhibits also. I did not construct a table showing the extent to which the actual flows at the canon were short of Mr. Fellows' estimated capacity, nor did I make a study of the records of the State engineer's office to ascertain whether in some of those months there was a shortage in the actual demand upon the stream. It is possible that in some of those months, in some of those years, the supply at the canon was insufficient for the actual demand. It is true that had Lake Cheesman not been constructed there would have been no such evaporation from the South Platte river at that place. The loss in evaporation is due to the fact that the D. U. W. Co. has constructed that lake and created the body of water from which such evaporation takes place. The method of stream measurement in use at Lake Cheesman is as nearly a correct record of what goes on at the Lake as it is possible to make. I have spent quite a little time worrying over that too. As State engineer I undertook to devise a means of determining the evaporation from the lake, or of charging the reservoir with the amount lost by evaporation, but did not establish one.

I do not think there has been such a method in the State engineer's office.

In Exhibit A-84, being the first hydrograph introduced, the yellow line indicates the requirements by rights prior to Lake Cheesman in Districts 8 and 2, acording to my estimates of the use as previously described, in connection with my determination of demand upon the canon. The requirements of the decrees representing districts 8 and 2 prior in time to Lake Cheesman would furnish a different line which would be above the yellow line as shown here. In plotting the yellow line I estimated the distribution on a percentage basis, as follows: May 15%, June 25%, July 25%, August 20%, September 10%, October 5%. I don't remember that these are the same percentages that were used by Mr. Anderson in his distribution of the irrigation supply. I made a separate determination and if I arrived at the same figures it is a coincidence. I did not attempt to assign any particular supply to any particular ditch. I had previously determined that 105,000 acre feet for the six months period, would be an adequate supply for these prior rights. I dis-
1051 tributed the 105,000 acre-feet through these six months in accordance with the percentages without regard to what ditch gets the water and what ditch does not. Using the decreed priorities as the factor would give a horizontal line stretching over the twelve months in the year, somewhere near the top of the hydrograph. I did not assign any water for irrigation in the month of April though ditches take water in that month in small quantities. I also closed the irrigation season on the first day of November, each year.

For the month of June, 1911, the hydrograph, Exhibit A-84 indicates the same storage that was indicated in the exhibits presented in my original testimony. I don't remember that in that month the High Line Ditch received only 500 acre feet and the Burlington Ditch no water at all, but if true I don't think those are determining factors, because if there is an adequate supply of water for the irrigation of all the lands, and if is wasted by some ditches and others are deprived of it, I don't think that the fact that some of the junior ditches are without water is justification for putting a limitation on other juniors. Furthermore, there have frequently been periods when the Burlington did not get water and did not want it. It cannot be assigned that because the Burlington Ditch does not get the full amount of its decree or does not get any water at all, that it is short in the sense that its needs are not satisfied. That is not equally true of the High Line, but true to some extent. The amount of water received by the High Line is not a criterion or proper measure of storability of water in Lake Cheesman. The only new matter shown by the hydrograph that was not shown in connection with my original testimony is in Exhibit A-85, showing the quantity of water left in the river after taking out my estimate of storage. The other data was put on for use in connection with that one thing. The two hydrographs are really one exhibit, but I found that they would be so badly confused if I put all the information on one sheet that I separated them to avoid confusion.

It would have been better if they could have been put on one sheet

without confusion. The horizontal scale is the same in both, so they can be easily read by placing one on top of the other and allowing for the difference in the vertical scale. In Exhibit A-85, where the red line drops below the yellow line it indicates that the quantity of water in the river is not sufficient to meet the requirements indicated by the yellow line. That occurs in the month of July, 1913. In the month of June of that year the hydrograph indicates that there was enough water left in the river to satisfy those demands after the discharge had been reduced by deducting for estimated stor-
1052 age. The yellow line on A-85 represents the same quantities as the yellow line on A-84, but it is drawn to different scale.

Exhibit A-86 showing the quantities of water reported as passing from District 8 to District 2 by the water commissioners of the two districts and by the gauge record shows a difference between the three sets of figures all through the exhibit. The information is all supposed to be taken from the same gauge. That is where the State engineer's office gets its information and that is where the water commissioners should get theirs. The stream varies at different hours of the day, but the gauge is an automatic recording gauge and the chart contains a record continuously of the variation.

Reading the gauge at different hours of the day and taking the readings at the hour read might account for a difference between the figures. The state engineer's office takes the record for the entire day and averages it. I did not make any effort to average the reports of the commissioners of the two districts and the State engineer's office. It would not surprise me to learn that the averages are very close together taking it through the entire period, nor would it surprise me to know that the water commissioner in District No. 2 averaging the several years covered by the exhibit, reports more water coming into his district than is reported out by district No. 8. I do not imagine that the commissioner of district No. 8 would report less water going out of his district than was going out, if he knew it. Or that the commissioner of Water District No. 2 would charge himself with more water than was actually coming in, if he knew the facts. These reports of the water commissioners are used by the State engineer's office and relied upon to the extent that thy must be for the lack of more accurate information. They are not regarded, as far as my experience goes, by either the division engineer or the state engineer as entirely trustworthy. But they are the best evidence that we have. That includes the record as to what ditches are and what ditches are not diverting water.

I stated that taking a single recent year as a basis for determining the use of water for the future was an improper method. If "A recent average year," such as you suggest could be found that compares in all respects with past experience, that might be proper, but that recent year must first be determined to be a fair average as compared with the past for a longer period. Which resolves itself back to the proposition that you should take the average for the longest possible period, rather than a fair sample of a recent year, assuming that a fair sample can be determined. It is not true that during

my term as state engineer that I gave Lake Cheesman prefer-
1053 ence on account of its being used as a domestic supply. I frequently said that I would give it the preference if the Lake was nearly empty, and there was danger of a shortage, but that occasion never arose. I have never operated a reservoir for either irrigation or domestic purposes, or bought or sold water rights in a storage system. I based my statements made in the discussion of the difference between the efficiency of the reservoir on different drafts on knowldge acquired from contact with irrigators. I think every purchaser of a water right and every user knows that whatever the source of supply may be, and whatever right he may have purchased, there will be times when he won't get as much water as at others and that whatever proportion of supply he may have purchased, it will yield less sometimes than others.

An irrigator would know if he only got 28 per cent of supply in one year and 51 per cent in the next. But in view of the fact that the shortage that produced that situation was known to affect practically every other supply in the same neighborhood, I don't think it would affect the market price of the water. I stated that in my judgment, on account of the water held over from year to year, and the wastage indicated in the estimates of Messrs. Fields and Fellows, that operation of Lake Cheesman on a basis of a 40,000 acre-foot draft would be unbusinesslike because there was too much wastage to protect two or three short years. I cannot answer, as an abstract question, whether it would be justifiable to increase the draft on that reservoir 50 per cent, or to 60,000 acre feet. It would be necessary for me to go into the results obtained under the 60,000 acre-foot draft. Lake Cheesman has never been operated as an irrigation reservoir. Its operation as such on a draft of 40, 50 or 60 thousand acre-feet would very materially change the condition of things on the river, as they have existed ever since Lake Cheesman was constructed. It is true that some of the water, that it is estimated is capable of being used for storage in Lake Cheesman, has in the past been used more or less by appropriators junior to Lake Cheesman. I do not know that the United States Weather Bureau regards the records of the Loveland station as inaccurate, they did not so advise me. I know that the present station is at Boothroyd's ranch, and there is now no station at Loveland. I assume that it was the intent of the law, requiring waste gates and waste ways on ditches, to bring about the return to the stream of excess water diverted with as little loss as possible.

1054 Redirect examination by Mr. Dorsey:

In respect to the seepage ditches about which I was asked, in District No. 3, they are really drainage ditches constructed below certain irrigated lands to pick up the excess water and carry it to other lands. The practice is common in all parts of the state and not confined to District No. 3. I cannot give any idea of the quantity of water so caught and distributed, but it would be a small percentage of the total supply.

The figures set forth in Exhibit A-79 include all water actually

diverted from the stream, except that diverted to recognized storage reservoirs. As to this matter, the figures of diversion only include that which has been stored in such reservoirs and subsequently returned to the natural stream, and then diverted by ditches as stored water for irrigation. In district No. 3 there are storage reservoirs having an aggregate capacity of about 150,000 acre-feet. About half of the water diverted by them, and not included in the diversion figures in A-79, is applied to land without again getting to the natural stream. Therefore, is not ac-ounted for in this exhibit. In order to get the actual duty of the water in District No. 3 it would be necessary to add that one-half of these reservoirs to the total quantity of the water used in the district thus increasing the duty about 3-10 of an acre foot per acre. In enumerating the ditches prior to the Platte Canon Ditch, that I considered in arriving at my requirements of 129 second feet during the irrigation season before the Platte Canon ditch could draw its full appropriation, I omitted the Epperson or Green Valley ditch which is located within the City of Denver, 20 miles from Platte Canon, has a decree for 2.25 second feet and is supplied by inflow below the canon creating no demand on the canon. There are also the Brantner and the Farmers and Gardners ditch ahead of the first priority of the Platte Canon and the Platte valley, Farmers and Gardners, Brantner, Lupton Bottom and Brighton ditches with priorities subsequent to the first priority of the Platte Canon and earlier than the second. With the possible exception of the Farmers and Gardners, they are all in District No. 2. Prior to 1912 the Farmers and Gardners, took water between 18th and 19th Streets. It now takes water right at the Tramway Company's power house. I am not certain whether it is in District 2 or 8 now. Its original location was in District No. 2. The Dugan Ditch in District No. 2 has a priority between the second and third appropriations of the Platte Canon Ditch. I believe that its water has been transferred to the Burlington. I did not consider any of these ditches in estimating my demand on the canon, be-
1055 cause, I considered that accretions to the stream in Districts 8 and 2, were adequate to supply their needs.

No charge has ever been made against Lake Cheesman for loss of water due to evaporation. The measurements of inflow and outflow at Lake Cheesman are based upon the readings of actual gauges and measuring devices. The reports of water commissioners as to the needs for water in his district, are not based upon any measuring devices, but upon his own judgment, or the judgment of the ditch superintendent. The yellow line on the hydrographs A-84 and A-85, expresses the demand estimated by me upon Platte Canon for irrigation water in Districts 2 and 8 in cubic feet per second. It is true that that demand is not as great as indicated by the decrees of the ditches in those districts. I do not know of any ditch in Districts 2 and 8, or anywhere which has a direct flow right and is used for irrigation purposes which constantly and at all times draws water to the full quantity specified in its decree. Objection overruled. Exception.

If all the ditches in Districts 2 and 8, prior in point of time to

Lake Cheesman, constantly drew water to the limit of their decrees, there never has been sufficient water at Platte Canon to satisfy them. And if they did so draw water, all of it would not have to be supplied from Platte Canon. In respect to the discrepancies shown between the reports of water commissioners of Districts 8 and 2 and the gauge at the Denver gauging station, as set forth in Exhibit A-86, it is not likely that they would be accounted for by the difference in time of the gauge readings by the different individuals. On most days there is not enough variation in the stream to make that possible. On occasional days there might be abrupt changes sufficient to account for such discrepancies. The gauge record made by the state engineer's office is the average flow for the day, as shown by the gauge. It is the understanding of the division engineer and the state engineer that the water commissioner's reports also set forth the average flow for the day. I stated that, in my judgment, greater experience in the use of water for irrigation was developing a skill in that regard, on the part of irrigators, that was gradually increasing the economy in the application of water, and that that economy would be likely increased in future years. I believe that taking into consideration the unscientific and uneconomical use of water, which has occurred in the past, that the method that I adopted in arriving at the amount of water required for irrigation in the future took into consideration every possible need, and that such a method of forecasting is much more accurate than one based upon conditions existing in any one year. Taking into consideration the ad-
1056 vance in the science in irrigation in the past, we may reasonably expect in the future to reduce the quantity of water estimated to be required.

In estimating the storage for Lake Cheesman it is assumed that the total estimated draft has been made upon the reservoir each year. In actual practice that draft does not occur, each year, because the consumers draw only such water as they need. That need varies from year to year. In my estimates of the storage capacity of Lake Cheesman I think I have taken into consideration all of the changes in conditions on the river, which would be brought about by the operation of Lake Cheesman by the method I have assumed.

Recross-examination by Mr. Nye:

Referring to the 75,000 acre feet of stored water in District No. 3 which was not included in the table of diversions in Exhibit A-79 and which I said should be included, there should be no consideration of the question of seepage and evaporation in connection with that quantity. Such loss would effect the portion of that water that would ultimately reach the land, but the loss should not be applied to reduce the amount of the actual diversion. There is such a loss in the case of all water diverted from the stream.

When for the purpose of computing the demand for water for irrigation in Districts 8 and 2, I considered the average demand rather than the decrees for the district, I knew and had in mind the fact that the Platte Canon ditch, with a decree for irrigation purposes only, was drawing water practically every day in the year at a rate

which would make the duty if applied upon lands under the ditch, very much lower than the duty assumed by me for other ditches. The record charts of the gauge at the Denver gauging station are removed by the state engineer's office, once a week. There is no reason, however, why the charts cannot be accurately read while it is attached to the gauge and without interference with its operation. Ordinarily a single glance at the gauge would be sufficient even for an untrained man. I don't think either of the water commissioners of District 8 and 2, saw that gauge once a month. I don't think their reports came very near the results of the state engineer, based on the gauge readings. Nearly every reservoir is operated on the basis of an assumed draft for the irrigation season. That assumed draft being the capacity of the reservoir. The reservoirs in Colorado are sold, or offered for sale, up to the limit of their capacities and they may be drawn upon to that extent if the water is demanded.

1057 Witness ALFRED A. EDWARDS.

Direct examination by Mr. Dorsey:

Q. At the time you formerly testified, I think you gave at some length your experience in irrigation matters and I will not ask you to repeat that now, but will ask you whether such experience in connection with irrigation matters has made you familiar with the operation of reservoirs for irrigation purposes and with the efficiency of such reservoirs?

A. It has.

Q. Various witnesses in this case, Mr. Edwards, have given testimony relative to the possible storages which might be made at Lake Cheesman under its decreed appropriation, and upon these estimates of possible storages have likewise presented their theories of the proper annual draft to be placed upon the reservoir in selling water rights under it. I desire to ask you a few questions on that subject. Mr. John Field testified and also showed by his Exhibits 45 and 46 that according to his estimates of possible and actual storages in Lake Cheesman and upon an assumed annual draft from the reservoir of 40,000 acre-feet, the performance of the reservoir for the period of eleven or twelve years, 1902 to 1913, inclusive, would be as follows: That in eleven of those years the reservoir would furnish the full quota of 40,000 acre-feet, thus showing an efficiency of 100 per cent, and in one of these years, to-wit, the year 1904, would furnish 81 per cent of 40,000 acre-feet; likewise Mr. Field, upon his estimates of pos-ible storages at Lake Cheesman, and upon an assumed annual draft of 50,000 acre-feet, showed a performance of the reservoir in point of efficiency as follows: For the years 1901 to the year 1913, inclusive, a period of thirteen years, in ten of those years 100 per cent efficiency—that is, a delivery of the full 50,000 acre-feet, and in the other three years efficiencies as follows: In the year 1903, 61.5 per cent; in the year 1904, 45.9 per cent, and in the year 1911, 89.71 per cent, the average efficiency for the period of twelve years of the 40,000 acre foot draft being 98.4 per cent, made

up as I have described, and the average efficiency on the 50,000 acre-foot draft being 92.08 per cent, made up in the manner I have described. I ask you to state, Mr. Edwards, whether or not there is a sufficient difference upon the efficiency of the reservoir between those two assumed drafts to make any difference in the price per acre-foot of the water rights in the reservoir?

A. I do not think it would make any difference in the price.

Q. I also call your attention to the fact that under Mr. Field's estimates of possible and actual storages, and upon his assumed draft of 40,000 acre-feet, he had left in the reservoir at the end of each calendar year the following percentages of the quantity
1058 which he had assumed as his annual draft, that is the following percentage of 40,000 acre-feet, to-wit: At the end of 1902, 91 per cent; 1903, 33 per cent; 1904, 10.9 per cent; 1905, 100.0 per cent; 1906, 168.6 per cent; 1907, 191.1 per cent; 1908, 102.3 per cent; 1909, 190.95 per cent; 1910, 121.24 per cent; 1911, 38.66 per cent; 1912, 124.16 per cent; 1913, 135.31 per cent, and that in addition thereto in the operation of the reservoir on the 40,000 acre-foot draft only, he was obliged to waste out of the water otherwise available under the reservoir's decreed appropriation and allow to flow away over the spillway, the following quantities in percentage of 40,000 acre-feet, to-wit: In 1902, 29.7; 1907, 62.39, equivalent to 24,957 acre-feet; in 1908, 9.44 per cent, equivalent to 3,775 acre-feet; in 1909, 93.76 per cent, equivalent to 37,505 acre-feet, and in 1910, 77.96 per cent equivalent to 31,183 acre-feet, which he lost over the spillway. Please state, Mr. Edwards, whether, in your judgment, in view of the quantities left in the reservoir at the end of each calendar year and in view of the wastage over the spillway necessitated by the operation of the reservoir on an annual draft of 40,000 acre-feet, it was a proper and economical annual draft at which to operate the reservoir or should the annual draft have been greater.

A. I think the annual draft should have been greater to be economical.

Q. And in proper reservoir practice and operation under the conditions I have described, would the draft have been greater from that reservoir?

A. It would.

Q. When I use the word "proper" I mean business-like; if I substitute the word business-like for proper, would or not your answer be the same.

A. It would be the same.

Q. Mr. Fellows also made like estimates which he presented in testimony and by his Exhibit 44, in the estimate which Mr. Fellows made of the actual and possible storage in Lake Cheesman under its priorities and upon the assumption of a draft each year of 40,000 acre-feet form the reservoir, he arrived at percentages of efficiency for a fourteen-year period beginning with 1900, as follows: In twelve years out of fourteen, 100 per cent efficiency; in the other two, in one year, corresponding to the year 1903, an efficiency of 77.32 per cent, and in the other year, corresponding to the year 1904, an efficiency

of 61.88 per cent, making an average efficiency for the fourteen years of 95.6 per cent. Mr. Fellows made a like estimate according to his estimate of possible and actual storages at Lake Cheesman, and upon an assumed draft of 50,000 acre-feet annually from the reservoir, under which he shows an efficiency as follows on the 50,000 acre-draft in ten years out of the fourteen he got an efficiency of performance of 100 per cent and in the other four years
1059 he produced an efficiency, according to his figures, in the year 1903 of 28 per cent, in the year 1904 of 51 per cent, in the year 1909, 98 per cent, and in the year 1911 of 97 per cent, making an average efficiency for the whole period on the 50,000 acre-foot draft of 90.95 per cent. I will ask you to state, Mr. Edwards, whether in your judgment there is a sufficient difference between the efficiencies according to Mr. Fellows' estimate on the 40,000 acre-foot draft and the 50,000 acre-foot draft to make any difference in the market price or value per acre-foot of the water rights in the reservoir?

A. I think not.

Q. I also call your attention, Mr. Edwards, to these facts in respect to the 40,000 acre-foot draft assumption of Mr. Fellows, that at the end of the irrigation season, that is, at the end of October in each year and at the beginning of November in each year, he had left in his reservoir the following percentages of his assumed draft of 40,000 acre-feet, namely, at the end of the first season, 133.68 per cent; second season, 107.83 per cent; third season, 58.79 per cent; fourth season, nothing left in the reservoir; fifth season, 1.78 per cent, the fourth and fifth seasons being 1903 and 1904; sixth season, 64.90 per cent; seventh season, 89.93 per cent; eighth season, 177 per cent; ninth season, 92.24 per cent; tenth season, 181.67 per cent; eleventh season, 107.83 per cent; twelfth season, 40.25 per cent; thirteenth season, 131 per cent; fourteenth season, 154 per cent, and at the same time, out of the water available from the decreed appropriation of the reservoir he was obliged to let go over the spillway and otherwise waste the following percentages of his assumed draft of 40,000 acre-feet, to-wit: The first year, 157.5 per cent, equivalent to 63,005 acre-feet; the second year 23.4 per cent, equivalent to 9,359 acre-feet; in the eighth year, 25.9 per cent, equivalent to 10,360 acre-feet; the ninth year, 18.4 per cent, equivalent to 7367 acre-feet; the eleventh year, 118.8 per cent, equivalent to 47,516 acre-feet, and in the fourteenth year, 4.5 per cent, equivalent to 1,825 acre-feet.

I will ask you to state, Mr. Edwards, whether, considering the quantities of water left in the reservoir at the end of each irrigation season and the quantities which the reservoir, upon these assumptions, was obliged to lose out of its appropriation by permitting it to flow away over the spillway, the operation of that reservoir on the assumed annual draft of 40,000 acre-feet was in your judgment a proper and businesslike method of operating it?

A. I would not consider that it was.

Q. Ought it, in your judgment, to be operated upon an annual draft larger than 40,000 acre-feet under those conditions?

A. I think it ought to be, yes, sir.

1060 Q. Another witness on this subject was Mr. Bull, who presented estimates relative to possible and actual storages at Lake Cheesman and the results of its operation on various assumed annual drafts, which are set forth in his Exhibit No. 39. According to Mr. Bull's estimates of possible and actual storages at Lake Cheesman and upon an assumed annual draft of 40,000 acre-feet, he showed an efficiency for the reservoir of 100 per cent for each year of a period of thirteen years from 1901 to 1913, inclusive, at the same time wasting considerable water over the spillway; and on an assumed annual draft of 50,000 acre-feet for the same period of thirteen years, he showed ten years of 100 per cent efficiency, one year of 57.98 per cent, one year of 70.38 per cent, and one year of 82.99 per cent, making an average efficiency upon the 50,000 acre-foot draft of 93.2 per cent, made up as I have described. I ask you to state whether there is sufficient difference in the efficiency, according to Mr. Bull's estimates on the 40,000 acre-foot draft and the 50,000 acre-foot draft, to make any difference in the price or value per acre-foot of water rights in the reservoir?

A. I think not.

Q. Mr. Bull also made an estimate for the same period of thirteen years—that is, 1901 to 1913, inclusive—on an assumed annual draft from the reservoir of 60,000 acre-feet, and showed upon that assumed draft an efficiency for the reservoir of 100 per cent in eight years out of the thirteen, and an efficiency in the other five years as follows: In the year 1902, 95.2 per cent; in the year 1903, 19.5 per cent; in the year 1904, 58.6 per cent; in the year 1911, 42.9 per cent; and in the year 1913, 86.6 per cent, making an average efficiency for that period of thirteen years of 84.8 per cent, the lowest percentage being that of 1903 caused by the shortage of 1902. Is there, in your judgment, enough difference in the efficiency, according to Mr. Bull's estimates on the 60,000 acre-foot draft and the 50,000 acre-foot draft, to make any difference in the market price per acre-foot of water rights in the reservoir?

A. I think not.

Q. Mr. Anderson also made certain estimates—Mr. George Anderson—and upon those estimates showed the results of operation of the reservoir on an assumed annual draft of 60,000 acre-feet, and, as figured by Mr. Bull, according to Mr. Anderson's estimates, the efficiency of the reservoir for the thirteen-year period 1901 to 1913, would have been as follows: In ten years out of the thirteen the efficiency would have been 100 per cent, and in the other three years the efficiency would have been as follows: In the year 1903, 27 per cent; in the year 1904, 59.2 per cent; and in the year 1911, 84.2 per cent. I should have said there were ten years of 100 per cent

1061 efficiency, and the other three years as I have described; the lowest being that of 1903, caused by the abnormally small supply of 1902, all resulting in an average efficiency of 90 per cent. I will ask you to state whether there is enough difference in efficiency of the reservoir on Mr. Bull's estimate of 40,000 acre-feet, his estimate of 50,000 acre-feet annual draft, and Mr. Anderson's esti-

mate of 60,000 acre-foot annual draft, to make any difference in the price per acre-foot of water rights in the reservoir?

A. What were the averages?

Q. The averages were: Mr. Anderson, on the 60,000 acre-foot draft, 90 per cent; Mr. Bull, on a 50,000 acre-foot draft 93.2 per cent; Mr. Bull, on a 40,000 acre-foot draft, 100 per cent.

A. I think not.

Cross-examination by Mr. Nye:

The efficiency of a reservoir to supply the water which it is expected to supply has a bearing upon the value of that supply. I don't believe that under the average percentages obtained here there would be any difference in the market value. If the efficiency dropped below 50% it would decrease the value and there might be some decrease above that percentage, but as I understand it all owners of reservoir rights except short years below 100% and from my experience that has not been the cause for depreciation in market value. Most of my experience has been with reservoirs owned by mutual companies, where each share of stock participated in all of the water of the company from every source. The original owners having participated in the expense of production of the reservoir. I would base an estimate of the value of direct flow rights upon the same consideration of efficiency as reservoir rights.

Redirect examination by Mr. Dorsey:

The efficiency of a direct flow right as bearing upon its value, would depend upon the period in the irrigation season when water was available under it. If you could only get water very early in the season it would have a considerable effect on the value of each acre-foot diverted.

Recross-examination by Mr. Nye:

The efficiency of any water right for irrigation purposes must be measured in connection with the purpose for which that right is used, namely, to grow and mature crops with.

1062 Witness GEORGE G. ANDERSON.

Direct examination by Mr. Dorsey:

Exhibit A-88 is a tabulation comparing the estimates of storage in Lake Cheesman as shown by the testimony of the several witnesses who have testified upon that subject in this case: Messrs. Field, Fellows, Bull, Comstock, and myself. The exhibit covers the years from 1901 to 1913 inclusive. The estimates being set forth, month by month, in columns devoted to each witness. In the last column are notes referring to rainfall, stream flow, and other conditions affecting Districts 8 and 2.

The rainfall data is taken from United States Weather Bureau records. The stream flow from the records of the state engineer, or the records of The D. U. W. Co. at Lake Cheesman. Notes as to particular conditions in the districts are from the reports of the

water commissioners. The first column of the exhibit gives data of the actual storage that occurred at Lake Cheesman during the years it has been in existence. Notes occurring on the different pages and in the different columns call attention to minor discrepencies between the exhibits of different witnesses, or to the treatment of corrections in the figures of the different witnesses, based upon testimony given by them on the witness stand.

The notes at the end of the year 1911 refer to the fact that in that year 11,000 acre feet of water was stored in Antero reservoir, and the note at the end of the year 1912, to the fact that reservoirs in District No. 2 stored a total of 91,000 acre feet according to the reports of the water commissioner after the month of April. The only reservoir in District No. 2 prior to Lake Cheesman is Barr Lake with a right to 11,000 acre feet, which usually is filled during the winter from November to April. The last sheet of the exhibit summarizes the estimates of storage for the several years, by the several witnesses. Set out first to indicate the total gross storage possible in the reservoir and immediately below that the storage possible, limited by the capacity of the reservoir to 79,064 acre-feet during any year. Blank spaces indicate that no estimates were made by the particular witness for the year or period where the blank occurred. In considering the results obtained by the other witnesses I have added on this summary sheet, full capacity storage for the years 1900 and 1914, in the case of the witnesses who submitted no estimates on these years, and compared the results with those years added in the cases of the other witnesses with the results obtained by me from a consideration of those years. Offered and ad-
1063 mitted. Referring to the forecasts of demand for irrigation water at Platte Canon, made by Mr. Fellows, on the basis of the demand for the year 1913, and by Mr. Field based upon a consideration of the years 1912 and 1913, I don't believe that fair and accurate judgment is possible from the experience of one season alone or from the average of two seasons. There are so many factors to be taken into consideration that have a controlling effect upon the demands for water; weather conditions, rainfall, and the rate of volume of flow, being most important. Another material element is the wide fluctuation from season to season in the accretions to the river below the canon from tributary streams and seepage. Mr. Fellows treated his estimated demand on the canon in acre-feet for each month and applied his demand in such a way that Lake Cheesman was not permitted to store unless the flow of the river at the canon for that month had aggregated a quantity in excess of the demand.

This would tend to an unjust effect, because during part of the month a greater volume than needed might be available and storage permitted, though a decreased flow for the remainder of the month reduced the total flow so that under that rule no storage could be had. The flow of the river varies largely from day to day. I am of the opinion that such a rule would have operated to prevent legitimate storage in quite a number of cases where peak floods occurred in the stream. Taking the requirements set forth by Mr. Field as to flow

at the canon before Lake Cheesman can store and comparing them with the facts of actual storage that occurred in the year 1912, gives an indication of the operations of that rule. In the month of April Mr. Field estimated 4,884 acre feet for Lake Cheesman in that month. There was actually stored in Lake Cheesman that month, according to his exhibit 47, 7,425 acre feet. The total stream flow at Lake Cheesman during April was 8,019 acre feet as shown by Mr. Fellows' exhibit 44. There was stored in District No. 2 during the month 6,370 feet and in Antero reservoir in March and April, 2,400 acre feet, one-half of which may be fairly estimated as storage for April. Under these conditions Lake Cheesman could have stored all of the stream flow, 8,019 acre feet; plus 1,200 feet stored at Antero or a total of 9,219 acre feet, an excess of 4,385 over Mr. Field's estimate. In May Mr. Field estimates 7,328 acre feet, there was actually stsored according to Exhibit 47, 10,968 acre feet. The total stream flow at Cheesman in May was 11,600 acre feet, according to Exhibit 44. There was stored in District 2 in that month, 10,500 acre feet, therefore, all of the stream flow at Cheesman could have been stored.

There was stored in Antero that month 1,800 acre feet, which
1064 plus stream flow at Lake Cheesman makes a total of 13,400 acre feet available for storage at Cheesman or 6,072 acre feet in excess of Mr. Field's estimate. In the month of June Mr. Field estimated 25,968 acre feet available for storage. On the same analysis there was available for storage 43,761 acre feet or 17,793 acre feet more than Mr. Field's estimate. In the month of July Mr. Field's estimate was 17,740 acre feet. There was available at least 3,500 acre feet more than was estimated by Mr. Field. For the month of August, Mr. Field's estimate was 9,694 acre feet, there was actually stored in Antero in that month 5,500 acre feet, which at least should be added to Mr. Field's estimate. In September, Mr. Field estimated 120 acre feet for storage. There was at least 9,186 acre feet available, or 9,066 acre feet in excess of this estimate. In the month of October Mr. Field's estimate was 368 acre feet. The stream flow at Cheesman was 6,324 acre feet, there was actually stored in Lake Cheesman 738 acre feet and in District No. 2 during that month, 23,380 acre feet. So that Cheesman could have stored the entire stream flow, or 5,956 acre feet in excess of his estimate. For the whole year 48,208 acre feet additional storage should be added to Mr. Field's estimate, using his own factors and assumptions in view of the storages made elsewhere.

A similar analysis of the results obtained by Mr. Fellows shows that in the month of April, 1912, there was 1,200 acre feet more available than he allowed. In the month of May, 1,800 acre-feet; June, 18,696 acre-feet; July, 3,500 acre feet; August, 5,500 acre feet; September, 9,186 acre-feet; October, 6,324 acre-feet, or a total of 46,206 acre-feet, to which volume should be added any storage in Antero reservoir from January to March and November to December. Mr. Fellows in arriving at the quantity available for storage, treated the amount in excess of his estimated demands on the canon as constituting the storable quantity. In the month of April there was stored in District No. 2 out of the quantity estimated by him to be

necessary for direct irrigation 6,370 acre feet. In the month of May 7,717 acre feet. In the month of June, 9,290 acre feet. In the month of July, 12,400 acre feet. In the month of August, 5,710 acre feet. September, 8,186 acre feet, and in October, 23,380 acre feet. In the month of October, Mr. Fellows estimated that there could have been no storage at Lake Cheesman because his canal demand, 16,883 acre feet, exceeded the stream flow at Platte Canon, which was only 16,040 acre feet. Yet the storage of 23,380 acre feet occurred in District No. 2.

This would indicate that Mr. Fellows' demands upon the canon for direct irrigation were too high. Exhibit A-89 is a tabulation showing the exact storages that have occurred at Lake Cheesman by months, in the various years since it has been operated, with the amount of water that was passing Platte canon at the time the storage occurred, compared with the demands made upon the stream at the canon during the months of the irrigation season by Messrs. Field and Fellows. For the purpose of this exhibit I converted Mr. Fellows estimate in acre feet to cubic feet per second. The data contained in this exhibit is based upon all of the records available. There are many instances where storage actually occurred at Lake Cheesman when the stream flow was much less than the demand stated by Messrs. Field and Fellows.

1065

For the month of June, Mr. Field's demand upon the canon is 1,000 second feet. Mr. Fellows' demand, 1,023.93 second feet. In June, 1904, considerable storage occurred at Lake Cheesman when the average flow at Platte Canon was 541 second feet, with a mainimum of 407 and a maximum of 792 second feet.

Defendant's exhibits Nos. 1 to 18, inclusive, offered and admitted. Complainant's Exhibit A-88 offered and admitted.

Exhibit A-89 offered and admitted.

Mr. Bull in arriving at his estimate of the demand for water on the canon before storage would be permitted in Lake Cheesman, used a different method than was used by Messrs. Field and Fellows. He examined the records for as many years as data was available, and took as his basis either the demand for water expressed by the water commissioner of District No. 2, or such evidence of demand as was indicated by the reports of diversions of the ditches prior in point of time to Lake Cheesman. I do not think that the reports of the water commissioners are entirely dependable, nor is the fact that a ditch was not demanding, or taking water, evidence that it was unable to get it. It frequently occurs that ditches which can get water do not divert at all or do not divert up to the limit of their decree. And the fact that they are not diverting does not indicate that there exists an unsupplied demand to the extent of the lack of diversion on their part.

If from the water commissioner's reports it should appear that a junior ditch in District 8 was drawing water and a senior ditch in District 2 was not drawing, the natural conclusion would be that the senior ditch in District 2 did not require water. In the regulation of reservoirs in Colorado, the right to store water is ordinarily governed by the conditions existing when the water is at the reservoir,

and not by conditions that may exist when the water has passed the reservoir and might reach the ditches further down stream.

The regulation of the stream ahead of all conditions that may present themselves is hardly a feasible proposition. There
1066 are irrigation ditches all along the South Platte River to the Nebraska state line, distant from Platte Canon from 200 to 250 miles, and from Lake Cheesman from 250 to 300 miles. It would take several days for the water to flow that distance. In estimating the storage at Lake Cheesman I have not permitted storage at any given time unless there was enough water flowing at Platte Canon to satisfy the requirements of Districts 2 and 8. The condition that might affect the regulation of storage at a reservoir where matters other than the presence of the water at the reservoir would be considered is such as would arise with a rising river following a long continued low flow in the stream. Some time might elapse from the appearance of the increased flow at the reservoir until water in sufficient volume would reach the ditches downstream. Such occasions do not occur frequently, but they have been given due consideration and weight in making my estimate of storage. The method of measurement which has always been in vogue at Lake Cheesman is such that the stream flows are recorded, less such loss from evaporation as is sustained in the Lake. The stream flows so recorded, less the evaporation loss, are the flows which have been used by the various witnesses testifying in this case. In order to ascertain the actual stream flow since Lake Cheesman has been in existence, the evaporation loss should be added to the recorded flows. I have made no such additions in making up my estimates of possible storage at the lake. Notwithstanding that fact, I have made deductions for evaporation according to the water surface exposed on the lake, under my assumptions, from month to month. That deduction affords an additional factor of safety in my estimates.

Exhibit A-90 is a tabulation showing records of evaporation experiments at Pikes Peak, Colorado Springs, Denver, Cheyenne and Marston Lake with the factors used by Mr. Bull and the factors used by myself. These were the bases of the deductions for evaporation at Lake Cheesman. The evaporation at Marston Lake would be much greater than at Lake Cheesman. In estimating storage at Lake Cheesman I did not consider the demand of the Platte Canon ditch as affecting that storage in the winter months. I allowed as storage for Lake Cheesman all the water available in the south fork and later in considering the Platte canon ditch rights, deducted from the yield of the ditch whatever deficiencies existed in the stream after the Lake Cheesman storage was taken out. Mr. Field and Mr. Fellows, in estimating storage at Lake Cheesman, gave the Platte Canon ditch a full supply before allowing storage. Their method of treatment decreases the quantity of storage available for Lake Cheesman, by comparison with the method used by me. Using the
1067 stream flows recorded for the South Platte river, which are less the evaporation loss at Lake Cheesman, also decreases the total storage available to the extent that loss occurred from evaporation. Exhibit A-91 is a tabulation showing the quantities which

should be added to the various estimates of storage on account of additions that should be made to the stream flow at Lake Cheesman because of the evaporation loss which has occurred from the Lake; also the additions that should be made to the estimates of Messrs. Field and Fellows, because of their method of treatment of the Platte Canon ditch. In the matter of the additions to be made because of the method of treatment of the Platte Canon ditch, I have gone through the estimates of Messrs. Field and Fellows, year by year and month by month, and made the additions. In the case of the estimate of storage made by Mr. Bull, I have made the additions for evaporation loss only because he treated the Platte Canon ditch in the same manner that I did.

Objection to admission of Exhibit A-91 because it practically involved a change of point of diversion of the Platte Canon ditch. Overruled. Offered and admitted.

In computing the addition to be made to the stream flow for the loss of evaporation in the case of Messrs. Field, Fellows and Bull, I took the area of water surface exposed in the reservoir in each month and applied the evaporation factor used by the individual to whose estimate the increase was being made. In the case of Mr. Field, I used the stream flow at Lake Cheesman as testified to by Mr. Comstock. Mr. Field having stated that he used Mr. Comstock's figures of stream flow in arriving at his estimate of storage.

Exhibit A-92 is a comparative tabulation showing the estimates of available storage by the various witnesses, with corrections for additions on account of the Platte Canon ditch treatment and on account of actual evaporation at Lake Cheesman.

This table is built up from exhibits A88 and A91. Exhibit A92 offered and admitted. I know of no irrigation ditches on the South Platte river having their intake between the point of intake of the Platte Canon ditch and Lake Cheesman. The High Line ditch intervened between the original location of the Platte Canon ditch and Lake Cheesman. Exhibit A93 shows the actual storage that has been made in Lake Cheesman since it has been in operation, with comparisons in the months and years with the estimates of Messrs. Field, Fellows, and Bull, when their estimates of available storage were less than the storage which actually occurred. Offered and admitted.

1068 In the years where they allowed storage to the full capacity of the reservoir, though discrepancies occurred between actual and estimated storage in certain months, I have eliminated the discrepancies. Exhibit A94 is a tabulation showing the actual storage which occurred in Antero reservoir in the years 1910 to 1913 inclusive. And which were not considered or credited as available to Lake Cheesman, by Messrs. Field, Fellows, and Bull. This water did not appear in the stream flow at Lake Cheesman and should have been added to the stream flow and to the available storage. I also ignored this storage in my estimates of storage available for Lake Cheesman. These amounts should be added to all estimates of available storage in Lake Cheesman, because the rights of Antero reservoir being subsequent to Lake Cheesman, these amounts if

available for storage at all would have been available for Lake Cheesman first. I note a deduction for the Antero storage for the year 1912, because in that year all the estimates allow Lake Cheesman its full capacity. I did not consider the storage in Antero in 1909 for the same reason. The figures as to actual storage in Antero reservoir were obtained from the testimony of Mr. Wall. Exhibit A94 offered and admitted.

Exhibit A95 is a tabulation setting forth the various months in which the estimate of storage in Lake Cheesman by Messrs. Field, and Fellows, exceeded my estimate. (By Mr. Dorsey, "Mr. Field went into an extended criticism of Mr. Anderson's figures and deducted in certain months the quantities which in Mr. Anderson's estimate were higher than his own, but he failed to make any additions to Mr. Anderson's figures when they were less than his own.") Exhibit A95 offered and admitted.

Exhibit A96 is a tabulation showing the amounts of the estimates by various witnesses for the purpose of comparison, after the various additions about which I have testified have been made to their original estimates. It is really a summary of the exhibits that have gone before. Offered and admitted.

Exhibit A97 shows the extent to which the 1947 acre feet, Bear creek or Platte canon flow to Marston Lake, which I eliminated from Marston Lake in the months of April and May each year because that reservoir was full, could be utilized by being stored in Lake Cheesman. Exhibit A97 offered and admitted.

Objection, overruled, exception.

Q. Mr. Anderson, various witnesses, as you have already stated, have presented their estimates as to possible and actual storages at Lake Cheesman, and also their statements as to the operating results in operating the reservoir on various assumed drafts for irri-
1069 gation purposes under their respective estimates. According to the estimates of Mr. Field as to possible and actual storages at Lake Cheesman, and upon an assumed draft of 40,000 acre-feet per annum, the efficiency resulting, as appears from Mr. Field's Exhibits 45 and 46, is as follows: An average efficiency for the years 1902 to 1913, a period of twelve years, of 98.4 per cent; the efficiencies in the respective years being as follows: In eleven years out of the twelve, 100 per cent, and in one year, to-wit, the year 1904, 81 per cent; also upon Mr. Field's estimates of possible and actual storages in Lake Cheesman, and upon his assumption thereunder of a 50,000 acre-foot draft annually, an average efficiency results of 92.08 per cent for the period of years 1901 to 1913, to-wit, thirteen years, the efficiency in the respective years of the period being as follows: In ten years out of the thirteen, 100 per cent, and in the other three years the following efficiencies: 1903, 61.5 per cent; 1904, 45.9 per cent; 1911, 89.71 per cent; I ask you to state whether or not in your judgment there is a sufficient difference in the efficiency of the reservoir, as between a draft of 40,000 acre-feet and a draft of 50,000 acre-feet, according to the results found by Mr. Field.

to make any difference in the market price or value, per acre-foot, of a water right in the reservoir?

A. There is not, in my judgment.

Q. On the 40,000 acre-foot draft annually, as assumed by Mr. Field, it appears from his testimony and his exhibits that the following would be the operating results in respect to water left in the reservoir at the end of each calendar year, and in respect to the waste over the spillway: That at the end of the year 1902 there would be left in the reservoir 91 per cent of the assumed draft of 40,000 acre-feet; 1903, 33 per cent; 1904, 10.9 per cent; 1905, 100.4 per cent; 1906, 168.6 per cent; 1907, 191.1 per cent; 1908, 102.3 per cent; 1909, 190.95 per cent; 1910, 121.24 per cent; 1911, 38.66 per cent; 1912, 124.16 per cent; 1913, 135.31 per cent; and at the same time there would have been wasted over the spillway necessarily out of the water otherwise available to the reservoir under its appropriation the following quantities: 1902, 29.7 per cent of the assumed draft of 40,000 acre feet; 1907, 62.39 per cent, equivalent to 24,957 acre-feet in that year; 1908, 9.44 per cent, equivalent to 3,775 acre-feet; 1909, 93.76 per cent, equivalent to 37,505 acre-feet; 1910, 77.96 per cent, equivalent to 31,183 acre-feet. I will ask you to state, Mr. Anderson, whether in your judgment, under those conditions, the operation of that reservoir for irrigation purposes upon an annual draft of 40,000 acre-feet only would be a proper or businesslike or economical method of operating the reservoir.

A. It would be neither an economical nor a businesslike method of operating the reservoir.

1070 Q. Would it be in record with proper irrigation practice?

A. I don't quite get the connection of the word "proper" in connection with irrigation practice in this case. I do believe—and I think that most irrigation operators would not so operate it, on account of the fact that they would not be making the most of the opportunities of the water supply available for the reservoir under such conditions as set forth there.

Q. Do you think any irrigation operator who was in the business for profit would operate it in that way?

A. Certainly not.

Q. Is it your judgment——

A. (Interrupting and continuing.) I mean, further than that, any mutual company or community company operating in the irrigation business would not operate a reservoir under such conditions as that, because it would not be economical nor businesslike, and could be made to render service satisfactorily, on a much larger draft.

Q. When you say "render service satisfactorily," satisfactorily to whom do you mean?

A. To the consumer.

Q. Mr. Fellows also presented certain estimates, and upon his estimates of possible and actual storages at Lake Cheesman, upon an assumed annual draft of 40,000 acre-feet, as assumed by him, and for a period of fourteen years, or, rather, fourteen irrigation seasons,

beginning with 1900, the reservoir, according to that method of operation, and upon his estimate, showed the following efficiencies: An average for the fourteen-year period, on a 40,000 acre-foot draft, of 95.6 per cent, and the efficiency in the respective years of the fourteen year period being: in twelve out of the fourteen years, 100 per cent, in one year, corresponding to 1903, 77.32 per cent; and in the next year, corresponding to 1904, 61.88 per cent. Mr. Fellows made an estimate or a determination of the operation of the reservoir according to his estimate on a 50,000 acre-foot draft for the same fourteen-year period, and for that fourteen year period he got an average annual efficiency, or an average efficiency of 90.95 per cent, made up of efficiencies in the individual years as follows: In ten years out of the fourteen, 100 per cent of the 50,000 acre-foot draft, and in the other years the following percentages of efficiency; In one year, corresponding to 1903, 27.8 per cent; in the next year, corresponding to 1904, 50.6 per cent; in the year corresponding to 1909, 98.2 per cent; and in the year corresponding to 1912, 96.7 per cent, making an average efficiency for that period of fourteen years, on a 50,000 acre-foot draft, of 90.95 per cent, or, as he stated it in his exhibit, in round figures, 91 per cent. I will ask you to state whether or not, in your judgment, there is sufficient difference in the efficiency of the reservoir, according to Mr. Fellows' estimates on the 40,000 acre-foot draft and the 50,000 acre-foot draft,
1071 to make any difference in the market price or value, per acre-foot, of the water rights in the reservoir?

A. No sir, there isn't any such difference, in my judgment.

Q. Under Mr. Fellows' estimates, on the basis of a 40,000 acre-foot annual draft, he had left in his reservoir at the end of each irrigation season of the fourteen—that is to say, at the end of the month of October and on the first day of the month of November—the following percentages of his assumed draft of 40,000 acre-feet, to-wit: In the first year, 133.68 per cent; second year, 107.83 per cent; third year, 58.79 per cent; fourth year, corresponding to 1903, no per cent, fifth year, corresponding to 1904, 1.78 per cent; sixth year, 64.90 per cent; seventh year, 89.93 per cent; eighth year, 177 per cent; ninth year, 92.24 per cent; tenth year, 181.67 per cent; eleventh year, 107.83 per cent; twelfth year, 40.25 per cent; thirteenth year, 131 per cent; fourteenth year, 154 per cent; and at the same time, in operating the reservoir in that way, he was obliged to permit to go to waste over the spillway out of water otherwise available to the reservoir under its appropriation the following percentages of the annual draft of 40,000 acre-feet, to-wit: In the first year, 157.5 per cent, equivalent to 6,305 acre-feet; in the second year, 23.4 per cent, equivalent to 9,359 acre-feet, in the eighth year, 25.9 per cent, equivalent to 10,360 acre feet; in the ninth year, 18.4 per cent, equivalent to 7,367 acre-feet; in the eleventh year, 118.8 per cent, equivalent to 47,516 acre-feet; and in the fourteenth year, 4.5 per cent, equivalent to 1,825 acre-feet. I will ask you to state whether or not, in your judgment, under those conditions, the operation of that reservoir at an assumed annual draft of 40,000 acre-feet was a businesslike and economic operation of the reservoir?

A. No sir, it was not, in my judgment.

Q. Why not?

A. Because, as I said before, it would not be making the most, in a business way, of the opportunities for storage afforded, and in such a way as to fully satisfy the consumers under it upon such assumed draft—in other words, to the perfect satisfaction of the consumer, the draft could be enlarged, in a business way.

Q. Mr. Bull in his exhibit 39, according to his estimate of actual and possible storages, and upon an assumed annual draft of 40,000 acre feet, showed an annual efficiency of 100 per cent for the period of thirteen years, being the years 1901 to 1913, and an average efficiency for that period of 100 per cent; on an assumed draft of 50,000 acre-feet, Mr. Bull, according to his estimates, gave a result in respect to efficiency as of 93.2 per cent as the average for the full period of thirteen years, made up in the individual years as
1072 follows: Ten years of 100 per cent efficiency; one year of 57.98 per cent efficiency; one year of 70.38 per cent efficiency, and one year of 82.99 per cent efficiency. I will ask you to state whether or not, in your judgment, there is enough difference in the efficiency upon the assumed annual drafts of forty and fifty thousand acre-feet as determined by Mr. Bull, to make any difference in the market price or value, per acre-foot, of water rights in the reservoir?

A. No sir, there is not.

Q. Mr. Bull also made an estimate on a 60,000 acre-foot draft for the same thirteen years' period, and in the thirteen years on that assumed annual draft he had an efficiency of 100 per cent in eight years, and in the other years efficiencies as follows: 1902, 95.2 per cent; 1903, 19.5 per cent; 1904, 58.6 per cent; 1911 42.9 per cent; 1913, 86.6 per cent; giving an average for the thirteen-year period, in percentage of efficiency, of 84.8 per cent. Does that represent a sufficient variation from the efficiencies as determined by Mr. Bull on the drafts, of forty and fifty thousand acre-feet, respectively, to make a difference in the price per acre-foot?

A. No sir, not in my judgment.

Q. Upon your own estimates of available storages and actual storages in Lake Cheesman and upon the assumed annual draft of 60,000 acre feet as taken by you, Mr. Bull shows in his exhibit 39 that for the thirteen-year period, corresponding to the period which he had taken, 1901 to 1913, upon your estimates, and upon an assumed annual draft of 60,000 acre-feet, the reservoir would show an average efficiency of 90 per cent, made up as follows: Out of the thirteen years, ten years of 100 per cent efficiency, the other three years showing efficiencies as follows: In 1903, 27 per cent; in 1904, 59.2 per cent; in 1911, 84.2 per cent. I will ask you to state whether or not, in your judgment, there is a sufficient difference in efficiency between the efficiency of the reservoir on the 60,000 acre-foot draft, according to your estimates, and the efficiency of the reservoir according to Mr. Bull's estimates, on the forty- fifty, and sixty thousand acre-foot drafts to make the unit price, per acre-foot, of a water right under any of Mr. Bull's estimates any less than under your estimate?

A. No, there is not, in my judgment.

Q. Do you think there is a sufficient difference in the efficiencies under any of those estimates to make any difference between them——

A. No sir.

Q. —in respect to the market value, per acre-foot, of water rights in the reservoir?

A. No sir, not in my judgment.

Mr. Dorsey: That is all.

1073 Cross-examination by Mr. Nye:

The data in Exhibit A-88 relating to actual storage in Lake Cheesman was prepared from the records of the D. U. W. Co. I compared it with Mr. Field's Exhibit 47 and noted the variations that occurred. The records in the water company's office give the lake elevation from which I computed the acre feet stored. Differences between Exhibit A-88 and No. 47 may be due to errors in computation or slight differences in the stream flow as converted into lake elevations.

In the month of October, 1902, Lake Cheesman actually stored 740 acre-feet, leaving a flow of 62 second feet in the stream after storage was made. In October, 1900, I estimated storage to the amount of 5,208 acre feet, after which there was 86 second feet left in the stream. Comparing this stream flow with the flow in 1902, when storage was permitted, I think my 1900 estimate is justified. The rainfall in September, 1902, was three and one-half times normal, that had some bearing on that storage. The heavy rain was followed by a snowstorm in October, according to the weather bureau records.

The note in June, 1901, "Water within one foot of masonry on the 16th," indicates that a storage was limited that month to the amount of 3,037 acre-feet, because of structural conditions. This exhibit is intended to show only the storage that occurred in irrigation months. The fact that it does not set forth storage in the non-irrigating season does not indicate that there was no storage. I do not know why less water was actually stored in October, 1904, than is estimated to have been available. No storage occurred in October, 1905, because the reservoir was full. Was also full June and July, 1906. About 500 acre feet, less than the estimated amount available, was stored in April, 1912. That available water was taken for other purposes by the company itself. A slight difference in May that year is probably due to differences in converting stream flow into acre-feet and lake elevations. The reservoir was filled early in June, which accounts for that difference. The water stored in District No. 2 in 1912 may have come either from Platte Canon or from tributary streams. In the summary of storage estimates by different witnesses, Mr. Fellows' average for twelve years is 51,148 acre feet; for 13 years, 50,941; for 14 years, 56,316 acre feet. Mr. Bull and Mr. Fellows both estimated the 12-year period, 1902 to 1913, omitting the year 1901, which for the purposes of this summary I added to their estimates, as I also added 1900. Therefore, the three sets of averages. These calculations were made by me personally. I think the addition

of the two full years, 1900 and 1914, to the estimates for the
1074 other years, is perfectly proper considering that records exist from which such computations can be legitimately and fairly made. This is true even though it made the estimated period begin with a high year and end with a high year. I am beginning to doubt that years of high and low flow come in cycles. The so-called cycle is becoming more and more erratic, the period- between low years seem to be increasing, and the fluctuations increasing; that may, however, be only a condition of time. I don't believe that I have avoided the effect of the years of low flow in this cycle by considering the high years at the beginning and end, particularly as that period includes the year of lowest known flow on the stream. 1890 and 1896 were years of low flow, as I recollect them, but not extremely low. I do not recollect that 1897 was a year of low flow. I should have gone back of 1900 and searched all of the years for an average of the flow if there were records upon which it could be done. Those in existence are very broken.

Exhibit A-89 contains figures of actual storage and actual flow. No theoretical or estimated figures at all. The exhibit was prepared to compare with the theoretical storage and theoretical demand estimated by Messrs. Field and Fellows. It shows the actual storage and the actual stream flow at Platte Canon, when storage was allowed, compared with the theoretical quantity required at the canon by Messrs. Field and Fellows. The purpose of the exhibit is to show the actual storage that took place when the amount of water passing through Platte Canon was less than the estimate of requirements by Messrs. Field and Fellows. And to that extent show that their estimate of demand is in error.

The record of stream flow passing Platte Canon given in Exhibit A-89 was obtained from the State engineer's office. The presumption is that before such storage was made in the various periods of the various years the demands of the ditches below had been satisfied. In the month of May, 1903, for example, storage was accomplished when the average flow was 212 second feet. Mr. Fellows' demand for that month was 421 second feet before storage would be allowed. In May, 1912, the minimum flow was 165 feet, Mr. Fellows' demand was 421 feet, there were sixteen days in the month when the flow was less than his demand. In June, 1912, the average for the entire month was 980 feet, Mr. Fellows' demand was 1,023.93. The month of July, 1912, was not considered because the reservoir was filled June 16.

Mr. Fellows alloged storage to the full capacity of the reservoir in
1912, so the conditions stated do not affect the storage to the extent of cutting the reservoir down. The tabulation was not pre-
1075 pared for that purpose, but simply to show that the arbitrary demands estimated by Mr. Fellows are not made upon the canon in actual practice. To this extent it is important, because the first thing necessary in dealing with this question is to ascertain the total quantity of water available for storage. The limitations of the capacity of the reservoir are another matter. I stated that the water

commissioner's reports are an unsatisfactory basis for determining the demands upon the river. They are used to a very considerable extent as the basis for regulating the river flows.

I think that the fact that ditches having direct flow rights do not divert all the water to which they are entitled is indicative that like situations will prevail in the future. There will be periods when they do not divert, and that enters very largely into any consideration of estimated storage.

I am not so sure that the water commissioners' records of diversion and demand of ditches are as accurate as theoretical estimates made, not upon the records, but upon some other basis of calculation. I have never managed an irrigation reservoir, but have been connected with them as an engineer. Among them are two stream bed reservoirs, the Clear creek, and Beaver, smaller than Lake Cheesman, but similarly situated with relation to the stream. In speaking of the proper method of controlling and regulating storage in a reservoir, I do not speak from experience obtained with these reservoirs, but from general knowledge. The operation of Lake Cheesman as an irrigation reservoir would be under the regulations of the State engineer and his subordinates. I do not believe that storage has been permitted in reservoirs when the stream flow was inadequate to meet the needs of the prior direct-flow rights.

In ascertaining the quantity of water which in my judgment was available for storage in Lake Cheesman, I took into account the quantity flowing in the stream and the quantity that should pass Platte Canon as evidenced from time to time, in the various months, by the quantity in the stream, when storage had been permitted at Lake Cheesman. I considered each year by itself to determine the effect of rainfall and climatic conditions upon the general demand for water. From those examples, I formed my judgment as to storage available. The proper demand on the canon is determined by the amount of water which passes Platte Canon before storage has been permitted. That demand has been and will be a variable quantity to satisfy the requirements of practically the same ditches.

It is proper and necessary in order to determine the total quantity of water storable at Lake Cheesman to add the loss due to evaporation from the reservoir to the quantities measured in the stream at that point. In arriving at the quantity storable, we must treat
1076 the stream as though Lake Cheesman did not exist. If there was no obstruction in the stream, such evaporation would not have taken place. After the quantities available for storage are determined, evaporation loss is a proper charge against those quantities assumed to be stored in the reservoir.

In Exhibit A-91 for the months of November and December, 1902, under Mr. Field's estimate, where he estimated no storage, I have nevertheless charged up the amount of the evaporation as determined by me. That evaporation was based upon the existing lake levels. In treating part of the supply of the Platte Canon ditch as storage in Lake Cheesman I proceeded as though the change of point of diversion of that ditch was settled and such a diversion already possible to Lake Cheesman. The legal question does not enter into that assump-

tion at all. To make the assumptions of Mr. Comstock and myself comparable with the assumptions of Messrs. Field, Fellows and Bull, as treated by me, the evaporation loss that has occurred at Lake Cheesman should be added to our estimates of storage available at Lake Cheesman even though, in our assumption, we left that out as an additional margin of safety in our estimates.

The fact that it is treated as a margin of safety in our estimates, does not imply that it should be so treated in the estimates of Messrs. Field, Fellows and Bull, because of the difference in the method of treating the demand upon the canon. Their method applies the maximum demand against the stream, that can be made. In my method of treating part of the water of the Platte Canon ditch appropriations as storable at Lake Cheesman, I did not consider that the appropriation of the Platte Canon ditch was not all required for domestic purposes in the City of Denver. I did not consider the demand for domestic purposes at all, but simply considered the product of the Platte Canon Ditch in water, for the purpose of valuation. It was simply a consideration of the quantity of water that this property can produce, divorced from its present condition, and with the question of domestic needs, entirely eliminated.

I insist that the quantities shown on Exhibit A-93 as having been actually stored in Lake Cheesman in certain years, and months, in excess of the theoretical storage allowed by Messrs. Field, Fellows and Bull, should be added to their estimates of storage. The storage was made and apparently legally. I do not understand that Mr. Bull added the storage that had been made in Antero Reservoir to his estimate of the storage available for Lake Cheesman. The total storage in Antero reservoir from 1910 to 1913, inclusive, was 53,500 acre-feet, from which I deducted 29,000 acre-feet for 1912, leaving
1077 24,500 acre-feet for the years 1910, 1911, and 1913, which spread over the period of 15 years increases the average annual storage in Lake Cheesman 1,633 acre-feet, or spread over the 14 year period increases the average, 1,750 acre-feet. This is simply applying it to the annual average storage and has nothing to do with the assumed total storage accomplishment in any individual year.

If I am wrong in my assumption that Mr. Bull did not add to the storage available for Lake Cheesman the storage made in Antero Reservoir, then the quantities that I have added to his estimate on that assumption should be deducted. Exhibit A-97 is prepared simply to show what portions of the Bear creek and Platte canon supplies that were available, but could not be stored in Marston Lake, might have been stored in Lake Cheesman in different years under consideration. With these rights in common ownership exchange could be made to make possible the utilization by storage in Lake Cheesman.

In the practical operation of any irrigation system, storage or direct flow, efficiency has a great deal to do with both the actual and market value of the water rights. It is difficult to determine the point at which falling efficiency affects market prices. I gave my answer to the hypothetical question on the experience which I have had in a successful reservoir in which the water right prices

are maintained and in which the efficiency is not so high as that under consideration here. I don't think anybody can undertake to say where that efficiency would affect value, whether from 75% to 50% or anywhere near that, but from the experience in Northern Colorado where reservoirs have been developed, we do not know that an efficiency of 80% and upwards makes no difference in the market value. It is true that Lake Cheesman has never been operated as an irrigation reservoir, and that the testimony here is based upon the estimates of the various witnesses.

Redirect examination by Mr. Dorsey:

In Exhibit A-88 notes referring to precipitation relate to the precipitation at Denver. In reviewing the years from 1899 to 1914, as a basis for my estimate of storage at Lake Cheesman, I have taken into consideration every year for which sufficient data is available upon which to base judgment. Prior to 1899 there are practically no records of Cheesman, and Platte Canon records are broken and interrupted. It makes no difference whether Lake Cheesman has been operated as an irrigation reservoir or not. For the purpose of my estimate of storage, it was considered as an original proposition, having no connection with what it might or might not have been in the past. I have kept myself in-
1078 formed for the past 30 years as to the operation of reservoirs for irrigation purposes.

Messrs. Field, Fellows and Bull arrived at their estimates of storage available in Lake Cheesman by applying an arbitrary and unchanging rule of demand to the stream flow at Platte Canon. It was my purpose in making the additions for evaporation losses and method of treatment of the Platte Canon ditch supply as shown by Exhibit A-91 to the estimates of Messrs. Field, Fellows and Bull, to indicate that even with their unchanging and arbitrary demands upon the canon there was sufficient available storage actually in the stream to give the result as shown on my final assumption. In adding the storage accomplished at Antero reservoir to the storage available at Lake Cheesman, I did not add any given quantity for any individual year, but simply increased the average for the period to the extent set forth in Exhibits A-94 and A-96. The storage shown by Exhibit A-96 is the net available limited by the capacity of Lake Cheesman. If the gross storage available was being considered, then the storage accomplished by Antero reservoir in the whole period from 1909 to 1913 should be added to the total available for Lake Cheesman.

The elements that determine the efficiency of water rights are different in the case of direct flow rights than in storage rights. In the case of the direct flow right the quantity of water in relation to the appropriation, and the time at which it can be obtained in relation to the demands of the crops, are the important elements to be considered in determining its efficiency. In the case of stored water, the element of time with reference to the critical period in the crop growing season can be always controlled.

Recross-examination by Mr. Nye:

There is some uncertainty even in the matter of delivery of reservoir water. There is such a thing as a 100% efficiency in a direct flow right but very rarely. It makes no difference to the individual irrigator whether he gets his water from direct flow rights or from reservoir rights, if he gets the water at the time he needs it.

Witness JAMES C. SWEENEY.

Direct examination by Mr. Hodges:

Am superintendent of the city division of the D. U. W. Co. Have been employed by the company, or its predecessors a little over 24 years, serving in the capacities of calker, forman and super-
1079 intendent. Have served in the present position a little over 7 years. My department has to do with the opening of streets, building of extensions to pipe system, repair work and matters of that kind and the employment of labor for such work. The present scale of wages for unskilled labor is $2 a day for 9 hours, and for skilled labor, $2.25 and $2.50 a day for 9 hours. Objection overruled. Exception.

These rates of wages have been in effect for a little over five years. The $2.25 rate applies to men who investigate leaks and do certain classes of pipe work. The $2.50 rate applies to calkers, and men who make the joints on cast iron pipe. The largest number of skilled laborers employed are of that class. By comparison with them we have only a few $2.25 men. Prior to the time that this scale of wages went into effect, the rate of wages was lower. In 1893 and 1894, and up until about 1897 we paid $1.50 per day for unskilled labor for 10 hours and from 25 to 50 cents a day more for skilled labor. From then until about 5 years ago we pair $1.75 a day for unskilled labor for a 10-hour day and a proportionate raise for skilled labor. Scale now in effect is the prevailing scale with the other public utility corporations.

When openings are made in paved streets for the purpose of doing work on mains, the pavements are replaced by the city after the pipe work is completed, the company being required, before the opening is made, to deposit with the city a sum sufficient to cover the cost of replacing the pavement and probably 50% more. When the repairs are made the city deducts from the deposit the cost and refunds what is left, if any. The prices charged by the city for asphalt and concrete pavement is $3.00 per square yard. Stone, $2.50 per square yard. Macadam, $2.00 per square yard, and in surfaced streets, 15 cents per lineal foot with a flat charge for small openings of $2.50. The city requires us to backfill the hole properly by tamping or flushing, then cover it with plank brought level with the surface of the paved street, later the city removes the planking, installs a concrete base under the pavement and — the pavement.

Objection to interrogation as to area of pavement cut away and replaced with reference to size of excavation, overruled, exception. The excavations are usually allowed to stand some time to permit

settlement before the pavement is repaired. Sometimes they stand for months, then the portion of the pavement outside the excavation that has been beaten down by vehicles is cut away and usually the area of pavement replaced is much larger than the area of the excavation. The new pavement always overlaps the old base
1080 to give it firmer support, the lap being from 4 to 6 inches on each side of the hole. We use water to settle the trench when it is convenient, except in clay ground where we tamp the backfill because water would keep the clay soft too long. The plank that we place over the excavation is removed by the city. I don't know what becomes of it. We use plank three inches in thickness and 10 and 12 inches wide as required.

Cross-examination by Mr. Stevens:

What I have testified about is the custom of the city in relation to repairs on paved streets. I never undertook to construct a wholly new system and don't know what the custom of the city might be in relation to that.

Redirect examination by Mr. Hodges:

I have constructed extensions of the water system under surfaced streets, but I do not recall any under asphalt streets. There has been no difference in the treatment of the question by the city in extension work or in repair work.

Recross-examination by Mr. Stevens:

Proportionately more cutting in pavement would be necessary on the repair openings than on long trenches, because of the overlap at the end.

Witness WILLIAM O'GARA.

Direct examination by Mr. Hodges:

Reside in Denver. Am a general contractor, in which business I have been engaged 16 years, and for 15 years prior to engaging in contracting was in construction work for others. Work consisting of water work, railroad, harbor improvements, canal, building, and iron construction. My first work was with the Chicago, Milwaukee and St. Paul railroad, between Ottumwa, Ia., and Kansas City. Later on the Duluth, South Shore and Atlantic railroad, between Soo Junction and Sault Ste. Marie, later in charge of installation of four tracks on Pennsylvania railroad entering Philadelphia, that required raising the tracks and depressing the streets, taking care of paved streets, gas mains, water mains, and sewers, and erecting steel bridges. Later in installing a four track road on the Pennsylvania railroad under the Delaware and Raritan Canal in Trenton, New Jersey, later in charge of the construction of the Mexico, Cuernavaca and Pacific Railroad in Mexico, later
1081 in charge of the harbor work at Tampico, extending the jetties, involving an expenditure of about a million and a

half dollars, later was in charge of the construction of the Chihuahua-Pacific railroad, involving an expenditure of 6 million dollars, 4 million dollars of which came under my jurisdiction. Carried out part of the work as superintendent and part of it under contract; that is where I started in the contracting business. Since then built the Colorado & Southern Interurban lines between Denver and Louisville Junction. Built the double track in Eagle Canon for the Denver and Rio Grande Railroad. Part of the water supply system for Colorado Springs. Built approximately 30 miles of conduit for the D. U. W. Co. and several irrigation canals throughout the state. The conduits that I built were Nos. 5, 6, and 7 and am now engaged in building a new conduit from Marston Lake to the city, known as No. 9. Have had experience in hauling material and delivery to the place of installation. Have made an investigation of the use of motor trucks for use for that purpose in connection with the work now under way. Objection to result of investigation, overruled, exception. I asked a motor transportation company to submit a price for delivering material necessary for the construction of this conduit. Representatives of the company, with a man named Langston from Kansas City, manager of the Kelly-Springfield Motor Company, after investigating the work, declined to submit a price. I concluded to continue delivering material as I had heretofore with teams. My experience delivering material by teams based on cost figures, kept by me, shows the cost to range from 30 cents to 50 cents a ton mile. On the conduit I am now constructing I am paying for hauling the material $1.50 a ton for an average haul of 2.35 miles at the rate of 62½ cents per ton mile. If this material could be hauled cheaper by motor trucks I would have employed them.

I am familiar with the road from Buffalo to Lake Cheesman. The road could be so repaired and reconstructed that motor trucks could be used to haul material over it. I am familiar with the location of the several conduits of the D. U. W. Co. and the roads by which they are reached. Motor trucks could be used, but I don't think it would be advisable for a contractor to use them for the transportation of material, it would be better, cheaper and more reliable to haul by team. Am familiar to some extent with the distribution system of the D. U. W. Co., part of the material for which could be hauled by motor truck. Teams would be necessary in the outlying districts. I could not state the percentage of the hauling by motor trucks and teams without a detailed investigation to determine just where the
1082 pipes were going. I have had experience with trenching machines. In 1909, I undertook to use one on the construction of Conduit No. 6, length of which was between 13 and 14 miles, requiring a trench 6 feet wide at the bottom, with a slope of ¼ to 1, varying in depth from 7.2 feet to 20 feet. After taking the contract I entered into negotiations with manufacturers of trenching machines for a machine that would excavate that trench. The agent for the Parsons Trench Excavator represented that their machine would dig a trench 78 inches wide and up to a depth of 20 feet, and guaranteed a minimum capacity of 45 cubic yards per hour. On this

statement I estimated that by operating the machine 20 hours per day I could excavate 500 lineal feet of trench per day. I entered into an agreement to purchase the machine for $9,000 if it would do the work. The machine was delivered for thirty days' trial and started to work in South Denver, I believe at Exposition Avenue; the material was not very hard, just ordinary Colorado work. The machine accomplished about 20% of what it was guaranteed to do. After 30 days I notified the manufacturers that I would not take the machine; they sent their designing engineer and general sales agent to Denver to see whether they could remedy the trouble. The result was that they built a special machine 7,500 pounds heavier than the first one, which accomplished approximately 5% more than the first machine; the result was that the actual cost of excavation to the manufacturer without taking into consideration the cost of the machine or repairs, was about 5% more than it would have cost me by employing other methods. With the repair costs amounting to about 10 cents per cubic yard, the cost was 50% more than it would have been with teams. The machines were constantly operated by the manufacturer. The machine excavated about 23% of the trench for that conduit, the balance was done by teams and hand labor. I have seen such trenching machines used elsewhere. I am not using a machine on conduit No. 9, because in my judgment it cannot be usd advantagously and economically on a trench of that size. A machine will work fairly well in soft material that has a tendency to cave, but it is necessary in that material to retard the progress of the machine to the rate of progress you can make in timbering the trench.

A trench caves much more excavated by a machine than by teams. There are places on the distribution system within the city of Denver where a trenching machine would work fairly well on the smaller trenches, in such localities as near Berkeley Lake, Washington Park and northwest of City Park, where there is a sandy soil. But there are many places where the trenching machine could not be
1083 used economically within the city, taking into consideration only soil conditions. In the districts in the city where there are paved streets, street railways, water pipes, sewers, and poles at the side of the street, the progress of the machine would be retarded, increasing the cost of excavation which would be governed by the amount of construction encountered. I should say as a reasonable estimate you would get three or four per cent efficiency out of your machine. The excavation would not be as cheap as by ordinary means. Where poles occur at the side of the street and overhead wires, they would interfere with the conveyor which carries the dirt away from the machine, necessitating taking down the pole or removing the conveyor for each such obstruction.

Were I figuring on reproducing this pipe system, I would expect to use trenching machines on the smaller trenches where it could be handled to advantage, and do the rest of the excavation by hand labor and with teams, and would figure on excavating for the conduits entirely with teams and hand labor. Objection overruled. Exception.

Plates 27 to 30, following page 107, Exhibit C, show the cross sections of conduit trenches as constructed by me for the D. U. W. Co. The trenches are excavated according to those plans with side slopes in order to give the skilled laborers room in which to construct the pipe. On Conduit No. 6 we built about 600 feet of pipe in a trench 78 inches wide with vertical sides, with the result that the pipe would not hold water when it was turned in, because the workmen did not have room in which to build the pipe properly. They could not reach portions of the pipe with a hammer to set up the bands as they cinched them. Proper setting and cinching of the bands is essential in the construction of wood stave pipe, and the trench must be constructed in the manner indicated in order that that operation may be successfully carried on. Trench machines do not construct a trench in that shape. Such a pipe could not be built in a straight side trench having a width 28 inches in excess of the internal diameter of the pipe, as stated by Mr. Bickel. As a contractor I would not take a contract to build a pipe in that kind of a trench, because I would have to guarantee the work after the pipe was in service and supply a bond to protect the guarantee and in a trench of that size and width I could not comply with the contract.

In backfilling the conduit trench it is necessary to backfill by hand and tamp the material to a height of six inches above the center of the pipe. That portion of the trench must be filled with selected material free from rock and lumps. The tamping must be
1084 done carefully to properly support the pipe. That portion of the backfilling represents about 25% of the work. The balance is put in by teams with scrapers. If the work is done in public road that is surfaced, we remove the surfacing first, in making the trench and replace it, bringing the road back to grade after the work is completed.

If the material around the lower side of the pipe is not properly tamped and put in the movement of the pipe when water is turned in may result in leaks and breaks. The selection of the material for the first part of the backfill is frequently expensive. In rock excavation it is necessary at times to haul this material a considerable distance. I have figured the actual cost of the backfilling. The cost of the tamped portion is 24 cents per cubic yard and of the remainder of the fill 13 cents per cubic yard, the 24-cent price applying to 25% of the total fill and the 13 cents to 75%. I have found the average cost of excavation for 48-inch pipe to be 26 cents per cubic yard for earth, 50 cents for loose rock, $1.25 for solid rock. In one case on conduit No. 6 it cost me $12 per yard for wet excavation, and in another case $6 per yard; the yardage was small, about 350 yards at the crossing of the Platte river near Petersburg. The cost of that excavation was $12 per cubic yard. The prices that I have given apply to work within a radius 14 or 15 miles of Denver, where the rock is soft. When you get into the granite the cost of rock excavation is higher. On conduit No. 8 in Platte Canon I bid $1.75 per cubic yard for rock excavation in 1911. The unit costs that I have given for excavation and backfill are the average price per yard on all of the work that I have done on about 30 miles of conduit.

I have made no investigation of the conditions applying to the other conduits of the company, and would not say without investigating that those prices would apply to them. You will find many different costs on different lines. On Conduit No. 6 within a distance of 1,500 feet the cost varies from 20 cents to $1.50 per cubic yard. The total cost to me of the Platte river crossing on Conduit No. 6 was a little over $6,200.

I have investigated construction work at Raton, New Mexico. In my judgment material would be a little easier to handle in excavating there than in Denver. The formation is sandstone erosion and as a rule that is easier to work than the material in the vicinity of Denver. There would be comparatively few obstructions in the streets in Raton. It is a small town without any paved streets or street railways. In designing a water works system there the engineers no doubt have avoided encountering these obstructions or reduced them to the minimum. In Denver it would be quite a problem to avoid obstructions.

1085 In my judgment, the distribution pipe system and the conduit system in Denver could not be constructed within two years without enormous unnecessary cost. I would not say how long it would require to do that work without having at least sixty to ninety days for investigation after the plans and specifications were furnished me by the city of Denver, but from my experience I would say that it could not be constructed economically in two years. Such work can be done with great rapidity, but at a greater cost than would be normally encountered. It is my experience in my business that the overhead cost and profit represents from 22% to 25% of the actual cost of the work under way. This is necessary to cover the contractor's office, legal and general expenses, interest on the money that he is required to furnish, contingencies, and his profits. On work of this character a considerable percentage of the contract price is retained until the work is completed and finally accepted.

If the period specified for the completion of the work was shorter than it would ordinarily take, the overhead charges would be increased. It is customary for contractors on work of considerable magnitude to employ their own engineers, to advise and consult with them during the progress of the work and not to rely wholly upon the engineers of the company. There is a difference in this respect between large contracts and small contracts. On the conduit work during the last five years, I have paid $2 a day for common labor and $3 a day for skilled labor for 10 hours. For some labor I pay a still higher price. The average wage on conduit No. 6 was $2.62 per day for 10 hours. Owing to scarcity of work there is more labor available now than there is usually, but I am paying the same price that I have paid heretofore. I presume I could secure labor cheaper than in 1909 but pipe work requires men with some experience, and I do not believe it would be advisable to employ the cheapest labor possible. I would not get satisfactory results. In 1907, labor costs were higher than they are now.

The price of labor is determined by momentary labor conditions.

I have had no experience in the relaying of asphalt pavements. I did some work in connection with relaying stone pavements in Philadelphia. In my experience on construction work in the city a contractor will not be permitted to obstruct any considerable amount of street with construction material or open trenches. In the work on Conduit No. 6 on University Avenue, the commissioner continually watched us, and while the street was in the outlying districts he would not permit me to have more than 3 blocks involved in the construction at any time. He watched me very closely
1086 and I endeavored to comply with his requirements in that respect. I would not consider it advisable in constructing a work of this magnitude to distribute material very far in advance of construction. As a matter of self protection the contractor should not do it, because of the liability of accident and the necessity for protecting and red-lighting the pipe at night. I am not familiar with the requirements of the fire department as to distributing obstructions in the streets. In opening trenches at cross street intersections it is required that provision be made to take care of traffic at these intersections. In handling cement, when I was doing work for the Colorado Fuel and Iron Company, using from 10 to 15 carloads a day, we provided a warehouse with a capacity of 40 days' supply in order to allow time between the date of delivery and date of use of the cement for the tests that were necessary to determine whether the material was of proper quality. This is the usual system on large work where they are careful and interested in getting good work. If the cement manufacturer is aware that such tests are not made he is liable to ship cement of very little value. This method requires about four handlings of the cement.

Cross-examination by Mr. Stevens:

I did some work in Philadelphia on water works construction, approximately 25 miles of pipe. Also did some work for the City of Colorado Springs, in 1903 or 1904, contract involving between $250,000 and $350,000. Built two reservoirs, 3 or 4 miles of pipe line and some tunnel to connect up the Colorado Springs system with the Seven Lakes supply.

I think the contract on Conduit No. 6 was awarded as a result of competitive bidding. I furnished a detailed bid. As I remember the total price I received on this contract was between $130,000 and $140,000. I don't know what anyone else bid. It is not true that that contract was awarded to me because of any relationship with anybody connected with the water company or with the First National Bank. It is my understanding that it was awarded as the result of competitive bidding. I know that other contractors went over the work. I think I allowed for excavation the figures I stated on direct examination. In the case of some other work I allowed less than the figure about which I testified.

The job was not a profitable one. I lost $2,800 on it. The conduit started at the Capitol Hill reservoir and ended at Wynetka station, about a mile west of Littleton. We encountered obstructions

in the way of service pipes, sewers, crossings of Cherry Creek and the Platte River, street railroad tracks and railroad tracks.

1087 In crossing the sewers we had some large special steel fittings that cost $25 each to haul from the West Denver station, of the D. U. W. Co., to the place of installation, somewhere on Clayton street. That was not my first experience on wood pipe construction. In 1907, I built conduit No. 5, from Cherry creek near Sullivan to the Capitol Hill reservoir, that was about 6 miles long. In 1910 and 1911, I built conduit No. 7, about 10 miles long. It was on conduit No. 6 that I experimented with the trenching machine. Such machines were not quite new then. They had been using them for a number of years. I had attempted to use one on a previous occasion but the material was too hard.

I should say that about 40 per cent of my work has been railroad work. My work at Colorado Springs was all outside of the city. I know they have had some difficulty with the reservoirs at Colorado Springs because of the moraine formation on which the dams are built. It is necessary to cover that formation with puddled clay in order to make them water tight. That work was done by the city with its own forces and not by me. I have investigated the Austin Trenching Machine to see whether or not I cared to purchase one, but have not actually operated it on work. I have not used a trenching machine since my experience on conduit No. 6. They have been experimenting with them and endeavoring to make improvements on machines but they have not, to my knowledge, succeeded in making substantial improvements so as to construct a reliable machine to excavate a trench such as described for this conduit work.

I know they are almost universally used wherever the soil will permit. That has been true for some years. But machines are not built that can excavate all the soil in Denver and vicinity and do it economically. I know that Charlie Connors has attempted to use trenching machines in Denver from time to time and has brought suit against the manufacturers for damages. He still uses machines where material is favorable. I don't think he would use them if they were not profitable. I do not intend to use machines on conduit No. 9. It is not part of my contract that I should not use them, but absolutely on my own discretion and choice. I understand that I got the contract on conduit No. 9, on a competitive bid. A private corporation does not notify you as to who you are competing with. I submit a proposal in accordance with their request, if I am a successful bidder I get the contract, that is as far as I know.

It might be the custom now to have cement tested at the mill and accept the mill test. It might be handled that way, if you

1088 care to take chances, but as a matter of business I don't think that even though it is the custom to accept the manufacturers' tests, that it should be practiced. It probably would be less expensive to handle it that way than the way I have described.

It is true that I have never engaged in a city enterprise of the extent and character of the reproduction of this water plant. I was in Cincinnati when a similar work was going on and had occasion

to investigate the conditions. There was no considerable amount of pipe distributed along the streets there. In the outlying districts they permitted delivery of material considerably in advance, but in the city they were just allowed what was necessary to carry on construction operations.

I know that during the construction of the Subway in New York they excavated the entire street and fenced it in. I have noticed pipe on the sides of the streets in New York, but did not inquire as to why it was there. As a contractor I would not use the streets for the storage of material but would provide a storage yard and transport it to the works as required. I believe in the end that it would be more economical. If another contractor saw fit to store it in the street, I presume he would arrange to take care of the difficulties that might arise from so storing it. Personally I would not do it. I have never used motor trucks for the delivery of my material.

I was paid unit prices on conduit No. 6. The total price received was between $130,000 and $140,000. I don't remember exactly, I will have to look it up. I lost $2,800 on the job. I did not figure any overhead charges against the job at all. The work cost me $2,800 more than I received for it in cash. I charged to the work only the actual cash expenditures on the work. I did not charge contractor's bond, interest on the money, and contingencies, because there was nothing left to charge them against. I did not know in advance that I was going to lose money on the job.

If you want to get at the paper loss on the job add 22% to the entire cost of the work and you will have it. My books do not show that, because in my way of accounting you cannot charge a loss for something that you never had. I paid for my bond which was a cash expenditure. I drew no compensation for myself out of the work. At the time this work was under way I had about a million dollars' worth under way. This work was entered on the books as part of the general work. I drew money for myself out of the general business. The contractor on the job was The Phillips Construction Co. and O'Gara.

The Phillips Construction Company and myself were associated together on the work and were on all construction work
1089 for about 8 years, up to six months ago. I am now operating for myself and they for themselves. The actual cost to me of conduit No. 6 was approximately $142,000. That covers the actual money expenditures on the job. Nothing was charged to that work at all for our general expenses because there was nothing there to pay it. I don't understand the nature of accounting they refer to where a man attempts to make entries on his books for a profit before it is earned. I have never kept my accounts that way. The actual cash expenditures were all charged to the work but I have expenses in maintaining the business outside of them. The $2,800 was an actual monetary loss after having paid the actual expenses of construction. I never did any work in Raton. I made investigations there for construction. I think there are probably one or two blocks in Raton pretty thickly built up.

Redirect examination by Mr. Hodges:

In figuring what was actually paid out on conduit No. 6 nothing whatever was included for any payment to the Phillips Construction Company or myself or anyone else for the overhead organization of the company employed on the job. That was a matter of cost and should be pro rated against that work the same as other work, but it was not repaid and is not included in the figure of $142,800 that has been spoken of here.

The price paid me did not include the material for the conduit. That was all furnished by the water company. The company also did some special work in connection with the conduit, and in making connections with other mains. Those expenses should be added to what was actually paid me. Liability insurance protects the contractor under certain limitations and he is required not to violate the provisions of the policy or he will not get the protection for which he is insured. That is one of the reasons that I am careful not to place unnecessary obstructions in the street or to string pipe along the streets for miles in advance of the work. The openings that were made in the streets of New York for the construction of the subway were such as were essential for the necessary progress of the work. The cost of maintaining traffic while this work was in progress must have been considerable. That character of expenditure is commensurate at all times with the inconvenience to which the public would otherwise be subjected, and the greater the amount of open work in the city the greater the expense. I could use trenching machines in my business if they were perfected to handle the work economically or for less cost than by my present method. In my judgment the Austin Machine today is not perfect to excavate a
1090 trench 7 feet wide and 20 feet deep. If I had used trenching machines throughout the work on Conduit No. 6 I would have had to use eight machines to complete the work within the time limits. These machines with equipment would have cost me $80,000.

Recross-examination by Mr. Stevens:

If the proportion of the overhead expenses of our company that should have been charged to conduit No. 6 had been so charged they would have amounted to between 10 and 11 per cent on the cost price of that work. I did not charge that because there was nothing to charge it against. The work showed a loss. The overhead charges are going along constantly in the office. That has been detailed by the general office and may run two years before it is applied to the work. Our office expenses and other charges amounted to between 10 and 11 per cent of all the work that was being carried out during the period that that work was being done. In the construction of Conduit No. 9 the water company is furnishing all material the same as it did in the construction of Conduit No. 6. In the work for the water company I have not been obliged to make any provision for storage of materials. That expense is borne by the water company. My contract relates to the transportation of the material, excavating the trench, and actually installing the pipe. I

have not inquired of the water company what it costs them for storage, but I have a general idea of what it costs to store material. There are five different classifications of soil in Denver, much of it classed as earth is so hard that trenching machines could not handle it economically. There is one ideal material, a sandy soil, where a trenching machine will work beautifully and at low cost. I don't know whether a trenching machine will work in adobe soil. If I had a chemical analysis of it I might be able to tell you. If I had a contract for the complete construction of a water system I would use trenching machines where I could excavate with them for less cost than by other methods.

Redirect examination by Mr. Hodges:

I would not use trenching machines in the construction of the conduits if I were to build them. I have determined to my satisfaction that that is impossible. I would use them for excavating small trenches in particular districts where they have a sand loam soil, by small trenches; I mean trenches for from four to 20-inch pipe.

The ten or eleven per cent that I stated represented the office and overhead costs on our work would not include any profit.

1091 Witness DAVID D. SEERIE.

Direct examination by Mr. Hodges:

Have resided in Denver 35 years. Am a builder and stone mason. Am connected with the firm of Geddis and Seerie. We constructed the Cheesman Dam. Have built a great many buildings in Denver and elsewhere. Among those the Trinity Church, Railroad Building, Brown Hotel and the Capitol Building. Built the post office at Omaha, the post office at Kansas City, a dwelling house for General Palmer at Glenn Eyre, with a number of others in Wyoming too numerous to mention; also built the Pathfinder Dam in Wyoming.

The Pathfinder and the Cheesman are the only large dams we built. The Pathfinder contained about 60,000 cubic yards of masonry. The Cheesman about 104,000 cubic yards. We were engaged in the construction of Cheesman Dam about four years. When we started in the necessary location work and exploration had been done. There was a masonry wall in there that was part of the first dam, that was left in the new dam. We did considerable excavation in the bottom of the channel, but the trench for the excavation had been started, the outlet tunnels built and a temporary diverting dam constructed. We proceeded with the construction work as rapidly as it could be done and done properly and economically. The dam could be constructed in less time, but it would cost a good deal more. You would have to run two shifts of men. The old wall that was incorporated was part of the core wall of the old dam with a steel facing, which extended up the sides quite a little ways. We paid drillers 30 cents an hour; common labor, 25 cents; stone masons, 50 cents; teaming, 50 cents; blacksmiths, 55 cents; helpers, 27½ cents. Labor prices are a little higher today.

Mr. Bickel's assumption that he would have to quarry only 72,902

cubic yards of rock to furnish with the mortar the 102,897 cubic yards in the dam is not correct. There is never any allowance for mortar joints. You can take that 104,000 cubic yards of rock and fill it in with about 1-3 of mortar and you will not have any more than 104,000 cubic yards when you get the mortar filled in. There is a space to be filled, that is because you measure the rough outside of the rock at the largest dimension, and there are spaces left that are filled up with the mortar. You have to quarry the whole contents of the dam. There wasn't very much waste from the quary at Cheesman. That was an exceptionally good quarry. In other places where we have been quarrying we waste as high as 25%. That would be a good safe thing to go by unless you were perfectly sure of the place.

1092 I wouldn't say that we made a profit on the job. We probably got a pretty fair salary out of it, each of us, for the time we were on the work. If we had no other work going on at the same time we would have used all we got out of it in living during the time it was being constructed. In taking into consideration the profit, I did not consider overhead, interest costs, bond, liability insurance, etc. We happened to have enough money to keep running, so we didn't take into consideration any interest charges or funds necessary to run the work. I wouldn't want to build the dam today for the same price. It would cost about 10 per cent more. Our construction plant cost about 90 cents a yard, actual money paid out for it, or approximately $90,000. That included boarding houses and all temporary structures that are burned up when you are done with them. Our cost did not include a temporary dam, that was already built. I would consider 15% a fair allowance for contractor's overhead costs and profit. That is, 15% on the total cost.

Cross-examination by Mr. Stevens:

I don't remember just how much we received for the job. The water company's books would show it. Our books have been burned up. I keep them 6 years after the job is finished, and having so many jobs they accumulate too fast. We were paid in cash every month. We got the job on a competitive bid. Afterwards I believe there was a little cut made in it before the contract was entered into. We included, when we were making the contract, 15% for overhead charges, etc., but when we got through we did not include any of them. You know jobs don't always turn out the way you figure at the start. The accounts on this job were kept at Cheesman. We had a whole town there, even a postoffice. The work was carried on separately from our general office. The books were kept there by a bookkeeper who was right on the job all the time. We include these overhead charges in the estimates of our work, but don't carry them in our bookkeeping. We keep separate books on the job on all big jobs.

There were a few hoisting engines saved from the construction plant, that we shipped to Caspar, Wyoming, that amounted to maybe $7,500 dollars. We had invested in the total plant about $90,000. We were not held back in the work waiting for the dam to fill with

water to assist us in floating material. The fact that we didn't have the water added to our expense because we had to use teams. But we couldn't have done the work any quicker if we had had the water. The total price which we received for the work was $477,998.15. I
1093 am able to state this, having refreshed my memory. The water company furnished all the cement and materials, except the rock and sand, that we got right at the dam.

The company put in the pipes and valves in the tunnels and all that. The front part of the dam was all dressed stone laid in about an inch mortar joint. The back of it was just square blocks, as we could get them out of the quarry laid up as close as we could get them. That would all come under dimension stone. The irregular stone was placed in the center of the wall. No allowance whatever should be made for the mortar, for instance, you take a cubic yard of crushed rock, you put in about a third of a yard of sand and put in a barrel of cement and you only have a yard of concrete. There were three of us in the company, Mr. Geddis, Mr. Anderson and myself. Between us we got about $60,000 out of the job. That isn't any profit.

Redirect examination by Mr. Hodges:

I was on the job the greater part of the time, superintending it. We found the sand on the ground just the same as we found the granite. The company owned the land where it was located. We just took it and used it. I believe the company had opened up a little of the quarry for the rock fill dam before we started to work.

Stipulation between parties to permit statement in writing by Allen Hazen, as to accrued depreciation up to time of former appraisal, to go into record as though testified to by Mr. Hazen.

Witness LEONARD METCALF.

Direct examination by Mr. Dorsey:

Exhibit A-98 is a table comparing the estimates of the various witnesses who have testified as to the value of the property of The D. U. W. Co. both on behalf of the city and the company. The original figures set forth in Exhibit C have been corrected to reduce them to a statement of the fair contract price at which the property could be reproduced. This price includes all expenditures necessary to be made by the contractor in the prosecution of the work. It excludes such costs as would be borne by the company preliminary to, and in connection with the work, which were included in the original estimates of value set out in Exhibit C. The prices given for Messrs. Gaffy, Bickel, and the Public Utilities Engineers, are the prices contained in their exhibits, with deductions, where deductions are necessary, and additions, where additions are neces-
1094 sary, as indicated by their testimony given in the case, in order to make their figures comparable on this basis with the figures taken from Exhibit C. Notes in connection with the exhibit explain the treatment of certain items of property which were valued

in Exhibit C, but which were not valued by the witnesses testifying on behalf of the city. For the purpose of study of this table these notes must be considered in connection with the figures set out in the different columns bearing upon the value of different items in the plant. The figures given are for reproduction cost of the plant, new, with no allowance for depreciation. They embrace classes C to S being the structural property of the plant. And exclude Class A Lands, Class B Water rights, and Class T personal property, and materials on hand. The final figures for each of the estimates are as follows: Metcalf & Anderson, $9,416,861; John Gaffy, $8,361,406; Ackert Bickel, $8,662,437; Public Utilities Commission Engineers, $8,755,212. The exhibit readily shows the items upon which the major differences between the estimates of Metcalf & Anderson and the city's witnesses, occur. In class C Lake Cheesman, the difference between Metcalf & Anderson and John Gaffy is $73,000, due largely to the omission of the portion of preliminary expense covering the work on the rock fill dam, which was incorporated in the final structure, amounting to about $35,000, the balance being in the difference in unit costs on the masonry. In the same class, the difference between the Metcalf & Anderson and the Bickel estimate is $129,348. Made up by the exclusion by Bickel entirely of the preliminary expense item that embraces that portion of the old dam included in the new, and in his estimate of the amount of rock to be quarried. The difference between the estimates of Metcalf & Anderson and the Public Utilities Engineers, *are* in the unit figures assumed and probably to partial exclusion of the items, called preliminary expense, but which include the old dam structure. The difference amounts to $83,801.

In Classes D to H South Platte river division, the difference between Metcalf & Anderson and John Gaffy amounts to $129,589. Of this amount approximately $18,000 was allowed by Mr. Gaffy in correction of the item of excavation on cribs. Almost the entire remaining difference grows out of the unit costs assumed for excavation and backfill on the conduits, and the expense of filter sand. In the same class the difference between the Metcalf & Anderson and Bickel estimates, amounts to $38,969 found in the difference in filter sand and quantities and cost in the construction of conduits. In this class the estimate of The Public Utilities Engineers, exceeds the estimate of Metcalf and Anderson by about 4%, difference occurring in the units costs assumed. As to the difference in the
1095 Bickel estimate it probably disappears as a result of the additions made by Mr. Bickel as shown in note four, for overhead costs and increase in excavation.

In classes I, J, & K, Bear creek division, Mr. Gaffy's estimate is about $66,511 below the Metcalf & Anderson estimate, due to difference in excavation and backfilling on conduits and excavation and embankments at Marston Lake. The difference between the Bickel and Metcalf & Anderson estimate is negligible. That between Metsalf & Anderson and the Public Utilities Engineers, amounts to $26,226 due to difference in unit prices.

In Class L, Cherry Creek division, the only important difference

is between Metcalf and Anderson and The Public Utilities Commission engineers, amounting to $167,488 mostly due to their exclusion of Sullivan Reservoir valued by Metcalf & Anderson at $159,505.

In classes M & N Mississippi Street galleries and West Denver pump station, the differences are trifling. In Class O Capitol Hill reservoir, the differences between Metcalf & Anderson and Messrs. Gaffy and Bickel, are in the cost of concrete lining and handling the earth work. The difference between Metcalf & Anderson and the Public Utilities Engineers, amounting to $76,706 is due to three things, difference in unit price for earthwork, and for concrete, and the omission, as I understand it, of a portion of the excavation for reservoir No. 2. This excavation difference being 20,800 cubic yards. Mr. C. P. Allen, testified that they had used the Metcalf & Anderson figures after checking them, so apparently the error occurred in transcribing the figures. In Class P Ashland Avenue reservoirs, the difference between Metcalf & Anderson estimates and those of Mr. Gaffy and the Public Utilities Engineers, arise from the exclusion by them of the asphalt lining in the reservoir, which should have been included in the reproduction cost and then depreciated. This exhibit is a comparison of reproduction cost undepreciated.

Exhibit A-99 shows the actual cost to the company of different parts of the plant and of materials, compared with the prices allowed for such parts of the plant and similar materials, by the different witnesses. The prices, given by the different witnesses, are on the sasme basis as treated in Exhibit A-98. The exhibit is divided into a series of tables, lettered A to H. Table A shows the prices paid for cast iron pipe by the company during the past ten years. Table B prices paid for cement during the past ten years. Below the tables, are stated the prices assumed by the various witnesses for the city. Table C shows the prices paid the Geddis & Scerie Stone Company for the construction of Cheesman Dam, by com-
1096 parison with the estimates submitted by the different witnesses for both the city and company for the reproduction cost of the dam with the excesses and deficiencies between original cost and the several estimates. Generally the treatment is the same as in the Exhibit A-98.

Item 6-*a* refers to the item entitled preliminary dam expense, in which, in the Metcalf & Anderson estimate, is incorporatd the cost of that portion of the old dam now a part of the present structure.

The item of water control, allowed by Metcalf & Anderson, in table C is allowed because it is the actual cost that would be incurred by anyone constructing that work, and was actually incurred by the company. That portion of the original dam that was incorporated in the present dam, was not included anywhere in the Metcalf & Anderson estimate, except under the title "Preliminary dam expense." It was impossible to ascertain from the company records the exact quantity of masonry involved in that work, but it was somewhere in the neighborhood of 30 feet in height. The item also contains the expenditures for excavation work that had been done,

test pits, to determine the character of material, opening quarry, etc. The money involved in this work was actually expended by the company in addition to the price paid Geddis & Seerie. The Metcalf & Anderson estimate of reproduction cost is approximately 9 3/10 per cent above the cost under the Geddis & Seerie contract. We having allowed $4.50 a cubic yard for masonry work as against $4.10 under that contract.

It has been my experience in the construction of works of this character that it is necessary to quarry rock to the extent of the entire contents of the dam in order to produce such a structure complete after the mortar is added. Table D refers to the South Platte River division. In Class E item 5-D an allowance of $1,200 for "abating ice in river and at dam site" is a necessary expense in connection with work in a stream that might be incurred either in handling water in summer, or ice in winter. It refers to the stream control necessary for such work.

Item 10-A-13 Class F South Platte River division, as set forth in Exhibit C, contains an error in the yardage in the foundation of the brick bunk house. The item should be $98 instead of $976. Item 8-H-5 Class F shown by Exhibit C should be eliminated as a duplication. The amount to be deducted is $3,456. Table- E and F of Exhibit A-99 shows the cost to the company of constructing the new roof at the Ashland Avenue reservoir to replace the roof broken down by the snow in December 1913.

1097 The actual cost to the company of concrete work in connection with this job was $11.01 per yard, to which in my judgment should be added 10% for overhead cost to make it comparable with contract figures, or making the cost $12.11 per yard. The actual cost of the roofing was 3.84 cents per foot board measure. 15% for overhead expense and contractor's profit added to this makes the cost on the contract basis 4.42 cents. With these costs are compared the estimates of reproducing the reservoir roofs as testified to by the several witnesses. Table G, Exhibit A-99, shows the actual costs, as nearly as they can be determined from the company's records, of the construction of the Capitol Hill reservoirs, compared with the estimated reproduction cost testified to by the different witnesses.

Table H is a statement of the cost of motor truck transportation in connection with the Los Angeles Water Works and with the works of the Spring Valley Water Company in San Francisco.

Discussion over admissibility of Table H. Table withdrawn by Mr. Dorsey.

Exhibit A-99 offered and admitted.

Referring to the allowances by Messrs. Gaffy and Bickel for the cost of placing sand in the slow sand filters, I believe that their estimates are too low, and that considerably greater expense would be incurred because of the methods necessary to be followed in placing this sand upon the filters. The various materials must be very carefully sized, washed and cleaned and spread over the beds in thin layers with uniform compression over the entire area in order that the filters will properly perform their function. It

cannot be dumped upon the beds and spread by mechanical appliances. It is not a question of simply depositing a certain yardage of material within a certain area. If the material is compacted more in one place than in another, as would result from dumping the sand into the bed, it will result in unequal rates of filtration and an unsatisfactory effluent from the filters.

Referring to the items in Exhibit A-98 dealing with the differences in the estimates of the cost of trenching and back-filling for conduits between Metcalf & Anderson and Mr. Bickel, the differences were produced largely by the fact that Mr. Bickel assumed the digging of a trench with vertical sides, instead of slopes. Sloped trenches are necessary as pointed out by Mr. O'Gara in his testimony, in order that the pipe may be properly built. The D. U. W. Co. uses extra clear lumber in its wood stave pipe construction.

Cement is used in large quantities in water works construc-
1098 tion. It is the practice in the large works with which I have had experience, to test the cement on the ground where the work is to be done and to provide special warehouses in which the different lots of cement received from the mill may be stored separately, pending the results of the tests, so that unsatisfactory cement may be picked out and removed from the work.

Such provisions for testing and storage are, in my judgment, necessary. Cement used for manholes and like structures need not be handled as carefully as cement for dams and structures of that character. Cement for manholes, however, represents a small percentage of the material used on the work. I consider 15 cents a barrel a fair allowance for the cost of handling, storing and testing the cement. That does not include the expense of taking the cement from the warehouse to the works, but simply means that the cement is ready for delivery to the works. I am of the opinion that trenching machines could not be used advantageously in the construction of the conduits, or in the distribution pipe system in the commercial or congested value district of the city. I believe they can be used in the outlying districts where obstructions are not material, where there is room for the work and where the material is advantageous. It is difficult to say what portion of the system could be built in that way. It might be anywhere from 30% to 50%. It has been my experience that trenching machines are not successful on wide trenches. Mr. Anderson and myself went into the question with a number of contractors who have used trenching machines in Denver, and formed our judgment as to the methods to be used, partly as a result of these inquiries. The average costs obtained through these inquiries, were in very close accord with the figures finally adopted by us. Trenching machines are not generally used by water works in this country.

Exhibit A-100 is a comparative table showing the estimates of the various witnesses as to the reproduction cost of the distribution pipe system of The D. U. W. Co. The estimate of Metcalf & Anderson being corrected as in the case in Exhibit A-98, in order to show the fair contract price for the reproduction of this system. The estimates of the other witnesses are as submitted in their exhibits

with such corrections as have been applied to make them conform with the figures finally adduced as a result of their oral testimony.

The first group of items compares the various estimates of excavation and backfilling, with allowances for difficult work, sheeting, etc. and the labor of laying and cost of lead and yarn, and cover the work that the contractor would do if he was furnished with the
1099 materials and there were no pavements and special obstructions to be met with.

In the case of Mr. Gaffy's estimate, I allowed 5% for overhead cost and profit on cast iron pipe and specials as estimated by him and have noted a reduction of $109,000 as the difference between the wages that would have to be paid in doing the work for a corporation and in doing the work for the city.

The second group of Exhibit A-100 shows the allowance in the various estimates for pavement, special crossings and other obstructions, with notes calling attention to the exclusion by some of the witnesses, for the city, of some of these items. The third group includes the estimates on the purchase of the materials necessary for the construction of the system. In order to make the Metcalf & Anderson figures comparable with the estimates of the other witnesses in this respect, there should be transferred from the general allowance for administration, engineering and contingencies, covering the entire plant, to this division of the plant, the sum of about $200,000 as representing the amount of such expenses as would be borne by the contractor directly in connection with the distribution pipe system. This segregation does not increase the total allowance upon the plant.

The Metcalf and Anderson estimate amounts to about $10,160 per mile of pipe; The Public Utilities engineers to $9,270 per mile; Mr. Gaffy, to $8,534 per mile, on the reduced labor scale; Ackert Bickel $8,660 per mile; Mr. Gordon, to $7,780 per mile, and Fremont Hill to $7,970 per mile. The Metcalf and Anderson estimate for excavation and backfilling alone is $626,589. Fremont Hill's estimate is $146,428. Mr. Hill assumes that he can dig and backfill his trench at an average price of 6½ cents a foot, the average price adopted by Metcalf & Anderson is 27.8 cents per foot.

The Metcalf and Anderson estimate for pavement is $539,558. The Public Utilities Commission engineers' estimate is about 10% less or $491,700. Mr. Gaffy's estimate about $100,000 less than the Public Utilities Engineers and Messrs. Bickel Hill and Gordon still lower. The three last mentioned used a narrower width of trench and made no allowance for the pavement and concrete footing overlapping the sides of the trench in order to give it solid bearing on old soil. Metcalf and Anderson, The Public Utilities Engineers, and Mr. Gaffy allowed for the cost of removing the pavement and replacing it. The other witnesses simply allowed for replacing it. It has been my experience over the country that it is customary to cut the pavement wider than the trench in order to give it strength from the support of the solid earth outside the trench.

In cities where that is not the practice you can see the depressions in the pavement where the trench has settled and let the un-

supported pavement down. Metcalf and Anderson obtained
1100 the information upon which they based the unit costs for the replacement of pavement by interviewing certain employes and officials of the D. U. W. Co., from examination of some of the vouchers with which they had paid the city for this work, by interviewing officials of other public utility corporations, and Mr. J. B. Hunter, City engineer. Mr. Hunter was interviewed December 9, 1913. There were present at this interview, Mr. Skouland, Mr. Anderson and myself. After the meeting I made a memorandum of what Mr. Hunter stated and submitted it to the other men to see if it was correct.

The memorandum is as follows: It is headed "Paving", with a marginal note on the right hand side "Hunter conference on backfilling and paving, December 9, 1913." (Reading) "Paving charges of City to Public Service Corporations in Denver, given at a conversation between Mr. J. B. Hunter, City Engineer, and Messrs. Anderson, Skouland and Metcalf. Mr. Hunter submitted the following schedule of prices governing the deposit required of public service corporations upon the street work done in the city. The city requires the corporations to backfill their trenches, in general, so as to get back into the trench all the material excavated from them, tamping them very thoroughly and then to lay a plank paving in the trench, in the case of cuts in asphalt, macadam (Bitulithic) and stone block, which is allowed to remain until such time as the city's contractor can replace the pavement, or until the city itself can do the work in case the contractor's guarantee has expired. The City requires in general that a concrete foundation for first class pavements should be laid to a width of twelve inches in excess of top width of trench and the present procedure seems to be to lay the pavement with its joint over the concrete joint, although Mr. Hunter expressed the view that in large work such as construction of duplicate mains it would probably be necessary to extend the pavement outside of the concrete joint a distance of three inches, more or less, on each side of the trench.

Asphalt on 6″ concrete base $3.00 per square yard.

(Macadam) plain $2.50 per cut, 5 feet long by 2 feet wide.

Stone (Sandstone Block) $2.50 per square yard.

Concrete (Portland Cement) 6 inches thick, $3.00 per square yard.

"Surfaced" 3 inches of gravel, sand or slag, $2.00 per cut 5 feet by 2 feet or 15c per lineal foot of trench.

Mr. Hunter also gave the following as the present city wage scale:

Common Labor, $2.50 for eight hours.

Two horse team and driver; $5.00 per eight hours.

Overtime 1-½ times scale.

1101 Mr. Hawes of The Denver Union Water Company office gives the following additional data concerning cost of paving charged by city:

Asphaltic concrete material, $3.00 per sq. yd.

Brick on 6-inch concrete base, $2.50 per sq. yd."

All of the witnesses except Metcalf and Anderson, excluded the

items of parallel tracks and corporation cocks in place, amounting to the sum of $249,960. Metcalf and Anderson base the price of cast iron pipe and specials upon average prices for a period of 10 years prior to the date of valuation. Public Utilities Commission Engineers based it upon a brief period prior to the date of valuation. The other witnesses practically upon present day prices. There are a few items in the schedules which it was impossible to segregate for the purpose of this comparison. They are of minor importance however.

Tables B-2 and B-3, of Exhibit A.100 give a statement of the method of arriving at the summarized results set forth wherever the testimony of the witnesses seemed to require it. This is offered so the defendants engineers can check my results going through the processes step by step when following my figures. Exhibit A. 100 offered and admitted.

The total of the Metcalf and Anderson estimate in Exhibit A 100, $4,333,412, differs from the total shown in Exhibit C under distribution pipe system, $1,874,262, because there is included in the figures in Exhibit C the company's overhead costs which are not a part of the fair contract cost.

Exhibit A 101 divided into tables A to G gives in detail the estimates of the several witnesses upon the cost of trenching and backfilling, per lineal foot, and the total amount for each size pipe from 3 inches to 30 inches in diameter. Table A is a summarized statement of all tables. Treatment of the overhead charges is the same as in Exhibits A-98, 99, 100. The comparison being the fair contract cost of excavation and backfilling. The average cost per foot of pipe for excavation and backfilling by the different witnesses is as follows:

Metcalf and Anderson 27.77 cents; Public Utilities commission engineers, 16.99; Mr. Gaffy, 13.87; Mr. Gordon, 10.33; Mr. Bickey, 14.77; Mr. Hill, 6.44.

There are some minor discrepancies in the distribution of the items of some of the witnesses because of the different methods adopted by them in arriving at their final results, but as ultimately worked out they are negligible. The detail of my processes in distributing Mr. Gaffy's figures are set forth in tables C and D. That in the case of Messrs. Gordon and Hill in tables E and F and in the case of Mr. Bickel, in table G. The figures as finally set out are substantially correct. Exhibit A 101 offered and admitted.

1102 Exhibit A. 102, is a similar tabulation showing a comparison of the estimates of pipe laying costs, including labor, lead and yarn, treated as the preceding exhibits, to reduce the estimates in all cases to the fair contract cost of doing the work, excluding any overhead cost of the owner or company but including the contractor's overhead costs and profit. The exhibit is divided into tables A. to F. and the analysis of the figures of the several witnesses is made in the same manner as in previous exhibits. The figures of all of the witnesses are very close, except Mr. Hill, who is substantially higher than any of the others.

Exhibit A. 102. Offered and admitted.

In my opinion it would be possible to find locations for the pipe in the streets that would avoid some of the obstructions that were considered by Metcalf and Anderson, but it would not be possible to avoid a great many of them. None of the right angle obstructions could be avoided. There is a possibility where there is much underground work that the efforts to relocate the pipe would result in greater expense than to lay the pipe in the existing location with the attendant difficulties because of a known obstruction. If you dig a new trench in close proximity to an old trench the material between the new trench and the old is very likely to slide in on you, involving the cost of much additional work. For that reason in the commercial districts where the streets have been dug up to a considerable extent it is difficult to find a location for pipe which will not involve as great expense as though the pipe were relaid in its present location. There are many sections in Denver where the multiplicity of pipes and obstructions which would be met in reduplicating, replacing or reproducing this system would be great.

The plates following page 388 of Exhibit C show the condition of street railroad tracks in certain streets and intersections where the obstructions and expense incidental thereto could not be avoided. In addition to the street railway tracks and water pipes there shown, there are located in those streets a multiplicity of other pipe conduits. In reproducing the water pipe system, much interference would be encountered from these conduits, such as telephone, steam heating, gas mains and sewers, which could only be avoided by laying the water pipe at greater depth and increasing the cost of excavation, backfilling, and labor in the laying of the pipe. In estimating the reproduction cost of a distribution pipe system or any other structure the effort is to reproduce the identical plant. Generally speaking it is the custom in cities to limit the distribution of construction material in the streets according to traffic conditions.
1103 In the congested districts the limit is very close and bridging and crossings must be maintained for the convenience of the public. In the outlying districts they will permit the distribution of more material, but in general within my experience the amounts permitted to be distributed are very much less than implied by some of the witnesses in this suit. It has always been my practice and the practice of contractors on work with which I have been connected, to have storage yards at which material may be stored on being unloaded from the cars and from which it may be conveyed to the works. I regard them as absolutely necessary. It has been my experience that it is very difficult to control the rate of delivery of material, and it is necessary to keep enough on hand to be perfectly sure that the work will not be interrupted. It is absolutely impossible, I believe, as a result of my experience, to obtain delivery of materials just as you need them. I have investigated the cost of transportation of materials by motor trucks and compared such costs with the cost of wagons and teams.

It is my judgment that a cost of 30 cents per ton mile of the haulage by motor trucks would be a much safer figure than the 20 cents stated by Mr. Gaffy, taking into consideration the conditions under

which material must be delivered on streets with trenches open and over country roads. I have investigated the matter through inquiry of a number of large concerns in the East that do a great deal of motor truck transportation and have come in contact with the matter on the works of the Spring Valley Water Company in San Francisco where they are using trucks in hauling materials to the Calaveras dam, in which case they operated the trucks 24 hours a day in order to keep down overhead costs. They were obliged to keep eight trucks in order to keep five in service. It is the experience of eastern concerns, that in order to maintain their transportation service they must keep sufficient horse equipment to handle their haulage over bad roads in bad weather. The trucks being used on the paved streets and under the most favorable conditions. Eliminating the added expense to them of maintaining an auxiliary horse equipment their average costs for motor truck haulage over paved streets and under the best conditions is almost exactly 20 cents per ton mile, as testified by Mr. Gaffy would be the rate for construction work here. Generally these records were the records of trucks that had been in service from one to one and one-half years, so were practically new and had been operating a minimum cost for repairs. As the trucks age and necessity for repairs increase, this cost would increase. Some of the costs ran up to 29 cents per ton mile.

1104 In estimating the reproduction cost of this system, Mr. Anderson and myself contemplated the use of motor trucks in delivering part of the materials, and we took that use into consideration in arriving at our prices. I will present a tabulation showing the cost of motor truck hauling, as ascertained by me, in other cities. I don't think that Mr. Gordon could have meant that the cost of laying distribution pipe systems in other cities was one half of 45 cents per foot, excluding the costs of materials. I think that allowance is totally inadequate to cover the cost of work in cities of which I have known or ever heard of. In order to arrive at gross reproduction cost of this property to the company it is necessary to add to the contract costs, set out in Exhibits A98 to A102, the valuations on class A lands, Class B water rights, Class T personal property, stock and material on haul. Also, an allowance for the company's costs in connection with the physical structures and other items, for engineering, preliminary investigations, administrative costs, and for such contingencies as arise in connection with such work. These latter items grouped together, Metcalfe and Anderson, have assumed would involve a cost of approximately 12½ per cent on top of the cost heretofore stated. To the sum of all these items should be added the cost of interest during construction. This charge to be distributed according to the average period of construction necessary for the several units of the plant.

In addition to that there is the item of preliminary expenses, organization, incorporation, etc. covering the work of those who were planning the project and getting it under way, to the extent that the work preliminary to construction, could be commenced. These costs might include the expense of negotiations with the city looking toward the securing of the right to occupy the streets.

Finally there is to be added the item of going concern value, which covers in general the cost of developing the business. Having found the grand total there must be deducted the amount of the accrued depreciation upon the structural property included in the valuation. This item of depreciation is independent of abandoned property that is not included in the schedule. At page 64 of Exhibit C are shown the allowances made by Metcalfe and Anderson for preliminary expense and organization, interest during construction, and going concern value.

I heard the testimony of the several witnesses for the defendants with regard to the reasonable construction period for these works. Those periods, in my opinion, are not reasonable or justified by general experience in water works construction. Assuming that the structures would be built within the period stated by the defendants' witnesses, the cost would be substantially more than the
1105 cost estimated by Mr. Anderson and myself. And would more than offset the saving in cost for interest during construction assumed under the longer period.

The overhead cost of mangement, etc., may also be greater even though the period be shorter, because of the greater number of men and greater expense that would be involved by doing the work in a much shorter time. It is my judgment, that on the shorter period of construction, assumed by the defendant's witnesses, the increased cost of the work would exceed whatever saving might be made by the shorter period in respect to the interest during construction. Exhibit A-103 is a summary of the actual construction periods consumed in building the more important structures of the D. U. W. Co. It is based upon the best information that I was able to obtain from various employes and officers of the company. This tabulation does not give much information on the period necessary for the installation of the distribution pipe system, because most of it has been built as what might be called piecemeal constructoon. In the case of the Cheesman Dam and certain other structures, the conditions were similar to those which in my judgment would actually prevail under reproduction conditions. The first work in connection with the location of Lake Cheesman was done in 1892. From 1892 until 1898, 2 years and eight months of actual work was done in connection with acquiring the reservoir site from the government, making plans and surveys, preliminary to construction, and getting rid of the claims of other persons to lands within the reservoir site.

Between 1898 and 1900 there was done approximately 19 months of actual construction work on the rock filled dam, and from 1900 to 1904, four years and 4 months of actual work in making plans and building the present structure. Part of the work done on the rock filled dam was wasted when that dam was washed out. The four years and more of actual work on the construction of the present dam followed the preliminary construction work done by the company in connection with the first dam, which still remains in the structure. Sheets B, C, and D, show in greater detail the activities during the several periods.

Sheet E gives similar information concerning Marston Lake. The total period there involving 7½ years which could have been cut in two under reproduction conditions. The construction of the slow sand filters actually covered a period of approximately 2 years. The Platte Canon reservoir, 1 year, Capitol Hill reservoir, 1 basin 9 months, the other 1 year. Sheet F gives similar data for the Ashland Avenue reservoir and the conduits up to No. 7. Sheet G conduits 8 and 9.

1106 The only record of considerable work on the distribution pipe system occurs in the year 1890, when from January 2 to November 10th, the American Water Works Company laid approximately 99 miles of pipe from 2 inches to 48 inches in diameter. In arriving at the assumed period of construction Mr. Anderson and myself made use of all such records of construction as were obtainable from other cities, where extensive work has been done. Among them, Cincinnati, Louisville, New Orleans. Amended table H, Exhibit A-99, substituted for Table H, originally presented.

We have reduced the figures to the average number of months required to spend a million dollars on such works as these. The record shows that a fair average rate of progress corresponds to the expenditure of about 1 million dollars per year. In the case of Cincinnati, construction began in the fall of 1897, completed in 1909, 12 years. The expenditure was, $11,457,500. In New Orleans where substantially an entire new plant was built, construction began in May, 1905, completed December 31, 1913, 8 years and 7 months. The total expenditure being $8,967,240. I think that is a fairly comparable record for the reason that we know the construction was pushed with vigor, because you will remember they had had a yellow fever epidemic and the water supply was derived almost wholly from cisterns and they were considered a menace to the health of the community. In the large works in New York's new water supply, it has taken from six months to seven months to spend a million dollars on different pieces of work.

Generally it may be assumed that it will require one year's time to expend a million dollars. In a situation like Denver where the work is more or less scattered with the dam at one end of the line, and structures, involving several million dollars, that could be carried on collaterally, I have assumed a 5 year period of construction for the entire works. If that had all been within the city limits of Denver I should have lengthened it to a period of from approximately 9 to 10 years of time. In view of the actual periods of construction devoted to building the structures constituting this plant, it is my opinion that the figures submitted by Mr. Cheyne in Exhibits Z, and A-54, do not contain all of the expenditures that have actually been made upon these structures. They are substantially accurate for the years covered by them, but much of the construction work on this plant was done by predecessors of The D. U. W. Co. and not included in the statement.

Generally in the distribution of the items in The Metcalf & Anderson valuation, the classification is the same as in Mr. Cheyne's Exhibits Z and A-54, but the limits of the work involved are quite

different. In conduit installation Mr. Cheyne's figures in-
1107 clude the connections made to the conduit and all such items, while our classification drops the conduits at the special, by means of which it is connected to the other pipes. For these reasons it is absolutely impossible to obtain from the company's records the actual original costs of the different items involved in the plant.

The figures that I have submitted of original cost, cover, I think, all such items as can be segregated, except possibly some of the conduit lines which I had not the time to work up, but which, because of the fact that the witnesses for both sides are so nearly agreed, are of less importance than the other figures. I do not believe that the public would tolerate the conditions that would develop in the city from an effort to install the distribution pipe system in a period of from 2 to 3 years. If it did, such precedure would increase the cost substantially above the figures assumed by us.

I do not believe that the entire plant could be reproduced in a period of three years, portions of it could, but the whole plant could not. And certainly not at the figures assumed by us. Overhead charges to the company should represent a proper percentage of the total cost of the works to the company and not the cost of the works to the contractor doing the work. Contractor's profit is a cost to the company. To determine the amount of interest during construction it is necessary to first determine the reasonable period in which the works can be built. Generally, if that reasonable period is reduced with a view to saving the interest charges, the reduction in time results in increased actual cost of construction that more than offsets the saving effected. Interest charge against any part of the plant runs from the time construction work is commenced on it until that part of the plant goes into service. It does not necessarily stop when the structure is completed, if it is completed in advance of being put into service. In my opinion, it would not be possible in financing such a project as water works construction, to arrange to get the money in semi-annual installments, as the work progresses. General experience has been that the money must be gotten at the inception of the project, though in some large works where the period of construction has been long, and the amount involved large, the money has been obtained in two and three installments.

The capital furnished is drawing interest all the time. If the interest during construction is offset by allowance for interest received by the builder on money in the bank awaiting investment, that treatment would very largely increase allowances for going concern value. In determining the going value we have made deductions for the items of interest during construction allowed. If you con-
1108 sider that interest during construction is offset in a measure by interest on bank balances, the going concern value must be increased by the amount that we have deducted for the allowance which was made for interest during construction. Essentially our deductions for depreciation were based upon actual examination of much of the existing property to which depreciation was applied, then certain methods of computation were used as an

aid to judgment. It is impossible to determine depreciation on the basis of any rule or system laid down without a careful inspection of the property and a modification of such rules to meet existing conditions. The witness Hill, in his depreciation table, exhibit 68, has given no consideration to the actual conditions which exist in this plant and which largely modify the result of his computation.

The use by him of the two and one-half per cent sinking fund method is not in my judgment a fair method, though it is used by some engineers in the middle west in connection with very long lived property. The same engineers use a four per cent rate on shorter lived property. Their theory being that on property having a life of 100 years, the lower rate is justified because banks would not care to allow the larger rate for such a long period of time.

The extent of depreciation that has accrued, must be determined first and foremost by an actual inspection of the plant. In our depreciation allowance for the future, we based our estimate on the sinking fund method with a four per cent interest rate. If the interest rate were reduced the depreciation allowance to be set aside each year must be increased so that the same total sum will be available at the end of the useful life of the property. I have not estimated what the additional allowance would be at the lower rate, but it would be much greater. For example, on property having a life of 20 years, you set aside annually under the 4% method, $3.35 for each $100, value of property; on the 2½% basis you set aside $3.91 per year. On property having a life of 40 years, you set aside on the 4% basis, $1.05 per year for each $100; on the two and one-half per cent basis you set aside $1.48, or nearly 50% more. On a life of 60 years, the four per cent basis requires 42 cents on each $100, and the 2½% basis requires 74 cents. I do not believe that the "straight line method" of computing depreciation, is as significant as the "sinking-fund method." At any rate it is more applicable to short life than to long life property.

The assumption as to life of the property in question makes a very material difference in the annual allowance for depreciation. I believe that Mr. Hill, in his table, has very much underesti-
1109 mated the probable life of the conduits and the cast iron pipe system, particularly. If the water power pumps at the West Denver station were eliminated, it would be necessary to substitute other pumps to do the work that they are now doing. I would not advise the elimination of those water power pumps.

Exhibit A-104, tables A to E, is a computation on the subject of going value or development expense, dealing with the subject upon the assumptions that were made by Messrs. Van Diest and Fellows, in their testimony. As I understand their method, it is a modification of the method of the Wisconsin Railway Commission, or what might otherwise be called, the equal annual payment method with certain assumed construction or investment costs.

"The theory may be described in this way: It is assumed that it is desirable to lay aside a depreciation allowance of such magnitude that it will meet the losses in abandoned and replaced property, in any given term of years, and that the allowance shall be so made

within that period of years that it, added to the average repairs, as covered by operating expenses and the fixed charges upon the capital sum, which I will define in a moment, but which in a general way represents the investment, shall be uniform year by year throughout that period of time, assuming that no additional construction is undertaken; and assuming, further, as we understand the law to be, that the returns shall be predicated upon the depreciated value of the property. Now, assuming in any plant that no additional construction is made during any period of years, it is obvious that, year by year, the capital sum or the investment is decreased by the amount of the depreciation which takes place upon that plant. Therefore, year by year, the amount of money which must be raised through the agency of the rates to cover the profit item, or, in other words, to cover the fair return upon the depreciated value of the property, will decrease; therefore, if your rate of payment is to be uniform on the part of the public to the corporation, throughout that period of years, the depreciation allowance would have to increase correspondingly. That is advantageous, because, during the early years of the formative period of the plant and acquisition of its business, the paying of a depreciation allowance is burdensome to the rate payer and the corporation, whereas, when the business is well under way, the payment of an increased amount is not so burdensome as would be the payment of a uniform amount throughout that entire period of time. That is the general theory of this method of computation. The capital sum is then arrived at in this way: starting on the first year of operation, you have the fair investment cost of the property as of that date; you assume then
1110 that you were entitled to earn upon that fair investment cost a fair rate of return; in addition to that, the allowance for depreciation figured according to the method stated; and I may say in passing that the result is that you get a sinking-fund depreciation rate. You are entitled, it is assumed, to earn also the operating costs and the necessary repair account, taxes and so on. The sum total, then, of those provisions is deducted from the actual gross revenue of that year. If there be a deficit, the deficit is added to the capital sum, and the capital sum of the second year becomes the investment cost of the first year, plus the deficit. If there is an excess, it is subtracted from the investment cost on the theory that the excess repays to the owner a portion of his capital sum. In each year, you see, you deduct, however, from the capital sum the depreciation allowance, and figure your fair return upon the depreciated value of the property. Now, there is one other requirement, which I think Mr. Fellows must have overlooked, and which is the most important criticism that I would make of his computation—assuming the assumptions which are made by him in regard to the investment cost to be admitted—and that is this: the total allowance in the depreciation fund during the entire period covered by the computations must be sufficiently large not only to cover the accrued depreciation upon the existing property, but must take care of the property abandoned during that interval of time."

Mr. Fellows' annual depreciation allowance should be materially increased.

Table C shows the result obtained under the method outlined by Mr. Fellows, applied to the conditions that actually have existed with reference to the property of The D. U. W. Co. for the year 1914 under this method, assuming that 7% represents a fair rate of return, the gross revenue of the plant should be $1,416,725, allowing approximately $500,000 a year for operating expenses and taxes; $284,193, for the year, for depreciation allowance under the method assumed by Mr. Fellows, and $633,532, as a fair return at the rate of 7% upon the investment cost of the property shown at this time. The depreciation allowance set forth in Table C is based upon the "sinking-fund-method," at 0.95% per annum, which results in a development expense allowance of $711,000., and the investment cost of the property, less depreciation, $9,036,000. In Table- B and D, the same method of computation is used except that depreciation is based on the "straight-line-method." Table D shows that the development expense at the end of the year 1913, amounted to $3,672,560, and the capital sum was $14,598,374. That the fair gross revenue for the year 1914 under these conditions should be $1,732,103, comprising a depreciation allowance of $210,-
1111 217, operating expenses and taxes $500,000, and a fair return at the rate of 7% on the capital sum $1,021,886.

In Table E is shown a similar computation based again on the "sinking-fund-method" of handling depreciation, as was the case in Table C, but on a basis requiring an annuity of 8/10 of one per cent per annum for depreciation, instead of 95/100 of one per cent as assumed in Table C. On this basis the equitable gross revenue for the year 1914 is $1,834,322. The increase above Table D being due to the higher allowance necessary to provide for depreciation.

Exhibit A-104 offered and admitted.

Exhibit A-105 sets forth the estimated cost of the new construction now being done in connection with the 48-inch pipe line from Marston Lake to the City, together with an estimate of the increase of operating expenses that will result from this addition to the plant. This work was planned and work leading up to the construction was actually under way prior to May 1, 1914. Objection to admitting Exhibit A-105 sustained.

I have examined Exhibits A-73 and A-74, presented by Mr. Cheyne, particularly as they relate to operating expenses. In my judgment the operating expenses there set forth are reasonable and proper expenses and properly charged.

Cross-examination by Mr. Nye:

It is true that the item entitled "preliminary dam expense" included in the valuation by Metcalf & Anderson, and excluded by other witnesses, contains the cost of the steel that was used in the construction of the first dam and which was incorporated with the masonry included in the present dam. It is impossible to ascertain the exact amount of that, I think not over $10,000 perhaps less.

The dam could have been built without the steel, but I would not say that it is of no value in the dam.

The estimates of Messrs. Gaffey and Bickel, included Sullivan Reservoir in the gross reproduction cost. The Public Utilities Engineers did not. It is my understanding that in estimating paving allowances Mr. Gaffy and The Public Utilities engineers allowed for pavement cuts wider than the trench.

"Correction of minor errors in setting down some of the figures in Table G, Exhibit A-99. In Exhibit A-100," the figures setting forth Mr. Gaffy's estimate for excavation and backfill, were difficult to compare with our figures because he gave first his estimate of the cost of ordinary excavation and backfill and subsequently included under one item, an estimate for difficult excavation and
1112 sheeting, all combined. In making my comparison, as I stated on direct examination, I left out of consideration the item of the sheeting and the difficult trench. Including that with the straight excavation brings the average cost per lineal foot of trench under Mr. Gaffy's estimate to 16-2/3 cents.

It is apparently also true that Mr. Gaffy's estimate considered in Table C, Exhibit A-102, treated separately the item of laying specials and valves, for which correction should be made.

The corrections made in these two exhibits, should be carried into the units in Exhibit A-100. They do not affect the final footings at all, but merely the distribution as between the several classes of the work. By the fair contract cost, I mean such a price as you would get on work after fair competitive bidding upon specifications prepared in advance of the bidding so that the bidders might bid on the same basis and under present-day conditions at normal prices. The costs so arranged for each of the segregated items, that each item bears proportionately a proper relation to every other item in the general construction. In the estimate of The Public Utilities Engineers, the average cost assumed for laying 12-inch pipe was less than the average cost assumed for laying ten inch pipe, due as set out by defendants' Exhibit 28, to a consideration of the localities in which each of the different sizes of pipe was to be laid, and their judgment of its cost under that consideration. In my original estimates of present fair value, set out in Exhibit C, I included both the contractor's overhead costs and profit, and the company's overhead and contingencies.

In the preparation of the exhibits here introduced, dealing with the fair contract price, I eliminated from the figures shown in Exhibit C, the company overhead and contingencies. It was my intention to make the Metcalf and Anderson perfectly comparable with the other estimators.

I have undertaken to make a determination of the relative cost of operating the water power pumps at West Denver and of pumping the same quantity of water by steam with new pumps. In actual money expended for operation it costs the company less to operate the water power pumps. If you consider the overhead charges due to the property necessary in connection with the water power instal-

lation plus the operating expenses, then the total cost of pumping by water power is more expensive.

I do not know what the exact difference would be, but I can and will prepare a memorandum showing it.

If the plant were reproduced at present-day prices but under the conditions existing at the time the original structures were built, it would reduce the allowances for such items as paving,
1113 some track obstructions, and some other pipes and conduits now existing under ground and under which water mains would have to be laid.

Cross-examination by Mr. Stevens:

The cross sections showing the conduit trenches used by the D. U. W. Co. call for a width at the bottom of the trench 2 feet greater than the internal diameter of the pipe, and with sloping sides. On the vertical trench assumed by Mr. Bickel using a width 28 inches greater that the internal diameter of the pipe the gain in the very small triangle at the bottom of the trench would be infinitesimal compared with the deficiencies in his trench quantities due to the gain in the large triangle in the upper part of the sloping trench. The D. U. W. Co. has not kept a separate depreciation account or maintained a sinking fund to take up depreciation.

1114 Witness THOMAS CHEYNE, recalled.

Direct examination by Mr. Dorsey:

Exhibit A-107, is a table showing earnings and operating expenses of The D. U. W. Co. for the fiscal year ending October 31st, 1914. Also an estimate of the net earnings of the company for the year beginning May 1, 1913, ending April 30, 1914, as the result would be, as nearly as can be ascertained, had the rate reduction ordinance been in effect during that period. The estimate is based upon the experience of the six months season, May 1, to Oct. 31, 1914, with the effect of the rate reduction ordinance applied to the business of that period and carried forward to the following six months period. Estimated reduction in gross earnings for the year ending April 30, 1915, had the rate reduction ordinance been in effect is $271,485.32.

In preparing the estimate of the reduction, under the proposed ordinance, I have made an actual count and computation of the items, appearing on the service records of the company, from which the revenue is obtained, which results in a correction reducing the former estimated reduction by $47.52. I have ascertained that the amounts charged by the company to maintenance and repair accounts are proper charges to such accounts. The items marked C. D. and E., are items of an extraordinary character which in my judgment should be charged to depreciation account or contingent reserve fund, were such funds available. I have examined the company's records for the past five years and find that except for these matters, to which I have called attention, that there are no charges to maintenance account that should not properly be made to such account. The aver-

age annual charge to maintenance for the five years is $60,767.68 per year.

Exhibit A-108 shows the expenditures for maintenance and repairs for the years 1910 to 1914, inclusive.

Exhibits A-107 and A-108 offered and admitted.

Cross-examination by Mr. Stevens:

All of the repairs and replacements made by the company in this period are shown by this exhibit. The replacement of the Ashland Avenue Reservoir roof is not properly chargeable to new construction. It is a proper charge to operating expense, there being no depreciation fund from which to care for it.

Cross-examination by Mr. Nye:

In the beginning of my work I went over these records of the company from the beginning. I found no other case where large
1115 replacements were charged to operation and maintenance accounts. The Cherry Creek conduit, being entirely new construction was charged to property account. There was no depreciation fund against which to charge any part of the cost of the abandoned Cherry Creek pipe line. There was another item, the replacement with cast iron of 420 feet of the 40 inch conduit, which was partly replacement and partly betterment. The replacement should have been charged to depreciation account had there been one. Those are the only items of that character that I recollect. The exact point of division between proper charges to maintenance and operation, and to depreciation, is a question of judgment. The operation and maintenance account has been a steadily increasing account since the beginning of the life of the company.

Legal expenses in the statement are separated from the expenses attached directly to the rate case, the rate case expenses being considered as extraordinary expenses. In the case of the railroad using water through meters at a rate of 6 cents per thousand gallons, I computed the earnings from them in the future at the rate of 6 cents, though under the ordinance the company may charge 8 cents. I did not anticipate that the company would be able to change the existing rate. If the rate were increased to 8 cents, the earnings of the company would be increased by $13,017.38 and the reduction provided by the ordinance would be reduced to that extent. In using the figure, $170,000, for depreciation and contingent reserve, I simply adopted the estimates of the company's engineers.

Redirect examination by Mr. Dorsey:

The company has not, since 1894, carried a replacement account. The property account as shown and carried on the books and records of the water company, aggregates considerably more than $16,000,000.

In addition to the railroad companies, the Union Stock Yards Company and the Phipps Sanatorium, are served with water at a rate of 6 cents per thousand gallons, which would make the total correction, under the meter account, if the 8 cent rate made possible under the

ordinance were collected, $16,560.40 for the year ending December 31, 1914. The 6 cent rate, in the case of these large consumers was in effect prior to the adoption of the rate reducing ordinance and has remained in effect since. The Phipps Sanatorium is a semi-charitable institution.

1116 Witness LEONARD METCALF Recalled.

Direct examination by Mr. Dorsey:

Exhibit A-12, offered and admitted. I have made an analysis of the repair account of The D. U. W. Co., and am satisfied that the charges thereto are normal charges. I did not intend that the allowance made by me for depreciation and contingent reserve should cover items of ordinary repair expenses. If no fund is provided out of which extraordinary expenses may be paid, they also must be charged to operating expenses. They cannot be charged to property account.

Property contained in a water works system is generally much longer lived than the property of gas and electric plants, street railways and other utilities, and this feature has a very important bearing upon the element of depreciation. The rate of depreciation is much less in the early years of the property than in the later years, therefore, the sinking fund method of computing the allowance necessary, is the most nearly accurate. It provides for small annuities, compared with the straight line method, that with accretions produce a larger allowance year by year as the end of the useful life of the property is approached. The accretion under the sinking fund method grows constantly by the compounding effect of the interest thus more nearly keeping pace with the depreciation upon the property. Banking houses usually require in providing for loans that the earnings available for the payment of interest shall amount to at least one and one-half times and from that to two times, the amount of the interest charge actually represented by the coupons attached to the securities in question. Unless such funds are available for payment of interest the rate at which the money is obtained exceeds very considerably the rate fixed by the security.

Cross-examination by Mr. Stevens:

In determining the depreciation that had accrued upon the various items of property, I based my judgment upon experience. In determining the depreciation allowance for the future judgment was relied upon as to the remaining useful life of the property and the computation to ascertain the annuity required to amortize the property was made upon the sinking fund method with a 4% interest rate. The straight line method and the sinking fund method were both used as aids to judgment in checking the estimate of accrued depreciation.

It would make no difference in my allowance for depreciation of this plant, if I were making the estimate to apply to the case of a company that had just taken over and was just beginning to
1117 operate these works. The estimate would be exactly the same as in the case of the present company. Whether the

company had or had not a franchise makes no difference in the depreciation upon the physical property. If a franchise existed limited to a certain period, if I included any value for its existence, I would also depreciate it according to the life provided for it. If it is to be assumed, as Senator Patterson indicates, that this property is to be scrapped when the city completes its new plant and takes over the business of this one then it would be equitable for this company to increase its rates to amortize the value remaining in this plant within that period.

Cross-examination by Mr. Nye:

It would make comparatively little difference in the annual allowance now required to amortize the remaining value in this property even though depreciation allowance had been made and a fund provided during the past operations of the company. For the purpose of this valuation, the property has been depreciated up to the date of valuation. The depreciation allowance made is not intended to take care of ordinary repairs to pumps, conduits, or works of that kind. The question of what items are to be charged to repair account and what items are to be charged to depreciation account is a matter of judgment. The judgment to be applied when the work is done. If the repair is of a character that will extend the life of the portion of the property repaired, only up to the point where it will make the structure serve until such time as the whole structure is abandoned, I would charge that to repair account. If the repair provided a structure that would extend the life of the portion repaired to such an extent as to make that work serve as part of the final replacement, I would charge it to depreciation account. The items charged to maintenance and repairs as shown by exhibit A108, are properly charged to repairs. If a company borrowed, at a certain rate of interest, up to three-fourths of the value of its property and attempted to borrow further, it would be obliged to pay a higher rate of interest. It makes no difference whether the additional capital was obtained from its stockholders or from the public at large.

The pumps of the West Denver station were depreciated 47%. It is my judgment that the water power pumps were depreciated more than the steam pumps though at this moment I cannot lay my hand on the data from which to state the relative allowance.

1118 Redirect examination by Mr. Dorsey:

The allowance for accrued depreciation was made from judgment, after a careful examination of the property depreciated, which examination determined the extent to which depreciation had occurred and informed us as to the remaining useful life of the property, thus enabling us to determine the rate of depreciation to be allowed for the future. I stated on cross-examination that had a depreciation fund been set aside in the past a slightly smaller annuity might be sufficient at the present time. This is due to the fact that the company would have on hand an accumulated contingent reserve fund, possibly as much as $200,000, which accumulation would affect, but not substantially, the requirements for the aggregate of the

two allowances; depreciation and contingent reserve. In water works properties the depreciation replacements occur at long intervals, because the bulk of the investment is in long lived property. The time for large replacements has not yet arrived in this plant. I believe that the allowances which I have made for depreciation and contingent reserve in this case will be justified by experience.

Witness ARTHUR D. WALL. Recalled.

Cross-examination by Mr. Nye:

The Antero and Lost Park Reservoir Company in acquiring its reservoir site purchased two direct flow ditches. The Drake Ditch, priority of Oct. 10, 1881, 6.27 feet, and the Chubb, priority June 1, 1884, 91.52 second feet, that being an outlet ditch from Greene's Lake (which is part of the reservoir).

Redirect examination by Mr. Hodges:

These ditches had been used for the irrigation of hay meadows.

Sur-rebuttal by Defendants.

Witness A. LINCOLN FELLOWS. Recalled.

Cross-examination by Mr. Dorsey:

Exhibit A106, is a copy of the report made by the engineers of The Public Utilities Commission to The Public Utilities Commission, January 16, 1914. Exhibit A106, offered and admitted. Objection overruled. Exception. The report was made, fixing a valua-
1119 tion as a basis for purchase of the plant of the company and not for rate making purposes. The report stated in effect, that if such purchase was made, little or no change should be made in the rates.

Witness HORACE HILTON MITCHELL.

Direct examination by Mr. Stevens.

Reside at Colorado Springs, am a certified public accountant. Was designated by the Master in this case to make an examination of the books of the D. U. W. Co. Exhibit 72, is my report of the result of said examination.

Exhibit 72 offered and admitted.

Cross-examination by Mr. Dorsey:

I find that because of a rebate claim that was allowed to the City of Denver, on account of charges in meter rates for the years 1911 and 1912, that the meter revenues for the year 1913 should be increased by the sum of $9,366.06 and a profit and loss entry should be made to compensate for the increase, leaving the net earnings of the company exactly as shown by Mr. Cheney's estimates in Exhibits A73 and A74. I also find that Exhibits A73 and A74, should be corrected by increasing the reduction developing under the rate

reducing ordinance by the amount of $392.48 and the net earnings be reduced by the same amount, because of the fact that Mr. Cheyne in preparing Exhibits A73 and A74 based his estimate upon the number of items producing a certain class of revenue for which charge was made in the year 1913. The actual count of those items for the year 1914 altering the result to that unappreciable extent.

The amount involved is against the interest of the company.

It was stipulated and agreed by and between counsel for the respective parties that all exhibits not excluded by Master, even though not formally offered in evidence during the hearing, be considered as offered in evidence.

1120 COMPLAINANT'S EXHIBIT No. E.

Case No. —.

State of Colorado.

Office of the Secretary of State.

Certificate.

UNITED STATES OF AMERICA.
State of Colorado, ss:

I, James B. Pearce, Secretary of State of the State of Colorado, do hereby certify that the annexed is a full, true and complete transcript of the Certificate of Incorporation of The South Platte Canal & Reservoir Company which was filed in this Office the Thirteenth day of January A. D. 1894 at 2:15 o'clock P. M. and admitted to record, also

Certificate of Amendment to The Certificate of Incorporation of The South Platte Canal & Reservoir Company which was filed in this Office the Twentieth day of April, A. D. 1914, at 9:59 o'clock A. M. and admitted to record, extending the Corporate Existence.

In Testimony Whereof, I have hereunto set my hand and affixed the Great Seal of the State of Colorado, at the City of Denver, this twenty-ninth day of May, A. D. 1914.

(Colorado State Seal.) JAMES B. PEARCE,
Secretary of State.
By THOMAS F. DILLON, JR., *Deputy.*

1121 *Certificate of Incorporation of The South Platte Canal & Reservoir Company.*

Know All Men By These Presents: That we, David H. Moffat, Walter S. Cheesman, Thomas S. Hayden, Charles P. Allen and Richard Holme, desiring to form a company under the name and for the purposes hereinafter mentioned, in accordance with the laws

of the state of Colorado in such case made and provided, do hereby make, sign and acknowledge in sextuplicate this certificate of incorporation, and as required by the said laws of Colorado, we herein make the following statements:

1st. The name of this corporation shall be The South Platte Canal & Reservoir Company.

2d. The object for which said Company is incorporated and organized is, in the Counties of Douglas, Jefferson, Arapahoe and Weld, in the state of Colorado, to construct, maintain, operate and enlarge, purchase, receive, hold, sell, grant and convey reservoirs, canals, tunnels, pipe lines, water pipes and water mains, for the purpose of conveying water to be used for irrigating, domestic, sanitary, fire, mining, manufacturing and mechanical purposes, and all rights, privileges and franchises belonging to or to be acquired by the same; to appropriate water, water rights, franchises and privileges; to sell and otherwise dispose of water and the right to the use of water for the purposes aforesaid; to construct, maintain, enlarge, purchase, receive, hold, sell, grant and convey all necessary or convenient lateral ditches, tunnels and pipe lines; to sink wells, cribs and underground galleries for collecting water; to acquire rights of way for its reservoirs, ditches, canals, pipe lines, tunnels, water mains, laterals, cribs and galleries; to furnish and sell water to water works companies and to irrigating companies; to sell and supply the city of Denver and additions thereto, and towns
1122 and cities in the vicinity thereof, and the inhabitants thereof and others in the vicinity and all municipalities and the inhabitants thereof, and all corporations and individuals along the line of its canals, ditches, pipe lines, water mains, and water pipes with water for the purposes aforesaid; to purchase, receive, hold, sell, grant and convey real and personal property; to improve and cultivate lands; to construct houses and buildings; to aid by advances or loans of money in the development, improvement and cultivation of farms; to borrow money; to assume any indebtedness upon property said company may purchase; to issue bonds secured by deeds of trust or mortages upon any or all of its property; also to construct, maintain and operate a reservoir at the intersection of the South Fork of the South Platte River and Lost Park Creek, and a tunnel, canal and pipe line to convey water from such reservoir and the stream known as the South Platte river for the purposes aforesaid; and to adopt the bed of the South Platte River as the canal or channel for the purpose of conducting said waters to any other canals or pipe lines in the Counties of Douglas, Jefferson, Arapahoe and Weld in the State of Colorado.

3d. The said reservoir is to be constructed by said company on the South Fork of the South Platte River at its intersection with Lost Park Creek in Jefferson and Douglas Counties, Colorado. The dam of such reservoir is located in the N. W. ¼ of S. W. ¼ of Section Six (6), Township Ten (10) South, of Range Seventy (70) West, the north end of which will be from the N. W. corner of said Section Six (6) South, 11° 25′ E., 2,832 feet; thence S., 22° 40′ E., 473 feet to the south end of said dam. Said reservoir at high water

mark, will cover so much of the following legal subdivisions of land as lie within the canons of said South Fork of the South Platte River, Lost Park Creek and Turkey Creek, in Douglas and Jefferson Counties, Colorado, towit: 13.5 acres in the N. W. ¼ of S. W. ¼, 12.5 acres in W. ½ of N. W. ¼ of said Section 6, Twp. 10 S., R. 70 W.; 33.9 acres in the S. E. ¼ and 17.7 acres in S W. ¼ all in Section 36, Twp. 9 S., R. 71 W.; 1.. acres in S E. ¼ of S. E. ¼ of Sec. 35, Twp. 9 S., R. 71 W.; 94.6 acres in N. E. ¼ of
1123 Sec. 1; 8.4 acres in N. W. ¼ of Sec. 1; 2.7 acres in N. E. ¼ of N. E. ¼ of Sec. 2; 105.3 acres in S. E. ¼ of Sec. 1; 15.8 acres in S. W. ¼ of Sec. 1; 64.8 acres in N. E. ¼ of Sec. 12; 63.2 acres in N. W. ¼ of Sec 12; 8 acres in S. E. ¼ of Sec. 12; 73.1 acres in S. W. ¼ of Sec. 12; 90.4 acres in N. W. ¼ of Sec. 13; 2.4 acres in N. E. ¼ of N. E. ¼ of Sec 14; 61.2 acres in S. W. ¼ of Sec. 13; 7 acres in S. E. ¼ of Sec. 13; 29.7 acres in S. E. ¼ of Sec. 14; 29.6 acres in N. E. ¼ of Sec. 23; 3.4 acres in N. W. ¼ of Sec. 23; 4.9 acres in S. W. ¼ of Sec. 23, all in Township Ten (10) South, of Range Seventy-one (71) West of the Sixth (6th) P. M. The total number of acres covered by said reservoir at high water mark is seven hundred and thirty-seven (737) acres. The outlet gate of said reservoir is located near the north end of said dam, the said gate being south, 73° 8′ E., 280 feet from the N. W. corner of the S. W. ¼ of said Section Six (6), in Township Ten (10) South, of Range Seventy (70) West.

4th. The line of said proposed tunnel, canal and pipe line will be as follows: From said outlet gate by tunnel South 79° 4′ E., 580 feet, more or less, to the bed of the South Fork of the South Platte River; thence down the South Fork of the South Platte River to the South Platte River; thence down the South Platte River, adopting the bed of said last mentioned streams as the canal or channel for conveying said waters to the headgate of the pipe line, located 257 feet South and 214 feet East of the N. W. corner of Section Four (4), Township Seven (7) South, Range Sixty-nine (69) West; thence through pipe line North, 57° 0′ E., 1,500 feet; thence on 30° curve to L., 95.3 feet; thence N., 28° 36′ E., 44.4 feet; thence on 18° curve to R., 130.6 feet; thence N., 51° 54′ E., 333 feet; thence on 28° curve to R., 192.3 feet thence on 24° curve to R., 155.2 feet; thence S., 39° 14′ E., 190.4 feet; thence on 16° curve to L., 107 feet; thence S., 56° 21′ E., 180.6 feet; thence on 22° curve to L., 165 feet; thence N., 87° 21′ E., 58.8 feet; thence on 40° curve to L., 92.9 feet; thence N., 50° 11′ E., 229.6 feet; thence on 20° curve to R., 136.7 feet; thence N., 77° 31′ E., 15.6 feet; thence on 20° curve to L., 115 feet; thence N., 54° 31′ E., 223.4 feet; thence on 14° curve to L., 160.7 feet; thence N., 32° 1′
1124 E., 330.5 feet; thence on 16° curve to R., 131.3 feet; thence N., 53° 0′ E., 547.1 feet; thence N., 38° 30′ E., 229 feet; thence S., 77° 45′ E., 84.4 feet; thence on 12° curve to L., 112.5 feet; thence N., 88° 50′ E., 3.9 feet; thence on 12° curve to R., 101.3 feet; thence S., 78° 55′ E., 77.7 feet; thence on 12° curve to R., 101.3 feet; thence N., 89° 5′ E., 29.5 feet; thence on 10° curve to L., 262.4 feet; thence N., 62° 51′ E., 320 feet; thence on 4°

curve to R., 200 feet; thence N., 70° 51′ E., 399 feet; thence on 10° curve to L., 200 feet; thence N., 50° 51′ E., 401 feet; thence N., 62° 51′ E., 448.4 feet; thence on 30° curve to L., 133.3 feet; thence N., 22° 51′ E., 196.7 feet; thence on 20° curve to R., 140 feet; thence N., 50° 51′ E., 231.6 feet; thence on 8° curve to R., 150 feet; thence N., 62° 51′ E., 722.8 feet; thence on 10° curve to L., 250 feet; thence N., 37° 51′ E., 324 feet; thence on 10° curve to L., 250 feet; thence N., 12° 51′ E., 644.2 feet; thence on 8° curve to R., 255 feet; thence N., 33° 15′ E., 1,012.4 feet; thence on 30° curve to L., 133.3 feet; thence N., 6° 45′ W., 685.7 feet; thence N., 9° 45′ E., 1,420 feet; thence N., 17° 45′ E., 1,184 feet; thence N., 10° 0′ E., 3,236 feet; thence N., 0° 50′ E., 1,760 feet; thence on 2° curve to L., 254.2 feet; thence N., 4° 30′ W., 4,680 feet; thence on 2° curve to R., 245.8 feet; thence N., 0° 25′ E., 469.7 feet; thence on 4° curve to R., 214.5 feet; thence N., 9° 0′ E., 1,671.3 feet; thence on 2° curve to L., 429.2 feet; thence North 3,101.5 feet parallel with and 20 feet West of the East line of Section Ten (10) Township Six (6) South, Range Sixty-nine (69) West; thence on 2° curve to R., 1,208.3 feet; thence N., 24° 10′ E., 10,385.7 feet; thence N., 8° 33′ E., 2,624 feet; thence N., 29° 27′ W., 2,845 feet; thence N., 1° 3′ E., 3,921 feet; thence on a 4° curve to R., 544.5 feet; thence N., 22° 50′ E., 1,505.2 feet; thence on 4° curve to R., 384.2 feet; thence N., 38° 13′ E., 2,004 feet to a point which is 1,191.5 feet North of the S. W. corner of Section Thirteen (13), Township Five (5) South, Range Sixty-nine (69) West; thence N., 38° 31′ E., 3,214 feet; thence N., 9° 29′ W., 400 feet to a point in Marston Lake, said point being 1,467 feet North and 781.2 feet West
1125 of the center of Section Thirteen (13), Township Five (5) South, Range Sixty-nine (69) West.

The dimensions of said pipe line, through which the said waters are to be conducted from the South Platte River at its headgate in Section 4, Twp. 7 S., Range 69 W., are sixty (60) inches in diameter, inside measurement, in that part of the pipe line which is made of wood, and seventy-eight (78) inches in diameter, inside measurement, in that part of the pipe line which is made of cement; the said pipe line to be partly of wood, bound by iron bands, and partly of cement. The descriptions and location of said reservoir, tunnel canal and pipe line, as herein given, are as accurate as can be given at the present time, and the right of said Company to deviate therefrom when it is impracticable or inexpedient to construct exactly according to said description and location is authorized and is reserved to said Company.

5th. The water flowing through said reservoir and tunnel and canal and pipe line is to be used for the purpose of irrigating lands, and for domestic, sanitary, mining, manufacturing and mechanical purposes, and for other uses set forth in paragraph 2 of this certificate of incorporation.

6th. The capital stock of this Company shall be Five Hundred Thousand Dollars ($500,000.00), divided into five thousand (5,000) shares of One Hundred Dollars ($100.00) for each share.

7th. The said Company shall exist for the term of twenty (20) years.

8th. The affairs of said Company shall be managed by seven directors, and Walter S. Cheesman, David H. Moffat, George W. Clayton, Thomas S. Hayden, Charles P. Allen, Erastus F. Hallack and Richard Holme shall be the directors for the first year and until their successors are elected and entered upon their duties.

9th. The principal office of said Company shall be in the city of Denver, in Araphoe County, Colorado.

10th. The business of said Company shall be carried on in the counties of Douglas, Jefferson, Arapahoe and Weld, in the state of Colorado.

1126 11th. The Directors of said Company are authorized to make such by-laws as they may deem necessary for the management of the affairs of the said corporation.

In testimony whereof, we, the above named incorporators, have set our hands and seals to this certificate of incorporation this Ninth day of January, 1894.

DAVID H. MOFFAT. [SEAL.]
WALTER S. CHEESMAN. [SEAL.]
THOMAS S. HAYDEN. [SEAL.]
CHARLES P. ALLEN. [SEAL.]
RICHARD HOLME. [SEAL.]

STATE OF COLORADO,
County of Arapahoe, ss:

I, Almon E. Hart, a Notary Public in and for said County in the State aforesaid, do hereby certify that Walter S. Cheesman, David H. Moffat, Thomas S. Hayden, Charles P. Allen and Richard Holme, who are personally known to me to be the persons whose names are subscribed to the foregoing certificate of incorporation, appeared before me this day in person, and duly acknowledged that they signed, sealed and delivered the said instrument in writing as their free and voluntary act, for the uses and purposes therein set forth.

Given under my hand and Notarial Seal this Ninth day of January, 1894.

(My commission expires Sept. 23rd, 1896.)

[Seal Almon E. Hart, Notary Public, Arapahoe Co., Colorado.]

ALMON E. HART,
Notary Public.

1127 Endorsed: 16443. Certificate of Incorporation of The South Platte Canal & Reservoir Company. Domestic. Filed in the office of the Secretary of State, of the State of Colorado on the 13 day of Jany. A. D. 1894 at 2:15 o'clock P. M. Recorded in Book 36 page 633. Nelson O. McClees, Secretary of State. By ——— ———, Deputy. 50.00.

1128 Examined and O. K. for Filing. Sims, Clerk.

Certificate of Extension and Renewal of Corporate Life of the South Platte Canal & Reservoir Company, for a Term of Twenty Years from the 13th Day of January, A. D. 1914.

We, John Evans and Walter P. Miller, respectively the President and Secretary of The South Platte Canal & Reservoir Company, a corporation duly organized under and by virtue of the laws of the state of Colorado, on the 13th day of January, A. D. 1894, do hereby certify that pursuant to the laws of the state of Colorado, in such case made and provided, and the unanimous action of the stockholders thereof, the term of the corporate life of said The South Platte Canal & Reservoir Company has been and hereby is continued, extended and renewed for a period of twenty (20) years from the 13th day of January, A. D. 1914, and that the minutes of the special meeting of the stockholders of said The South Platte Canal & Reservoir Company, held on the 21st day of March, A. D. 1914, inserted herein and made a part of this certificate, towit:

"Minutes of a special meeting of the Stockholders of The South Platte Canal & Reservoir Company, held at the offices of the Company, room 165 Shirley Annex in the city and county of Denver, State of Colorado, on Saturday, the 21st day of March, A. D. 1914, at the hour of two o'clock p. m.

"The meeting was called to order by Mr. John Evans, President of the Company, and L. M. Phebus was elected Secretary of the meeting.

"The following stockholders, owners respectively of the number of shares set opposite their names, were present, towit:

1129

In Person:	The Denver Union Water Company, by W. P. Robinson, President	4,993 shares.
	John Evans	1 share.
	W. P. Robinson	1 share.
	F. G. Moffat	1 share.
	D. C. Dodge	1 share.
	W. F. Hayden	1 share.
	Gerald Hughes	1 share.
By Proxy:	Walter P. Miller, proxy to John Q. Dier	1 share.
		5,000 shares.

"Total present in person and by proxy 5,000 shares, being all of the entire capital stock of said The South Platte Canal & Reservoir Company.

"The President read the call for the meeting, signed by the owners and holders of more than ten per cent of the entire capital stock of the Company, towit: By the owners and holders of all of the entire capital stock, and the proof of publication of the same,

which had theretofore been duly published for four consecutive weeks in a newspaper printed nearest the place where said The South Platte Canal & Reservoir Company has kept its principal office; also copy of the notice mailed to each of the stockholders of the Company more than thirty days prior to the date fixed for this meeting, and the proof or affidavit of such mailing, each thereof respectively being in words and figures as follows, towit:

"Call of Meeting.

GEORGE W. SKOULAND,

[NOTARIAL SEAL.] *Notary Public.*

"The following resolution was thereupon offered by Mr. Hayden, and is in words and figures as follows, towit:

" 'Whereas, the corporate life fixed in the charter heretofore granted to The South Platte Canal and Reservoir Company by the state of Colorado, did expire on or about the 13th day of January, A. D. 1914, and under and by virtue of the laws of the said State and by complying with certain requirements of the laws of the State of Colorado in reference thereto, an extension or renewal of said charter for a period of twenty years may be secured;

" 'Now, therefore, be it resolved that the charter of this Company be extended in accordance with the statutes of the state of Colorado in such case made and provided, and that the President and Secretary of The South Platte Canal and Reservoir Company be and they are hereby authorized and empowered to do any and all things required by the statutes of the state of Colorado to secure an extension or renewal of the charter of The South Platte Canal and Reservoir Company for a period of twenty years from and after the date of the expiration of said charter, as aforesaid, including the signing and filing of such certificates and the payment of such fees as may be necessary to carry into effect the purpose of this resolution.'

"Thereupon, it was moved and seconded that said resolution be adopted, and on ballot being taken thereon the said resolution was adopted by a vote of 5,000 shares, said shares being more than a majority, towit, all, of the entire capital stock of The South Platte Canal and Reservoir Company. That the stockholders voting by

ballot for said resolution and owners of and representing the number of shares set opposite their respective names are as follows, towit:

In Person:	The Denver Union Water Company, By W. P. Robinson, President	Owner of	4,993 shares.
1135	D. C. Dodge	Owner of	1 share.
	John Evans	Owner of	1 share.
	F. G. Moffat	Owner of	1 share.
	Wm. F. Hayden	Owner of	1 share.
	W. P. Robinson	Owner of	1 share.
	Gerald Hughes	Owner of	1 share.
By Proxy:	W. P. Miller, Proxy to J. Q. Dier	Owner of	1 share.

Makin a total of 5,000 shares present in person and by proxy, voting in favor of said resolution.

"There being no further business the meeting, on motion duly seconded, adjourned.

JOHN EVANS, *President.*

(Signed)

(Signed) L. M. PHEBUS,
Secretary of the Meeting."

Are a true and correct copy of the minutes of a special meeting of the stockholders of The South Platte Canal & Reservoir Company, duly called for and held, in compliance with the statutes of the State of Colorado in reference thereto, on Saturday, the 21st day of March, A. D. 1914, at the hour of two o'clock p. m. on said day.

In witness whereof we have hereunto set our hands and seals this 10th day of April, A. D. 1914, and attached the corporate seal of this Company.

JOHN EVANS,
President of The South Platte Canal & Reservoir Company.

[COPORATE SEAL.]

WALTER P. MILLER,
Secretary of The South Platte Canal & Reservoir Company.

1136 STATE OF COLORADO,
City and County of Denver, ss:

I, Walter E. Wilmot, a notary public in and for said City and County in the State aforesaid, do hereby certify that John Evans and Walter P. Miller, who are each personally well known to me and known to me to be respectively the President and Secretary of The South Platte Canal & Reservoir Company, appeared before me this day in person and acknowledged that they executed the foregoing instrument in writing in their respective capacities of President and Secretary of said The South Platte Canal & Reservoir Company, as the free and voluntary act of the said Company and as their own free

and voluntary act for the uses and purposes therein set forth; and the said John Evans and Walter P. Miller, being each by me duly sworn, do depose and say each for himself that the seal affixed to the foregoing instrument is the corporate seal of said The South Platte Canal & Reservoir Company, that said seal was affixed thereto and said instrument signed by them respectively as President and Secretary of said Company, as authorized and empowered by the resolution of the stockholders of said Company adopted on the 21st day of January, A. D. 1914, as in said foregoing certificate set forth, and that the statements contained in the foregoing certificate are true.

In Witness Whereof I have hereunto set my hand and set my official seal this 18th day of April, 1914.

My commission as a notary public will expire October 31, 1914.

[NOTARIAL SEAL.] WALTER E. WILMOT,
Notary Public.

1138 [Endorsed:] 6274. U. S. District Court, District of Colorado. Plaintiff's Exhibit E. Filed Oct. 6, 1915, Charles W. Bishop, Clerk.

1139 Case No. —.

COMPLAINANT'S EXHIBIT NO. Q.

STATE OF COLORADO,
County of Park, ss:

In the District Court of the Eleventh Judicial District of the State of Colorado, Sitting Within and for the County of Park.

Pleas in the district court of the eleventh judicial district of the state of Colorado, sitting within and for the county of Park, before the Honorable Charles Cavender, Judge of the fifth judicial district of the state of Colorado, sitting for and at the request and in the place of the Honorable Charles A. Wilkins, Judge of the eleventh judicial district of the state of Colorado, at a term thereof begun and held at the court house in the town of Fairplay, in said county, on the third Monday (it being the 19th day) of May, A. D. 1913.

Present:

Honorable Charles A. Wilkin, Judge of the District Court of the Eleventh Judicial District.

Honorable Charles Cavender, Judge of the District Court of the Fifth Judicial District and sitting as a Judge of the District Court of the Eleventh Judicial District.

Gilbert A. Walker, Esq., District Attorney of said District.

O. P. Speerlock, Esq., Sheriff of said County.

A. F. Willmarth, Esq., Clerk of said court.

Be it remembered, that heretofore and on, towit, the 22nd day of May, A. D. 1913, the same being one of the regular judicial days of the May A. D. 1913 Term of said Court, the following proceedings, inter alia, were had and entered of record in said court, towit:

1140 STATE OF COLORADO,
County of Park, ss:

In the District Court of the Eleventh Judicial District of the State of Colorado, Sitting Within and for the County of Park.

No. 1636.

In the Matter of PRIORITIES OF WATER RIGHTS IN WATER DISTRICT No. 23, IN THE STATE OF COLORADO.

On Petition of the South Platte Canal and Reservoir Company for the Adjudication of Water Rights of Lake Cheesman, for Beneficial Purposes other than Irrigation.

Decree.

Now on this 22nd day of May, A. D. 1913, this matter coming on before the court for final hearing and adjudication, upon the report of C. P. Gehman, Referee appointed herein, and to whom this matter was by order of this court, entered on the 22nd day of May, 1912, referred for the purposes and as in said order mentioned, and upon the several findings of the Referee, and upon the evidence taken herin; and the court being now fully advised in the premises,

Doth Find and Adjudge from the several notices, certificates of publication, affidavits and certificates and report of said Referee, that all the said testimony taken herein and returned by said Referee, and upon which the findings of said Referee have severally been made, was taken upon due and lawful notice, and in all respects according to the statute in such case made and provided, and the rules and several orders of this court in that behalf made and entered of record herein; and further, that all interested in this matter and entitled to notice in any stage of the proceedings herein have at all times been duly notified according to law and the orders of this court, and the report of said Referee, together with the returns of service of notices, affidavits, certificates, lists, exhibits, abstracts, testi-

mony, findings and draft of decree, are in due form, and the
1141 court having heard all parties, and their attorneys, so far as they may have desired to be heard, respectively, touching the several matters herein.

It is by the court, in consideration of all the premises, hereby Ordered, Adjudged and Decreed, that the several findings of said Referee, as reported to and filed in this Court, be in all things approved and confirmed, and that they be taken, deemed and held in all respects as the findings of the Court in this matter; and it is further, upon like consideration, by this Court,

Ordered, Adjudged and Decreed, in respect to all and singular the ditches, canals, pipe lines and reservoirs constructed and used for beneficial purposes other than irrigation, in and for said Water District No. 23, that:

1. Saving as decreeing the rights and priorities of appropriations of water to the claimants thereof, no part of this decree shall in any case be taken, deemed or held to confirm, impair, or in any manner affect any claim of right or property held or claimed by any person, association or corporation, in or to any canal, ditch, pipe line or reservoir, or any part thereof, or to the land or any part thereof, on which any of the same may be located or situated, or the land held or claimed for right of way of any of them, or any right, interest or claim of property whatever in or relating to any of them.

2. No part of this decree shall be taken, deemed or held as determining the rights of any consumer, renter, or lessee of water, or as affecting in any manner any question or claim of right between the owners or claimants of any ditch, canal, pipe-line or reservoir, as between each other, whether as part owners or shareholders therein, or as stockholders in any corporation or joint stock company claiming or to claim the same or any part thereof, nor shall it affect the rights, interests or claims of any consumer of water, whether as part owner, lessee, shareholder or stockholder in any corporation owning or controlling the same, or as purchaser of water therefrom, as against the rights, interests or claims of any other party or parties interested or claiming interest or right in or to such ditch, canal, pipe line, or reservoir, as owner, lessee, or part owner thereof,
1142 or as shareholders or stockholders in any corporation claiming the same, or as purchasers of water therefrom neither shall it affect any claim of seniority and priority made or resisted as between parties using water for said purposes from the same ditch, canal, pipe line or reservoir as to such water.

3. Saving as decreeing the rights and priorities of appropriations of water to the claimants thereof, this decree shall not affect in any manner, any claim, interest, or right of any corporation as to the right of property in any ditch, canal, pipe line or reservoir, or the ground on which the same may be located or situated, or any question which may arise between the stockholders thereof, or between them and any party or parties, upon the dissolution of such corporation by expiration of its charter or otherwise, as to any appropriation of water, or rights secured by condemnation proceedings by such corporation during its legal existence.

4. No part of this decree shall affect in any manner any right, claim or interest now or hereafter held or claimed to any appropriation of water made after the closing of testimony herein touching the construction or enlargement of the ditch, canal, pipe line or reservoir by means of which said appropriation may have been made.

5. No part of this decree shall be taken or held as adjudging to any claimant, or present or future representatives, of any claim to any ditch, canal, pipe line or reservoir, or party holding, using or controlling the same, any right to take and carry by means of any canal, ditch, pipe line or reservoir herein mentioned, or by virtue of any appropriation herein adjudged, any water from any natural stream, water course or any other source, except to be applied to the beneficial use for which such appropriation was made, nor to allow any excessive use or waste of water whatever, nor to allow any diversion of water, except for lawful and benficial purposes; that in all
1143 cases of non-consumptive beneficial use the water so beneficially used shall be immediately returned to the stream or other natural source whence it is taken, or the stream or streams into which such stream or other natural source may run or be tributary, within the nearest practical distance from the point of user, without diminution in quantity or contamination or injury in quality; in no instance shall water be permitted to run through any ditch, canal or pipe line, or into any reservoir, except for the purpose of beneficial use, nor in any greater quantity than actually required for the particular beneficial use herein decreed.

6. This decree shall be taken, deemed and held as determining and establishing the several priorities of right by appropriation to the use of water from the natural streams, water courses and other natural sources of water in said Water District No. 23 for all beneficial uses and purposes other than irrigation, of the several ditches, canals, pipe lines and reservoirs in said water district, concerning which testimony has been offered in this matter, according to the construction, enlargement, extension or use, thereof, with the amount of water held herein to have been appropriated thereby. And it is ordered, adjudged and decreed that the claimants hereinafter named respectively, or others lawfully entitled thereto under and by virtue of the several approriations of water hereinafter stated to be established or decreed be and they are hereby authorized and permitted to take, divert, impound or otherwise use water as it is hereinafter determined and established to be the right of such claimants or others so to do.

7. Whenever the dimensions of any ditch or of any feeder to a reservoir are found, or the height to which any reservoir may be filled is stated in this decree, such dimensions shall be deemed and taken to control the statement of the estimated carrying capacity thereof, and such height shall be deemed and taken to control the statement of the estimated storage capacity of any such reservoir.

Subject to the foregoing seven provisions, it is further, as to said ditches, canals, pipe lines and reservoirs, and to the several
1144 appropriations of water by means of them, respectively, claimed in this matter, Ordered, Adjudged and Decreed that

said ditches, canals and pipe lines, and said reservoirs be, and the same are, hereby separately numbered consecutively and chronologically according to the dates of their several and respective constructions, and said numbers and said dates are hereby determined and decreed to be as follows, that is to say:

* * * * * * *

And as to reservoirs for beneficial uses other than irrigation:

No.	Name of Reservoir.	Date.
3	Lake Cheesman.	June 27, 1889.

* * * * * * *

And the several appropriations of water for said reservoirs, respectively, as acquired by their respective construction, extensions and enlargements, are hereby numbered and declared, with the dates of said appropriations, to be as follows:

As to reservoirs, for beneficial uses other than irrigation:

Priority No.	Name of Reservoir.	Date.
3	Lake Cheesman, by original construction.	June 27, 1889.
7	Lake Cheesman, by first enlargement.	Sept. 24,1893.

* * * * * * *

And said ditches, canals and pipe lines and reservoirs, respectively, are entitled to said appropriations, and priorities on the aforesaid numbers, and in the amount of water according to their respective appropriations and priorities as follows, towit:

* * * * * * *

And as to reservoirs for beneficial uses other than irrigation:

1145

Reservoir No.	Name of reservoir,	Priority No.	Cubic feet.
3	Lake Cheesman.	3	1,336,898,400.
	Lake Cheesman.	7	2,107,140,012.

* * * * * * *

And more particularly in respect to said ditches, canals, pipe lines and reservoirs, respectively, and the enlargements thereof, respectively, it is Found, Ordered, Adjudged and Decreed, as follows, towit:

* * * * * * *

Reservoir No. 3.

Lake Cheesman.

The Court finds: That said Lake Cheesman reservoir is owned by the South Platte Canal and Reservoir Company, which is a corporation duly organized and existing under and by virtue of the laws of the state of Colorado; that valid appropriations of water for storage purposes and other beneficial uses have been made by said The South Platte Canal and Reservoir Company, and its predecessors in title, for and by means of said Lake Cheesman, and that said The South Platte Canal and Reservoir Company is entitled, by reason of said appropriations, to have the water rights of said Lake Cheesman in the amounts, of the dates and to the extent hereinafter set forth, numbered as follows, towit: Priority No. 3, by construction, and Priority No. 7, by enlargement; that said reservoir and the water and storage rights thereunto appertaining are leased by said The South Platte Canal and Reservoir Company to The Denver Union Water Company; that said The Denver Union Water Company has at all times since its organization in 1894, and is now, affording to the city of Denver, and its inhabitants their sole protection against fire and drouth, and with its predecessors has been engaged since the year 1872 in supplying and furnishing to the city of Denver and its inhabitants, and to towns and people living along the lines of its conduits, water for all municipal uses,
including fire protection, street sprinkling, street washing,
1146 sewer flushing, park, lawn and garden watering, public
fountains, and other public and sanitary purposes, and manufacturing, domestic, mechanical and other beneficial uses and purposes, said city of Denver and its inhabitants being chiefly dependent upon said The Denver Union Water Company for their water supply; that said The South Platte Canal and Reservoir Company is an auxiliary or subsidiary company of said The Denver Union Water Company; that said reservoir constitutes the chief storage or impounding source of water supply of said The Denver Union Water Company for the beneficial uses and purposes aforesaid; that said reservoir is located on the south fork of the South Platte river, in Jefferson and Douglas counties, Colorado, in Water District No. 23, upon land owned in fee by The South Platte Canal and Reservoir Company; that said land upon which said reservoir is located, together with the land immediately adjacent thereto, acquired and owned by claimant for the purpose of protecting and maintaining the purity of the water stored and impounded in said Lake Cheesman, consists in area of 8436.1 acres and is described as follows, towit: All of sections 1, 2, 11, 12, 13, 14, 23, and 24, in township 10 south, range 71 west, all of sections 6, 7, 18 and 19, in township 10 south, range 70 west, all of section 36 in township 9 south, range 71 west, and the southeast quarter of section 35 in township 9 south, range 71 west of the Sixth Principal Meridian; and that said reservoir covers an arear of 874.08 acres in sections 35 and 36, township

9 south, range 71 west, sections 6 and 7, township 10 south, range 70 west, and sections 1, 2, 12, 13, 14, 23 and 24, township 10 south, range 71 west; that said Lake Cheesman is supplied with water from the flow in Lost Park or Goose Creek, and Turkey Creek and their tributaries, and the South Fork of the South Platte river, and all of its tributaries above said reservoir; that the dam of said reservoir is located in the northwest quarter of the southwest quarter of section 6, township 10 south, range 70 west, in the channel of the south fork of the South Platte river, near its junction with Lost Park or Goose Creek; that the center of the top of the north end of said dam is from the northwest corner of said section 6 south 14 degrees 11 minutes 4 seconds east 2818.4 feet; that the length
1147 of said dam from said north end along the center line of the the top thereof is 700 feet to the southerly end thereof, the center line of the top of said dam being on the arc of a circle whose radius is 390.89 feet, that the center of said arc is south 56 degrees 50 minutes 17 seconds east 390.89 feet, from the center of the top of the north end of said dam as given; that the length of said dam on top is 700 feet, that the height thereof is 217 feet above datum, that the level of the spillway is 212 feet above datum, and thence 5 feet to the crest of the dam; that the spillway is located on a spur of the mountain about 200 feet north of the north end of said dam; that the length of the spillway is 300 feet at the elevation of 212 feet, and 400 feet at the elevation of 217 feet; that the datum plane for elevation was the low water mark of the south fork of the South Platte river at the dam site before construction, and is 6644 feet above sea level and 250.849 feet below the top of a bolt in the township corner at the northwest corner of section 6, township 10 south, range 70 west; that the area of the catchment basin or watershed of said Lake Cheesman is 1796 square miles; that the capacity of said reservoir at the high water level, towit, 212 feet, is three billion, four hundred and forty-four million, thirty-eight thousand, four hundred twelve cubic feet (3,444,038,412 cu. ft.) of water; that the inlet to the lowest outlet tunnel leading from said reservoir is 15 feet above the datum line of contour of reservoir and is near the north end of said dam, being south 7 degrees 26 minutes 30 seconds east 2937.6 feet from the northwest corner of section 6, township 10 south, range 70 west; said tunnel running thence south 70 degrees 17 minutes east 455 feet through a spur of the mountain, and is 6 feet wide and 7 feet high for 290 feet and is 7 feet wide and 9 feet high for the remaining 165 feet, with two valves therein side by side, each being 42 inches in diameter; that the middle outlet tunnel of said reservoir is 5½ feet wide by 6½ feet high, with a 42-inch valve therein, and the upper outlet tunnel of said reservoir is 5 feet wide by 6 feet high, with a 42-inch valve therein, and said
middle and upper tunnels are respectively 60.5 and 104.7
1148 feet above said datum perpendicularly over said lowest tunnel, and by an incline tunnel empty into the last 165 feet of said lowest tunnel; that water can be drawn off to within 15 feet of the datum or base of said Lake Cheesman; from the lower end of said tunnel, the water stored and impounded in said Lake Cheesman

now empties into the bed of the south fork of the South Platte river and thence is taken along and in the same and in the bed of the South Platte river to the headgates and intakes of the pipe lines, flumes, ditches, settling basins, auxiliary reservoirs, filter beds and water works belonging to claimant and The Denver Union Water Company at or near the mouth of Platte Canon, in section 5, township 7 south, range 69 west, and in sections 33, 34 and 35, in township 6 south, range 69 west, in Douglas and Jefferson counties, Colorado, and to such other ditches, flumes and conduit lines as claimant or said The Denver Union Water Company may desire to furnish water.

The Court further finds: That the Citizens Water Company, one of the predecessors of said The Denver Union Water Company and a corporation duly organized under the laws of the state of Colorado for the purpose of engaging in the business of supplying the city of Denver and the inhabitants thereof with water for the municipal, domestic, manufacturing, mechanical and other beneficial uses and purposes aforesaid, on the 27th day of June, A. D. 1889, commenced the construction of a certain storage or impounding reservoir known as the Strong reservoir for the purpose of augmenting its supply of water for the uses and purposes aforesaid; that on the 28th day of December, 1889, said The Citizens Water Company duly made and filed in the office of the state engineer of Colorado its statement of claim of an appropriation for storage purposes of the unappropriated waters of the South Platte river and its tributaries above the headgates of the diverting conduits of said Strong reservoir for the full capacity of said Strong reservoir at high water mark, towit, one billion, three hundred thirty-six million, eight hundred ninety-eight thousand, four hundred cubic feet (1,336,-
1149 898,400); that said Strong reservoir was located near the mouth of said Platte canon in Jefferson county, Colorado, upon land owned in fee by said The Citizens Water Company, in sections 16, 17 and 21, in township 6 south, range 69 west of the 6th Principal Meridian, and the surface area of said reservoir at high water mark was 396.61 acres.

That said reservoir was planned to be formed by the construction of an inner and an outer earthen dam; that the length of the inner dam was 600 feet; width of inner dam at bottom was 986 feet; height of inner dam to crest thereof, 245 feet; that the height of the outer dam was 320 feet; that the length of the feeder conduits was 18 miles; that said conduits as planned consisted of wooden pipe lines 48 inches in diameter; that water could be stored in said reservoir to a depth of 245 feet; that the capacity of said Strong reservoir at high water level was one billion, three hundred thirty-six million, eight hundred ninety-eight thousand, four hundred cubic feet (1,-336,898,400) of water;

That the source of the water supply of said Strong reservoir was the said South Platte river, a natural stream, by means of diverting conduits and pipe lines; that a duly certified copy of said statement of claim for and map of said Strong reservoir and feeder pipe lines so filed as aforesaid in the office of the Colorado State Engineer

on the 28th day of December, 1889, has been offered and received in evidence herein;

That the construction of said reservoir was a large and hazardous undertaking, involving many engineering difficulties and risks on account of its being solely an earthen dam, and necessitating large expenditures of money, and extensive preliminary work;

The Court finds, from all the evidence concerning the conditions surrounding the construction of said Strong reservoir; That the construction of said Strong reservoir was actively carried on by said The Citizens Water Company and prosecuted with due diligence from said 27th day of June, 1889, until the 24th day of September, 1893, said The Citizens Water Company expending in said work
1150 of construction about the sum of $70,000; that after the work of the construction of said Strong reservoir had progressed as aforesaid and the sums of money aforesaid had been expended therein, James D. Schuyler, the consulting engineer of said The Citizens Water Company, recommended and advised on account of the height of the proposed earthen dams of said reservoir, the liability and danger of said earthen dams breaking when the reservoir was filled and the uneasiness and anxiety which would be felt in that regard, that said The Citizens Water Company find and obtain a better and safer reservoir site in the mountains and transfer its water rights and claims thereto; that accordingly, and pursuant to said recommendations and advice, on said 24th day of September, 1893, a surveying party under the charge of the chief engineer of said The Citizens Water Company discovered the reservoir site of said Lake Cheesman; that thereupon all construction work upon said Strong reservoir was suspended and shortly thereafter the claimant company, The South Platte Canal and Reservoir Company, was organized by the parties owning and controlling said The Citizens Water Company and all rights to the use of water and appropriations for storage and other beneficial uses and purposes from said South Platte river for and on account of said Strong reservoir and for and on account of said Lake Cheesman reservoir were transferred, assigned and set over by said The Citizens Water Company to said The South Platte Canal and Reservoir Company, claimant herein, which Company thereafter continued the work of the construction of said Lake Cheesman; that on the 19th day of January, 1894, said The South Platte Canal and Reservoir Company duly made and filed in the office of the state engineer of Colorado, its map and statement of claim of its appropriations for storage purposes for and by means of said Lake Cheesman of all the unappropriated waters of the south fork of the South Platte river, of Lost Park or Goose creek, and Turkey creek and their tributaries, above the point where the dam of said reservoir was then proposed to be and is now constructed, said waters to be used, as set forth in said statement of claim, "for irrigating, domestic, sanitary,
1151 mining, manufacturing and mechanical purposes, and to supply and sell to irrigating companies and water works companies for the purposes aforesaid," and further claiming "the right to use said reservoir for any other purposes for which it may be

utilized, not inconsistent with the main purposes"; that in and by its said map and statement of claim said The South Platte Canal and Reservoir Company also claimed for said Lake Cheesman the appropriation and date of priority of said The Citizens Water Company made for said Strong reservoir; that a duly certified copy of said map and statement of claim thus filed in said State Engineer's office has been offered and received in evidence herein:

The Court further finds; that the work of construction of said Lake Cheesman was commenced by said The Citizens Water Company by original survey on, towit, the 24th day of September, A. D. 1893, being the date found by the court to be the date when construction work was actually commenced on said Lake Cheesman; that the construction of the dam of said Lake Cheesman and the clearing of the reservoir site of trees, brush and debris was a very large and expensive undertaking, involving many engineering difficulties, owing to the remote location of said reservoir site in the mountains, far removed from any railroads, and the rugged and mountainous character of the surrounding country; that said The Citizens Water Company and its successor, the said The South Platte Canal and Reservoir Company, the claimant herein, carried on the work of construction of said Lake Cheesman reservoir and the building of the dam and prosecuted the same with due diligence until its completion; that a rock fill dam was first constructed and was well under way when it was washed out by unprecedented high water on the 3rd of May, 1900; that immediately thereafter the present masonry dam was begun and was completed in the fall of the year 1904; that the storing and impounding of water in said Lake Cheesman began in the year 1900 and continued as the work of constructing said masonry dam progressed; that the waters stored in said Lake Cheesman have been put to a beneficial use by the claimant and said The Denver Union Water Company in supplying the city of Denver and its inhabitants with water for all the
1152 municipal, domestic, manufacturing, mechanical and other beneficial uses and purposes aforesaid, and in affording fire protection and protection against drouth to said city and its inhabitants, since the year 1900 as aforesaid, and from that time continuously; that on the 7th day of July, 1904, said The South Platte Canal and Reservoir Company, pursuant to the provisions of an Act of the General Assembly of the state of Colorado, entitled "An act concerning water rights," approved April 11, 1903, duly made and filed in the office of the state engineer of Colorado its map and statement of claim of its appropriations for storage purposes for and by means of said Lake Cheesman, and in said map and statement made its claim of its appropriations as follows, towit: "The South Platte Canal and Reservoir Company appropriates and claims the right to store in said reservoir all of the unappropriated and flood waters, and waters flowing in the non-irrigating season, in Lost Park or Goose Creek and in Turkey creek and their tributaries, and in the south fork of the South Platte river and in all its tributaries above said reservoir, as of the date of October 23, 1893, and also as of the date of the filing of The Citizens Water Company, towit: De-

cember 28th, 1889, on a reservoir intended to store the same waters for the same use, to whose rights claimant has succeeded, and also claims the right to use such stored water for domestic purposes in the city of Denver and along the lines of its mains and the mains of The Denver Union Water Company, and for irrigating, sanitary, mining, manufacturing, mechanical, fire, power and storage purposes, and for all other beneficial purposes, and the right to supply and sell such waters for the purposes aforesaid;" that a duly certified copy of said map and statement of claim thus filed in said state engineer's office has been offered and received in evidence herein; that said Lake Cheesman was filled to its full capacity, towit: 3,444,038,412 cubic feet, for the first time on the 9th day of May, A. D. 1905;

The court further finds from the evidence; that on the 17th day of March, 1912, there was stored and impounded in said Lake
1153 Cheesman, 2,205,780,749 cubic feet of water, and that on said date The Denver Union Water Company had impounded or in storage in said Lake Cheesman and the only other storage reservoir owned by said company a supply of water only equal to the demands and necessities of the city of Denver and its inhabitants for one year.

The Court further finds: That all of the storage rights and capacity of Lake Cheesman is needed by the claimant and The Denver Union Water Company for the municipal, domestic, manufacturing, mechanical and other beneficial uses and purposes aforesaid, and that all the waters therein stored and impounded have been applied to said beneficial uses and purposes;

The Court further finds: That the said city of Denver and the inhabitants thereof, and outlying towns and people living along the lines of the conduits of The Denver Union Water Company, are dependent upon said The Denver Union Water Company and said The South Platte Canal and Reservoir Company for water for protection against fire and drouth, and for the municipal, domestic, manufacturing, mechanical and other beneficial uses and purposes aforesaid, and that the present provisions for storing and holding in reserve of water at Lake Cheesman to meet these demands and necessities are required, and that anything less than the present supply and storage capacity and water held in reserve would be inadequate for the uses and purposes aforesaid in the climatic conditions prevailing in the state of Colorado.

The Court further finds that said Strong reservoir was intended by said The Citizens Water Company, to whose rights claimant herein has succeeded, for the impounding and storage of the same waters and for the same uses which are impounded and stored for the uses aforesaid in Lake Cheesman.

It is therefore, ordered, adjudged and decreed: That claimant, its successors and assigns, and the lawful owners of said Lake Cheesman, have appropriated for storage purposes and have a priority of appropriation to take effect on the 27th day of June, A. D. 1889, and be allowed to take, divert, store and impound from the other-
1154 wise unappropriated waters flowing in said Lost Park or Goose creek and in Turkey creek and their tributaries, and

in the South Fork of the South Platte river, and in all its tributaries, above the dam of said Lake Cheesman, and flood waters and waters flowing in the non-irrigating season, and at all times by replenishing to maintain so far as such otherwise unappropriated waters aforesaid are sufficient and will permit, as of said date, the same being the date of the commencement of the work of the construction of said Strong reservoir, which date is hereby by relation made and is to be deemed, taken and considered as the date of the appropriation by original construction, to the extent of one billion, three hundred thirty-six million, eight hundred ninety-eight thousand, four hundred (1,336,898,400) cubic feet of water each year; and that said Lake Cheesman be given priority No. 3 by construction therefor.

It is Further Ordered, Adjudged and Decreed: That claimant, its successors and assigns, and the lawful owners of said Lake Cheesman have further appropriated for storage purposes and have a further priority of appropriation as by enlargement to take effect on the 24th day of September, A. D. 1893, and be entitled to further take, divert, impound and store, in addition to the said priority No. 3 by original construction as of the date and to the extent and amount as aforesaid, from the unappropriated waters flowing in said Lost Park or Goose creek and in Turkey creek and their tributaries, and in the South Fork of the South Platte river and in all its tributaries, above the dam of said Lake Cheesman, and flood waters and waters flowing in the non-irrigation season, and by replenishing to maintain, so far as said unappropriated water flowing in said natural streams are sufficient and will permit, as of said date, the same being the date of the commencement of the work of the construction of said Lake Cheesman reservoir, and which date, for the reasons and consideration herein set forth, shall be and hereby is directed and ordered to be, taken and deemed as the date of the first enlargement of said
1155 Lake Cheesman, to the extent of two billion, one hundred seven million, one hundred forty-thousand and twelve (2,107,140,012) cubic feet of water each year; and that said Lake Cheesman be given priority No. 7 by first enlargement therefor.

It is Further Ordered, Adjudged and Decreed: That said claimant, its successors and assigns, and the lawful owners of said Lake Cheesman, to take effect as of the dates and to the extent of the quantities as aforesaid, be authorized and permitted to take divert, impound, store, hold and use, and by replenishing whenever and as often as may be necessary to maintain such storage, to the full capacity of said Lake Cheesman once each year, towit, three billion, four hundred forty-four million, thirty-eight thousand, four hundred and twelve (3,444,038,412) cubic feet of water, from the natural streams and sources of supply aforesaid, and to draw from such storage at any time water in any amount for its or their beneficial uses and purposes.

And it is Further Ordered, Adjudged and Decreed that this decree shall not be taken, held or deemed as in any wise limiting or restricting the uses or purposes to which the waters now or hereafter diverted, stored and impounded in said Lake Cheesman may be beneficially

applied or as in anywise having the effect of a waiver of, or foreclosing or determining, the right of said claimant and its said lessee, and their successors and assigns, and the lawful owners of said Lake Cheesman, to make beneficial application of said waters to any or all of the purposes and uses specified and enumerated in said maps and statements of claim duly filed as aforesaid in the office of the Colorado State Engineer, or as in anywise barring or estopping them from asserting and maintaining such right in any other proceeding or proceedings.

STATE OF COLORADO,
County of Park, ss:

I, A. F. Willmarth, clerk of the district court of the County of Park, state aforesaid, do hereby certify the above and foregoing to be a true, complete and perfect transcript and copy of the decree of said court had and entered of record in a certain cause in
1156 said court lately pending entitled "In the matter of Priorities of Water Rights in Water District No. 23 in the State of Colorado, on Petition of the South Platte Canal and Reservoir Company for the Adjudication of Water Rights of Lake Cheesman, for beneficial purposes other than irrigation," as the same now remains on file and of record in this office, so far as said decree relates to Reservoir No. 3, Lake Cheesman.

In Testimony Whereof, I have hereunto set my hand and affixed the seal of said court, at my office in Fairplay, and in said County and State, this 31st day of May, A. D. 1913.

[Seal of Park County District Court.]

Court, District of Colorado. Plaintiff's Exhibit Z. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

1159 Case No. —.

COMPLAINANT'S EXHIBIT No. ZZ.

(Copy.)

This agreement, made the sixteenth day of December in the year Eighteen hundred and Seventy between the City of Denver in the Territory of Colorado, by the Mayor of said City of the first part, and the Denver City Water Company by their President of the second part, Witnesseth:

That for and in consideration of the agreements and covenants hereinafter mentioned to be made and performed by the party of the second part, the party of the first part doth hereby grant unto the said party of the second part the sole and exclusive right to lay pipes for the distribution of water within the city limits of said City of Denver and any additions that may hereafter be made thereto, and in consideration of said grant the said party of the second part hereby covenants and agrees to and with the party of the first part to lay within one year from the Eighth day of December, A. D. 1870, at least three miles of main distributing pipe within said city limits and supply the same with water, and to extend the same from time to time thereafter so as to meet the demand for the same as fast as possible, and the said party of the second part further covenants and agrees as aforesaid to erect hydrants on the line of said main pipe at all points that the said party of the first part may from time to time direct said party of the first part paying the party of the second part therefor the actual cost of erecting the same, said hydrants each to furnish a supply of water for the use of the Fire Department of said city not less in quantity than one stream forced through a nozzle one inch in diameter to a height of seventy-five feet above the grade of said city at the intersection of Larimer and F streets, such supply to be continuous unless cut off by accident or casualty and in such event the party of the second part shall make all reasonable
1160 effort to repair the same immediately, and the party of the second part further covenants and agrees as aforesaid that the party of the first part shall have free and uninterrupted use of the water from said hydrants or fire plugs for the purpose of washing gutters and watering streets. And the party of the first part hereby covenants and agrees to pay the party of the second part for the use of water from said hydrants as aforesaid the sum of one hundred and fifty dollars annually for each hydrant from the time the same are erected and ready for use as aforesaid, to be paid quarterly on the first days of January—April—July—and October in each and every year. The party of the second part hereby covenants and agrees as aforesaid to furnish water to the occupants of houses and other persons along the line of the water pipes for domestic use and other purposes at rates not to exceed those charged by the city of St. Louis, in the State of Missouri to its inhabitants. And it is further agreed by and between the parties to these presents that at the expiration

of the term of twenty years from the said Eighth day of December in the year Eighteen hundrd and seventy the said party of the first part may at their option purchase the said water works with its appurtenances from the party of the second part, yielding and paying therefor to the party of the second part such sum or sums of money to be determined by an appraised valuation of the same. Said valuation to be made by five disinterested persons as appraisers, two of whom shall be appointed by each of the parties to these presents and the four so appointed shall appoint a fifth. Any three of whom when so appointed, agreeing may fix said valuation.

In witness whereof the said party of the first part have hereunto caused the common seal of the City of Denver to be affixed the day and year first above written.

(Endorsed:) D. U. W. Co. File No. 238, Doc. No. 1C. 6274. U. S. District Court, District of Colorado. Plaintiff's Exhibit Z-Z. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

1162 Case No. —.

COMPLAINANT'S EXHIBIT No. A-1.

Contract With the City of Denver.

This Agreement, made this ninth day of May, A. D. one thousand eight hundred and seventy-four, between the city of Denver, a municipal corporation, organized under and by virtue of an act of the legislature of the terrirtory of Colorado, by the Mayor of said city, of the first part, and the Denver City Water Company, by their President, of the second part.

Witnesseth: That for and in consideration of the covenants and agreements hereinafter mentioned, to be done and performed by the party of the second part, the party of the first part doth hereby

grant unto the party of the second part, the sole and exclusive right to lay pipes for the distribution of water within the city limits of the said city of Denver, and any additions that may hereafter be made thereto, for the period of seventeen years from the date of this agreement; and in consideration of said grant, and other considerations hereinafter mentioned, the said party of the second part hereby covenants and agrees to and with the said party of the first part, to lay, each and every year during the continuance of this agreement, in and along the streets of the said city of Denver, one and one-half miles of main distributing pipes, in addition to the pipes now in use in the said city, the said pipes not to be less than five inches in diameter, and to supply the same with water; and that in measuring the said one and one-half miles of pipe to be laid each year, as aforesaid, no pipe shall be measured or estimated on more than two sides of any one square or block, nor shall any pipes be measured, in estimating the said one and one-half miles of pipe, within the limits of any water pipe now laid in said city; and that the said one and one-half miles of pipe to be laid annually, as aforesaid, shall be laid along those streets where it will afford
1163 protection from fire to the greatest number of inhabitants, and shall be laid outside the limits above mentioned.

And the said party of the second part further covenants and agrees with the said party of the first part, to erect hydrants on the line of any of the pipes now laid or hereafter to be laid by the said party of the second part in the said city, at all points where the said party of the first part may from time to time direct, said party of the first part paying to said party of the second part therefor the actual cost of erecting the same; said hydrants each to furnish a supply of water for the use of the fire department of said city, not less in quantity than one stream forced through a nozzle one inch in diameter to a height of sixty feet above the grade of any street whereon the hydrant with which such nozzle is connected is erected, and at the point of such street whereon such hydrant is erected, such supply to be continuous, unless cut off by accident or casualty; and in such event the party of the second part shall make all reasonable effort to repair the same immediately.

And the party of the second part further covenants and agrees that the party of the first part shall have the free and uninterrupted use of the water from said hydrants or fire plugs, for the extinguishment of fires and for the use of the fire department, and the purpose of washing gutters and watering streets.

And party of the first part hereby covenants and agrees to pay the said party of the second part, for the use of water from said hydrants, as aforesaid, the sum of twenty thousand dollars ($20,000) per year, for the period of seventeen years from the date hereof, to be paid semi-annually, on the first days of June and Dec. of each and every year of the said seventeen years.

The party of the second part further covenants and agrees as aforesaid, to furnish water to the occupants of houses, and to other persons along the line of the water pipes, for domestic use and other

929

purposes, at rates not to exceed those charged by the city of St. Louis, in the state of Missouri, to its inhabitants.

1164 And It Is Further Agreed, by and between the parties to these presents, that at the expiration of five years from the date hereof, or at the expiration of ten years from the date hereof, or at the expiration of the said term of seventeen years from the date hereof, the said party of the first part may, at their option, purchase the said water works, with its appurtenances, from the party of the second part, yielding and paying therefor to the party of the second part such sum or sums of money to be determined by an appraised valuation of the same, said valuation of the same to be made by five disinterested appraisers, two of whom shall be appointed by each of the parties to these presents, and the four so appointed shall appoint the fifth, any three of whom, when so appointed, may fix said valuation.

And It Is Further Agreed, by and between the parties to these presents, that during the continuance of this contract, the said party of the second part shall furnish as good a quality of water for domestic purposes as it has heretofore done and is now doing, and that the present and future purity of said water may be determined, it is hereby stipulated that there shall be an analysis of the water as now furnished, by competent persons, which analysis shall be signed by the parties to this agreement, and spread of record upon the records of the said city of Denver, and which analaysis shall be taken as the standard of all future tests.

And It Is Further Agreed, that all contracts heretofore entered into between the parties to these presents, are hereby absolutely annulled and held for naught, and that if the party of the second part shall fail to perform either or every of the acts incumbent on him by these presents, and at the time and in the manner herein specified, then this and all previous contracts between the parties to these presents shall be void.

This Agreement to be in force from and after the first day of May, one thousand eight hundred and seventy-four.

1165 In Witness Whereof, the said party of the first part have hereunto caused the common seal of the city of Denver to be affixed, the day and year first above written.

Case No. —.

COMPLAINANT'S EXHIBIT No. A-2.

Ordinance No. 119, 1889.

A Bill For An Ordinance Granting To The Citizens' Water Company The Right to Lay and Maintain Water Mains, and to Connect Service Pipe Therewith, in the Streets, Avenues and Alleys in the City of Denver and the Additions Thereto and That May Hereafter Be Made Thereto.

Be it Enacted by the City Council of the City of Denver:

Section 1. That there be and hereby is granted unto the Citizens' Water Company the right to lay and maintain water mains and to make necessary connections therewith of service pipes for the distribution of water in, through and along the public streets, avenues and alleys of the city of Denver, hereinafter in this ordinance specifically mentioned, and to repair, remove or replace such water mains as necessity may from time to time require.

Sec. 2. Nothing in this ordinance shall be construed as granting unto the said The Citizens' Water Company any exclusive right or privilege, or to prevent the granting of similar rights and privileges to others for like purposes.

Sec. 3. The franchise and privilege hereby granted are granted upon the express condition that the city of Denver shall have the right at any time to purchase the plant, rights and properties of the said The Citizens' Water Company upon the valuation of the value of such plant, lands, water rights and machinery at the time of such purchase by the city, less the deterioration in the same from use and wear; which valuation is to be determined by the appraisement of three disinterested parties, one to be selected by The Citizens' Water Company, one by the city of Denver, and the third to be selected by the two thus chosen; and upon the further condition that the said Citizens' Water Company shall not charge the inhabitants of premises along the line of its mains within the corporate limits of the city of Denver for water for the purposes required by them any greater rates therefor than the present rates charged to the inhabitants of the city of Denver for water for like service; and upon the further condition that the said The Citizens' Water Company shall at the end of three years from the passage of this ordinance have in operation at least forty miles of water mains within the city limits of the city of Denver, and thereafter shall lay and operate at least three miles of water mains additional thereto each year during the existence of this franchise; and upon the further condition that the said The Citizens' Water Company shall not sell out its plant, rights or privileges to, or consolidate with or pool rates with any other water company furnishing water in said city of Denver. Any violation of these conditions shall work a forfeiture of the privileges and the franchises granted herein; provided that the said city of Denver shall not on or before the ninth day of May, A. D. 1891, elect to purchase the plant, lands, water rights and machinery of the said Citizens' Water Company as above herein provided, and shall at that time enter into a contract with the said The Citizens' Water Company to furnish water for the uses and purposes of the city of Denver for extinguishing fires, sprinkling streets, flushing gutters and sewers, upon terms and conditions to be mutually agreed upon by and between the said Citizens' Water Company and the said city of Denver; and in case of inability to so agree upon the rates to be paid by the said city to the said Citizens' Water Company, for water for the uses aforesaid, such rates shall be fixed and determined by the President of the Board of Supervisors, the President of the Board of Alderman and two persons to be selected by the said Citizens' Water Company, and one other person to be selected and chosen by the senior judge of the district court within and for the county of Arapahoe.

Sec. 4. That before exercising any of the rights granted by this ordinance, the said The Citizens' Water Company shall file a bond in the penal sum of twenty thousand ($20,000) dollars, with two or more sureties to be approved by the Mayor, conditioned that it will properly fill all excavations and openings made by it,
1167 and that it will assume and pay all damages for personal and other injuries that may happen either to private persons or to corporations, as well as to the City of Denver, resulting from or occasioned by any negligence or want of care on the part of the said The Citizens' Water Company in the work of laying, maintaining,

repairing or removing its said water mains or making connections therewith; and that it will preserve and save harmless the City of Denver from all liability or expense to which it may be subject, or for which it may be held liable on account of any injury resulting from or caused by such, or any negligence on the part of the said The Citizens' Water Company as aforesaid; and will indemnify and save harmless the said City of Denver of and from all damages, costs, charges and expenses to which it may be subject or adjudged liable for or on account of any infringing upon the existing rights of any other corporation by The Citizens' Water Company.

Sec. 5. The City Council of the city of Denver shall prescribe, by ordinance, reasonable rules and regulations for the proper protection of water mains and fire hydrants, and to prevent the undue waste of water and the use thereof by persons not entitled to use the same.

Sec. 6. The rights and privileges hereby granted may be exercised and enjoyed for the period of twenty years from and after the passage of this ordinance and no longer.

Sec. 7. That the rights and privileges hereby granted shall extend and be confined to the following streets, avenues and alleys of the city of Denver, and to all extensions thereof, towit: First street from the city limits to Fifteenth avenue, Second street from Wazee to Fifteenth avenue, Third street from the city limits to Fifteenth avenue, Fourth street from Platte river to Fifteenth avenue, Fifth street from Wewatta to Fifteenth avenue, Sixth street from Wewatta to Fifteenth avenue, Seventh street from city limits to Fifteenth avenue, Eighth street from Pierce street to Fifteenth avenue, Ninth street from Pierce street to Fifteenth avenue, Tenth street from Pierce street to Fifteenth avenue, Eleventh street from Wewatta to Fifteenth avenue, Twelfth street from Wewatta to Cherry Creek, Thirteenth street from Wewatta to Cherry Creek, Fourteenth street from Holladay to Fifteenth avenue, Fifteenth street from Mary to Fifteenth avenue, Sixteenth street from junction of Fay street to Broadway, Seventeenth street from Fairview avenue to Broadway, Eighteenth street from Fairview avenue to Broadway, Nineteenth street from Fairview avenue to Broadway, Twentieth street from Delgany to Welton street, Twenty-first street from Stanton to Grant avenue, Twenty-second street from Wazee to Parkinson street, Twenty-third street from Wazee to Fifteenth avenue, Twenty-fourth street from Wazee to Pierpont, Twenty-fifth street from Market to Larimer and Curtis to Pierpont (if at any future time the street is opened from Larimer to Curtis, that portion of the street also), Twenty-sixth street from Wazee to Larimer and Curtis to Pierpont, and from Larimer to Curtis if at any time street there is opened, Twenty-seventh street from Wazee to Welton, Twenty-eighth street from Wazee to Glenarm, Twenty-ninth street from Wazee to Downing avenue, Thirtieth street from Wazee to Downing avenue, Thirty-first street from Quincy to Downing avenue, Thirty-second street from Wazee to Downing avenue, Thirty-third street from Wazee to Downing avenue, Thirty-fourth street from Wazee to Downing avenue, Thirty-fifth street from Platte river to Downing avenue, Thirty-sixth street from Platte river to Downing avenue, Thirty-eighth

street from Platte river to Larimer, Thirty-ninth street from Platte river to Wazee, Fortieth street from Wewatta to Larimer, Forty-first street from city limits to Wewatta, Forty-fourth street from city limits to Wewatta, Cleveland place from Fifteenth avenue to Broadway, Court Place from Fifteenth avenue to Broadway, Tremont street from Fifteenth avenue to Broadway, Glenarm street from Fifteenth avenue to Downing avenue, Welton street from Fifteenth avenue to Downing avenue, California street from Fifteenar avenue to Downing avenue, Stout street from Fifteenth avenue to Downing avenue, Curtis street from Fifteenth avenue to Downing avenue, Champa street from Fifteenth avenue to Downing avenue, Arapahoe street from Cherry Creek to Downing avenue, Lawrence street from Fifteenth avenue to Downing avenue, Larimer street from Grand avenue to Downing avenue, Holladay street from Platte river to Twenty-third street, Market street from Twenty-third street
1168 to Marshall street, Blake street from Thirteenth street to Fortieth street, Wazee street from Platte river to Twentieth street, Wyncoop street from Platte river to city limits, Wewatta street from Cherry Creek to city limits, Delgany street from Cherry Creek to city limits, Bassett street from Fifteenth street to Sixteenth street, Water street from city limits to Platte river, Platte street from city limits to Nineteenth street, Pierce street from city limits to Platte street, Frances street from city limits to 14th street, Johns street to Mary street, Ashland avenue from city limits to Mary street, Fay street from city limits to Mary street, Bigler street from city limits to Erie street, Fairview avenue from city limits to Palmer street, Gray street from Pierce street to Prospect avenue, Bert street from Pierce street to Prospect avenue, Mary street from Pierce street to Fairview avenue, Goss street from Fairview avenue to Prospect avenue, Arlington street from Fairview avenue to Humphrey street, Witter street from Fairview avenue to Humphrey street, Clear Creek avenue from Fairview avenue to city limts, Bayard street from city limits to city limits, Alameda avenue from Platte river to city limits, Buyers street from Platte river to Broadway, Cedar street from Platte River to city limits, Maple street from Evans street to city limits, Ellsworth street from Platte river to city limits, West First avenue from Platte river to Broadway, First avenue from Broadway to city limits, West Second avenue from Platte river to Broadway, Second avenue from Broadway to city limits, West Third avenue from Platte River to Broadway, Third avenue from Broadway to city limits, West Fourth avenue from Platte river to Broadway, Fourth avenue from Broadway to city limits, West Fifth avenue from Platte river to Broadway, Fifth avenue from Broadway to city limits, West Sixth avenue from Platte river to Broadway, Sixth avenue from Broadway to city limits, West Seventh avenue from Platte river to Broadway, Seventh avenue from Broadway to city limits, West Eighth avenue from Platte river to Broadway, Eighth avenue from Broadway to city limits, West Ninth avenue from Platte river to Broadway, Ninth avenue from Broadway to city limits, West Tenth avenue from Platte River to Broadway, Tenth avenue from Broadway to city limits, West Eleventh avenue

from Platte river to Broadway, Eleventh avenue from Broadway to city limits, West Twelfth avenue from Platte river to Broadway, Twelfth avenue from Broadway to city limits, West Thirteenth avenue from Platte river to Broadway, Thirteenth avenue from Broadway to city limits, West Fourteenth avenue from Platte river to Broadway, Fourteenth avenue from Broadway to city limits, West Fifteenth avenue from city limits to Broadway, Fifteenth avenue from Broadway to city limits, Sixteenth avenue from Broadway to city limits, Seventh avenue from Broadway to city limits, Eighteenth avenue from Broadway to city limits, Nineteenth avenue from Broadway to Downing avenue, Twentieth avenue from Broadway to Downing avenue, Twenty-first avenue from Downing avenue to city limits, Twenty-second avenue from Pierpont to city limits, Twenty-third avenue from Pierpont to city limits, Twenty-fourth avenue form Pierpont to city limits, Twenty-fifth avenue from Pierpont to city limits, Twenth-sixth avenue from Pierpont to city limits, Twenty-seventh avenue from Downing avenue to city limits, Twenty-eighth avenue from Downing avenue to city limits, Twenty-ninth avenue from Downing avenue to city limits, Thirtieth avenue from Downing avenue to city limits, Thirty-first avenue from Downing avenue to city limits, Thirty-second avenue from Downing avenue to city limits, Thirty-third avenue from Downing avenue to city limits, Thirty-fourth avenue from Dwning avenue to city limits, Thirty-fifth avenue from Downing avenue to city limits, Thirty-sixth avenue from Downing avenue to city limits, Thirty-seventh avenue from Downing avenue to city limits, Thirty-eighth avenue from Franklin street to city limits, Thirty-ninth avenue from Franklin street to city limits, Fortieth avenue from Franklin street to the junction of York and Pacific, South Seventh street from Fifteenth avenue to Burnham, South Eighth street from Fifteenth avenue to city limits, South Ninth street from Fifteenth avenue to city limits, South Tenth street from Fifteenth avenue to city limits, South Eleventh street from Fifteenth avenue to city imits, Santa Fe street from Fifteenth avenue to city limits, Clark street from Fifteenth avenue to city limits, South Water street from Fifteenth avenue to city limits, South Twelfth street from Fifteenth avenue to
1169 city limits, South Tremont street from Fifteenth avenue to city limits, South Thirteenth street from Fifteenth avenue to city limits, Evans street from Fifteenth avenue to city limits, South Fourteenth street from Fifteenth avenue to Ellsworth street, South Fifteenth street from Fifteenth avenue to Ellsworth street, Broadway from Welton street to city limits, Lincoln avenue from Twentieth avenue to city limits, Sherman avenue from Twentieth avenue to city limits, Grant avenue from Pierpont street to city limits, Logan avenue from Twentieth avenue to city limits, Wasoola street from Twentieth avenue to Pierpont street, Parkinson street from Twentieth avenue to Pierpont, Pennsylvania avenue from Twentieth avenue to city limits, Pearl street from Twentieth avenue to city limits, Washington street from Twentieth avenue to city limits, Clarkson street from Twentieth avenue to city limits, Venice street from Fiftenth avenue to city limits, Atla street from Fifteenth

avenue to city limits, Corona street from Fifteenth avenue to city limits, Hallett street from Fourteenth avenue to city limits, Corsline street from Fourteenth avenue to city limits, Inslee street from Fifteenth avenue to city limits, Hunt street from Fifteenth avenue to city limits, Frankline street from Fortieth avenue to city limits, Gilpin street from Fortieth avenue to city limits, Williams street from Fortieth avenue to city limits, High street from Fortieth avenue to city limits, Race street from Fortieth avenue to city limits, Vine street from Fortieth avenue to city limits, Green street from Fortieth avenue to city limits, York street from Fortieth avenue to city limits, Josephine avenue from Twenty-sixth avenue to Fortieth avenue, Columbine avenue from Twenty-sixth avenue to Fortieth avenue, Murdock avenue from Twenty-sixth avenue to Fortieth avenue, Clayton from Twenty-sixth avenue to Fortieth avenue, Filmore avenue from Twenty-sixth avenue to Fortieth avenue, Finlay avenue from Twenty-sixth avenue to Fortieth avenue, Clenman avenue from Twenty-sixth avenue to Fortieth avenue, Walnut street from city limits to Thirty-seventh street, Estes street from Marshall to city limits, Legge street from Marshall street to city limits, Parsons street from Marshall street to city limits, Stallcup street from Marshall street to city limits, Apple street from Marshall street to city limits, Banana street from Pacific street to city limits, Cherry street from Pacific street to city limits, Damson street from Pacific street to city limits, Elder street from Pacific street to city limits, Fruit street from Pacific street to city limits, Grape street from Pacific Street to city limits, Hazel street from Pacific street to city limits, Lemon street from city limits to city limits, Melon street from city limits to city limits, Orange street from city limits to city limits, Plum street from city limits to city limits, Miner street from Estes street to city limits, Barnum street from Estes street to city limits, Marshall street from Apple street to city limits, Louis street from Damson street to city limits, Randolph street from Damson street to city limits, Pacific street from Apple street to city limits, East Larimer from Josephine to Allen avenue, East McClennan street from Josephine to Allen avenue, Allen avenue from Twenty-seventh street to Pacific street, Downing avenue from Fifteenth avenue to Market street, Pierpont street from Twentieth avenue to Welton street, Hotchkiss street from Fifteenth avenue to Twenty-sixth avenue, Ogden street from Fifteenth avenue to Twtnty-sixth avenue, Marion street from Fifteenth avenue to Twenty-seventh avenue, Lafayette street from Fifteenth avenue to Twenty-seventh avenue, Humboldt street from Fifteenth avenue to Twenty-seventh avenue, Backus street from Edmunds street to city limits, Murdock street from Edmunds street to city limits, Scott street from Edmunds street to city limits, Kent street from Edmunds street to city limits, Wanless street from Edmunds street to city limits, Bell avenue from Nineteenth street to Gaston street, Palmer street from Nineteenth street to Gaston street, Clifton street from Nineteenth street to Gaston street, Justina street from Fairview avenue to Gaston street, Merrill street from Fairview avenue to Gaston street, Converse street from Fairview avenue to Gaston street, Edmunds street from Fairview

avenue to Gaston street, Everett street from Prospect avenue to Gaston street, Argo street from city limits to Gaston street, Lowell street from Prospect avenue to Gaston street, Quincy street from Prospect avenue to Gaston street, Prospect avenue from Argo street to city limits, Beecher avenue from Argo street to city limits, Greeley avenue
1170 from Argo street to city limits, Dakota avenue from Lowell street to city limits, Colorado avenue from Lowell street to city limits, Wyoming avenue from Lowell street to city limits, Erie street from Fairview avenue to Bigler, Boulder street from Fairview avenue to Mary, Central street from Fifteenth street to Nineteenth street, Cheyenne street from Fifteenth street to Broadway, Cheyenne street from Twentieth avenue to Pierpont, Hartford street from Nineteenth street to Stanton avenue, New Haven street from Eighteenth street to Division street, Division street from Stanton avenue to New Haven street, Stanton avenue from Twenty-first and McNassar to Platte River, McNassar avenue from Stanton avenue to Platte river, Corbett street from Stanton avenue to Platte river, Montgomery street from Stanton avenue to Platte river, Winne street from Stanton avenue to Platte river, Gerspach avenue from Stanton avenue to Sigler's Ditch, Williams street from Cherry creek to Sixteenth street, Center street from Platte river to Fifteenth street, Vintage street from West Thirteenth to water works, Maple street from West Thirteenth to water works, Titus street from West Thirteenth to water works, Walnut street from West Thirteenth to water works.

view avenue, Clear Creek and Bell avenues, Bell avenue and Palmer street, Palmer and Clinton streets, Clinton and Justina streets, Justina and Merrill streets, Merrill and Converse streets, Converse and Edmunds streets, Everett and Argo streets, West Fourth avenue and Center street, Vintage and Maple streets, Maple and Titus streets, South Seventh and South Eighth streets, South Eighth and South Ninth streets, South Ninth and South Tenth streets, South Tenth and South Eleventh streets, South Eleventh street and Santa Fe avenue, Santa Fe avenue and Clark street, Clark and South Water streets, South Water and South Twelfth streets, South Twelfth and South Tremont streets, South Tremont and South Thirteenth streets, South Thirteenth and South Evans streets, Evans and South Fourteenth streets, South Fourteenth and South Fifteenth streets, South Fifteenth street and Broadway, Broadway and Lincoln avenue, Lincoln avenue and Sherman avenue, Sherman avenue and Grant avenue, Grant avenue and Logan avenue, Logan avenue and Pennsylvnia avenue, Pennsylvania avenue and Pearl street, Pearl street and Washington avenue, Washington avenue and Clarkson street, Clarkson and Venice streets, Venice and Alta streets, Alta and Corona streets, Corona and Hallett streets, Corsline and Inslee streets, Hallett and Corsline streets, Inslee and Hunt streets, Hunt and Franklin streets, Franklin and Gilpin streets, Gilpin and Williams streets, Williams and High streets, High and Race streets, Race and Vine streets, Vine and Gaylord streets, Gaylord and York streets, Clarkson street and Emerson avenue, Emerson avenue and Ogden street, Ogden street and Downing avenue, Downing avenue and Marion street, Marion street and Lafayette street, Lafayette street and Humboldt street, York street and Josephine avenue, Josephine avenue and Columbine street, Columbine avenue and Murdock avenue, Murdock avenue and Clayton avenue, Clayton avenue and Filmore avenue, Filmore avenue and Finley avenue, Finley avenue and Clellan avenue, Clellan avenue and Walnut street, Estes and Legge streets, Legge and Parsons streets, Parsons and Stallcup streets, Stallcup and Apple streets, Apple and Banana streets, Cherry and Damson streets, Damson and Elder streets, Elder and Fruit streets, Fruit and Grape streets, Grape and Hazel streets, Hazel and Lemon streets, Lemon and Melon streets, Melon and Orange streets, Orange and Plum streets, and in, upon, along and through all extensions of said streets, avenues, alleys and public places, is hereby granted to The Denver Water Company, its successors and assigns to such extent as the city may lawfully grant the same, subject to be terminated in the manner hereinafter in this ordinance provided.

Sec. 2. The City of Denver shall hereafter, whenever it shall be requested so to do, make a grant to such extent as it lawfully may to said The Denver Water Company, its successors and assigns, of the same rights mentioned in section one hereof, in and upon any streets hereafter laid out or extended, and will also, whenever requested, make such additional and confirmatory grants to said The Denver Water Company, its successors and assigns of the rights and privileges mentioned in section one hereof, as it may at the

time have the lawful right and power to make; all of such further additional and confirmatory grants, if made, to be subject to termination in the manner in this ordinance hereinafter specified.

Sec. 3. The Denver Water Company, its successors and assigns, shall at all times save and hold the city harmless of and from all loss, cost or damage to person or property occasioned by any
1175 negligence in the excavation of any street, lane, alley or public place within the city, made by it in the laying of any of its mains, pipes, valves or other apparatus. And whenever the said The Denver Water Company, its successors or assigns, shall open, or cause to be opened, any street, lane, alley or other public place for laying any main, pipe, valve or hydrant or other apparatus, it shall forthwith restore the same to as good condition as the same was in before any such opening, at its own expense, and in case of any failure so to do for space of twenty-four hours after the laying of such main, pipe, hydrant, valve or other apparatus shall be completed, notice shall be given to the said company so to do by the officer, for the time being, having charge of the streets in said city; and in case of default for twenty-four hours after such notice, the said street may be put in such order by the said city, but at the expense of said company.

Sec. 4. The said The Denver Water Company shall at all times furnish water from its mains, through connections to be made by parties desiring the same, to premises abutting upon streets in which it may have a pipe laid, upon application of the owners of the same, under such rules as now prevail, and such further reasonable rules as it may prescribe, and to enable such owners to obtain such supply of water, shall permit connection to be made with its mains and pipes under its direction and in such manner and subject to such conditions as it now permits the same.

Sec. 5. The rate to private consumers for water shall not be greater than now charged by the said The Denver Water Company, a schedule of which rates is hereto annexed, marked schedule A, and the said The Denver Water Company may require any consumer to furnish a meter and pay for water by meter measurement, provided, however, that at any time after five years from date the City Council may require said company to fix schedule rates for private consumers equivalent to the average rate prevailing in the cities of Chicago, St. Louis and Cincinnati for the same service.

Sec. 6. The said The Denver Water Company shall at all times furnish water to the city and to private consumers, of a quality as good and fit for private consumption as that shown by the analysis made by order of the city of Denver by Professor Joseph A. Sewall, in the month of August, 1889.

Sec. 7. The Denver Water Company hereby purchases of the city of Denver four hundred and ninety-three hydrants, now set upon its main and owned by the city of Denver, for the sum of twenty-five thousand dollars ($25,000), payable to the City Treasurer within four months after the taking effect of this ordinance. And within one year after the taking effect of this ordinance, the said The Denver Water Company shall replace all said hydrants with hydrants having

two nozzles for hose and one for steamer connection, and with not less than a six-inch barrel. And within six months after this date the City Council shall designate the location of so many additional hydrants to be set upon the present lines of main of The Denver Water Company as will bring the total number of hydrants upon the present line of main of the said company up to the number of one thousand. And within the said one year after the taking effect of this ordinance, the said The Denver Water Company shall cause to be set in the said location, hydrants of the description last aforesaid, so that the number of hydrants upon its present lines of mains shall then be one thousand in number.

Sec. 8. The said company shall at all times, until the first day of May, 1891, keep and supply the said hydrants with an abundant supply of water for fire purposes under such pressure as it now gives; and after said first of May, 1891, shall supply all of said hydrants, and any hydrants which may be ordered to be set upon additional mains, as hereinafter in this ordinance mentioned, with a pressure equivalent, taking the elevation of the surface of the ground into account, to 115 pounds at the hydrant in front of the Union depot in said city; provided, the city shall not be in default with the company upon any of its agreements; and provided further, that if, owing to the extension and growth of the city, hydrants shall be ordered upon locations where, owing to the difference in elevation, there shall be less than forty-five pounds pressure, with a pressure of 115 pounds at the hydrant in front of the Union depot, to the number of fifty or more, the said company shall put such hydrants upon a separate high service, and keep and maintain on each of said hydrants a water pressure of not less than fifty pounds.

Sec. 9. The act of God, unavoidable accident, interference of rioters or other unlawful disturbance shall excuse any default by the company in the furnishing of any water in this ordinance provided to be furnished, for the time being.

1176 Sec. 10. Until the first day of May, 1891, the said city shall pay to The Denver Water Company, its successors and assigns, semi-annually, the sum of money mentioned in said contract between the city and the company of May 9, 1874, in full for all water furnished to the said city for all purposes mentioned in said contract, until the said first day of May, 1891. And during the remainder of the period of twenty years from and after the date of the passage and approval of this ordinance, the said city shall pay to the said The Denver Water Company, its successors and assigns, for fire purposes as follows, viz.:

For the period of ten years from and after the first day of May, 1891, the sum of thirty-five dollars per hydrant per annum for all hydrants then set and in operation, and for the remaining period until the right of purchase shall accrue, as mentioned in section 11 hereof, the sum of twenty-five dollars per hydrant per annum for all hydrants then set in operation, all payments by the city to be made semi-annually on the first days of May and November in each year during the period aforesaid, at office of the City Treasurer.

Sec. 11. At the expiration of the period of twenty years from and

after the date of the passage and approval of this ordinance, in case the city shall then elect so to do, the said works may be purchased by the said city, and in case the parties cannot agree, after such election, upon the price to be paid by the city for the water works of the said company, its successors and assigns, then their fair cash value shall be determined by arbitration, by five disinterested persons, none of whom shall be residents of Denver, two of them to be chosen by the city, two by the company and the fifth by the four first chosen; and in case of failure on the part of the company to name arbitrators for the period of thirty days after the city shall have named arbitrators and notified the company so to do, the city may apply to any court having equity jurisdiction in the county in which the city of Denver shall be situated for the appointment of two persons of the qualifications aforesaid as such arbitrators, and the court may thereupon appoint two such persons who shall act with the same force and effect as if appointed by the company, and a decision of a majority of said board shall be final and binding upon both parties; and upon the payment, or tender of payment, by said city, the said company shall convey to said city all of its property, real or personal, easements, rights and privileges, and thereafter all franchises, rights and privileges which have been at any time therefore granted said company, its successors or assigns, and which it may then possess, shall cease and be at an end.

Sec. 12. At the expiration of the said period of twenty years the said city may, at its election, renew the contract hereby made by ordinance to that effect for a like period of twenty years, but at a price for hydrant rental ten per cent. less than mentioned in section 10 hereof, for the period remaining after the ten years after May 1, 1891, and for successive periods of twenty years at the price last aforesaid, as often and as long as the city may choose. This section is conditioned, however, upon the full performance by the city of the provisions of section two hereof.

Sec. 13. The said company shall at all times after the taking effect of this ordinance, whenever so ordered to do by ordinance duly passed, extend its mains upon any street upon which no main shall then be laid, and set fire hydrants thereon, for each of which the city shall pay to the said company, its successors and assigns, the price per hydrant hereinbefore mentioned. Provided, however, that no such extention shall be ordered to be made, nor, if ordered, shall the same be of any binding effect, unless a fire hydrant is ordered for every four hundred feet of extension at least, or fractional part thereof; rent for such hydrants to accrue from and after the date when the City Clerk shall be notified that the same are set and ready for use, and at the same rate per hydrant as is hereinbefore mentioned in section ten hereof. Provided, however, that no such additional hydrants ordered and set before the first day of May, 1891, shall be entitled to any rental, except from the said last mentioned date, when the same shall begin to draw rental. And provided further, that no main laid by the said The Denver Water Company after the passage and approval of this ordinance, shall be of a less diameter than six inches.

Sec. 14. The said company, its successors and assigns, shall at all times during the existence of this contract, or any renewal thereof, furnish and supply to the city water free of charge for use in the city hall and fire department houses, also for flushing sewers and gutters and for sprinkling purposes, through special hydrants to be set for that purpose, not exceeding 400 in number, at such
1177 location as the City Council may determine, such last mentioned hydrants to be set and kept in order by the said company, its successors and assigns, and the hydrants purchased from the city under this ordinance may be used for that purpose.

To prevent controversy in regard to the manner and method of using water for the above purposes, the same shall be used under rules and regulations to be adopted by the board provided in section 18 hereof.

Sec. 15. The fire hydrants provided for in this ordinance shall not be used for any other purpose than for fire purposes and testing, and the opening and closing of said hydrants shall be under the exclusive direction of the chief of the fire department and such persons as he may appoint, and the officers and agents of said company; and the opening and closing of sprinkling hydrants shall be under the direction of such officer as the city may designate; and the city shall be liable for any damage done to the said fire hydrants or said other hydrants by any officer or agent of the city. All fire hydrants and sprinkling hydrants shall be closed when not in actual necessary use, and in times of fire the sprinkling hydrants shall not be used in any place to the detriment of the service from the fire hydrants. Nor shall the city suffer or permit undue waste of water from any of said sprinkling hydrants.

Sec. 16. The right of all persons under license from the said company, desiring to excavate the streets to connect with the mains of said company, under such proper and reasonable rules as now prevail in said city, shall not be inhibited by the said city.

Sec. 17. The said company being charged with a public duty, the said city shall pass such ordinances as will prohibit all unlawful interference with its operations, pollution of its water supply, trespass upon its property and unauthorized use of hydrants.

Sec. 18. The said city and said company shall presently, and on or before the first day of January of each third year, each appoint some competent person, and they two shall choose a third person, to whom all complaints by either party against the other of any violation of the terms of this ordinance and contract, or any controversy as to the construction and meaning of the terms of this ordinance, and the framing, altering or amending rules governing the use of water for flushing sewers and gutters and sprinkling purposes, shall be referred. And the decision of a majority of said board shall be binding on both parties. In case either party shall neglect or refuse at any time to appoint any such arbitrator, and any complaint shall then be pending, the party guilty of such neglect or omission shall be deemed to admit the claim of the other; and in case the said two so chosen shall be unable for fifteen days to agree upon a third person, such third person may be appointed upon ap-

plication of either party by any court of general equity jurisdiction in the county in which the said city of Denver shall then be situated. The parties so chosen as above shall hold such positions for the period of three years, and until their successors shall be chosen and qualified.

Sec. 19. This ordinance, when the same shall be in writing accepted by The Denver Water Company, becomes a contract between the city of Denver and the said The Denver Water Company, its successors and assigns, and the same shall, as to every provision herein contained, as fully bind and inure to the benefit of the successors and assigns of the said The Denver Water Company as to the said company. And it is expressly understood that by the acceptance of this ordinance the said The Denver Water Company loses no rights in regard to the occupation of the streets, alleys and public places, or as to the rights of any other person or persons thereto which it now possesses, but the same are hereby recognized and confirmed, and are to be deemed independent of and not merged in any grant in this ordinance, elsewhere contained.

Sec. 20. All mains, pipes, valves and other apparatus now owned by said The Denver Water Company, and composing its plant, and all such mains, pipes, valves, hydrants and other apparatus as said The Denver Water Company, its successors or assigns, shall hereafter lay down or set in or upon any of the streets, alleys or other public places within said city, shall be and remain the sole and absolute property of said The Denver Water Company, its successors and assigns. And the said The Denver Water Company, its successors or assigns, shall forever be considered and entitled to be in possession thereof, except in case of purchase by said city under the terms of this ordinance, or some agreement between said city and said company, its successors or assigns, when all rights of whatsoever
1178 nature of said company, its successors or assigns, in and to the subject matter hereof shall vest in said city.

Sec. 21. While the consideration for the respective agreements of the city and the company are upon each side, the several agreements of the other, all of the several grants, contracts and agreements in this ordinance contained are to be deemed independent agreements with the same force and effect as if each section of this ordinance was contained in a separate ordinance by itself.

Sec. 22. This ordinance shall take effect and be in force from and after its passage.

WALTER J. CONWAY,
President of the Board of Aldermen.
D. C. PACKARD,
President of the Board of Supervisors.

I do hereby certify that the above bill for an ordinance, having been by the Mayor of the city of Denver returned to the City Clerk of the city of Denver without his approval, with his objections in writing thereto; that the said City Clerk presented the same to the Board of Aldermen of the City Council of said city (it being the board in which said bill originated) at the next regular meeting of

said board after the said bill with objections had been so returned, on, to wit: April 3, A. D. 1890, and that the said board at said meeting proceeded forthwith to consider the question pending on said bill, which was, "Shall the bill pass notwithstanding the objections of the Mayor thereof?" and that two-thirds of all the members elected to said Board of Aldermen voted in the affirmative.

Attest:

WALTER J. CONWAY,
President of the Board of Aldermen.

I do hereby certify that the above bill for an ordinance, having been by the Mayor of the city of Denver returned to the City Clerk of the city of Denver without his approval, and with his objections in writing thereto, and it appearing by the certificate of the President of the Board of Aldermen that the said bill was passed by that body at the next regular meeting thereof, notwithstanding the objections of the Mayor thereto, and that two-thirds of all the members elected to said board voted in the affirmative upon said question; that at the next regular meeting of the Board of Supervisors held after the said above action on said bill by the Board of Aldermen upon, to wit: The 10th day of April, A. D. 1890, the said bill with the objections of the Mayor thereto, and the said certificate of the President of the Board of Aldermen, were presented to the Board of Supervisors by the City Clerk of the city of Denver, and that the said Board of Supervisors thereupon proceeded forthwith to consider the question pending on said bill, which was, "Shall the bill pass, notwithstanding the objections of the Mayor thereof?" and that two-thirds of all the members elected to said Board of Supervisors voted in the affirmative.

D. C. PACKARD,
President of the Board of Supervisors.

Attest:
[SEAL.]

W. H. MILBURN,
City Clerk.

1179 SCHEDULE A.

Water Rates of the Denver Water Company.

1890.

Schedule of Yearly Water Rates, Payable Semi-annually, in Advance, on the First Days of May and November of Each Year at the Office of the Company.

Alcohol, each barrel manufactured	$.10
Ale cellar, from	$20.00 to 50.00
Bakery, each oven, from	10.00 to 50.00
Barber shop, first chair	10.00
Barber shop, each additional chair	3.00
Bath, private, with heating apparatus	5.00

Bath, private, without heating apparatus		3.00
Bath, in boarding or tenement houses		5.00
Bath, public, not less than		15.00
Beer, for each barrel brewed		05
Beer house, from	$20.00 to	50.00
Billiard saloon, each table		3.00
Boarding-house, per room		1.50
But no license less than		10.00
Book bindery, not less than		10.00
Brick work, per thousand		10
Brick yard, each gang of hands		20.00
Camphine, each barrel manufactured		10
Candle manufactory, from	100.00 to	1,000.00
Candy manufactory, from	15.00 to	75.00
Church, from	5.00 to	15.00
Church, Baptist for baptistry, from	5.00 to	15.00
Cigar manufactory, per hand		2.00
But no license less than		15.00
Club room, from	$30.00 to	100.00
Coffee saloon	15.00 to	30.00
Confectionery	15.00 to	75.00
Cow		1.00
Distillery, for each barrel distilled		10
Dram shop, from	$25.00 to	100.00
Dyeing and scouring, from	25.00 to	100.00
Forge		3.00

Fountain, for six months, running not more than four hours per day, viz:

Fountain, 1 opening 1/16 inch diameter	22.50
Fountain, 1 opening ⅛ inch diameter	40.00
Fountain, 1 opening 3/16 inch diameter	52.50
Fountain, 1 opening ¼ inch diameter	67.50
Fountain, 1 opening 5/15 inch diameter	82.50
Fountain, 1 opening ⅜ inch diameter	97.50
Fountain, 1 opening 7/16 inch diameter	112.50
Fountain, 1 opening ½ inch diameter	150.00

Hall, from	$5.00 to	30.00
Hat manufactory, from	30.00 to	100.00
Horse, in private stable		3.00
Hose, for private stable, not less than		5.00

1180

Hose, for livery or sale stable, not less than		50.00
Hose, for sprinkling sidewalks and washing windows, per foot run		20
Hotel, per room		1.50
Ice cream saloon, from	$15.00 to	50.00
Laboratory, from	20.00 to	200.00
Laundry, from	20.00 to	300.00

Livery stable, per stall		2.00
Malting, per bushed		01
Office, from	$5.00 to	30.00
Oyster saloon	15.00 to	30.00
Packing house	40.00 to	500.00
Photograph gallery	20.00 to	40.00
Plastering, per square yard		½
Porter cellar, from	$20.00 to	50.00
Rectifying whisky, per barrel		03

Residence occupied by one family only:

Residence, 1 to 4 rooms		5.00
Residence, 5 or 6 rooms		6.00
Residence, 7 or 8 rooms		7.00
Residence, 9 or 10 rooms		8.00
Residence, 11 or 12 rooms		9.00
Residence, 13 or 14 rooms		10.00
Residence, 15 or 16 rooms		11.00
Residence, 17 or 18 rooms		12.00
Residence, 19 or 20 rooms		13.00
Residence of 10 or more rooms used as a boarding-house, per room		1.50
Sale stable, per stall		2.00
School, for every scholar		20
Shop, from	$5.00 to	30.00
Slaughter house, from	25.00 to	500.00
Soap manufactory, from	100.00 to	1,000.00
Soda manufactory, from	40.00 to	300.00
Spirit gas, for each barrel manufactured		10
Sprinkling street, for that portion of street embraced between the two cross streets		15.00
Sprinkling street with hose, including sidewalks, per foot run		20
Starch manufactory, from	$50.00 to	200.00
Steam boilers, per square foot of fire surface, not less than.		40
But no license less than		25.00
Stock yard, from	$25.00 to	500.00
Stone work, per perch		05
Store, from	$10.00 to	300.00
Sugar refinery, from	300.00 to	3,000.00
Tannery, per vat		6.00
But no license less than		25.00
Tenement, per room		1.50
But no license less than		10.00
Tobacco manufactory, per hand		2.00
But no license less than		15.00
Urinal basin, from	$10.00 to	40.00
Vault, for residence		5.00
Vault, accommodating double house, each house		3.00

Vault, for tenement or boarding-house, for every 15 rooms.		5.00
Vault, bar		5.00
Vehicle		2.00
Vinegar, for each barrel manufactured		05
Washing bottles, from	$5.00 to	20.00
Washing barrels, per barrel		05
Washing meat, from	$50.00 to	500.00
Water closet, private		5.00
Water closet, hotel		10.00
Wine cellar, from	$20.00 to	50.00
Restaurant, from	25.00 to	100.00

Special rates adopted by this company:

Irrigation of lots only through hose with nozzle, 40c. per front foot.

No license for irrigation will be issued for less than the season rate.

Water for irrigation must not be used except within the hours specified on the license, nor during a fire or conflagration. Any violation of this rule will subject the license to forfeiture.

For fountain in drug store, six months, opening not to exceed ⅛ inch in diameter	$50.00
For tumbler-washer in drug store, six months	50.00

Water used for elevators, motors or manufacturing purposes at the following rates, payable monthly:

When the quantity used per day is from 1,000 to 5,000 gallons, per 1,000 gallons	$.20
5,000 to 25,000 gallons per day, per 1,000 gallons	15
Provided that the rate for any month shall not be less than.	6.00

Where water is paid for all purposes on premises, there will be no additional charge for a stand-pipe for fire protection. Where The Denver Water Company's water is not used, a special rate will be made for such stand-pipes.

The water company reserves the right to require any customer to furnish a meter and pay for water by meter measurement. In any case before a meter is placed, a satisfactory rate must be established or agreed upon.

(Endorsed:) 6274. U. S. District Court, District of Colorado. Plaintiff's Exhibit A-3. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

2. Development expense upon revised revenue and operation figures and Public Utilities Engineer's assumptions upon Wisconsin Railroad theory with 7% fair rate of return and 1% annual depreciation allowance (Excluding construction costs other than those covered by proceeds of bond issues)	1,920,000.00
3. Development expense on basis of book account of new construction after the consolidation of the Companies in 1904 and an assumed construction account at that time of $7,000,000.00 upon Wisconsin Railroad Commission theory with 7% assumed fair rate of return and 1% depreciation allowance	$5,778,000
4. Development expense on basis number three, but with 6% fair rate of return and 1% depreciation allowance	$1,721,000
5. Going Concern value by comparative method based upon present revenue under leaflet Schedule and assumptions as to acquisition of revenue by comparative plant believed to be unduly favorable to the City rather than in accord with conservative interpretation of the Company's actual position	990,000.00
6. Going Concern value on basis similar to number five except that instead of the actual revenue under the Leaflet Schedule, the revenue is assumed at 6% fair return upon an assumed fair value of the property of $15,500,000 (Which involves an approximate increase in revenue for the year 1915 of $152,000.00)	1,630,000.00
7. Going Concern value by the comparative method under conditions similar to number six, except that the fair rate of return is assumed to be

The records for 1900 and 1901 are from the measurements at the dam of the Northern Colorado Irrigation Canal.

All others are from the records of the State Engineer.

From 1900 on, these records show only the quantity of water passing Platte Canon, not accounting for any storage in Lake Chessman.

THIS WATER LICENSE IS ISSUED BY THE DENVER UNION WATER COMPANY SUBJECT TO THE FOLLOWING TERMS:

It is agreed between THE DENVER UNION WATER COMPANY and the holder of this license that said Company shall have the right, and may without notice, shut off the water from the premises mentioned in this license should water be furnished to any other premises or for any other uses than those mentioned in this license, or if any person shall be permitted to take water from said premises to supply persons or premises not entitled thereto under this license. Water may also be shut off and this license revoked and all claims for water or payment therefor forfeited if the rules and regulations of the Company are violated, especially the following: Water shall not be allowed to run to waste. No stop cock or faucet shall be left opened or out of repair so that water can escape therefrom, or water be allowed to run to prevent freezing. All defective plumbing must be promptly repaired. Water must not be used for irrigation at any time except within the hours specified or stamped on the face of this license, and only for such time as may be sufficient to irrigate the premises for which payment is made. The Company expresly reserves the right to change or shorten said hours for irrigation.

It is further agreed that the said Company, by its agents, and employes, shall have the right to enter upon or in said premises at all proper and reasonable hours, to inspect the use of water in said premises.

1214 Case No. —. Complainant's Exhibit No. A-34. H. B. O.

(Endorsed:) 6274. U. S. District Court, District of Colorado. Plaintiff's Exhibit A-34. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

Schedule of Water Rates.

1898.

1215½ *Rules and Regulations of The Denver Union Water Company for the Information and Guidance of Consumers and for the Government of Plumbers.*

Schedule of Water Rates.

1898.

1216 The Denver Union Water Company.

Directors.

Walter S. Cheesman, David H. Moffat, Moses Hallett, George W. Clayton, Thomas S. Hayden, James B. Grant, George Coppell, Edward E. Poor, Theodore C. Woodbury.

Officers.

W. S. Cheesman, President; T. S. Hayden, Vice President; D. H. Moffat, Treasurer; W. P. Miller, Secretary; J. H. Kingwill, Auditor; W. P. Robinson, Ass't Manager; C. P. Allen, Chief Engineer; D. G. Thomas, Superintendent.

1217 Information for Water Consumers.

Licensed plumbers only are permitted to do work in connection with water pipes or fixtures, and they are not allowed to turn water on to any premises except to test their work.

Parties desiring water service put into their premises have only to sign an application and agreement at the Water Company's office, on which a permit will be issued to any licensed plumber. When the work is completed to the satisfaction of the Company, on payment of water tax at the Company's office, the water will be turned on the premises.

No deduction will be made from the rates on account of any fixtures not being used; if they are not wanted, have a plumber

disconnect them from the service pipes, and then the charge for their use will cease.

In making application for water it is unnecessary to state that there is a well or cistern on the premises, or that artesian water is used, or that a small quantity of water is used, as such facts can not affect the rates.

Consumers must keep their service pipes and fixtures in order, at their own expense.

1218 Care should be taken to see that the stop box at the curb is in order, as damage frequently occurs from pipes bursting, where the water can not be turned off readily, on account of the stop box being inaccessible. When stop boxes are covered by sidewalks or grass plots, the top of the box must be brought through and to a level with the top of the walk or surface of ground. In case a pipe bursts inside a building, water may be turned off by the occupant at a "stop and waste" cock, which should be found just where the pipe enters through the cellar wall. Consumers should see that this stop and waste cock is always in good working order, and instruct servants or members of the family as to its location and use. During cold weather, the house pipes should be drained through this stop and waste cock, to prevent freezing and bursting of pipes.

See that your service pipes are at least five feet under ground.

Examine the waste opening at the bottom of your hydrant, and see that it is unobstructed.

If the pipe enters your house, see that a stop and waste cock is placed just where the pipe comes through the cellar wall.

1219 During cold weather, shut the water off the house at night, and drain your house pipes through the stop and waste cock. Open all faucets in the house, so that the pipes will empty, but close them immediately, or otherwise you may flood the house when water is turned on in the morning.

In case the water does not flow at once after turning it on in the morning, apply hot water or hot cloths just above or below the stop and waste cock.

It is sometimes necessary for the Company to shut off the water in making repairs, or in case of breaks in the main pipes. As soon as you discover that the water is off, open the hot water faucet and let it stand open until the water runs. This will prevent accident by allowing the escape of steam from the boiler.

The use of hose for irrigating lots is only allowed during the hours specified in the license, and in every case a nozzle must be attached to the hose, with an outflow not greater than one quarter of one inch.

Many persons do not understand why the water at times has a milky appearance when first drawn: it is caused by air in the water, and is entirely harmless.

1220 Rules and Regulations to be Observed by Consumers.

The Company imposes no restrictions on water takers, which impair their right to use all the water necessary for the various

purposes for which licenses are issued, but only such as are necessary to prevent waste, and for the mutual protection of the Water Company and the consumer.

The following rules and regulations of the Denver Union Water Company are made a part of the contract with every person who takes water, and every such person in his application for water agrees to be bound thereby.

Section 1. Water will not be turned on to any premises until water license is paid, nor until, in addition thereto, all arrearages for water charges with reference to said premises have also been paid.

Sec. 2. Applications for water must be made at the office of the Company, by the owner or occupant of the property, and must state all purposes for which it is required; and when paying the semi-annual charges questions relating to its consumption must be truthfully answered by the applicant. In case of misrepresentation
1221 on the part of the applicant, or the uses of the water for purposes not embraced in his license, or of wilful or unreasonable waste of water, the supply of water will be stopped, unless the party shall promptly pay such additional charges as the Company may impose.

Sec. 3. Water rents must be paid in advance, on the first days of May and November in each year, at the office of the Company; and any person taking a license for the use of water in or upon any premises, will be required to pay the schedule rates for such premises, for all purposes for which water is required thereon; and if such water is received through a meter, he shall pay the schedule rates on such premises, and such sum in addition thereto as the meter shows has been taken, at meter rates; provided, that in all cases the party shall pay at least the schedule rates fixed for such premises for all purposes.

Sec. 4. No hydrant, goose neck, hose bib, or hose attachment shall be placed in any yard or area of any premises, so situated as to be accessible to persons living in or occupying neighboring premises; nor shall water takers be allowed to supply water to others, except by a special permit from this Company.

1222 Sec. 5. The inspector, or other authorized agent of the Company, shall have free access at reasonable hours, to any premises where water is used, for the purpose of inspection and examination.

Sec. 6. All persons taking water shall keep their own service pipes, stop cocks, and apparatus in good repair, and protected from frost, at their own expense; and it is expressly stipulated that no claim shall be made against the Company by reason of the bursting, or freezing, or any other derangement of any service pipes, or other apparatus in connection with them.

Sec. 7. In case of fire or an alarm of fire, and while fire pressure is on the pipes, the use of fountains, or yard and street sprinklers, is positively prohibited, and the Company reserves the right to place automatic shut-off valves on all service pipes, at the expense of owners

of the premises, for the purpose of shutting off water during times of fire.

Sec. 8. In no case will hose be allowed for the purpose of sprinkling gardens, lawns, sidewalks, or streets, or washing wagons, or other vehicles, with outflows or nozzles greater than one-quarter of one inch in diameter, and in no case will the use of hose without a nozzle be permitted.

1223 Sec. 9. In case two or more parties or families are supplied with water from the same service pipe, if either of the parties fails to pay the water rent when due, or to comply with any rule of the Company, the Company may turn off the water from such pipe until the water rent is paid, and the rules strictly complied with.

Sec. 10. No fountain shall run for more than six months, nor more than four hours per day.

Sec. 11. Water for irrigation shall be used only during the hours and in the manner specified on the license.

Sec. 12. Irrigation of lots, including sidewalks and trees, only through hose with nozzle not to exceed one-quarter of one inch in diameter, to be used only in accordance with the regulations of this Company.

Sec. 13. All waste of water is prohibited, and consumers must keep their hydrants, faucets, valves, hose, and other apparatus, including stop boxes, street washers and service pipes, in good order and condition, at their own expense, and all water ways closed when not in use.

Sec. 14. Water must not be left running to keep pipes from freezing.

1224 Sec. 15. The Company reserves the right to require any consumer to furnish a meter and pay for water by meter measurement.

Sec. 16. The Company reserves the right at any time, without notice, to shut off the water in its mains, for the purpose of making repairs or extensions, or for other necessary purposes; and all persons having boilers on their premises, depending upon the pressure in the pipes to keep them supplied, are hereby cautioned against danger from collapse.

Sec. 17. No rebate on any license will be allowed, except where the premises become vacant and the water is turned off by the Company; in such case, on surrender of the license, a rebate may be allowing for the unexpired time, less one dollar for the expense of shutting off the water.

Sec. 18. In any case where the water shall have been turned off of premises, by reason of water tax not being paid, a charge of one dollar will be made to meet the expense incurred in turning on the water when the tax is paid. But if the turning off at the box shall not be sufficient to prevent the turning on the same, or the taking of water without license, or payment, then the same may be cut off at the main, and before the water shall be turned on the

1225 person desiring the same upon such premises shall pay the cost and expense of turning off and on the same, including

the digging in the street or through pavement, and the amount required to be paid to the city for permit and as deposit on account of such cutting of pavement.

Sec. 19. Licenses for water for building purposes will be issued only upon a certificate of the architect, of the work to be done, specifying the number of brick, perches of stone, and square yards of plastering, for which water will be required; and in all cases payment for the water shall be a condition precedent to the issuance of the license.

Sec. 20. Water used for building purposes must be discharged through a hose directly into the mortar bed, and under no circumstances shall it be discharged upon the ground, or into or through a ditch or trench, and the builders must properly guard the hose connection or cock through which the water is taken, so as to render it inaccessible to others.

Sec. 21. No alteration, addition or disconnection in or about any conduit, service pipe, or water cock, or other apparatus connected therewith, shall be made or caused to be made by any person except a licensed plumber, who shall first obtain a written permit at the office of the Company.

1226 Sec. 22. When any job of plumbing shall be completed, and the work approved by the inspector of the Company, and the water tax paid, the water will be turned on, and not otherwise.

Sec. 23. Hose license, or a license to irrigate lots, will not be granted unless a license is taken for all purposes for which water is to be used on the premises.

Sec. 24. Hydraulic elevators and indicators must be kept in repair and proper working order at the expense of the owner or occupant of the premises. When the indicator fails to register, and is not repaired immediately, the supply will be shut off, unless a rate satisfactory to the Company be paid for the time the indicator is out of order.

Sec. 25. Water for motors or elevators will be furnished only through meters at schedule rates.

Section. 26. For any violation of any of these rules by any person or persons, the Company reserves the right to stop his or her supply of water, and the water rent already paid may be forfeited.

Sec. 27. The right is reserved to alter, amend, or add to these rules and regulations from time to time, as in the judgment of the Company it shall be deemed expedient or necessary.

1227 Rules and Regulations for the Government of Licensed Plumbers.

Section 1. Every plumber shall, before making any connection with any main or doing any work on any service pipe connected therewith, give to The Denver Union Water Company a bond in the penal sum of one thousand dollars, with good and sufficient surety, conditioned, that he will in all things well and truly comply

915

with all the rules and regulations of this Company, for the government of plumbers.

Sec. 2. No plumber shall allow his name to be used by any other plumber or person, directly or indirectly, to obtain a permit to do any work under his bond.

Sec. 3. All work on the streets must be done to the satisfaction of the Company, as directed by its manager or foreman.

Sec. 4. All excavations in the streets and alleys of the city must be done in accordance with the ordinances and requirements of the City Council of the City of Denver or other municipalities where excavations are to be made.

1228 Sec. 5. No street shall be opened or water pipe tapped, or service pipe be laid down, without written permission, and then only by persons authorized by the Water Company; and the particular person to be employed must in each case be named in the permit. The ferrule inserted in the distributing main, and the service pipe to be laid, must be of the size specified in the permit.

Sec. 6. The tapping of mains shall be under the exclusive control of the Company, and the size of the tap to be inserted shall in all cases be determined by the manager of the Company.

Sec. 7. No alteration, addition or disconnection of any fixture, in or about any conduit, pipe or water cock, or apparatus connected therewith, shall be made, or caused to be made by any plumber, for any person taking water, or for any person whatsoever, without notice thereof being previously given to and written permission granted by the Company.

Sec. 8. Any violation of Section 7 will render the plumber liable to a fine of not less than $5.00 for each service pipe or fixture connected, and the water rates upon the same from the time such connection was made, according to the Company's schedule.

1229 Sec. 9. Notice must be left at the office of the Company by the plumber about to lay down a service pipe, fixing the day on which he wishes the tap made. Such notice must be given at least twenty-four hours previous to the time when the excavation is begun.

Sec. 10. All service pipes must be of lead, and not less in weight than that called "extra strong."

Sec. 11. All service pipes must be laid at least five feet below the established grade of the streets, and in all places at least five feet below the surface of the ground.

Sec. 12. A stop cock, with a round water way, shall be inserted in each service pipe in every case, and protected by a box (to be supplied by the Company, at the expense of the owner of the premises), with a cast iron cover, having the words "Denver Union Water Co." thereon; the box shall be placed by the plumber on the edge of the sidewalk, near the curb, the top even with the pavement, and visible.

Sec. 13. When more than one building is supplied by a single tap, by means of branch service pipes, each branch pipe must have

a stop cock, with like box and cover complete, to be located on the sidewalk in like manner as required by Section 11.

1230 Sec. 14. Every service pipe shall have a brass stop and waste cock, placed within the cellar wall of the building, easily accessible to the occupant, so that the water may be drained from the pipes in the house by the occupant, to prevent freezing and bursting of pipes; the use of said stop and waste cock must be fully explained to occupants by plumber doing the work.

Sec. 15. No hydrant, goose neck, hose bib or faucet shall be located outside of the premises for which a license is issued, nor in any open area or place accessible from adjoining premises; nor over any slop sink or sewer connection.

Sec. 16. Water closets, vaults and urinals must be supplied with self-closing valves, that close with the pressure, and in no case will a bib or a faucet be allowed to be placed over a closet or urinal.

Sec. 17. No plumber shall leave the water on after completing the plumbing.

Sec. 18. Private mains shall not be laid in advance of or beyond the terminus of the Company's pipes, except at the option of the Company.

Sec. 19. A street washer will not be allowed on the sidewalk, except where the building is set out to the street line, thus

1231 leaving no room for it inside the lot.

Sec. 20. Where service pipes are found disconnected at the corporation cock or main, they may be reconnected only by the Company.

Sec. 21. All outlets in service pipes must be provided with air chambers not less than 18 inches on first floors, and 12 inches on upper floors. All air chambers must be securely capped.

Sec. 22. Corporation cocks will be furnished and taps made by the Company at the following prices:

For ⅜ inch Corporation Cock and Tapping	$2.00
For ½ inch Corporation Cock and Tapping	3.00
For ⅝ inch Corporation Cock and Tapping	4.00
For ¾ inch Corporation Cock and Tapping	5.00
For 1 inch Corporation Cock and Tapping	6.00
Stop Box and Water Way	2.50

Sec. 23. Any violation of any of the above rules by any plumber, shall be deemed a breach of the conditions of his bond.

1232 Water Rates of The Denver Union Water Company.

1898.

Schedule of yearly water rates, payable semi-annually, in advance, on the first days of May and November of each year, at the office of the company, calculated on minimum basis. By minimum is meant, for stores, shops and business places, 12 feet frontage, 500 square feet area space and least favorable location.

Alcohol, each barrel manufactured	$.07		
Ale Cellar, from	13.00	to	$32.00
Bakery, each oven, from	8.60	to	40.00
Barber Shop, first chair	6.80		
" each additional chair	2.40		
Bath, private, with heating apparatus, first tub	4.00		
Bath, private, each additional tub	3.55		
Bath, private, without heating apparatus, first tub	1.60		

1233

Bath, private, each additional tub, (without heating apparatus)	$2.90		
Bath in boarding or tenement houses, 15 rooms or less	4.00		
Over 15 rooms, each	8.00		
Bath, public (including every bath except the above) each	11.00		
Beer, for each barrel brewed	.06		
Beer House, from	13.00	to	$32.00
Beer Pump	16.65		
Billiard Saloon, first table	4.75		
Each additional table	2.40		
Boarding House, per room	1.05		
But no license less than	10.00		
Bottling Works, from	8.25	to	32.00
Book Binbery, not less than	7.75		
Bowling Alley, from 1 to 3 alleys, not less than	6.80		
Brick Work, per thousand	.08		
Brick Yard, each gang of hands	20.35		
Camphene, each barrel manufactured	.10		
Candle Manufactory, from	85.65	to	400.00
Candy Manufactory, from	17.00	to	60.00

1234

Church, including baptistry, from	$6.40	to	$12.00
Cigar Manufactory, per hand	1.40		
But no license less than	7.10		
Club Room, from	10.80	to	80.00
Coffee Saloon, from	9.35	to	24.00
Cow, each	.80		
Concrete, per cubic yard	.02		
Distillery, for each barrel distilled	.07		
Dram Shop or Saloon, from	13.00	to	60.00
Dyeing and Scouring, from	22.00	to	60.00
Forge, each	2.10		
Fountains, for six months, running not more than 4 hours per day, viz:			
1 opening 1/16-inch diameter	11.50		
1 opening ⅛-inch diameter	19.30		

1 opening 3/16-inch diameter	33.00	
1 opening ¼-inch diameter	36.00	
1 opening 5/16-inch diameter	51.50	
1 opening ⅜-inch diameter	70.60	
1 opening 7/16-inch diameter	93.00	
1 opening ½-inch diameter	118.30	
Hall, public, from	6.60 to	24.00
Hat Manufactory, from	9.50 to	60.00

1235

Horse, in private stable	$2.15	
Hose, for private stable, not less than	4.00	
Hose, for livery or sale stable	18.55	
Hose, for sprinkling sidewalks and washing windows, where irrigation rates are not paid, per foot front	.11	
Hotel, up to 12 rooms, with 12 persons or less, per room	1.05	
Over 12 rooms, per room	1.20	
Ice Cream Saloon, from	9.10 to	$32.00
Laboratory, from	24.50 to	80.00
Laundry, from	17.00 to	240.00
Livery Stable, per stall (including boarding and club)	1.95	
Lunch in Saloon, from	12.00 to	24.00
Malting, per 100 bushels	1.10	
Motor, church organ, from	25.00 to	32.00
Oyster Saloon, from	9.40 to	24.00
Offices and Banks on street, from	4.45 to	24.00
Offices, above first floor, each	2.35	
Packing House, from	46.00 to	400.00
Photograph Gallery, from	12.10 to	32.00
Plastering, per 100 square yds	.28	

1236

Porter Cellar, from	$13.00 to	$32.00
Rectifying Whisky, per 100 barrels	3.40	
Residence occupied by one family only:		
1 room	3.15	
2 rooms	3.15	
3 rooms	3.90	
4 rooms	4.25	
5 rooms	4.90	
6 rooms	5.90	
7 rooms	7.35	
8 rooms	7.70	
9 rooms	8.35	
10 rooms	8.70	
11 rooms	9.35	
12 rooms	9.85	

13 rooms	10.45
14 rooms	10.45
15 rooms	11.60
16 rooms	11.95
17 rooms	12.35

Store, from	4.45 to 240.00
Store, Confectionery, from	7.75 to 32.00
Store, Meat or Butcher Shop, from	6.10 to 24.00
Sugar Refinery, from	240.00 to 2,400.00
Tannery, not less than	28.30
Tenement, per room	1.05
But no license less than	10.00
Tobacco Manufactory, per hand	1.40
But no license less than	7.10

Urinal Basin, private, in boarding houses, stores and offices, as distinguished from public	8.00
1239 Urinal Basin, public, for each stall	$8.85
Vault, for residence, with water connection, direct or indirect	3.20
Vault, accomodating double house, each house	2.40
Vault, accomodating more than one tenant, each tenant	2.40
Vault for tenement or boarding house, for every 15 rooms or less	4.00
Vault, bar	4.00
Vehicle	1.45
Vinegar, for each barrel manufactured	.06
Washing Bottles, not less than	16.70
Washing Barrels, per barrel	.06
Washing Meat, from	22.65 to $400.00
Water Closet, private house, boarding or tenement house, first bowl	4.00
Each additional bowl	3.15
Water Closet, public, meaning hotel, saloon, sporting house and where the public 1240 may use it, as distinguished from private, boarding or tenement house	$6.50
Wine Cellar, from	13.00 to $32.00
Fountain in drug store, six months, opening not to exceed 1/8-inch in diameter	35.80
Tumbler Washer in drug store, six months	32.00

Irrigation Rates.

Irrigation of lots, including sidewalk and trees, only through hose with nozzle not to exceed one-quarter of one inch in diameter, to be used only within the hours specified on the license and never during a fire or conflagration, 22 cents per front foot for the season. Where irrigation is used outside of property line along the side of irrigated corner lots, the frontage is counted to include one-half lot additional. No license for irrigation will be issued for less than the season rate.

1241 Meter Rates—Payable Monthly.

1,000 to	15,000	gal. per mo.,	17c	per	1,000	gal.
15,000 to	30,000	" "	16c	"	"	"
30,000 to	60,000	" "	15c	"	"	"
60,000 to	150,000	" "	13c	"	"	"
150,000 to	315,000	" "	12c	"	"	"

COMPLAINANT'S EXHIBIT No. A-36.

Rules and Regulations of The Denver Water Company for the Information and Guidance of Consumers. 1887.

1244 Rules and Regulations to be Observed by Consumers.

The Company imposes no restrictions on water takers, which impair their right to use all the water necessary for the various purposes for which licenses are issued, but only such as are necessary to prevent waste, and for the mutual protection of the Water Company and the consumer.

The following rules and regulations of the Denver Water Company are made a part of the contract with every person who takes water, and every such person in his application for water agrees to be bound thereby.

Section 1. Water will not be turned on to any premises until water license is paid.

Sec. 2. Applications for water must be made at the office of the Company, by the owner or occupant of the property, and must state all purposes for which it is required; and when paying the semi-annual charges, questions relating to its consumption must be truthfully answered by the applicant. In case of misrepresentation on the part of the applicant, or the uses of the water for purposes not embraced in his license, or of willful or unreasonable waste of water, the supply of water will be stopped, unless the party shall promptly pay such additional charges as the Company may impose.

Sec. 3. Water rents must be paid in advance, on the first days of May and November in each year, at the office of the Company; and any person taking a license for the use of water in or upon any premises, will be required to pay the schedule rates for such prem-

ises, for all purposes for which water is required thereon; and if such water is received through a meter, he shall pay the schedule rates on such premises, and such sum in addition thereto as the meter shows has been taken, at meter rates, provided, that in all cases the party shall pay at least the schedule rates fixed for such premises for all purposes.

Sec. 4. No hydrant, goose neck, hose bibb, or hose attachment, shall be placed in any yard or area of any premises, so situated as to be accessible to persons living in or occupying neighboring
1245 premises; nor shall water takers be allowed to supply water to others, except by a special permit from this Company.

Sec. 5. The inspector, or other authorized agent of the Company, shall have free access at reasonable hours, to any premises where water is used, for the purpose of inspection and examination.

Sec. 6. All persons taking water, shall keep their own service pipes, stop cocks and apparatus in good repair, and protected from frost, at their own expense; and it is expressly stipulated, that no claim shall be made against the Company by reason of the bursting, or freezing, or any other derangement of any service pipes, or other apparatus in connection with them.

Sec. 7. In case of fire, or an alarm of fire, and while fire pressure is on the pipes, the use of fountains, or yard and street sprinklers, is positively prohibited, and the Company reserves the right to place automatic shut-off valves, on all service pipes, at the expense of owners of the premises, for the purpose of shutting off water during times of fire.

Sec. 8. In no case will hose be allowed for the purpose of sprinkling gardens, lawns, sidewalks, or streets, or washing wagons, or other vehicles, with outflows or nozzles greater than one-quarter of an inch in diameter, and in no case will the use of hose with a nozzle be permitted.

Sec. 9. In case two or more parties or families are supplied with water from the same service pipe, if either of the parties fails to pay the water rent when due, or to comply with any rule of the Company, the Company may turn off the water from such pipe, until the water rent is paid, and the rules strictly complied with.

Sec. 10. No yard fountain shall be used longer than ten hours daily, and not after ten o'clock P. M., without payment of additional charges.

Sec. 11. Water for irrigation shall be used only during the hours and in the manner specified on the license.

Sec. 12. A license to use water on a lot does not include sidewalk or street.

1246 Sec. 13. All waste of water is prohibited, and consumers must keep their hydrants, faucets, valves, hose, and other apparatus, including stop boxes, street washers and service pipes, in good order and condition, at their own expense, and all water ways closed when not in use.

Sec. 14. Water must not be left running to keep pipes from freezing.

Sec. 15. The Company reserves the right to set meters whenever,

and in such places only, as it may deem best. All meters shall be and remain the property of the Company, and may be removed whenever the Company may elect to do so.

Sec. 16. The Company reserves the right at any time, without notice, to shut off the water in its mains, for the purpose of making repairs or extensions, or for other necessary purposes; and all persons having boilers on their premises, depending upon the pressure in the pipes to keep them supplied, are hereby cautioned against danger from collapse.

Sec. 17. No rebate on any license will be allowed, except where the premises become vacant, and the water is turned off by the Company; in such case, on surrender of the license, a rebate may be allowed for the unexpired time, less one dollar for the expense of shutting off the water.

Sec. 18. In any case where the water shall have been turned off of premises, by reason of water tax not being paid, a charge of one dollar will be made to meet the expense incurred in turning on the water, when the tax is paid.

Sec. 19. Licenses for water for building purposes, will be issued only upon a certificate of the architect, of the work to -- done, specifying the number of brick, perches of stone, and square yards of plastering, for which water will be required; and in all cases payment for the water shall be a condition precedent to the issuance of the license.

Sec. 20. Water used for building purposes must be discharged through a hose directly into the mortar bed, and under no circumstances shall it be discharged upon the ground, or into or through a ditch or trench, and the builders must properly guard the hose connection or cock through which the water is taken, so as to render it inaccessible to others.

1247 Sec. 21. No alteration, addition, or disconnection in or about any conduit, service pipe, or water cock, or other apparatus connected therewith, shall be made, or caused to be made, by any person except a licensed plumber, who shall first obtain a written permit at the office of the Company.

Sec. 22. When any job of plumbing shall be completed, and the work approved by the inspector of the Company, and the water tax paid, the water will be turned on, and not otherwise.

Sec. 23. Hose license, or a license to irrigate lots, will not be granted, unless a license is taken for all purposes for which water is to be used on the premises.

Sec. 24. Hydraulic elevators and indicators must be kept in repair and proper working order at the expense of the owner or occupant of the premises. When the indicator fails to register, and is not repaired immediately, the supply will be shut off, unless a rate satisfactory to the Company be paid for the time the indicator is out of order.

Sec. 25. Water for motors or elevators will be furnished only through meters at schedule rates.

Sec. 26. For any violation of any of these rules by any person or

persons, the Company reserves the right to stop his or her supply of water, and the water rent already paid may be forfeited.

Sec. 27. The right is reserved to alter, amend or add to these rules and regulations from time to time, as in the judgment of the Company it shall be deemed expedient or necessary.

1248 *Rules and Regulations of The Denver Water Company for the Information and Guidance of Consumers.* 1890.

1249 Rules and Regulations to be Observed by Consumers.

The Company imposes no restrictions on water takers, which impair their right to use all the water necessary for the various purposes for which licenses are issued, but only such as are necessary to prevent waste, and for the mutual protection of the Water Company and the consumer.

The following rules and regulations of the Denver Water Company are made a part of the contract with every person who takes water, and every such person in his application for water agrees to be bound thereby.

Section 1. Water will not be turned on to any premises until water license is paid.

Sec. 2. Applications for water must be made at the office of the Company, by the owner or occupant of the property, and must state all purposes for which it is required; and when paying the semi-annual charges, questions relating to its consumption must be truthfully answered by the applicant. In case of misrepresentation on the part of the applicant, or the uses of the water for purposes not embraced in his license, or of wilful or unreasonable waste of water, the supply of water will be stopped, unless the party shall promptly pay such additional charges as the Company may impose.

Sec. 3. Water rents must be paid in advance, on the first days of May and November in each year, at the office of the Company; and any person taking a license for the use of water in or upon any premises, will be required to pay the schedule rates for such premises, for all purposes for which water is required thereon; and if such water is received through a meter, he shall pay the schedule rates on such premises, and such sum in addition thereto as the meter shows has been taken, at meter rates, provided, that in all cases the party shall pay at least the schedule rates fixed for such premises for all purposes.

1250 Sec. 4. No hydrant, goose neck, hose bibb, or hose attachment, shall be placed, in any yard or area of any premises, so situated as to be accessible to persons living in or occupying neighboring premises; nor shall water takers be allowed to supply water to others, except by a special permit from this company.

Sec. 5. The inspector, or other authorized agent of the Company, shall have free access at reasonable hours, to any premises where water is used, for the purpose of inspection and examination.

Sec. 6. All persons taking water, shall keep their own service

pipes, stop cocks, and apparatus in good repair, and protected from frost, at their own expense; and it is expressly stipulated, that no claim shall be made against the Company by reason of the bursting or freezing, or any other derangement of any service pipes, or other apparatus in connection with them.

Sec. 7. In case of fire or an alarm of fire, and while fire pressure is on the pipes, the use of fountains, or yard and street sprinklers, is positively prohibited, and the Company reserves the right to place automatic shut-off valves, on all service pipes, at the expense of owners of the premises, for the purpose of shutting off water during times of fire.

Sec. 8. In no case will hose be allowed for the purpose of sprinkling gardens, lawns, sidewalks, or street, or washing wagons, or other vehicles, with outflows or nozzles greater than one-quarter of an inch in diameter, and in no case will the use of hose without a nozzle be permitted.

Sec. 9. In case two or more parties or families are supplied with water from the same service pipe, if either of the parties fails to pay the water rent when due, or to comply with any rule of the Company, the Company may turn off the water from such pipe, until the water rent is paid, and the rules strictly complied with.

Sec. 10. No yard fountain shall be used longer than ten hours daily, and not after ten o'clock P. M., without payment of additional charges.

Sec. 11. Water for irrigation shall be used only during the hours and in the manner specified on the license.

Sec. 12. A license to use water on a lot does not include sidewalk or street.

1251 Sec. 13. All waste of water is prohibited, and consumers must keep their hydrants, faucets, valves, hose, and other apparatus, including stop boxes, street washers and service pipes, in good order and condition, at their own expense, and all water ways closed when not in use.

Sec. 14. Water must not be left running to keep pipes from freezing.

Sec. 15. The Company reserves the right to require any customers to furnish a meter and pay for water by meter measurement.

Sec. 16. The Company reserves the right at any time, without notice, to shut off the water in its mains, for the purpose of making repairs or extensions, or for other necessary purposes; and all persons having boilers on their premises, depending upon the pressure in the pipes to keep them supplied, are hereby cautioned against danger from collapse.

Sec. 17. No rebate on any license will be allowed, except where the premises become vacant and the water is turned off by the Company; in such case, on surrender of the license, a rebate may be allowed for the unexpired time, less one dollar for the expense of shutting off the water.

Sec. 18. In any case where the water shall have been turned off of premises, by reason of water tax not being paid, a charge of one

dollar will be made to meet the expense incurred in turning on the water, when the tax is paid.

Sec. 19. Licenses for water for building purposes, will be issued only upon a certificate of the architect, of the work to be done, specifying the number of brick perches of stone, and square yards of plastering, for which water will be required; and in all cases payment for the water shall be a condition precedent to the issuance of the license.

Sec. 20. Water used for building purposes must be discharged through a hose directly into the morter bed, and under no circumstances shall it be discharged upon the ground, or into or through a ditch or trench, and the builders must properly guard the hose connection or cock through which the water is taken, so as to render it inaccessible to others.

1252 Sec. 21. No alteration, addition or disconnection in or about any conduit, service pipe, or water cock, or other apparatus connected therewith, shall be made or caused to be made, by an- person except a licensed plumber, who shall first obtain a written permit at the office of the Company.

Sec. 22. When any job of plumbing shall be completed, and the work approved by the inspector of the Company, and the water tax paid, the water will be turned on, and not otherwise.

Sec. 23. Hose license, or a license to irrigate lots, will not be granted, unless a license is taken for all purposes for which water is to be used on the premises.

Sec. 24. Hydraulic elevators and indicators must be kept in repair and proper working order at the expense of the owner or occupant of the premises. When the indicator fails to register, and is not repaired immediately, the supply will be shut off, unless a rate satisfactory to the Company be paid for the time the indicator is out of order.

Sec. 25. Water for motors or elevators will be furnished only through meters at schedule rates.

Sec. 26. For any violation of any of these rules by any person or persons, the Company reserves the right to stop his or her supply of water, and the water rent already paid may be forfeited.

Sec. 27. The right is reserved to alter, amend, or add to these rules and regulations from time to time, as in the judgment of the Company it shall be deemed expedient or necessary.

COMPLAINANT'S EXHIBIT No. A-37. H. B. O.

Rules and Regulations to Be Observed by Consumers of The Beaver Brook Water Co. and The Mountain Water Co.

1254 Rules and Regulations to Be Observed by Consumers.

The Company imposes no restrictions on water takers, which impair their right to use all the water necessary for the various purposes for which licenses are issued, but only such as are necessary to prevent waste, and for the mutual protection of the Water Company and the consumer.

The following rules and regulations of The Beaver Brook Water Company and The Mountain Water Company are made a part of the contract with every person who takes water and every such person in his application for water agrees to be bound thereby.

Section 1. Water will not be turned on to any premises until water license is paid.

Sec. 2. Application for water must be made at the office of the Company, by the owner or occupant of the property, and must state all purposes for which it is required; and when paying the semi-annual charges, questions relating to its consumption must be truthfully answered by the applicant. In case of misrepresentation on the part of the applicant, or the uses of water for purposes not embraced in his license, or of wilful or unreasonable waste of water, the supply of water will be stopped unless the party shall promptly pay such additional charges as the Company may impose.

Sec. 3. Water rents must be paid in advance, on the first days of May and November in each year, at the office of the Company; and any person taking a license for the use of water in or upon any premises, will be required to pay the schedule rates for such premises, for all purposes for which water is required thereon; and if such water is received through a meter, he shall pay the schedule rates on such premises, and such sum in addition thereto as the meter shows has been taken, at meter rates, provided, that in all cases the party shall pay at least the schedule rates fixed for such premises for all purposes.

Sec. 4. No hydrant, goose neck, hose bibb or hose attachment, shall be placed in any yard, or area of any premises, so situated as to be accessible to persons living in or occupying neighboring premises; nor shall water takers be allowed to supply water to others, except by a special permit from this company.

1255 Sec. 5. The inspector, or other authorized agent of the Company, shall have free access at reasonable hours to any premises where water is used, for the purpose of inspection and examination.

Sec. 6. All person- taking water, shall keep their own service pipe, stop cocks, and apparatus in good repair and protected from frost, at their own expense; and it is expressly stipulated, that no claim shall

be made against the Company by reason of the bursting or freezing, or any other derangement of any service pipe, or other apparatus in connection with them.

Sec. 7. In case of fire, or an alarm of fire, and while fire pressure is on the pipes, the use of fountains, or yard and street sprinklers, is positively prohibited, and the Company reserves the right to place automatic shut-off valves on all service pipes, at the expense of owners of premises, for the purpose of shutting off water during times of fire.

Sec. 8. In no case will hose be allowed for the purpose of sprinkling gardens, lawns, sidewalks or streets, or washing wagons or other vehicles, with outflows or nozzles greater than one-quarter of an inch in diameter, and in no case will the use of hose without a nozzle be permitted.

Sec. 9. In case two or more parties or families are supplied with water from the same service pipe, if either of the parties fail to pay the water rent when due, or to comply with any rule of the company, the Company may turn off the water from such pipe, until the water rent is paid, and the rules strictly complied with.

Sec. 10. No yard fountain shall be used longer than ten hours daily, and not after 10 o'clock P. M., without payment of additional charges.

Sec. 11. Water for irrigation shall be used only during the hours and in the manner specified on the license.

Sec. 12. A license to use water on a lot does not include sidewalk or street.

Sec. 13. All waste of water is prohibited, and consumers must keep their hydrants, faucets, valves, hose and other apparatus, including stop-boxes, street washers, and service pipes, in good order and condition, at their own expense, and all water ways closed when not in use.

1256 Sec. 14. Water must not be left running to keep pipes from freezing.

Sec. 15. The Company reserves the right to set meters whenever, and in such places only, as it may deem best. All meters shall be and remain the property of the Company, and may be removed whenever the Company may elect to do so.

Sec. 16. The Company reserves the right at any time, without notice, to shut off the water in its mains, for the purpose of making repairs or extensions, or for other necessary purposes; and all persons having boilers on their premises depending upon the pressure in the pipes to keep them supplied, are hereby cautioned against danger from collapse.

Sec. 17. No rebate on any license will be allowed, except where the premises become vacant and the water is turned off by the Company, in such case, on surrender of the license, a rebate may be allowed for the unexpired time, less one dollar for the expense of shutting off the water.

Sec. 18. In any case where the water shall be turned off of premises, by reason of water tax not being paid, a charge of one dollar will be made to meet the expense incurred in turning on the water, when tax is paid.

Sec. 19. Licenses for water for building purposes, will be issued only upon a certificate of the architect, of the work to be done, specifying the number of brick, perches of stone, and square yards of plastering, for which water will be required; and in all cases the payment for the water shall be a condition precedent to the issuance of the license.

Sec. 20. Water used for building purposes must be discharged through a hose directly into the mortar bed, and under no circumstances shall it be discharged upon the ground, or into or through a ditch or trench, and the builders must properly guard the hose connection or cock through which the water is taken, so as to render it inaccessible to others.

Sec. 21. No alteration, addition or disconnection in or about any conduit, service pipe or water cock or other apparatus connected therewith shall be made or caused to be made, by any person, except through the office of the Company.

Sec. 22. Hose license, or a license to irrigate lots, will not be granted, unless a license is taken for all purposes for which water is to be used on the premises.

Sec. 23. Water for motors or elevators will be furnished only through meters at schedule rates.

1257 Sec. 24. All faucets placed over hand basins or sinks, together with all urinals and water closets wherever situated, shall be operated with self-closing valves, that close with the water pressure, except over bath tubs and stationary laundry tubs, where compression cocks may be used.

Sec. 25. For any violation of any of these rules by any person or persons, the Company reserves the right to stop his or her supply of water, and the water rent already paid may be forfeited.

Sec. 26. The right is reserved to alter, amend, or add to these rules and regulations from time to time, as in the judgment of the Company it shall be deemed expedient or necessary.

Sec. 27. Corporation cocks will be furnished and the taps made by the Company as follows:

For Corporation Cock and Tap	$5.00
For Stop Box and Water Way	3.25

Sec. 28. Notice must be left at the office of the Company, fixing the day on which he wishes the tap made. Such notice must be given at least twenty-four hours previous to the time when the excavation is begun.

Sec. 29. No plumber shall leave the water on after completing the plumbing.

Sec. 30. Private mains shall not be laid in advance of, or beyond the terminus of the Company's pipes, except at the option of the Company.

(Endorsed:) 6274. U. S. District Court, District of Colorado. Plaintiff's Exhibit A-37. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

RULES AND REGULATIONS FOR THE GOVERNMENT OF LICENSED PLUMBERS

Section 1. Every plumber shall, before making any connection with any main, or doing any work on any service pipe connected therewith, give to The Denver Union Water Company a bond in the penal sum of one thousand dollars, with good and sufficient surety, conditioned that he will in all things well and truly comply with all the rules and regulations of this Company, for the government of plumbers.

Sec. 2. No plumber shall allow his name to be used by any other plumber or person, directly or indirectly, to obtain a permit to do any work under his bond.

Sec. 3. All work on the streets must be done to the satisfaction of the Company, as directed by its manager or foreman.

1260 COMPLAINANT'S EXHIBIT A-75. A. W. H.

Comparative Statement of Net Valuations Placed on Lands of the Denver Union Water Company.

1261 COMPLAINANT'S EXHIBIT A-75.

Comparative Statement of Net Valuations Placed on Lands of the Denver Union Water Company.

The items covered appear on Pages 111 to 115, inclusive, of Exhibit C.

Column 1 contains the valuations placed upon the various properties and testified to by the City's Appraisers, Messrs. A. C. Anderson and J. I. Carper.

Column 2 contains the valuations placed upon all of the properties by the Public Utilities Engineers and testified to by Mr. E. C. Van Diest.

Column 3 contains the valuations placed upon said properties by Messrs. Leonard Metcalf and George G. Anderson, being the valuations enumerated in Exhibit C.

Column 4 contains the valuations placed on the various properties by The Denver Union Water Company's Appraisers, the valuations on land outside the City and County of Denver being agreed to by Messrs. C. W. Bowles and A. D. Wall, the valuations on city property being the average of the appraised valuations independently arrived at and testified to by Messrs. E. R. Conaway, H. W. Newcomb and W. W. Watson.

It will be noted from the testimony that the figures in Column 1 do not include improvements of any character. The figures in Columns 2-3-4 include the value of farm improvements only.

On page 7 will be found a comparison of the major differences.

Item 37. Rights of Way			3,815	17,400
			$365,480	$710,472

Difference in value on the six properties enumerated, $710,472 — $365,480 = $344,992.
Difference in total net values (see page 6) $854,639 — $513,601 = $341,038.

It will be noted that the differences in values on all other lands are comparatively small and approximately balance each other.

Cement Costs, f. o. b. Cars Denver. Metcalf in Rebuttal.

Cost of Portland Cement, f. o. b. Cars Denver, Bought by the Denver Union Water Company, Accepting the Lowest Bidder on Competitive Bidding, with Deduction for Returned Sacks.

NOTE.—This record includes all records concerning any substantial purchases by the Company.

Year.	Barrels.	Brand.	Cost per barrel f. o. b. cars.	Amount.
1905	6,000	Iola	$1.85	$11,100
1906	10,312	"	2.00	20,624
1907	6,140	"	2.30	14,122
1908 } 1909 } 1910	none	.....	.....	.....
1911	3,000	Iola	1.20*	3,600
1912	2,000	Colorado	1.17*	2,340
1913	482	Iola	1.97	950
1914	408	Colorado	2.02	898
	28,342	Average.....	($1.89)	$53,634

*Prices abnormal on account of disastrous competition.

It is probably fair to assume a credit per barrel for sacks returned, of.....	0.25
Net cost..... excluding handling, storage, and testing	$1.64

Metcalf & Anderson Pl. Exh. C:

Cement per bbl. f. o. b. cars Denver.....	$2.00
Deduct credit upon bags.....	0.25
Net price per barrel.....	$1.75
Storage and handling into storehouse, testing, etc.....	0.15
Cost per bbl. ready for delivery on site work.....	$1.90

John Gaffy Def. Exh. 58, p. 11:

Cost of cement f. o. b. Denver	$1.62
Handling once in storehouse	.04
(Gaffy allows three handlings from cars to work @ 60¢ per ton.)	$1.66
Profit, 12%	.20
	$1.86
Contractor's bond, insurance & interest, 3.52%	.07
Cost per bbl. on teams or in storehouse	$1.93

Ackert Bickel:

Bickel in cross examination said that he estimated the fair cost of cement f. o. b. Denver, at	$1.37
and in submitting his total cost of the "Capitol Hill Concrete Costs" used as the price of the cement delivered on the work	$1.52

per barrel, to which he applied a 25% contractor's overhead and profit allowance.

Edmund C. Van Diest

of the Public Utilities Engineers did not submit in his exhibits detailed figures showing their assumption as to the cost of cement.

Leonard Metcalf in Rebuttal.

The Denver Union Water Company Rating Case as of May 1, 1914.

Transportation by Motor Trucks.

In connection with the investigation of the value of The Spring Valley Water Company, which supplies the City of San Francisco with water, Metcalf had occasion to look up the cost of transportation by motor trucks in that vicinity. He found that motor trucks were being used in the transportation of the cement from Milpitas, a small town on the railroad upon the east side of the San Francisco Bay, to the site of the Calaveras Dam under construction by The Spring Valley Water Company, a distance of approximately nine and one-half miles. The contract cost for this work was 28¢ per ton mile, the contractor loading his truck from the cars, the Company unloading the cement from the truck into its store-houses. The cost to unload amounted to approximately 27½¢ per ton. The road conditions were reasonably good, there being but one short stiff pitch in the entire distance, the work being done in the summer season. One truck made the round trip of nineteen miles in five hours, or four and one-half hours of travel and one-half hour of loading and unloading. With a view of reducing the overhead costs, the contractor hauled cement by night as well as by day. This necessitated the use of eight trucks to keep five trucks going in serviceable condition, there being insufficient time between trips to make the necessary repairs.

The hauling costs upon lumber and all other materials was 30¢ per ton mile plus 25¢ per ton for loading, the Company in these cases also unloading the material. The time lost in loading and unloading these materials was one hour per trip. Over 100,000 sacks of cement were hauled in this way.

Inquiry was also made of the conditions in Los Angeles and figures were obtained during the investigation by Metcalf upon the cost of this work to the City in 1912, the figures being 65¢ per ton for the first mile, 15¢ per ton each for the second and third mile, and additional miles at 10¢ per ton mile. Metcalf's recollection is not clear with regard to the limit of the distance to which the latter figures applied, but he remembers it as applying to hauls within the city limits and not to great distances.

Analysis Distri. Pipe System of the Public Utilities Engineers. Metcalf in Rebuttal.

The Denver Union Water Company. Rating Case as of May 1, 1914.

Mr. Edmund C. Van Diest of the Public Utilities Engineers submitted in Def. Exh. 54-19, sheet 11, estimate showing "Replacement Cost" and "Contractor's Profit 15% of the "General Schedule" of the distribution pipe system, "valve pits, river and bridge crossings, 24 inch (2552 feet) wood stave pipe, 24 inch (2582 feet) steel pipe," having previously submitted in Def. Exh. 28 their estimated replacement cost of the main items entering into the "General Schedule," (which latter (Def. Exh. 28) excluded contractor's profit in the specific items, although it added this overhead charge in a lump sum at the end) and gave under cross examination the allowance made by the Board upon the cast iron pipe, (to-wit: 3″ and 4″ diameter, $32.75 per ton delivered; 6″ to 16″ inclusive, $31.75 per ton delivered; 18″ and above, $31.50 per ton delivered.)

From the latter figures, Metcalf computed the following:

Public Utilities Engineers' Estimate of Cost of Cast Iron Pipe Delivered on Trench, Excluding Contractor's Overhead and Profit (15%).

Diameter of pipe.	Tons of pipe.	Price per ton.	Amount.
3″	86.126	$32.75	$2,821
4″	2,569.172	"	84,140
6″	20,156.307	31.75	639,963
8″	4,315.090	"	137,004
10″	2,522.685	"	80,095
12″	13,509.596	"	428,930
14″	1,734.454	"	55,069

20″	1,167.250	"	36,768
24″	7,606.747	"	239,613
Total ...	59,508.623 Tons		$1,889,517
30″ Capitol Hill line Def. Exh. 54-19, Sheet 9, Item E-D-6 ...	928.2405 "	32.50	30,168
	60,436.8635 Tons		$1,919,685

Deduction:		
24″ West Alameda 2552′ @ 233.3# @ $31.50 p. ton	$9,377.	.....
24″ So. Clarkson 2582′ @ 233.3# @ $31.50 p. ton	9,488.	18,865
		$1,900,820
Add 15% contractor's profit		285,123
		$2,185,943

To the amount of the specials ($90,992) shown on the last page of Def. Exh. 28, was added the 15% contractor's profit, giving $104,641.

To the items "Valves and valve boxes" ($216,358.73) and "Smith specials" ($1,781.44) shown in Def. Exh. 28, was added the item "Valve pits" shown in Def. Exh. 54-19, sheet 11, ($4,597.29), with 15% contractor's profit upon all of these items, giving the total sum of $256,149.

1315 PL. EXH. —, B 2.

Jan. 7th, 1915—L. M.

Analysis Distri. Pipe System of the Public Utilities Engineers. Metcalf in Rebuttal—Continued.

The hydrant item, $146,542, Def. Exh. 28, was increased by the 15% contractor's profit, giving $168,523.

The derivation of the items "Excavation and Backfilling" $383,160 and "Pipe Laying, Labor, Lead and Yarn," ($306,347) both including 15% contractor's profit, is discussed in Metcalf's rebuttal exhibits relating to these subjects.

The item "Sheeting and Bracing" was derived from Def. Exh. 28, under the tabulation "Cost of Trenching and Backfilling," which tabulation does not include the 15% contractor's profit, which was subsequently added giving a total sum of $21,773.

The item "Pavements" was derived from the statement contained at the foot of Def. Exh. 54-25, page 6, "In the valuation of the engineers of the Public Utilities Commission, there was included for paving over mains, including engineering, contractor's profits, contingencies and interest during construction, $504,310.66." This amount, if figured in accordance with Van Diest's statement contained in Def. Exh. 54-19, sheet 11, must have been based upon replacement cost, 100%, plus contractor's profit 15%, plus engineering 10%, total 125%, plus interest during construction @ 8.4% thereon, or 10.5%, giving a grand total of 135.5% of the "replacement cost." From this should be made deduction for depreciation, which presumably amounted to 12.91%, as shown in Def. Exh. 54-19, sheet 11, which would make the net present value 135.5%

x 87.09%, equal to 118% of replacement cost. For the purpose of the present comparison, the "replacement cost" plus Van Diest's 15% contractor's profit is desired, which would therefore amount to 115%

118%, or 97.5% of $504,311, equal to approximately $491,700.

To the "River and Bridge Crossings" item, ($12,435.18), shown in Def. Exh. 54-19, sheet 11, was added the contractor's profit of 15%, giving a total of approximately $14,300.

The item "Obstructions, Railroad, Electric, Telephone, etc." was given Metcalf by the Public Utilities Engineers, $10,228.40, "replacement cost" excluding (15%) contractor's profit, or $15,342.60 inclusive.

The item "Steel and Wood Pipe" was derived from Items No. 1 and No. 2 in foot-note to Def. Exh. 54-19, sheet 11, which show the replacement value of the wood stave pipe to be $2,883.70 and of the steel pipe $10,057.47, making a total of $12,941.17. Inasmuch as these values are the total replacement value, including 10% engineering, 15% contractor's profit, and 8.4% over-all interest allowance, the replacement cost plus 15% profit only would be in the ratio of 115% to 135.5% x $12,941 = $8,480.

This item indicates by comparison with the items of all of the other witnesses that either the excavation and backfilling and laying expenses were omitted or that they were included in the items relating thereto and not in the item "Steel and Wood Pipe."

1316 PL. EXH. B3.

Metcalf (Continued).

Jan. 7th, 1915.—L. M.

Analysis Distri. Pipe System of the Public Utilities Engineers.

Metcalf in Rebuttal.

The sum total of these items is—

	Amount, inc. 15% contractor's profit.	Per foot of pipe.
C. I. Pipe	$2,185,943	97.0¢
Specials	104,641	4.6
Valves, boxes, Smith Specials, Pits	256,149	11.4
Hydrants (set in place)	168,523	7.5
Excavation and Backfilling	383,160	17.0
Laying, Labor, Lead and Yarn	306,347	13.6
Sheeting and Bracing	21,773	1.0
Pavements	491,700	21.8
River and Bridge Crossings	14,300	0.6
Obstructions, R. R., El. Tel	15,343	0.7
Steel and Wood Pipe	8,480	0.4
	$3,956,359	$1.756

This amount, $3,956,359, is comparable with the total amount shown in Def. Exh. 54-19, sheet 11, with the following modifications:

Def. Exh. 54-19, sheet 11, Van Diest, replacement cost.		$3,404,726.26
do. do. 15% contractor's profit.		510,708.95
		$3,915,435.21
Less correction for credit (Van Diest) on wood stave pipe	$7,549.39	
" steel "	408.59	7,957.98
		$3,907,477.23
Add account 30" C. I. Pipe Capitol Hill, 5,570 ft. Van Diest's Def. Exh. 54-19, sheet 9, replacement cost	$41,420.97	
Contractor's profit, 12½%	5,177.62	46,598.59
		$3,954,075.82
Metcalf's footing		3,956,359
		$2,283

This error, $2,283, is about 1/20 of 1%, and if the figures on trenching and backfilling had been applied to the Def. Exh. 28, Schedule of Lengths, instead of to the Pl. Exh. C, Schedule, the error would have been reduced to about $200 instead of $2,283.

Analysis of Excavation & Backfilling on Basis Public Utilities Engineers. Van Diest. Def. Exh. 28.

Metcalf in Rebuttal.

PLAINTIFF'S EXHIBIT —, TABLE B. LEONARD METCALF.

The Dener Union Water Company—Rating Case as of May 1, 1914.

In Defendants' Exhibit 28, Mr. Edmond C. Van Diest submitted for the Public Utilities Engineers an estimate of the "Cost of Trenching and Backfilling" for pipe of different diameters, including work upon trenches with and without sheeting. These figures excluded the contractor's profit.

In order, therefore, to make general comparison of the Public Utilities Engineers' cost of trenching and backfilling on basis of "The fair Contract Cost" segregation had first to be made of the item of sheeting shown in column (4) below, to obtain the cost exclusive of the sheeting shown in column (5) below, and to this the contractor's profit item of 15% had to be added, column (6) below. The unit costs thus obtained were applied to Metcalf and Anderson, Exhibit C, "lengths in feet" column (2) below, instead of lengths in feet given in Def. Exh. 28. To obtain the comparable amount shown in column (7) below, the item of 30″ pipe was obtained by Metcalf, courtesy of Mr. Fellows, from the Board figures.

DEFENDANTS' EXHIBIT 28. VAN DIEST.

1321 Jan. 6th, 1915.—L. M.

Analysis Excavation and Backfilling on Basis John Gaffy's Def. Exh. 57 and 58.

PLAINTIFF'S EXHIBIT —, TABLE C, LEONARD METCALF.

The Denver Union Water Company—Rating Case as of May 1, 1914.

In Gaffy's Defendant's Exhibit 57, page 134, Items 12 *a* and *c* Mr. Gaffy gives the following amounts:

Excavation, machine work....	527,907	c. y.	21.4 ¢	$112,972
" hand work.....	508,896	c. y.	28.8 ¢	146,562
Total excavation.....	1,036,803	c. y.	25.03¢	$259,534
Backfilling	1,036,803	c. y.	10 ¢	103,680
Total	1,036,803	c. y.	35.03¢	$363,214

This average rate per cubic yard, (35.03¢) was therefore applied by Metcalf to the quantities in cubic yards per linear foot of trench for pipes of different diameters given in Gaffy's Defendant's Exhibit 58, page 116, thus arriving at the unit costs per foot of pipe of pipes of different diameter on the basis assumed by Mr. Gaffy, including, as stated by him, 12% contractor's overhead costs and profit. To the figures thus arrived at and shown in Column 3 hereunder was then added Gaffy's allowance of 3.52% approximately, (applied to the combined contractor's cost and overhead and profit,) to cover the contractor's bond, insurance and interest, thus giving a grand total contractor's overhead, bond, insurance and interest cost and profit of 15.92% upon the estimated contractor's cost, excluding the said items. In other words, the results obtained in Column 3 are multiplied by the factor 1.0352 in order to obtain the items shown in Column 4.

1322 Jan. 6th, 1915.—L. M.

Analysis Excavation and Backfilling on Basis John Gaffy's Def. Exh. 57 and 58.

Analysis Excavation and Backfilling on Basis Gordon's Def. Exh. 60.

PLAINTIFF'S EXHIBIT —, TABLE E, LEONARD METCALF.

The Denver Union Water Company—Rating Case as of May 1, 1914.

In Gordon's Defendant's Exhibit 60, page 2, are given the estimated costs per foot for pipes of different diameters of "trenching and backfilling" excluding allowance for contractor's overhead costs and profit.

In order, therefore, to make Gordon's figures upon excavation and backfilling comparable with those of the other witnesses on the basis

of "fair contract cost" Metcalf added to Gordon's figures 10.25% to cover Gordon's allowance for "tools, interest, liability and bond, unlooked for conditions and contingencies, profit and office expense," Mr. Gordon's actual figures amounting to 10.27%. The error thus introduced (for convenience in computation) is negligible for comparative purposes, amounting to less than 1/5 of 1%.

1324 Jan. 6th, 1915.—L. M.

Analysis Excavation and Backfilling on Basis Freemont Hill's Def. Exh. 63.

PLAINTIFF'S EXHIBIT —, TABLE F. LEONARD METCALF.

The Denver Union Water Company—Rating Case as of May 1, 1914.

In Defendant's Exhibit 63, Mr. Freemont Hill submitted his estimate of the necessary width of trench and a condensed computation of the cubic yards of excavation involved per linear foot of trench for pipes of different diameter, assumed to be "6 feet deep" arriving at a total footing of 950,845 cubic yards of excavation and backfilling. To this amount he applied a rate of 14¢ per cubic yard, excluding contractor's profit, giving a total sum of $133,116.30, or, adding his 10% contractor's profit, $146,427.93.

Detailed computation was therefore made by Metcalf of the excavation and backfilling per linear foot of pipe of each diameter upon Hill's assumed basis, and price of 15.4¢ per cubic yard, including 10% contractor's profit and overhead, was applied thereto, thus giving the cost per foot of pipe and amount for pipes of each diameter, as shown below.

Dec. 17, 1914.

Jan. 6th, 1915.—L. M.

Analysis Pipe Laying Costs on Basis of John Gaffy's Prices, Def. Exh. **57.**

Leonard Metcalf.

The Denver Union Water Company—Rating Case, as of May 1, 1914.

The pipe laying costs shown in Gaffy's Exh. 57, page 134, Item 12*b*, include 12% contractor's overhead costs and profit, but don't include allowance for contractor's bond, liability insurance, and contractor's interest costs. The latter upon Gaffy's figures amount to 3.52% of the cost, including contractor's overhead and profit, which correction was therefore made, resulting in the following figures:

Metcalf's Analysis of John Gaffy's Cost of Pipe Laying (Covering Labor Cost, Lead, and Yarn), Including 15.92% Contractor's Overhead, Bond, Insurance, Interest, and Profit, Based upon Def. Exh. 57, Page 134.

Analysis Pipe Laying Costs on Basis of D. G. Gordon's Def. Exh. 60.

Leonard Metcalf.

The Denver Union Water Company—Rating Case, as of May 1, 1914.

The figures on cost of pipe laying, comprising labor, lead and jute costs, contained in Defendant's Exhibit 60, are exclusive of contractor's overhead and profit allowances. They have therefore been increased by a total amount of 10.25%, which comprises 6.92% contractor's overhead costs and profit plus 3.33%, Gordon's allowance for "tools, interest, liability and bond, unlooked for conditions and contingencies," Gordon's total addition being $101,000 or 3.35%, 3.33% being used here as a matter of convenience in figuring, the error introduced thereby being approximately 1/5 of 1%.

Metcalf's Computation of D. G. Gordon's Estimate of Cost of Pipe Laying (the Latter Comprising Labor, Lead, and Jute), with Contractor's Overhead, Bond, Insurance, Interest, and Contingent Costs, and Profit of 10.25% (Gordon Having Actually Assumed 10.27%).

The Denver Union Water Company.

Analysis Pipe Laying Costs.

On Basis of Fremont Hill's Figures.

Jan. 5, 1915.

L. M. L. M.

The following detailed figures on pipe laying costs of Fremont Hill as applied to Class S. Distribution Pipe System, including the labor cost of handling and laying pipe and the cost of lead and jute, including 10% contractor's profit and overhead, was determined from Defendant's Exhibit 63 (Fremont Hill) in the following manner:

To the cost of "Laying in cts. per ft." was added Hill's allowance 10% profit and overhead cost. The figures thus obtained for each pipe size from 3 inches to 30 inches were then increased in the ratio of $170,058 to $110,488, equivalent to 154% to cover the cost of laying valves and hydrants which were added by Mr. Hill in lump sums.

The amount of "Pounds of Lead" used in each pipe size was reduced to a "per ft. of pipe basis." To the latter was then applied

Hill's cost of lead—5.225¢ per pound, including 10% overhead and profit. The figures upon cost of lead per lin. ft. of pipe of each diameter thus found were then increased in the ratio of the total tons of lead given by Hill, including the lead used in laying specials, hydrants and valves and amounting to 1,756 tons, to the tonnage found as above stated upon the pipe laying alone, 1,291.17 tons, equivalent to 136%.

The cost of the Jute per lineal ft. of pipe of each diameter was found in a similar manner to that used for the lead. Hill's price including 10% overhead and profit being 5.775¢ per pound. The cost per lin. ft. of jute upon the pipe being increased in the ratio, 104,254 pounds, total including the jute used in laying specials, hydrants and valves, to 82,237 pounds used in laying the pipe only, equivalent to 127%.

The prices thus found are as follows:

Metcalf's Analysis of Fremont Hills Cost of Laying Pipe in Distribution Pipe System. Comprising Therein Only the Labor of Laying and the Cost of the Lead and Jute, with 10% Contractor's Overhead Cost and Profit Based Upon Defendants' Exhibit 63 (Fremont Hill).

Diam. pipe. inches.	Length in feet.	Revised costs per foot, incldg. 10% contractor's.			Total revised cost of labor of laying, lead, & jute, including 10% contractor's overhead and profit.	
		Laying.	Lead.	Jute.	Per foot.	Amount.

Analysis Pipe Laying Costs on Basis of Ackert Bickel's Def. Exh. 65, and His Testimony.

The following table, showing the detailed costs of laying pipe of different diameters, including Bickel's 16% contractor's overhead costs and profit, was prepared from the testimony submitted by Mr. Bickel, in explanation of his Class S distribution pipe system schedule.

To it has been added Bickel's overall allowance of 4.46% to cover "Contractor's general overhead and contingencies" (Def. Exh. 65, p. 67*a*. revised by Bickel) making the equivalent total Contractor's overhead costs, bond, liability insurance, contingencies and profit, 21.17% on his basic cost.

See Exhibit on Excavation and Backfilling. Table G for these details.

Construction Period Cheesman Dam.

Metcalf in Rebuttal.

Summarized Statement of Period of Time Involved in Design and Construction of Cheesman Dam.

The Denver Union Water Company—Rating Case as of May 1, 1914.

1892–1898.	6 years' surveys and plans, net period	22	months
	Clearing up "filing" plans with United States Government, net time	19	"
	Clearing up "placer claims" net time	5	"
	Construction period, say net time	8	" ?
	Total net time, 2 years 8 months	32	
1898–1900.	2 years' active construction on rock fill dam, net time, and in tunneling.	19	months
1900–1904.	3 mos.' plans and studies in dam. 4 years' active construction present dam, net time	4 years,	1 month
	Gross period 12 years comprising—		
	Surveys and plans,	2 years,	1 month
	"Filing plans" United States Govt.	1 "	7 months
	Clearing up "placer claims"		5 "
	Construction,	6 "	4 "

Of the latter period, perhaps 1 year and 4 months was lost by the washing out of the loose rock of the rock fill dam. The work done upon the foundations and the steel faced masonry core wall of the latter remained, however, and was incorporated in the present structure.

Statement of Work Done on Cheesman Dam from 1892 *to* 1904, *Both Inclusive.*

1892. Some months of reconnoissance works.
1893. Six months' surveys.
1894. 8 months of planning and construction.
11½ " conferring and correspondence with U. S. Govt. officials in regard to the "filing plans," etc.
1895. 7½ months more conference and corresponding with Govt. officials on "filing plans."
5 months clearing up placer claims.
Some construction work on tunnels.
1896. 1 month's surveys and assessment work.
1897. 1 month, surveys completed.
1898. 3 months, further investigation of different dams built in the United States.
3 months, construction on rock fill dam.
1899. 12 months, construction on rock fill dam.
1900. 4 months, construction on rock fill dam.
May 3rd, rock fill dam partially washed out.
3 months, further studies and plans.
4 months, construction on present dam.
1901. 1 year, do.
1902. 1 " do.
1903. 1 " do.
1904. 9 months, do.

1338 (C.)

Detailed Statement of the Period of Time Required for the Planning and Construction of Cheesman Dam.

1892. February, James D. Schuyler, in reporting upon the Strong Reservoir, recommended that studies be made of other available stream-bed reservoir sites.

From P. 261, Testimony of W. F. Allen in the matter of the Petition of The South Platte Canal and Reservoir Company for the adjudication of water rights of Lake Cheesman for beneficial purposes other than irrigation. Testimony

taken before C. P. Gehman, at Hartsel, Colo., Sept. 1912, for the District Court of Colorado in the District of Park County.

During the year 1892 Schuyler, C. P. Allen and others made reconnoissances through the South Park District, following up the above recommendation.

1893. Late in April or early in May, W. F. Allen began surveys of the Bonus and Mosier reservoir sites. Page 262.

September, 1893, C. P. Allen, J. A. Osner, A. E. Meek, A. M. Grace, C. P. Allen, Jr., Geo. McNoll, John Williams, and W. F. Allen, also Peter O'Brien, discovered the Cheesman site, locating the dam site September 24th, 1893. Pages 262-3.

Rough contour survey made September 25th.

October 7th, 1893, W. F. Allen returned to the field with a party for permanent survey; completed October 16th, 1893, p. 263.

1894. April 14th, W. F. Allen returned to site and began construction of outlet tunnel. In fall of 1894 C. P. Allen made plans for solid masonry dam, and alternative plans for a rock fill dam.

Jan. 19th, 1894, first filing made. p. 267.

In April, 1894, filing was rejected by the Department of the Interior, and additional surveys followed to comply with the Government requirements.

1895. August 19th.—Filing approved by the Department of the Interior, much correspondence between the Company and the Washington authorities having passed in the interval.

August, 1895, to December, 1896.—Effort made to clear up placer claims.

1896. December, W. F. Allen took crew of forty or fifty men and constructed power ditches from Goose Creek, performed assessment work on placer claims, and while the gorge in the canon was frozen solid, made the complete contour survey of the dam site.

1897. January, contour survey completed. Surveys made by suspending rodman over the cliffs by rope.

1898. In the summer, C. P. Allen made trip through the west, investigating rock fill dams, George G. Anderson and James D.

Schuyler assisting as consulting engineers upon the plans prepared by Allen.

Early fall of 1898, work preparatory to the construction of the rock fill dam was begun and continued until the washing out of the rock fill behind the dam *in* May 3rd, 1900.

1900. June, studies begun by Chief Engineer C. L. Harrison, with Alfred Noble and Lyman Cooley as consulting engineers.

August 29th, contract entered into with Geddie & Seerie Stone Co. for the construction of the present masonry dam, and work actively prosecuted thereafter until completion.

1903. October 26th.—Supplementary contract relating to construction of Cheesman Dam made with Geddis & Seerie Stone Co.

1904. October 1st.—"Estimate No. 49, final," made upon the completion of the dam by the Geddis & Seerie Stone Co.

In figuring the total time involved in the construction of the present masonry dam, it is to be remembered that all of the preliminary work done upon the rock fill dam in the way of exposing foundations and building core wall faced with steel was incorporated in the final structure, including the driving of the main tunnel, both of which were built at a much earlier date, the tunnel having been finished in the summer (?) of 1898.

Actual Construction Periods.

PLAINTIFF'S EXHIBIT —, TABLE E, LEONARD METCALF.

Actual Time Required for Surveying, Planning, and Building the More Important Structures of the Denver Union Water Company.

Marston Lake Reservoir: 2 Years Surveys and Planning. 5½ Years' construction (piecemeal).

1890. March 27.—Surveys of Reservoir Begun (Book 13, pages 11-15).

1892. Feb. 29.—Surveys for Embankment—(Book 13, pages 17).

Aug. Construction begun on the outlet towers and tunnels. Completed in the — — 1893.

In the winter, new reservoir construction begun. Construction begun upon the embankments of the reservoir; suspended in April, 1894, for a period of nearly a year, while the properties of the two companies, The Citizens Water Company and The American Water Works Company, were being combined.

Remember, that there was an old reservoir on the site, having a capacity of say one billion gallons, more or less. This old reservoir was drained by the tunnel construction of 1892 and in the winter of that year the basin partly filled and water was used from it during the season of 1893.

1895. In the spring, construction work resumed upon the embankments and suspended in the winter of 1896.

1899. Late Fall, construction begun again and continued for about a year, until the fall of 1900.

1902. In the early summer, raised the embankments 5 feet and rip-rapped slopes, completing it about spring of 1903.

1904–5. Plans and Estimates begun Dec. 1904, Revised plans and Construction, March 1905, built concrete spillway, apron, etc., during a period of less than one month.

1911. April. Constructed new inlet works to connect with Conduit No. 7 from Platte Canon, completing the work in less than 2 months.

Slow Sand Filter Plant:

Built one basin at a time.

Fall of 1900. Construction was begun and completed in a period of six years the active construction work probably having covered a period of two years or slightly less.

Platte Canon Reservoir:

Required one full year for preparation of plans and construction.

Capitol Hill Reservoir:

Basin No. 1 was built in the year 1887, and lined in a period of six weeks in the year 1893.

Basin No. 2 was built in the years 1906-7, in a period of approximately nine months, exclusive of preparation of plans.

1341 *Actual Construction Periods*—(Cont'd).

(F.)

Dec. 16, 1914.—L. M.

Ashland Reservoir.

Required a period of construction of approximately two and a half years.

Conduits.

Conduit No. 1. 2 years Planning & Construction.

1889. Surveys Begun in November, Work completed in the fall of 1890. Construction begun February, 1890, and completed in the fall of the same year. Diameter 30", length in miles, 21 mi. from Infiltration Galleries to Ashland Ave. Reservoir.

Conduit No. 2. 2 years Planning & Construction.

1892. Surveys and plans begun in spring of 1892. Construction began summer, 1892, completed spring 1894. Diameter 30" & 34", length in miles, 22 mi. from Platte Canon to Capitol Hill Reservoir.

Conduit No. 3. 2½ years Planning & Construction.

1899. Construction began May 19th, 1899, completed fall 1911. Diameter 40"-36" 34" & 30", length in miles, 21 mi. from Filter beds to Ashland Avenue Reservoir.

Conduit No. 4. 1 year Planning & Construction.

On original Construction data missing. Work done 1882-83.

1906. Rebuilt in spring. Survey March 7, Pipe Line soon after. Diameter 48" and 40", length in miles, 2.75 miles, from Mississippi St. Infiltration Gallery to West Side Reservoir. Finished in April, 1907.

Conduit No. 5. About 6 months Planning & Construction.

Cherry Creek, original conduit 36" *inched* in diameter, length 5.44 miles.

1907–8. Rebuilt, 30" & 36".

Conduit No. 6. 2 years Planning & 8 months Construction.

1907. Surveys begun March 5th, Preliminary covering 2 years time on different locations.

Construction begun November, 1909, and completed June, 1910. Diameter 48″ and 40″, length in miles 12.25 miles, from Wynetka to Capitol Hill Reservoir.

Conduit No. 7. Surveys 3 months, Construction 3 months.

1910. Surveys begun Dec. 1st, 1910, construction begun February 9th, 1911, completed May 13th. Note.—That preliminary surveys for this line were made a year or two before. Diameter 48″, length in miles, 10.02 miles, from Platte Canon to Marston Lake.

1342 *Actual Construction Periods*—(Cont'd).

(G.)

Dec. 16th, 1914.—L. M.

Conduit No. 8. Construction 1 yr.

1911. Construction begun November 12, 1911. Line completed November 12th, 1912. Diameter 60″ & 36″, length in miles, 60″—2.58 miles, 36″—.77 miles, from Intake to Platte Canon Spur and Platte Canon Reservoir.

Conduit No. 9.

1912. Surveys begun December.

1914. Construction begun December 1st, Now under construction. 48 inch diameter 6 miles long, from Marston Lake to Alameda Avenue and Federal Boulevard.

Distribution Pipe System.

No significant records of the rate of construction of the Distribution Pipe System are available on account of the piecemeal character of this construction, excepting the work done in the Year 1890 when the American Water Works Company built its plant and attempted to get the business of the Citizens Water Company. The construction work done at that time was pushed with the utmost vigor and the competition was of the keenest sort, resulting finally in the consolidation of the companies as the Denver Union Water Company.

During the period from January 2, 1890, to November 10th, 1890, or substantially one year's construction period, the American Water Works Company laid approximately 98 miles of pipe as appears from the subjoined schedule.

Amount of Pipe Laid by The A. W. W. Co.

Per Report of Pipe Foreman.

From January 2nd, 1890, to November 10th, 1890.

Sept. 13, 1893.—W. F. H.

Metcalf's Supplementary Summary.

Development Expense and Estimated Equitable Gross Annual Revenue for the Year 1914. Based Upon Arbitrary Assumptions as to Investment Cost Since 1894 and Different Methods of Accounting Depreciation Suggested in Testimony by Mr. Edmond C. Van Diest and A. Lincoln Fellows of the Public Utilities Engineers:

NOTE.—The detailed computations appear in the appended Tables B, C, D, E.

1. Based upon fair annual return of 7% upon "capital sum," consisting of bonds issued and outstanding, less depreciation allowance, plus deficit or minus excess in assumed fair return of 7%, with different methods of accounting depreciation, but providing for an assumed total depreciation allowance as of Oct. 31, 1913, amounting in abandoned property to $1,261,000, on existing property to $1,534,000 or a total of $2,795,000.

Table B. With 1.8% "Straight-Line-Depreciation" Annuity,

Development Expense	$711,000	
Equitable Gross Annual Revenue (1914)		$1,295,000

Table C. With 0.96% "Equal-Annual-Payment"-Method-Depreciation Annuity,

Development Expense	$711,000	
Equitable Gross Revenue (1914).		$1,417,000

2. Based upon fair annual return of 7% upon "capital sum," consisting of bonds outstanding in 1895, increased by the construction account reported annually thereafter by the company, less depreciation allowance, plus deficit or minus excess in assumed fair return of 7%, with different methods of accounting depreciation, but providing for an assumed total depreciation allowance as of Oct. 31, 1913, amounting in abandoned property to $1,261,000, on existing property to $1,534,000, or a total of $2,795,000.

1351 COMPL'T'S EX. A-106.

Extract Upon Loss in Revenue to City if It Build Its Own Plant Instead of Acquiring the Property of The Denver Union Water Compnay.

From the Report of the Public Utilities Engineers.

Jan. 16, 1914.

(Section- 1-9, pp. 91 & 82.)

If the City builds its own plant, it will lose the profits that would accrue to it by a purchase of the Water Company's plant. These profits would without a change in the rates accrue to the Water Company during the time required to build the Municipal Plant. In order that you may be advised as to the possible profits under the present schedule, during the period of five years, estimated as required to build a new plant, and based on the results of operation for 1912, we find, as follows:

Gross Revenue		$1,383,977.75
Operation & Maint.	$321,087,03	
Taxes and Rentals	126,319.46	
Interest	534,205.81	
Depreciation 1%	112,000.00	
		1,093,612.30
		$290,365.45

If, instead of an allowance for interest only, we allow 6% as a fair return, on an assumed value equal to the outstanding bonds, the total deductions would be $112,000.00 more or a total of $1,205,-612.30 leaving as net income, $178,265.45.

If five years are needed to build the new plant and reconnect the services, the aggregate for that time would be $891,827.25.

1352 The aggregate receipts from schedule rates for the year 1912 amounted to $1,142,654.68. If those rates should be reduced by 10%, the revenue reduction would amount to $114,265.47, reducing the net income to $64,100.00. It must not be forgotten that the year 1912 was the best year the Company has ever had; it was a year of maximum revenues, both gross and net, and is not submitted as a fair criterion of future earnings.

If we take the earnings of the five years, ending November 1st, 1912, we find the average net income under the same conditions to be $109,121.52. If the five years to November 1st, 1913, are taken, and the estimated revenues from 1913 are included in a five-year period, this average net income would be $140,564.42.

We submit the foregoing estimate of the amount of deficiency to November 1st, 1913, as a method of determining the fair amount of Development Expense due to The Denver Union Water Company at that time, in accordance with the opinions of the Courts of last resort. As we have already stated, we are of the opinion that the case under consideration is different from that of other cases in which such values were allowed by the courts, but as practically the entire trend of Court decisions in purchase cases has been toward such an allowance, we think it but fair to suggest the method outlined above, not as an obligation but rather as suggesting a sum which the City might be willing to pay on account of the connections and other advantages incident to taking over an operating plant in preference to taking the time and going to the inconvenience of building a new system.

Sec-. 1-9.

(Endorsed:) 6274. U. S. District Court, district of Colorado. Plaintiff's Exhibit A-106. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

DEFENDANT'S EXHIBIT No. 47.

The Field, Fellows and Hinderlider Engineering Company.

Suite 435, 811 17th Street, Denver, Colorado, U. S. A.

Telephone, Main 4472.

Consulting and Supervising Engineers on Irrigation, Drainage, and Power Developments for Bond Houses and Contractors.

John E. Fields, M. Am. Soc. C. E.
M. C. Hinderlider, M. Am. Soc. C. E.
H. A. Storrs, M. A. I. E. E. & Am. Soc. C. E.
A. Lincoln Fellows, M. Am. Soc. C. E.
S. D. Gromer, Ass't Sec. & Treas.

1356 *A Comparison of Estimates of Available Storage at Lake Cheesman.*

NOTE.—Estimates by Anderson, Comstock and Bull do not allow for a demand by the Denver Union Water Company's direct flow rights when water could be stored in Lake Cheesman.

Estimates by Field and Fellows allow a demand for the direct flow rights at the Canon.

Assumptions:

Anderson: Method not explained.

Comstock: Average supply of past years assumed to be a satisfactory future supply.

Field: Estimates of monthly demands made from the Water Commissioners' reports.

Bull: Conditions as reported by Water Commissioners used to determine the available storage during the periods governed by the reports.

Fellows: Demand of year 1913 assumed as future minimum normal demand.

Notes introduced are taken from the reports of Water Commissioners, in substance as to conditions and quantities.

(Here follow tabular statements marked pages 1357 to 1370.)

NOTE: - The Depreciation amount on the General Schedule includes two changes as follows:

Item No. 1 - Wood Stave Pipe

The 24" pipe (2552 Lin.ft.) on West Alameda Ave. between Zuni Street and Federal Blvd., was listed as Cast Iron -- Should have been listed as Wood Stave Pipe.

	Replacement Value	Depreciation	Net Value
2552 lin. ft. C. I. Pipe	$10,322.70	$345.81	$9,976.89
2552 " " Wood Stave Pipe	2,883.70	456.20	2,427.50
		Net Credit	$7,549.39

Both of these Credit items were included with Depreciation on the General Schedule, to avoid the necessity of changing the lists and schedules, which had been completed before these errors were found.

Item No. 2 - 24" Steel Pipe.

The 2,582 lin. ft. of 24-inch pipe, laid on South Clarkson Street, between Iliff and Yale Avenues, were listed as Cast Iron Pipe, but should have been Matheson Steel Pipe:
Difference in price per lin. ft. in place:

2,582 lin. ft. C. I. Pipe		$10,466.06
2,582 lin. ft. Steel Pipe		10,057.47
	Credit	$ 408.59

Depreciation General Schedule	$592,705.77
Correcting Item No. 1	7,549.39
Correcting Item No. 2	408.59
	$600,663.75

1390 DEFENDANT'S EXHIBIT No. 25.

Page 1.

Deductions from the valuation of the property of The Denver Union Water Company claimed by defendants as excessive, or for property not essential to the operation of the system, or not properly included in a rate case.

Valuation of all property of The Denver Union Water Company, as per Plaintiff's Exhibit C, p. 64		$16,038,379.00
Deductions:		
1. Difference in valuation of water rights, based on difference in quantity between "safe yield" claimed and the average daily consumption for a maximum year, in second feet, plus evaporation and seepage and plus farm use, at $6,000. per second ft., being $3,530,000 less $565,980.00	$2,964,020.	
2. Going Concern Value	1,200,000.	
3. Schedule A, p. 2, Unused, Unnecessary and obsolete property	622,289.	
4. Schedule B, p. 6, Difference in value of distributing system between 1913 valuation of Utilities Commission and Plaintiff's Exhibit C, including Corporation Cocks	601,765.	
5. Schedule C, p. 7, difference between the valuation of the Utilities Commission Engineers and Plaintiff's Exhibit C, on Miscellaneous Stock Account, etc.	64,727.	
6. Depreciation for 5 months from Oct. 31, 1913, to May 1, 1914, $56,665. less $10,981., (Plaintiff's Exhibit Z)	45,684.	
7. Paving over mains (as included in the valuation of distributing system by Utilities Commission Engineers)	504,310.	
8. Schedule D, p. 8, Net Difference in land valuations between Plaintiff's Exhibit C and Defendant's Exhibit 19, exclusive of Specific Deductions	236,496.	
Total Deductions		$6,239,291.00
Net value of Serviceable Property for Rate Making Purposes		$9,799,088.00

1391 DEFENDANT'S EXHIBIT NO. 25.

Page 2.

Schedule A.

Eliminations from Valuation of the Property of The Denver Union Water Company as Unnecessary or Obsolete, Valuations from Plaintiff's Exhibit C and Exhibit A-23.

1. Sullivan Reservoir	$133,693.00
2. Platte Canon Pumps (Schedule A-1)	31,610.00
3. West Denver Station (Schedule A-2)	112,152.00
4. Harriman Reservoir	12,807.00
5. Littleton Residence and Stables	7,576.00
6. Lands (Schedule A-3)	324,451.00
	$622,289.00

1392 DEFENDANT'S EXHIBIT NO. 25.

Page 3.

Schedule A-1.

Eliminations from Plaintiff's Exhibit C, Valuations from Plaintiff's Exhibit C, Pipe, Valves, Fittings Estimated Proportionately.

Platte Canon Pumping Plant—Valuations Metcalf & Anderson, p. 19 and sequent reports:

Units 1, 2, 3, and 5 (4 left for sand pumps)	$12,519.00
Items 6, 7 and 8	5,500.00
1 Boiler and Oven	2,797.00
Breeching 1 Boiler	330.00
C. I. Suction and Discharge Piping	6,122.00
Miscellaneous equipment, valves, steam piping and connections, etc., estimated	2,000.00
	29,268.00
Add Engineering and Contingencies, 12½%	3,658.00
	32,926.00
Add Interest during construction, 8%	2,634.00
	35,560.00
Deduct Depreciation	3,950.00
Total Value for Deduction	$31,610.00

1393 DEFENDANT'S EXHIBIT No. 25.

Page 4.

Schedule A-2.

Eliminations from Plaintiff's Exhibit C, Valuations from Plaintiff's Exhibit C, Pipe, Valves, Fittings Estimated Proportionately.

West Denver Station:		
Lake Archer and Canal (except water right and lands) Value from Exhibit A-23.....		$66,683.00
Items A-1-2-4, p-. 315, 316, Plaintiff's Exhibit C, $127,050, less $66,550.....	$60,500.00	
B-1 to 4.....	3,390.00	
Appurtenant pipe, valves and fittings, estimated proportionately.....	6,010.00	
	69,900.00	
Add Engineering and Contingencies, 12½%.....	8,437.00	
	78,337.00	
Add Interest during Construction, 8%...	6,267.00	
	84,604.00	
Deduct depreciation.....	39,135.00	45,469.00
Total Value for Deduction....		$112,152.00

Lake Archer Power Right not separately valued or included in water valuation under "Safe Yield," p. 13, Plaintiff's Exhibit C.

1394 DEFENDANT'S EXHIBIT No. 25.

Deduction from Valuation of Metcalf & Anderson for difference in total Valuation between Valuation of Metcalf & Anderson in P't'ff's Exh. A-22 and P't'ff's Exh. C, page 64.....	25,060.00
Net difference in Valuation as per P't'ff's Exh. C, in excess of that of Utilities Engineers.....	1,286,698.31

NOTE.—Schedule G, Valuation of Metcalf & Anderson, includes $137,522.00 for corporation cocks not included by Utilities Engineers.

Schedule K, Valuation of Metcalf & Anderson, includes $133,693.00 for Sullivan Reservoir not included by Utilities Engineers.

If Valuation of Lands in Plaintiff's Exhibit C contains a duplication of Woodbury Tract, under Item 34, No. 15, Arapahoe Land, Valuation of Exhibit C, Schedule A, should be reduced by $1,500.00, and the above difference in the Valuations decreased by $1,500.00.

(Endorsed:) 6274. U. S. District Court, District of Colorado. Defendants' Exhibit #54. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

1400 DEF'T'S EX. NO. 72.

Horace H. Mitchell, Certified Public Accountant, Mining Exchange Building, Colorado Springs, Colorado, Telephone Main 710, P. O. Box 84.

February 27, 1915.

Hon. W. J. Chinn, Master, in suit The Denver Union Water Company vs. City and County of Denver.

DEAR SIR: In pursuance of your instructions handed me January 11, 1915, as therein specified, I beg to report that I have completed my examination and verification of Exhibits known as A 73 and A 74 submitted by The Denver Union Water Company, and as the result of such examination I submit herewith as part of this my report, and attached hereto.

Exhibit A—Earnings and Expenses, six months ended Oct. 31, 1913;
" B— " " " " " " Oct. 31, 1914;
" C— " " " year " Oct. 31, 1913;
" D— " " " " " Oct. 31, 1914;
" E—Legal Expenses in detail " " Oct. 31, 1913;
" F— " " " " " " Oct. 31, 1914;
" G—Rate Case " " " " Oct. 31, 1914;

the items in which are found in the Amounts as set forth in Exhibits A 73 & A 74.

I have carefully examined all vouchers and bills attached thereto and in many instances the checks supporting same, together with the pay-rolls; and to the best of my knowledge and belief I have found them correctly charged, in accordance with the evidence furnished and the information given me.

I have also carefully tested the receipts for water (about 175,000 Water Licenses in the two years) under the different designations as per Exhibits A 73 and A 74, and am fully satisfied that all receipts of these different departments for the respective periods have been accounted for and accurately set down in each of the aforesaid Exhibits, with the exception of Meter Rates for 1912-1913, where I find that deductions claimed and allowances made amounting to $9,366.06 for years prior to November, 1912, were charged against the Meter Rates for 1912-1913, thus reducing to that extent the Gross Earnings for that period, and with this exception just noted, noth-
1401 ing has been omitted from said statement of Gross Earnings, which should have been properly included therein, to the best of my knowledge and belief.

The method just noted has been regularly pursued by the Company, of charging against the year when allowances or rebates have been made, rather than against the year when original charges occurred. It does not affect the net results as shown by my Exhibit C; but is simply a question of method of handling such items, and which will always occur in a large going concern; but as these items

were of a noticeable amount, I deemed it best to handle them as per Exhibit C for your information.

As Water Licenses and Builders' Licenses are not entered until collected, which method (and which is correct) put them on a cash basis, such methods as just noted does not affect these two accounts.

I find an unappreciable difference of $392.48 in "Estimated Reduction in Gross Earnings based on Rates Prescribed by City, etc.," as shown in Exhibit "B,"—caused by an error in figuring only 20% reduction in the Emergency Rate to the Court House of $550.00 for six months, whereas, it should have been entirely eliminated, and a difference of $47.52 less in figuring 1914 instead of taking figures for 1913.

There were 44,280 Taps in 1913, with an average receipt of $25.68 plus per tap, while in 1914 there were 44,798 Taps with an average receipt of $24.59½; the difference per average tap is accounted for to a great extent in the large increase of delinquents in 1914 over those of 1913.

The "Extraordinary Expenses" deducted from "Operating Expenses" as per Exhibits B and D have been very carefully computed, especially those marked (*b*) and (*c*).

All Directors, including officers who are also Directors, when in attendance at Board Meetings, receive each $20.00 per attendance, which amounted in 1912-1913 to $4,600.00, and in 1913-1914 to $4,780.00.

I find paid to Mr. Geo. W. Shouland in 1912-1913 for "General Expenses" and "undesignated" items amounting to $357.40
1402 and in 1913-1914 "undesignated" $4,728.18; and by Mr. W. P. Robinson in 1912-1913 for "Special" $150.00, and in 1913-1914 for "petty" and "undesignated" $1,147.05; all of foregoing were approved on the vouchers by the proper officers.

I have therefore not deemed it necessary to deduct these items from the different accounts, which were chiefly charged to General Expense.

In conclusion I would state that I have not experienced or noticed the slightest inclination or disposition on the part of any one connected with the Company to conceal anything appertaining to the accounts in question. I wish here to record my appreciation of the universal courtesy extended to me and the assistance rendered in the way of information when requested, by all the officers and employes while making the examination and verification.

Salaries of Executive Officers per annum $60,100.00.

Respectfully submitted,

HORACE H. MITCHELL,
Certified Public Accountant.

(Endorsed:) 6274. U. S. District Court, district of Colorado. Defendants' Exhibit *Exhibit* 72. Filed Oct. 6, 1915. Charles W. Bishop, Clerk.

1412 UNITED STATES OF AMERICA,
District of Colorado, ss:

In the District Court of the United States for the District of Colorado.

No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Plaintiff,
vs.
THE CITY AND COUNTY OF DENVER et al.

Proceedings February 1, 1916.

Mr. Dorsey: There are one or two matters to be taken up before the presentation of the final decree—merely formal matters, your Honor. On Saturday we received from the clerk a certified copy of the order which had been entered in this case, No. 6274, on the previous day, and on reading it I found that the order as entered contained this recital:

The Court (interrupting): I prepared that decree myself—that order. What do you object to in the order?

Mr. Dorsey: I think that it misrepresents what I said, or, at any rate, it misrepresents what I intended to say, and I fear as it is now framed it constitutes a waiver on my part of any exceptions we might have been at liberty otherwise to present.

The Court: I took it as a waiver both by you and Mr. Nye.
1413 I think Mr. Nye stood on the legal questions that he said were open for consideration.

Mr. Dorsey: I think Mr. Nye and myself were in exact agreement. Let me read what it says.

The Court: I remember what it says.

Mr. Dorsey: Your Honor will remember, when your recollection is refreshed, what I did was to call to your Honor's attention certain authorities, and without reading them, stated that in my judgment the effect of those authorities was that no question was open, under such consent of reference as this, except a pure question of law.

The Court: I don't remember your putting that qualification in, Mr. Dorsey; but even if you did it would have gone the same way, except the order might have said that you and Mr. Nye were of the same opinion. I don't think there is anything in it to bother about trying to change it to just what you think you said.

Mr. Dorsey: The only point is this, that it might be prejudicial in case of a review at any time. With this decree, of course, so far as we are concerned, nothing can be reviewed, as I understand, except those things to which we have excepted. If in the lower court we came in and waived all of our exceptions, it is quite possible that the Appellate court——

The Court (interrupting): Do you think it is conceivable
1414 that the Appellate Court would hear the other side on questions of law on the idea under the order of appointing the master that those questions were not foreclosed, but would not hear you on questions of law? I do not think it is possible any court would ever take any such position because you hadn't said, according to the order, that the questions of law were still open for discussion, that nevertheless the Appellate Court would hear Mr. Nye and Mr. Marsh on the questions of law, but say you were foreclosed to respond to those questions that they raised, or raised any other question of law. I cannot change that order now.

Mr. Dorsey: I would like the record to show I move that the order be amended to set forth in respect to my representation that it was to the effect that in my judgment the consent order appointing the master in chancery foreclosed the inquiry as to any finding of fact which the master in chancery had made but not as to questions of law.

The Court: I should not have hesitated to put it that way at the time if you had asked to have it put that way, but I will not change it, first, because I do not remember that you made such an announcement, and, second, because I think it is wholly immaterial to your rights.

Mr. Dorsey: All right, your Honor.

The Court: Now, what else?

Mr. Dorsey: Before entering the final decree it becomes necessary to make certain substitution of parties—defendant officials
1415 of the city—whose terms have expired and whose successors have been elected. The stipulation has been signed that that may be done, and I have prepared a written order pursuant to that

stipulation (handing paper to court).

The Court: Yes.

Mr. Dorsey: We have also prepared a draft of a decree which follows your Honor's judgment as we understood it to be. This was served on counsel on the other side on last Saturday. What, if any, objection to that form they have, I don't know exactly, but I think they have some exceptions to make.

Mr. Marsh: Your Honor announced on the argument on the exceptions that you would leave the question of water rights and going-concern to be determined by the Appellate Court. We very much fear in the present situation of the record we will be foreclosed from raising those questions. I want to call your Honor's attention just briefly to an authority on that point. I wasn't in the case at the time the special master was appointed. When I speak about it I only speak with such information as I obtained from other counsel; but my information which I have obtained is that the special master was appointed by an order of court, and that the person agreed upon was satisfactory to counsel on both sides. In other words, that while counsel agreed to the person who was appointed, that the reference was not by agreement but by order of the court. The record
1416 in the case, as I find it, seems to show that the reference was made by consent of both parties.

The Court: We will not change that order. There is a written order appointing the master: it was submitted to counsel, and everybody who appeared in the case agreed to that order. Whatever that order says will stand. I was firmly of the opinion that that order of appointment reserved to each party the right to except. I thought so until Mr. Dorsey made the suggestion he did at the last hearing, and I reached over and got this order that lay here with the papers. I hadn't read it since the appointment, and I discovered that counsel did ask to have put in that order a reservation of the right to object to testimony and I interlined that with a pen. I evidently got the idea what I had interlined was a reservation of the right to except.

Mr. Marsh: I don't understand it so appears now, a reservation of the right to except.

The Court: No; there is no reservation of the right to except.

Mr. Marsh: Unless that should appear as to the exceptions and that they are properly overruled, we will not be in position to raise them in the Appellate Court.

The Court: I don't think you can.

Mr. Marsh: That is the reason I failed to agree to the statement that the report of the special master is conclusive upon this
1417 court, because I did not understand that the agreement was by common consent, but it was upon an order of the court. If that is the view your honor takes of it and the reference order should not be modified in that respect, then I would like to have the exceptions passed, filed with the special master and overruled by him in order that we will be able to raise the question in the upper court.

The Court: I notice one phrase here (reading): "That the report

of the special master be, and the same hereby is, in all particulars, approved and confirmed, all exceptions thereto of each of the parties to this cause having heretofore been overruled." I have changed that word "overruled" to "stricken" reconsidering the matter in making that order last Friday, because I felt that provision might indicate that the court had considered the exceptions.

Mr. Marsh: In order that we may not be foreclosed from raising the question in the upper court, in view of your Honor's ruling, I ask to be permitted to file these exceptions with the special master for his approval before final decree is entered. I also desire to state in connection with that order that was entered, to which Mr. Dorsey called attention, that it was my idea and I intended to convey my impression to your Honor that I thought your Honor did have power to pass upon the exceptions as filed where the facts were not
1418 disputed and the facts clearly appeared on the face of them as being contrary to the finding which the special master made. I would like to have the record show that I think the court could pass upon the questions where the facts are not disputed, showing upon their face that they are contrary to the law.

The Court: I will treat your position as I have Mr. Dorsey's on that proposition.

Mr. Marsh: We would like to raise this question in the Appellate Court.

The Court: Yes; I don't suppose anybody connected with this case has any idea that there will ever come a time when this litigation will be finally at an end in this controversy. I haven't any notion of that sort, nor counsel have any idea about this case that there ever will be a time that it will not be in court for something.

Mr. Marsh: We have prepared another decree, which we would like to submit for your Honor's consideration.

The Court: All right, let's see it.

Mr. Marsh: The only change in paragraph 2 we have is wherein the ordinance is invalid, and the correction is as follows: That the ordinance is invalid "in that said ordinance attempts to and does deprive the complainant of its property without due process of law, and takes the private property of said complainant for public use without just compensation, in violation of Amendment V of
1419 the Constitution of the United States, and in that it abridges the privileges and immunities of the complainant and deprives the complainant of its property without due process of law, and denies to the complainant the equal protection of the law, in violation of the XIV Amendment to the Constitution of the United States." In other words, we think the decree should show that it is based upon a violation of the Constitution of the United States.

The Court: That is for the purpose of appeal direct to the Supreme Court?

Mr. Marsh: For the purpose of appeal direct to the Supreme Court. The matter of costs we would also like to be heard on briefly. I see the decree as submitted by Mr. Dorsey provides that all costs shall be taxed against the defendants. My idea is in an equity suit of this kind—and the rule so provides—that your honor may apportion the

costs; and I think your Honor suggested upon the allowance of the fees to the master, that the other side was interested in bearing some part of the costs.

The Court: I said we would take care of that later.

Mr. Marsh: This is, in my judgment, a proper case where the costs, or some portion thereof, should be borne by the complainant.

The Court: I don't think so. I see nothing in the record, and the master does not call my attention to anything in the record, showing that the council made any investigation at all; it passed that
1420 ordinance—just simply reached up and got it out of the air, regardless of what its effects might be—no inquiries—no ascertainment of the true facts, or know anything about—just passed it. I think when it did it, it entered upon a course that it ought to pay the expense for that ordinance declared to be void.

Mr. Marsh: The ordinance was initiated under the power conferred by the charter, and the municipality in initiating the ordinance was exercising a governmental function.

The Court: The people who initiated the ordinance, I take it, represented the whole city under the law. It seems that the law vests a certain number of petitioners with authority to represent the public, and if the public wants to submit its affairs in that sort of way, and who, by force under the statute under the initiative process, compel the officers to act, we shall have to leave the public to pay for it.

I have no objection to putting into your paragraph 2 a part of what you insert, towit: "That said ordinance attempts to and does deprive the complainant of its property without due process of law, and takes the private property of said complainant for public use without just compensation." I concur with that being the effect of that ordinance—necessarily so. I think you may write that into your form, Mr. Dorsey.

Mr. Dorsey: Just down to and including the word "compensation"?

1421 The Court: Yes. It gives the benefit of the same point that they desire.

Mr. Dorsey: I have no objection. I didn't put it in because I thought it was unnecessary, under the decisions.

The Court: I think so too, but if Mr. Marsh wants it we will let him have it. I think you can interline it without much trouble.

Mr. Marsh: I would like the record to show that I made an application to have the exceptions referred to the special master, and that it was denied, for his ruling.

The Court: I don't see how we can make the record show that, Mr. Marsh. You better put that in the form of a motion.

Mr. Marsh: A written motion?

The Court: Yes, I think we may preserve it better that way. We cannot enter it on the record proper.

Mr. Marsh: I will ask leave to prepare it and file it as of this time.

The Court: All right, we will let you get it in.

Mr. Marsh: Then I ask that the record show we presented a form of decree and your Honor declined to sign the form as presented.

The Court: All right. Attach that to that motion, if you can conveniently.

Mr. Dorsey: Will your Honor be sitting this afternoon?

1422 The Court: Yes: I will sign it any time you bring it in.

Mr. Marsh: The decree will be signed as of this time. I ask on behalf of all of the defendants that your Honor allow the appeal to the Supreme Court of the United States and fix the amount of the bond.

The Court: The bond will be very small. I think a $500 bond will do.

Mr. Marsh: Let the record show that the appeal has been allowed.

The Court: That can be granted at any time within six months.

Mr. Marsh: We make the application now orally to save the necessity of filing the petition.

The Court: Very well. We will let the record show, when we signed and entered the decree that appeal was prayed for and appeal granted, bond fixed at $500. Not a supersedeas bond. There is nothing to supersede anyway.

Mr. Marsh: Is it your Honor's understanding that the costs are not payable until the appeal is determined.

The Court: No; the costs are payable now.

Mr. Marsh: We will have to have some reasonable time to provide for the costs.

1423 The Court: I don't suppose Mr. Dorsey will want any process.

I, William W. Heinemann, do certify that I reported the foregoing proceedings, and that the same is a true transcript of the same as taken by me.

WILLIAM W. HEINEMANN.

(Endorsed:) 6274. U. S. District Court, District of Colorado. The Denver Union Water Company vs. City and County of Denver et al. Transcript of Proceedings of February 1, 1916. Filed Jul-29, 1916. Charles W. Bishop, Clerk.

1424 UNITED STATES OF AMERICA,
District of Colorado, ss:

In the District Court of the United States for the District of Colorado.

No. 6274. In Equity.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,

vs.

CITY AND COUNTY OF DENVER; ROBERT W. SPEER, as Mayor of the City and County of Denver; W. F. R. Mills, as Manager of Improvements and Parks of the City and County of Denver; Clair J. Pitcher, as Manager of Revenue of the City and County of Denver *of the City and County of Denver;* William H. Sharpley, as

Manager of Health and Charity of the City and County of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the City and County of Denver; James F. Markey, as Auditor of the City and County of Denver; Charles A. Lammers, as Clerk and Recorder of the City and County of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock, and Harry Zimmerhackel, as Members of and Constituting the Council of the City and County of Denver, and Armour C. Anderson, as Sole Member of and Constituting the Public Utilities Commission of the City and County of Denver, Defendants.

1425 *Stipulation.*

It is hereby stipulated by and between the parties to the above entitled cause, through their respective solicitors, that the foregoing statement of evidence, together with the transcript of the stenographer's notes of proceedings had in said cause February 1st, 1916, together with the addition of exhibits hereinafter listed (originals or copies whereof are to be included therein), may be approved by the court or judge as the statement of the evidence to be used for the purposes of defendants' appeal and the cross appeal of the plaintiff to the Supreme Court of the United States, under Equity Rule 75; and the plaintiff hereby waives its right to have said statement of the evidence first lodged in the Clerk's office for its examination, and further waives its right to ten days' notice of the time and place when and where the defendants will ask the court or judge to approve the same as provided in and by said Rule 75.

The following comprise the exhibits above referred to:

Plaintiff's exhibits C, E, Q, S, Z, ZZ, A-1, A-2, A-3, A-4, A-7, A-8, A-9, A-19, A-26, A-27, A-28, A-31, A-34, A-35, A-36, A-37, A-56, A-61, A-75, A-80, A-88, A-92, A-96, A-97, A-98, A-99, A-100, A-101, A-102, A-103, A-104, A-105, A-106, A-107, A-108.

Defendants' exhibits 47, 54 and 72.

GERALD HUGHES,
1426 C. C. DORSEY,
Solicitors for Complainant.

JAMES A. MARSH,
F. W. SANBORN,
Solicitors for Defendants.

The foregoing statement of the evidence and transcript of court proceedings to be included in the record on appeal and cross appeal (including the exhibits listed in the foregoing stipulation,) being now presented in due time and found to be true, complete and properly prepared, I do hereby approve the same.

And it is hereby ordered that the said exhibits in either their original form, or copies thereof, may be included in the said record on appeal and cross appeal.

Dated this 14th day of August, A. D. 1916.

ROBT. E. LEWIS,
United States District Judge.

(Endorsed:) No. 6274. United States District Court. The Denver Union Water Co., Complainant, vs. City and County of Denver, et al., Defendants. Stipulation in re Statement of the Evidence and Certificate of Approval. Filed Aug. 14, 1916. Charles W. Bishop, Clerk.

1427 Sixty-eighth Day, May Term, Thursday, October 7th, A. D. 1915.

Present: The Honorable Robert E. Lewis, district judge, and other officers as noted on the fourth day of May, A. D. 1915.

In Equity.

6274.

THE DENVER UNION WATER COMPANY

vs.

THE CITY AND COUNTY OF DENVER et al.

Bill for Injunction and for Other Relief.

This cause comes on now to be heard. And thereupon, on consideration thereof,

It is ordered by the court that all parties hereto may file herein exceptions to the report of William J. Chinn, Special Master, within thirty (30) days from this day, as they shall be advised.

1428 In the District Court of the United States for the District of Colorado.

In Equity. No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Plaintiff,

vs.

THE CITY AND COUNTY OF DENVER et al., Defendants.

Plaintiff's Exceptions to Report of Special Master.

In so far as, under the order of reference in this case, the report of the Special Master is in law conclusive as to any matters therein contained, the plaintiff does not consent to the review of such matters by the Court, but files these exceptions, subject to such rulings as the court may make as to its right and duty to review such matters, to be urged with respect only to such findings and conclusions as the court may find are so subject to review, and without waiver or prejudice of any and all of plaintiff's rights in the premises.

With the foregoing reservation, plaintiff excepts to certain portions of the report of the Special Master filed herein, in the following particulars and for the following reasons, towit:

I.

Because the Special Master is in error in finding that "The evidence shows no material change in the plant between this day and the time when the evidence was heard," (his report, paragraph 11), because in truth and fact, large additions of valuable property were made to the plaintiff's plant, of a value in excess of three
1429 hundred and fifty thousand dollars ($350,000.00), subsequent to the first day of May, 1914, and prior to the date on which the taking of testimony herein was closed, evidence of the value of which added property was offered on behalf of the plaintiff and excluded by the Master (plaintiff's abstract, rebuttal testimony, page 893, plaintiff's testimony, page 3806), and the Master should have limited his said finding to the property of the plaintiff, owned by it and constituting its plant on the first day of May, 1914, as was in other portions of the report so limited.

II.

Because the Master erred in finding the reasonable value of all the property used by the plaintiff on May 1st, 1914, as a part of its water plant for the delivery of water to the city and its inhabitants to be thirteen million, four hundred fifteen thousand, eight hundred ninety-nine dollars ($13,415,899.) as set forth in the twelfth paragraph of his report and table one thereof, and in paragraph forty-eight of his report, whereas all the evidence in the case shows that the fair and reasonable value of the property used by the plaintiff for the convenience of the public was on May 1st, 1914, in excess of fifteen million, three hundred thousand dollars (*$15,300.00*). That said errors in arriving at said total value are due to certain errors in law and fact with respect to certain items of the certain classes set forth in table one in said paragraph twelve, to which items, specific exceptions are hereinafter directed and taken.

1430 III.

Because the Special Master allowed for the Lake Cheesman Lands (Exhibit C, class A, Item 1) only the sum of one hundred sixty thousand dollars ($160,000), (his report paragraph 14), whereas the evidence shows without substantial dispute that said allowance should have been at least the sum of two hundred thousand dollars ($200,000.00) (plaintiff's abstract, pages 65, 81, 92, 101, 106, 139, 140, 159, 164, 181, 184, 189).

IV.

Because the Master allowed for the Platte River Stone Placer Mining Claim (Exhibit C, class A, item 2) only the sum of seven hundred sixty-five dollars ($765.00), (his report, paragraph 14), whereas the evidence shows without substantial dispute that said allowance

should have been at least the sum of thirty-six hundred dollars ($3,600.00), (Exhibit A-7, Exhibit A-75, plaintiff's abstract, page 146

V.

Because the Master allowed for the Platte Canon Valley lands (Exhibit C, class A, item 3) only the sum of three thousand, sixty-five dollars ($3,065.00), (his report, paragraph 14), whereas the evidence shows without substantial dispute that said allowance should have been at least seventy-five hundred dollars ($7,500.00), (Exhibit A-7, Exhibit A-75, plaintiff's abstract, page 164).

VI.

Because the Master allowed for the Platte Canon filter site
1431 (Exhibit C, class A, item 5) only the sum of one thousand dollars ($1,000.00), (his report paragraph 14), whereas the evidence shows without substantial dispute that said allowance should have been at least the sum of fifty-three hundred and fifty dollars ($5,350.00) (Exhibit A 7, Exhibit A 75, plaintiff's abstract page 164).

VII.

Because the Master allowed for the Platte Canon power house site (Exhibit C, class A, item 6), only the sum of one thousand dollars ($1,000.00) (his report, paragraph 14), whereas the evidence shows without substantial dispute that said allowance should have been at least two thousand dollars ($2,000.00), (Exhibit A 7, Exhibit A 75, plaintiff's abstract page 164).

VIII.

Because the Master allowed for the Marston Lake reservoir site (Exhibit C, class A, item 17) only the sum of one hundred and twenty-five thousand dollars ($125,000.00) (his report, paragraph 14), whereas the evidence shows without substantial dispute that said allowance should have been at least the sum of one hundred sixty-eight thousand dollars ($168,000.00) (Exhibit A 75, plaintiff's abstract pages 42, 45, 118, 119, Exhibit A 7, plaintiff's abstract pages 65, 30, 82, 88, 101, 104, 139, 140, 164).

IX.

Because the Master allowed for the Cherry Creek galleries site
(Exhibit C, class A, item 20) only the sum of four thousand,
1432 three hundred and seventy dollars ($4370.00) (his report, paragraph 14), whereas the evidence in this case shows without substantial dispute that said allowance should have been at least the sum of eighty-five hundred dollars ($8500.00) (Exhibit A 75, plaintiff's abstract, page 164).

X.

Because the Master erred, as a matter of law, in refusing to consider, in determining the present fair value of the lands, anything on account of the actual or estimated consequential or severance damages (his report, paragraph 15).

XI.

Because the Master erred in refusing to consider, in connection with the determination of the present fair value of the lands, or to include therein, anything whatever on account of overhead expenses, (his report, paragraph 15), which the evidence in this cause shows without substantial dispute would require an addition of at least ten per cent (10%) to the actual market value of the lands for ordinary purposes, amounting to an approximate sum from fifty thousand dollars ($50,000.00) to seventy-five thousand dollars ($75,000.00) (Exhibit C, class A, page 115; plaintiff's abstract, page 159; plaintiff's proof, volume IV, page 1821; plaintiff's abstract, page 327; defendant's proof, volume II, pages 628-631).

XII.

Because the Master erred in ignoring and refusing to allow
1433 any value on account of the special availability and adaptability for certain uses of Lake Cheesman and Lake Marston lands and of the specific tracts of land mentioned in paragraph 17 of his report, and hereinabove particularly referred to.)

XIII.

Because the Master erred in allowing for the Lake Cheesman lands (his report, paragraph 18) only the purchase price paid therefor by the Water Company in the year 1899 (plaintiff's abstract, page 45), overlooking the fact that, as the evidence shows without substantial dispute, the value of reservoir lands has greatly increased since said date, and also overlooking the fact, that as shown by the evidence, the Company was obliged to hold said lands for many years and incur great additional cost on that account, before it could complete the reservoir and make the same an operating unit in its plant (plaintiff's proof, vol. II, pages 444-445; vol. III, pages 1399-1400; vol. IV, pages 1492 and 1535-1536.)

XIV.

Because the Master erred in refusing to include in his valuation of the Marston Lake reservoir lands (Exhibit C, class A, item 17) anything whatever on account of their peculiar availability and adaptability (his report, paragraph 19), although the evidence shows without substantial dispute that for said reason they possess

a value largely in excess of their market value for ordinary purposes,
which alone the Master allowed (plaintiff's abstract, pages
1434 30, 65, 82, 88, 101, 104, 139, 140, 164), and therefore said
item I of Class A should have been valued by the Master in the sum of *at* one hundred and sixty-eight thousand dollars ($168,000.00).

XV.

Because the Master erred in excluding from the property valued by him as a rating base (his report, paragraph 21), the following items listed in Exhibit C, class A, towit, item 9, the Phoebe Strong ranch, which should have been valued in the sum of at least eighteen thousand, eighty dollars ($18,080.00); item 10, the William Strong ranch which should have been valued in the sum of at least fifteen thousand dollars ($15,000) (deducting filter site); item 11, the Becky Archer ranch, which should have been valued in the sum of at least thirteen thousand, one hundred dollars ($13,100); item 12, the Frank Archer ranch, which should have been valued in the sum of at least thirty-seven thousand, nine hundred dollars ($37,900.00); although the evidence shows without substantial dispute that the retention of said ranches is essential to the full protection and conservation of the water rights necessary for the supply of the city and its inhabitants (plaintiff's abstract, page 197; plaintiff's proof, volume V, page 2166; plaintiff's abstract, page 36; plaintiff's proof, volume III, page 1392; plaintiff's abstract, page 570; defendant's proof, volume VI, page 3471; plaintiff's abstract, pages 342, 344 and 348; defendant's proof, volume 2, pages 807, 822, 873, 874).

XVI.

1435 Because the Master erred in deducting from and not including in the property valued by him as a rating base the following items of real estate specifically mentioned in his report, paragraph 21 (the items being those under class A, Exhibit C); Item 13, Mountain Reservoir site, which should have been valued in the sum of at least six thousand, seventy-five dollars ($6,075.00); item 20-a, Woodbury land, which should have been valued in the sum of at least fifteen hundred dollars ($1500.00); item 23 De Lappe Place, which should have been valued in the sum of at least six hundred seventy-six dollars ($676.00); item 24, Cottage Hill tank site, which should have been valued in the sum of at least five thousand, two hundred and eight dollars ($5208.00); item 30, office and superintendent's residence, which should have been valued in the sum of at least three thousand, two hundred and fifty dollars ($3250.00); item 32, lots in Cottage Hill, which should have been valued in the sum of at least six thousand, eight hundred and eight dollars ($6808.00); for the reason that the evidence shows without substantial dispute that said items of property, if not in actual use, were provided and held for use in the reasonably near

future in connection with the waterworks system and as a part thereof.

XVII.

Because the Master erred in excluding from and not including in the property valued by him for a rating base (his report, paragraph 21) the following item of Class A, Exhibit C, towit: Item 15, Harriman Lake site, which should have been valued in the sum of at least eight thousand, four hundred and fifty dollars
1436 ($8450.00); although the evidence shows without dispute that the same, and the structure thereon presently useful in connection with the waterworks system and is fulfilling a necessary and valuable function in that regard (plaintiff's abstract, page 205; plaintiff's proof, vol. V, p. 2255; plaintiff's abstract, p. 33, plaintiff's proof, vol. II, p. 477.)

XVIII.

Because the Master erred in excluding from consideration and not including in the property valued by him as a rating base, the following item of Class A, Exhibit C, towit: Item 19, Sullivan Reservoir site, which should have been valued in the sum of at least two thousand dollars ($2000.00); although the evidence shows without substantial dispute that the same and the structures situate thereon, while not actually in use at the present moment, are provided for use in the reasonably near future and are a valuable part of the waterworks system or plant (plaintiff's abstract, p. 154; plaintiff's proof, vol. IV, pp. 1788, 1790, 1791, 1792; plaintiff's abstract, p. 347; defendant's proof, vol. II, pp. 858-863).

XIX.

Because the Master erred (his report, paragraphs 25 and 26) in valuing the water rights of the company upon the basis of their irrigation worth only, without consideration of their peculiar availability and adaptability for the purposes of city supply, and without any addition to their value on that account, although the evidence shows without substantial dispute that they possess high ad-
1437 ditional value because of that fact (plaintiff's abstract, pp. 189, 190, 194, 219, 258, 553, 555, 608, 621; plaintiff's proof, vol. V., pp. 2105, 2141, 2142, 2382, 2383, 2384; vol. VI, pp. 2855, 2861; defendant's proof, vol. IV, pp. 1802, 1804, 1805; vol. V, pp. 2782/2784, 2794; vol. VI, 3045, 3151; plaintiff's abstract, pp. 190, 199, 219, 554, 555; plaintiff's proof, vol. V. pp. 2106, 2107, 2110, 2183, 2382).

XX.

Because the Master erred in allowing as the value of the Company's water rights (his report, paragraph 27) only the sum of two

million, nine hundred forty-seven thousand, six hundred seventeen dollars ($2,947,617), whereas, as the evidence shows without substantial dispute, said allowance should have been at least the sum of three million, five hundred thirty thousand dollars ($3,530,000.) (Exhibit C, Class B, p. 118).

XXI.

Because the Master erred (his report, paragraphs 28 and 29) in allowing for the Lake Cheesman water right only the sum of one million, five hundred eleven thousand, one hundred and seventeen dollars ($1,511,117), whereas the evidence shows without substantial dispute that the value of said water right is at least the sum of two million dollars ($2,000,000) (Exhibit C, class B, item 12, p. 117).

XXII.

Because the Master erred in assuming as the unit price per acre foot upon which to determine the valuation of the Lake
1438 Cheesman water right, the sum of fifty-five dollars ($55.00) (his report, paragraph 28,) whereas the evidence shows without substantial dispute that a unit price or value, even for irrigation purposes, should be not less than sixty dollars ($60.00) per acre foot (plaintiff's abstract, pp. 202, 228, 233, 235, 251, 252; plaintiff's proof, vol. V. p. 2215; vol. VI. pp. 2448, 2521, 2533, 2686, 2695; also, plaintiff's abstract, pp. 238, 239, 257; plaintiff's proof, vol. VI. pp. 2534, 2564, 2571, 2845, 2848).

XXIII.

Because the Master erred in finding only fifty-four thousand (54000) acre feet to be the quantity of the water storable in and available for delivery annually by the Cheesman Reservoir (his report, paragraph 29), whereas the evidence shows without substantial dispute that said quantity should be at least fifty-seven thousand, sixteen (57,016) acre feet, on the basis of an assured supply worth sixty dollars ($60.00) per acre foot, and a greater quantity if a unit price of less than sixty dollars ($60.00) per acre foot is applied, because of less certainty in the supply on the larger draft (plaintiff's abstract, p. 195; plaintiff's proof, vol. V. p. 2147, 2153, Exhibit A 31).

XXIV.

Because the Master allowed only the sum of nine hundred forty-nine thousand, five hundred dollars ($949,500) as the value of group 1 of the water rights (his report, paragraphs 27 and 30), said group 1 consisting of the following items of Class B of Exhibit C, towit:
Items 1, 2, 3, 4, 13, 14, 15, 16, 17 and 21; whereas the evi-
1439 dence showed without substantial dispute that the value of

said group of water rights was not less than the sum of one million, one hundred and fifty thousand dollars ($1,150,000) (Exhibit C, class B, p. 117).

XXV.

Because the Master took as the annual yield of said group 1 of water rights only the quantity of thirty-seven thousand (37,000) acre feet (his report, paragraph 30), whereas the evidence shows without substantial dispute that said yield for irrigation purposes would be not less than forty thousand (40,000) acre feet and for purposes of city supply, a much larger quantity (plaintiff's abstract, pp. 121, 122, 191, 218).

XXVI.

Because the Master erred in employing the unit price or value of fifty-five dollars per acre foot in arriving at the value of said group 1 of water rights (his report, paragraph 30), whereas the evidence shows without substantial dispute that said unit price or value should be at least sixty dollars ($60.00) per acre foot (see references under similar exception relating to Lake Cheesman water right, supra, paragraph 22).

XXVII.

Because the Master erred in his valuation of water rights and found too low a value therefor, in that, after having determined their value for irrigation purposes only, ignoring their added value as sources of city supply, he deducted therefrom the reproduction cost of the water works structures and lands appurtenant
1440 thereto (his report, paragraph 27 to 32, inclusive) although the evidence shows without substantial dispute that such water works structures are much more costly than those used in irrigation, and although the evidence also shows without substantial dispute that the cost of reproduction, and therefore the value, of such or similar water rights equally available and adapted to the purpose of city supply, would be more than their total gross value for irrigation purposes, without deduction for any structures or other appurtenances whatsoever (plaintiff's abstract p. 189, 190, 194, 219, 258, 552, 553, 555, 608, 621; plaintiff's proof, vol. V., p. 2105, 2141, 2142, 2382, 2383, 2384; vol. VI, p. 2855, 2861; defendant's proof, vol. IV, pp. 1800, 1802, 1804, 1805, 1807; vol. V, p. 2782, 2784, 2780, 2794; vol. VI, p. 3045, 3051; also plaintiff's abstract, p. 190, 199, 219, 554, 555; plaintiff's proof, vol. V, p. 2106, 2107, 2110, 2183, 2382).

XXVIII.

Because the Master excluded (his report, paragraph 36) from and did not include in the property valued for a rating base the Harri-

man Lake structures, which should have been valued in the sum of at least eleven thousand eight hundred and fifty-eight dollars ($11,858.00) (Exhibit C, class I, item 6, p. 245;) (see references under exception 17 supra, relative to exclusion of Harriman Lake site).

XXIX.

Because the Master excluded from and did not include in the property valued for a rating base the office and superintend-
1441 ent's residence at Littleton, which should have been valued in the sum of at least eight thousand, five hundred and five dollars ($8,505.00) (Exhibit C, class J, items 2-*b*, 3 and 6-*a*) (see his report, paragraph 37, and references under exception 16 supra relating to exclusion of land upon which these improvements are located).

XXX.

Because the Master excluded from and did not include in the property valued as a rating base the structures at Sullivan Reservoir, which should have been valued at the sum of at least one hundred twenty-two thousand, five hundred and thirty-four dollars ($122,-534.00) (Exhibit C, class L, item 5, p. 302) (see his report, paragraph 38, and reference under exception 18 supra, relating to exclusion of Sullivan Reservoir site).

XXXI.

Because the Master erred in excluding and deducting (his report, paragraph 39) from his estimate of reproduction cost and consequent value of the distribution pipe system, the item of paving over mains, which should have been valued at least in the sum of five hundred thirty nine thousand, five hundred and fifty-eight dollars, ($539,-558.00) (Exhibit C, class S, item 17, p. 369,370), although the evidence shows without substantial dispute that the additional value in the plant arising therefrom is at least as much as the amount claimed therefor in Exhibit C; (plaintiff's abstract, p. 77, 91, 111, 143, 161, 349, 355; plaintiff's proof, vol. III, pp. 901, 902,
1442 1112, 1329; vol. IV, p. 1840, 1841, 1841-*a*, 1686, 1687, 1691, 1693; defendant's proof, vol. II, p. 754, 879, 880).

XXXII.

Because the Master excluded and deducted (his report, paragraph 39) from his estimate of reproduction cost and consequent value of the distribution pipe system, items of added cost occasioned by railway tracks and other obstructions, amounting to the sum of at least one hundred and nine thousand, nine hundred and ninety-two dollars ($109,992.00) (Exhibit C, class S, items 19-*c*, 20-*a*,-*b* and -*c*, and 21-*a*, p. 386, 387, 389), although the evidence shows without substantial dispute that the value of the distribution system is en-

hanced because of said matters in an amount not less than the sum claimed therefor in Exhibit C (plaintiff's abstract, p. 884; plaintiff's proof, vol. VIII, p. 3749 et. seq).

XXXIII.

Because the Master excluded and deducted (his report, paragraph 39) from his estimate of reproduction cost and consequent value of the distribution pipe system, the item of taps for private consumers, which should have been valued in the sum of at least one hundred forty thousand, thirty-eight dollars ($140,038.) (Exhibit C, class S, item 25, p. 390), although the evidence shows without substantial dispute that the value of the Company's distribution system is enhanced by reason of the existence of such taps which have become the property of the Company, by at least the amount
1443 claimed therefor in Exhibit C (plaintiff's abstract, p. 155, 167; plaintiff's proof, vol. IV, p. 1890).

XXXIV.

Because the Master excluded from the personal property valued by him for a rating base (his report, paragraph 40), the personal property on the Platte Valley ranches, used for farming purposes, which should have been valued in the sum of approximately twenty-eight thousand, one hundred fifty-nine *thousand* dollars ($28,-159.00) (Exhibit C, class T, items 19 and 20, p. 393), although the retention of said ranches and the conducting of farming operations thereon is shown by the evidence without substantial dispute to be necessary to the proper conservation and full preservation of the water rights used for city supply (see references under exception 15 supra, relating to exclusion of the ranch lands).

XXXV.

Because the Master in his valuation of the personal property (Exhibit C, class T) excluded (his report, paragraph 40), all overhead expense, amounting to approximately twenty-five thousand dollars ($25,000) although the evidence shows without substantial dispute that such expense is necessarily incurred in assembling, arranging and preserving such property, and that it adds to the value thereof not less than the amounts claimed on that account in Exhibit C (plaintiff's abstract, p. 279, 280; defendant's proof, vol. I, p. 193, et seq. p. 247).

1444 XXXVI.

Because the Master excluded (his report, paragraph 42) from his estimate of reproduction cost and consequent value, the item of preliminary expense and cost of organization, which should have been valued at the sum of at least one hundred and twenty thou-

sand dollars ($120,000) (Exhibit C, p. 64) although the evidence shows without substantial dispute that such cost must be necessarily incurred in addition to all overhead expense covered by other allowances, and that it adds value to the plant in at least the amount claimed therefor in Exhibit C (plaintiff's abstract, p. 144, plaintiff's proof, vol IV, p. 1700).

XXXVII.

Because the Master excluded (his report, paragraph 43) and failed to make any allowance whatsoever for working capital, although the evidence shows without substantial dispute that it is necessary for the Company to supply a working capital of not less than one hundred thousand dollars ($100,000) (plaintiff's Exhibit A-24; plaintiff's abstract, p. 150; plaintiff's proof, vol. IV, p. 1750).

XXXVIII.

Because the Master placed the going value of the plant at only eight hundred thousand dollars ($800,000) (his report, paragraph 46), whereas the evidence shows without substantial dispute that said value should be at least one million, two hundred thousand dollars ($1,200,000) (Exhibit C, p. 64; plaintiff's abstract,
1445 p. 64, 71, 73, 77, 83, 102, 107, 114, 574; also plaintiff's abstract, p. 147; plaintiff's proof, vol. IV, p. 1718).

Respectfully submitted,

C. C. DORSEY,
GERALD HUGHES,
Solicitors for The Denver Union Water Company.

WM. V. HODGES,
Of Counsel.

(Endorsed:) No. 6274. In Equity. United States District Court, The Denver Union Water Company, a corporation, Plaintiff vs. The City and County of Denver, et al., Defendants. Plaintiff's Exceptions to report of Special Master. Filed Nov. 5, 1915, Charles W. Bishop, Clerk. Hughes & Dorsey, William V. Hodges, Attorneys for plaintiff.

UNITED STATES OF AMERICA,
District of Colorado, ss:

In the District Court of the United States for the District of Colorado.

In Equity. No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,
vs.
THE CITY AND COUNTY OF DENVER et al., Defendants.

Exceptions to Findings and Report of Special Master.

Come now the City and County of Denver, a municipal corporation, and A. Lincoln Fellows and Armour C. Anderson, constituting

the Public Utilities Commission of the city and county of Denver, defendants in the above-entitled cause, and except to the findings and report of W. J. Chinn, Esq., the Special Master in said
1446 cause, filed in this cause on the 7th day of October, A. D. 1915, and for cause of exception show:

1st. That in paragraph or finding No. 4 of the report of said Master, and in subdivision (*a*) thereof, he discloses that one of the questions determined by him "was the reasonable value of the property used by the Water Company in delivering water to the City and its inhabitants" and that in his said report as a whole he undertakes to and does find and return the figures by him determined to be the figures of reasonable value of the property used by the complainant company in delivering water to the City and its inhabitants; whereas the said Master ought to have found and determined the reasonable value only of the property used and useful in delivering water to the city and county and its inhabitants, and should have excluded the value of all property used which was not found by him useful and necessary to be used in so delivering water to the city and county and its inhabitants.

2nd. That the Master has in his said report, and in paragraph or finding No. 12, and the table attached to said paragraph, stated and certified, and in the whole of his said report has found, the reasonable value of the plant of the complainant company on May 1st, 1914, to be $13,415,899.00, and in so finding has included the gross reproduction cost, including engineering and contingencies, less accrued depreciation, as the present reasonable value of said plant and property; whereas the Master ought to have used the fair
1447 contract cost new of the said property and plant, instead of the gross reproduction cost, less accrued depreciation, in determining the present reasonable value of the property of the complainant Company used and useful in supplying the City and County of Denver and its inhabitants with water, for that present reasonable value cannot in any event exceed fair contract cost new of the property used in supplying the City and County of Denver and its inhabitants with water.

3rd. That the Master has in his said report stated and certified in paragraph or finding No. 14 of said report, that he has included in table No. 1, which forms a part of paragraph No. 12, the item known as item No. 27, Lake Archer lands, $208,306.00, and the item known as item No. 26, Tail Race from West Denver Pumping Station, $10,731.00; whereas the Master ought to have found that said items were property not useful or necessary to be used by the complainant Company in supplying the City and County of Denver and its inhabitants with water.

4th. That the Master has in his said report stated and certified, in paragraph or finding No. 18 of said report, that he finds item No. 1, Class A, (Exhibit "C" pages 111-115,) known as Lake Cheesman Reservoir lands, also referred to in paragraph or finding No. 14 of the Master's report, as of the reasonable value of $160,000.00, basing his valuation upon the cost of said lands to the complainant Com-

pany; whereas the Master ought to have found that said lands
1448 were of a value not exceeding $40,799.00, for that the cost of said lands, as indicated by the evidence, was not indicative of the value thereof, but was in truth and in fact merely the price paid by the complainant Company to one of its subsidiary or interested companies, and in effect a price paid to itself.

5th. That the Master has in his said report stated and certified, in paragraph or finding No. 24, that the complainant Company owns the water rights claimed by it by original appropriation being items Nos. 4, 5, 6, 7, 8, 9, 10 and 12, Exhibit "C," because of its diversion of waters under such appropriations from the natural streams of Colorado, used by it in supplying its consumers in the city and county of Denver, and because contracts between the Water Company and its private consumers have been simply permits or licenses, upon which rates have been paid by the consumers; whereas the Master ought to have found that the City and County of Denver and its inhabitants as an entity has been and is now the consumer of all water appropriated by means of said appropriations initiated by said complainant Company, and the owner of such water rights, and that for purposes of determining fair value for rate-making purposes there should be taken into consideration only the cost of the structures and the cost of initiation of such appropriations.

6th. That the Master has in his said report, and in paragraph or finding No. 27, stated and certified that item No. 4, in group one, should be included; whereas the Master ought to have found
1449 that item No. 4 should have been in part excluded, because said item No. 4 includes a claimed appropriation, and was of 3.14 cubic feet of water per second of time in the non-irrigating season; whereas in truth and in fact there is no such thing as the non-irrigating season, and said amount of water, and the appropriation thereof, the right and title thereto, rests in others than the complainant Company, towit, in the Lehow Estate.

7th. That the Master has in his said report, and in paragraph or finding No. 27, stated and certified that items 5 and 6, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C," were of a value of $200,000.00, and has included said items and such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the City and County of Denver and its inhabitants, and that in the determination of fair value for rate-making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

8th. That the Master has in his said report, and in paragraph or finding No. 27, stated and certified that item 7, the Cherry Creek Galleries, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C," was of a value of $66,000.00, and has included said item and such valuation in his findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city
1450 and county of Denver and its inhabitants, and that in the determination of fair value for rate-making purposes no

value ought to be assigned to such water rights as if owned by the complainant Company.

9th. That the Master has in his said report, and in paragraph or finding No. 27, stated and certified that item 8, the Platte Canon Filter Galleries, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C," was of a value of $65,000.00 and has included said item and such valuation in his findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate-making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

10. That the Master has in his said report, and in paragraph or finding No. 27, stated and certified that item 9, Platte Canon 34-inch conduit, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C" was of a value of $24,750.00, and has included said item in such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate-making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

11th. That the Master has in his said report, and in para-
1451 graph or finding No. 27, stated and certified that item 10, Platte Canon 40-inch conduit, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C," was of a value of $30,000.00, and has included said item in such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the City and County of Denver and its inhabitants, and that in the determination of fair value for rate-making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

12th. That the Master has in his said report, and in paragraph or finding No. 27, stated and certified that item 12, Lake Cheesman, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C" was of a value of $1,611,-117.00, and has included said item in such valuation in his said findings and in this whole report, whereas the Master ought to have found that the ownership of said water rights is in the City and County of Denver and its inhabitants, and that in the determination of fair value for rate-making purposes no value ought to be assigned to such water rights as if owned by the complainant Company. And for the further reason that the appropriation of said right, made by The Denver Union Water Company, complainant herein, was expressly made for the use and benefit of the City and County of Denver and its inhabitants, and upon the representations made by said complainant Company, that its appropriations were

for the benefit of the said City and County and its inhabitants,
1452 and for no other purpose the said complainant Company acquired valuable rights, privileges and concessions, and is estopped to deny ownership by the said City and County and its inhabitants of the waters so appropriated for the benefit of said City and County and its inhabitants.

13th. That the Master has in his said report, and in paragraph or finding No. 28 of said report, found and determined that the unit price of $55.00 per acre foot should be applied in determining the value of the water rights of complainant Company, and particularly applied to the so-called Lake Cheesman rights and to the estimated volume of water yielded by the water rights included in Group one of Class B (Exhibit "C," pages 117-118); whereas the Master ought to have found that a unit price of not to exceed $40.00 per acre foot should be used in determining the value of the water rights of the complainant Company actually owned by it, by applying such unit price of $40.00 per acre foot to the volume of water yielded by such rights, and ought not to have applied any such unit price to the volume of water yielded by those rights ownership to which exists in the City and County of Denver and its inhabitants.

14th. That the Master has in his said report, and in paragraph or finding No. 29 thereof, applied the unit price of $55.00 per acre foot to an estimated yield of 54,000 acre feet from Cheesman Reservoir, and has found the gross value of such volume of water to be $2,970,000.00, and, after deducting the value of Lake Cheesman structures, previously found by him, finds a net value of
1453 Lake Cheesman water rights to be $1,611,117, which value he has assigned as their present value; whereas the Master ought to have found that the ownership of the water appropriated through the Lake Cheesman structures, and the appropriations therefor, is in the City and County of Denver and its inhabitants, and that the value thereof should be excluded from consideration in determining the fair value of complainant Company's property for rate-making purposes.

15th. That the Master has in his said report, and in paragraph or finding No. 30 thereof, stated and certified that he has applied the unit price of $55.00 per acre foot to the estimated yield of the water rights in Group one (Class B, Water Rights, Exhibit "C"); whereas the Master ought to have found that the unit price to be applied to the volume of yield of such rights should not in any event exceed the sum of $40.00 per acre foot, and that the estimated yield should not have exceeded 20,000 acre feet.

16th. That the Master has in his said report, and in paragraph or finding No. 41 thereof, stated and certified that $805,000.00 should be allowed for interest during construction as reasonable and fair; whereas the Master ought to have found that no allowance whatever should be made for interest during construction in determining the present fair value of complainant's property for rate-making purposes, if there is to be allowed also the item of "Going Concern" value, and because the plant of complainant Company was

not constructed as a new and complete plant, in the con-
1454 struction of which interest during construction might be an item for consideration, but was a plant constructed piecemeal and from time to time, and, except for a very inconsiderable portion thereof, has been constructed out of income and with money derived through the payment of water rates in advance.

17th. That the Master has in his said report, and in paragraph No. 46 thereof, stated and certified that $800,000.00 is a sum reasonable and fair to be allowed as the intangible element of "Going Concern Value" and proper to be included in the fair value of complainant's property for rate-making purposes; whereas the Master ought to have found that, having previously fully allowed the items of interest during construction and engineering and contingencies, which items go to make up the principal portion of overhead charges, there should be nothing further allowed for "Going Concern Value" and further should have found that in appraising the property of complainant Company at reproduction cost less accrued depreciation, including engineering, contingencies and interest during construction, the property had been appraised as an assembled and established plant, doing business and earning money, and that the intangible element of so-called "Going Concern Value" ought not thereafter to have been added, and ought not to be included in the determination of the present fair value of complainant's property for rate-making purposes.

18th. That the Master erred in his said report, and in his allowance of valuations, by duplicating certain values (as particu-
1455 larly appears from Table 1 of paragraph 12 of the report), in that he has included in the "Gross Reproduction Cost" an allowance of "12½% for Engineering and Contingencies," and an allowance of $699,545.00 for "Interest During Construction," and an allowance of $800,000.00 for "Going Concern Value" whereas the said allowance of "12½% for Engineering and Contingencies," and the allowance of $699,545.00 for "Interest during Construction" are what are commonly known as overhead charges and go to make up the item of "Going Concern Value."

19th. That the Master erred in making as great an allowance as $800,000.00 or any allowance at all, for "Going Concern Value" (paragraphs 12 and 46 of the Master's report), because, as appears by the uncontradicted evidence in the case, the franchise of the complainant Company has expired, and the complainant Company had not on May 1st, 1914, and has not since, and has not now, any franchise to do business in the city and county of Denver.

20th. That the Master has, throughout his entire report, attached undue weight and importance to the testimony of the witness Metcalf and Anderson, who were witnesses for the complainant, and has as the result thereof placed excessive value upon much of the property of the complainant Company.

21st. That the Master has in his said report, and in paragraph 50 thereof, stated and certified that $140,000.00 is allowed for "Annual Depreciation;" whereas the Master ought to have found that

nothing should be allowed for "Annual Depreciation" as the
1456 same is included annually in the item of "Operating Expenses."

22nd. That the Master has in his said report, and in paragraphs 8 and 53 thereof, found, stated and certified that the rate-making ordinance, being Ordinance No. 26, Series of 1914, does not permit the Water Company to earn for the use of its property such compensation as is fair to it and to the City, and that the enforcement of said ordinance will result in the taking of the use of said property without just compensation, and that said ordinance is invalid; whereas the Master ought to have found that said ordinance did permit the Water Company to earn for the use of its property such compensation as is fair to it and to the City, and that the enforcement of said ordinance will not result in the taking of the use of said property without just compensation, and that the same is valid.

Wherefore, these defendants pray that the report of the Special Master herein be not confirmed, and that the said report be modified, changed and altered, to the end that the errors hereinbefore pointed out and complained of be corrected, and that the vaildity of the rate-making ordinance herein be sustained.

GEO. L. NYE,
Attorney for Defendants A. Lincoln, Fellows, and Armour C. Anderson, Constituting the Public Utilities Commission of the City and County of Denver.

J. A. MARSH,
Attorney for Defendant City and County of Denver.

1457 (Endorsed:) No. 6274. In the United States District Court of the District of Colorado. The Denver Union Water Company, a Corporation, Complainant, versus The City and County of Denver, et al., Defendants. Defendants' Exceptions to Findings and Report of Special Master. Filed Nov. 5, 1915, Charles W. Bishop, Clerk. Thomas, Bryant, Nye & Malburn, George L. Nye, James A. Marsh, Attorneys for Defendants. 621-629 Ernest and Cranmer Building, Denver, Colo.

Fifty-Sixth Day, November Term, Friday, January 28th, A. D. 1916.

Present: The Honorable Robert E. Lewis, district judge, and other officers as noted on the second day of November, A. D. 1915.

1458 In Equity. 6274.

THE DENVER UNION WATER COMPANY
vs.
THE CITY AND COUNTY OF DENVER et al.

Bill for Injunction and for Other Relief.

And now on this January 28th, A. D. 1916, this cause came on again to be heard in open court, and the exceptions to the report

of the special master, William J. Chinn, Esq., came on for consideration; thereupon Clayton C. Dorsey, Esq., appearing as solicitor for the complainant, announced to the court that it was his opinion that under the terms of appointment of said special master there were no questions raised by the exceptions to said report by either of the parties that were open for consideration and that could be heard by the court, and George L. Nye, Esq., as solicitor for the Public Utilities Commission of the City and County of Denver, one of the defendants, announced to the court that he was of like opinion as to all questions of fact raised by said exceptions, but that he was of opinion that there were questions purely of law arising on said exceptions that could be heard, and J. A. Marsh, Esq., as solicitor for the City and County of Denver, the other of said defendants, announced that he would not commit himself as to what, if any, questions raised by said exceptions were or were not open for consideration, except that he concurred in the announcement of
1459 George L. Nye, Esq., that questions purely of law raised by said exceptions were properly now open for presentation and consideration by the court.

Thereupon, the court having heard counsel and being now sufficiently advised in the premises, and being of opinion that under the terms of the appointment of said special master questions of fact raised by exceptions to his report by the respective parties ought not to be and are not open for consideration and determination by the court, but that the finding of said special master thereon ought to be and is final and conclusive; and being further of the opinion that said exceptions do not raise questions of pure law for determination by the court material to the cause and that can be considered and determined by the court without an examination of and conclusion as to the facts, doth thereupon order and direct that the exceptions of the respective parties to said report be stricken and for naught held, that the report of said special master, W. J. Chinn, Esq., be and is in all things confirmed, and that the cause pass to final decree for complainant in accordance with the findings and recommendations of said special master.

1460 In the District Court of the United States for the District of Colorado.

In Equity. No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,
vs.
THE CITY AND COUNTY OF DENVER et al., Defendants.

Come now the defendants in the above-entitled cause, and move the Court:

1st. To modify and correct the "Order appointing Special Master" in this cause by adding thereto, after the word "consenting" in line six of said order, the following: "to the individual selected as Special Master."

2nd. To permit these defendants to file their objections and exceptions to the findings and conclusions of the Master before the Master, and to direct that such objections and exceptions be passed upon by the Master.

3rd. To modify the order entered on Friday, January 28th, in the above-entitled cause, directing "that the exceptions of the respective parties to said report be stricken and for naught held", by causing the same to read "that the exceptions of the respective parties to said report be and the same are overruled."

And for grounds of this motion these defendants show to the court:

1. That the original "Order appointing Special Master"
1461 in this cause was made by the court; that the parties to the action were only required to and did only consent to the individual appointed.

2. That the order itself shows that the reference to the Special Master was only "for the purpose of taking all testimony in the suit and reporting to the Court his findings of fact and such conclusions of law as he may deem essential to the proper advisement of the Court."

3. That it was understood by Court and counsel, and by all parties to said proceeding before the Special Master, that the report of the Special Master would be subject to review and confirmation by the Court.

4. That upon the argument upon the exception on January 28th, 1916, the Court foreclosed argument upon the question of water rights and water titles, by saying that such questions could be taken to the appellate court for review, and that without the modifications of the order suggested herein it may be impossible to obtain a review in an appellate court.

5. That unless objections and exceptions of these defendants are ruled upon by the Master it may be impossible to have the findings and conclusions of the Master reviewed by an appellate court.

J. A. MARSH,
City Attorney.
GEORGE L. NYE,
Attorney for Utilities Commission.

1462 [Endorsed:] 6274. U. S. District Court, District of Colorado. The Denver Union Water Company vs. The City and County of Denver et al. Petition for Correction of Record. Filed Feb. 1, 1916. Charles W. Bishop, Clerk.

Fifty-eighth Day, November Term, Tuesday, February 1st, A. D. 1916.

Present: The Honorable Robert E. Lewis, district judge, and other officers as noted on the second day of November, A. D. 1915.

6274. In Equity.

THE DENVER UNION WATER COMPANY
vs.
THE CITY AND COUNTY OF DENVER et al.

Bill for Injunction and for Other Relief.

This cause comes on now to be heard upon the petition of the defendants to modify and correct the orders heretofore entered herein, on, towit, the twenty-first day of May, A. D. 1914, and
1463 the twenty-eighth day of January, A. D. 1916, and is argued by counsel, J. A. Marsh, Esquire, appearing as solicitor for the City and County of Denver and others, George L. Nye, Esquire, appearing as solicitor for the defendant, The Public Utilities Commission of the City and County of Denver. And thereupon, on consideration thereof,

It is ordered by the court that the said petition be, and the same is hereby, denied.

And thereupon, the defendants by their counsel then and there further duly excepted to the recital in said orders of the twenty-first day of May, A. D. 1914, and the twenty-eighth day of January, A. D. 1916, referred to in said petition and to the retention thereof as it now appears in said orders.

In Equity.

6274.

THE DENVER UNION WATER COMPANY
vs.
THE CITY AND COUNTY OF DENVER, WILLIAM H. SHARPLEY, CLAIR J. PITCHER, ALEXANDER NISBET, JOHN B. HUNTER, AND LEWIS C. GREENLEE as Commissioners, Members of and Constituting the Council of the City and County of Denver; William H. Sharpley, as Mayor and Commissioner of Social Welfare of The City and County of Denver; Clair J. Pitcher, as Commissioner of Finance of the City and County of Denver; Alexander Nisbet, as Commissioner
1464 of Safety of the City and County of Denver; John B. Hunter, as Commissioner of Improvements of the City and County of Denver; Lewis C. Greenlee, as Commissioner of Property of the City and County of Denver; James F. Markey, as Auditor of the City and County of Denver; Armour C. Anderson and A. Lincoln Fellows, as Members of and Constituting the Public Utilities Commission of the City and County of Denver.

Bill for Injunction and for Other Relief.

This cause came on to be heard at this term and was argued by counsel; and thereupon, upon consideration thereof, it was ordered, adjudged and decreed as follows, viz:

1. That the report of the Special Master, W. J. Chinn, which report bears date October 5, 1915, and was filed herein on October 6, 1915, be, and the same hereby is, in all particulars, approved and confirmed, all exceptions thereto of each of the parties to this cause having heretofore been stricken.

2. That Ordinance No. 26, Series 1914 of the Ordinances of the City and County of Denver, a copy of which Ordinance is Exhibit A to the bill of complaint herein, and which Ordinance is entitled "An Ordinance to regulate charges for water furnished the City and County of Denver and its inhabitants by The Denver Union
1465 Water Company, while said Company shall continue so to do, as a tenant by sufferance, and to prohibit discriminatory rates and charges and provide a penalty for violation", and each and every part, portion, provision and requirement therein contained, including the schedule of rates and practices therein set forth, be, and the same hereby is, found, declared and adjudged to be in all respects invalid and of no force or effect whatsoever, in that said Ordinance attempts to and does deprive the complainant of its property without due process of law, and takes the private property of said complainant for public use without just compensation.

3. That the defendants herein, and each of them, their respective successors and the successors in office respectively of the defendant officials, and each of them, the officers, agents, representatives and attorneys of them, and each of them, as well as all of the consumers of water in the City and County of Denver receiving water or service from the plaintiff Company, and the officers, agents, representatives and attorneys of them, and each of them, be and hereby are, and each of them hereby is, perpetually enjoined and prohibited from individually or in combination with others, directly or indirectly, enforcing, or attempting to enforce, said Ordinance No. 26 of the Series of 1914 aforesaid, or any of the rates, terms, provisions or requirements thereof.

1466 4. That the plaintiff- herein do have and recover of and from the defendants its costs in this behalf expended and incurred to be taxed, and let judgment be entered therefor.

UNITED STATES OF AMERICA,
District of Colorado, ss:

In the District Court of the United States for the District of Colorado.

No. 6274. In Equity.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,
vs.
CITY AND COUNTY OF DENVER, WILLIAM H. SHARPLEY, CLAIR J. Pitcher, Alexander Nisbet, John B. Hunter and Lewis C. Greenlee, as Commissioners, Members of and Constituting the Council of the City and County of Denver; William H. Sharpley, as Mayor and Commissioner of Social Welfare of the City and County of Denver; Clair J. Pitcher, as Commissioner of Finance of the City

and County of Denver; Alexander Nisbet, as Commissioner of Safety of the City and County of Denver; John B. Hunter, as Commissioner of Improvements of the City and County of Denver; Lewis C. Greenlee, as Commissioner of Property of the City and County of Denver; James F. Markey, as Auditor of the City and County of Denver; Armour C. Anderson and A. Lincoln Fellows, as Members of and Constituting the Public Utilities Com-
1467 mission of the City and County of Denver, Defendants.

Petition for Substitution of Parties.

To the Hon. Robert E. Lewis, District Judge:

Come now the City and County of Denver, a municipal corporation, James F. Markey as Auditor of the city and county of Denver, and Armour C. Anderson as member of and constituting the Public Utilities Commission of the city and county of Denver, defendants above named, together with the following named persons, towit: Robert W. Speer, as Mayor of the city and county of Denver; W. F. R. Mills, as Manager of Improvements and Parks of the city and county of Denver; Clair J. Pitcher, as Manager of Revenue of the city and county of Denver; William H. Sharpley, as Manager of Health and Charity of the city and county of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the city and county of Denver; Charles A. Lammers, as clerk and recorder of the city and county of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the council of the city and county of Denver; all as petitioners; and respectfully represent unto this Honorable Court and petition as follows:

1. That, as appears from the bill of complaint in this action, the above named defendant, City and County of Denver, is a
1468 municipal corporation, and that all of the other defendants in this action were at the time the decree was entered herein, officers of said city and county, and that said decree was entered against them and affected them in their capacity as such officers and not otherwise.

2. That on, towit, the 9th day of May, 1916, there became effective and operative in said city and county of Denver an amendment to the charter thereof, by which the form of government thereof was in some respects changed; that at or about the same time certain persons, pursuant to the method prescribed in said amendment to said charter, became officers of the city and county of Denver, and thereby succeeded to the powers and duties of all the officers, with the exception of the defendant James F. Markey as Auditor of the city and county of Denver, and the defendant Armour C. Anderson as member of and constituting the Public Utilities Commission of the city and county of Denver, who were affected by the final decree herein as aforesaid.

3. That on or about said 9th day of May, 1916, pursuant to the provisions and terms of said amendment to said charter, the above

named Robert W. Spear became, and ever since has been and now is, the duly designated, qualified and acting Mayor of the city and county of Denver; and as such officer succeeded to, and became and is now possessed of the powers and duties theretofore possessed by the defendants William H. Sharpley as Mayor and Commissioner
1469 of Social Welfare of the city and county of Denver, Clair J. Pitcher as Commissioner of Finance of the city and county of Denver, Alexander Nisbet as Commissioner of Safety of the city and county of Denver, John B. Hunter as Commissioner of Improvements of the city and county of Denver, and Lewis C. Greenlee as Commissioner of Property of the city and county of Denver; except in so far as said powers and duties, pursuant to the terms of said amendment to said charter, have devolved upon and become vested in other persons hereinafter named.

4. That on or about the said 9th day of May, 1916, pursuant to the provisions and terms of said amendment to said charter, the above named W. F. R. Mills became and ever since has been and now is, the duly appointed, qualified and acting Manager of Improvements and Parks of said city and county of Denver, and as such officer succeeded to, and became and now is possessed of certain of the powers and duties theretofore possessed by the defendant John B. Hunter (as Commissioner of Improvements of the city and county of Denver, and the defendant Lewis C. Greenlee as Commissioner of Property of the city and county of Denver.

5. That on or about the said 9th day of May, 1916, pursuant to the provisions and terms of said amendment to said charter, the above named Clair J. Pitcher became and ever since has been and now is, the duly appointed, qualified and acting Manager of Revenue of the city and county of Denver, and as such officer succeeded to, and became and now is possessed of certain of the powers and duties theretofore possessed by the defendant Clair J. Pitcher as
1470 Commissioner of Finance of the city and county of Denver.

6. That on or about said 9th day of May, 1916, pursuant to the provisions and terms of said amendment to said charter, the above named William H. Sharpley became, ever since has been and now is the duly appointed, qualified and acting Manager of Health and Charity of the city and county of Denver, and as such officer succeeded to, and became and now is possessed of certain of the powers and duties theretofore possessed by the defendant William H. Sharpley as Commissioner of Social Welfare of the city and county of Denver.

7. That on or about said 9th day of May, 1916, pursuant to the provisions and terms of said amendment to said charter, the above named Dewey C. Bailey became, ever since has been and now is, the duly appointed, qualified and acting Manager of Safety and Excise of the city and county of Denver, and as such officer succeeded to, and became and now is possessed of certain of the powers and duties theretofore possessed by the defendant Alexander Nisbet as Commissioner of Safety of the city and county of Denver, and the defendant Clair J. Pitcher as Commissioner of Finance of the city and county of Denver.

8. That on or about the 1st day of June, 1916, pursuant to the provisions and terms of said amendment to said charter, the above named Charles A. Lammers became, ever since has been and now is, the duly appointed, qualified and acting clerk and recorder of the city and county of Denver, and as such officer succeeded in part to, and became and now is possessed of certain of the powers and duties theretofore possessed by the defendant Lewis C. Greenlee as
1471 Commissioner of Property of the city and county of Denver.

9. That on or about the said 9th day of May, 1916, pursuant to the provisions and terms of said amendment to said charter the above named Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Ryeraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, became, ever since have been and now are, the duly qualified and acting members of the council of the City and County of Denver; and said nine last named persons at all times since said date have constituted and do now constitute the council of the city and county of Denver and as such Councilmen, the nine last named persons succeeded to and became and are now possessed of the powers and duties theretofore possessed by the defendants William H. Sharpley, Clair J. Pitcher, Alexander Nisbet, John B. Hunter and Lewis C. Greenlee, as members of and constituting the then Council of the city and county of Denver.

10. That heretofore, and on towit, the 1st day of June, 1916, the term of office of the defendant A. Lincoln Fellows, as a member of the Public Utilities Commission of the city and county of Denver, expired, and thereupon by operation of law, the defendant Armour C. Anderson became the sole member of said Public Utilities Commission and that ever since said last mentioned date the said Armour C. Anderson has constituted and now constitutes the Public Utilities Commission of the city and county of Denver.

Wherefore, your petitioners respectfully pray as follows:

That an order of this court may be made substituting
1472 Robert W. Speer as Mayor of the city and county of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver, Clair J. Pitcher as Manager of Revenue of the city and county of Denver, William H. Sharpley as Manager of Health and Charity of the city and county of Denver, Dewey C. Bailey as Manager of Safety and Excise of the city and county of Denver, Charles A. Lammers as clerk and recorder of the city and county of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Ryeraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the Council of the city and county of Denver; and Armour C. Anderson, as sole member of and constituting the Public Utilities Commission of the city and county of Denver; for and in lieu of the defendants William H. Sharpley, Clair J. Pitcher, Alexander Nisbet, John B. Hunter, and Lewis C. Greenlee, as commissioners, members of and constituting the council of the city and county of Denver; William H. Sharpley as Mayor and Commissioner of Social Welfare of the city and county of Denver, Clair J. Pitcher as Commissioner of Finance of the city and county of Denver, Alexander Nisbet as

Commissioner of Safety of the City and County of Denver, John B. Hunter as Commissioner of Improvements of the city and county of Denver; Lewis C. Greenlee as Commissioner of Property of the city and county of Denver; and Armour C. Anderson and A. Lincoln Fellows as members of and constituting the Public Utilities Commission of the city and county of Denver.

By J. A. MARSH,
F. W. SANBORN,
Solicitors for Petitioners.

(Endorsed:) No. 6274. United States District Court. The Denver Union Water Co., complainant, vs. City and County of Denver, et al., defendants. Petition for Substitution of Parties. Filed Jul 29. 1916, Charles W. Bishop, Clerk.

1474 SATURDAY, July 29th, A. D. 1916.

At Chambers, before the Honorable Robert E. Lewis, district judge, the following proceedings were had:

In Equity.

6274.

THE DENVER UNION WATER COMPANY,

vs.

THE CITY AND COUNTY OF DENVER, WILLIAM H. SHARPLEY, CLAIR J. PITCHER, ALEXANDER NISBET, JOHN B. HUNTER AND LEWIS C. GREENLEE AS COMMISSIONERS, MEMBERS OF AND CONSTITUTING THE COUNCIL OF THE CITY AND COUNTY OF DENVER; WILLIAM H. SHARPLEY, AS MAYOR AND COMMISSIONER OF SOCIAL WELFARE OF THE CITY AND COUNTY OF DENVER; CLAIR J. PITCHER AS COMMISSIONER OF FINANCE OF THE CITY AND COUNTY OF DENVER; ALEXANDER NISBET AS COMMISSIONER OF SAFETY OF THE CITY AND COUNTY OF DENVER; JOHN B. HUNTER, AS COMMISSIONER OF IMPROVEMENTS OF THE CITY AND COUNTY OF DENVER; LEWIS C. GREENLEE, AS COMMISSIONER OF PROPERTY OF THE CITY AND COUNTY OF DENVER; JAMES F. MARKEY, AS AUDITOR OF THE CITY AND COUNTY OF DENVER; ARMOUR C. ANDERSON AND A. LINCOLN FELLOWS, AS MEMBERS OF AND CONSTITUTING THE PUBLIC UTILITIES COMMISSION OF THE CITY AND COUNTY OF DENVER.

Bill for Injunction and for Other Relief.

1475 This cause came on to be heard on this twenty-ninth day of July, A. D. 1916, upon the petition of the defendants for an order substituting defendants herein. The defendants appearing by James A. Marsh, Esquire, their solicitor. Thereupon upon consideration thereof,

It is ordered that Robert W. Speer as Mayor of the city and county of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver; Clair J. Pitcher as Manager of Revenue of the city and county of Denver; William H. Sharpley as Manager of Health and Charity of the city and county of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the city and county of Denver; Charles A. Lammers as clerk and recorder of the city and county of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the Council of the city and county of Denver; and Armour C. Anderson, as sole member of and constituting the Public Utilities Commission of the city and county of Denver, be, and they are hereby substituted for and in lieu of the defendants, William H. Sharpley, Clair J. Pitcher, Alexander Nisbet, John B. Hunter and Lewis C. Greenlee, as commissioners, members of and constituting the council of the city and county of Denver, William H. Sharpley as mayor and commissioner of Social Welfare of the city and county

of Denver; Clair J. Pitcher, as commissioner of Finance of the
1476 city and county of Denver; Alexander Nisbet as commissioner of Safety of the city and county of Denver; John B. Hunter, as commissioner of Improvements of the city and county of Denver, Lewis C. Greenlee as Commissioner of Property of the city and county of Denver; and Armour C. Anderson and A. Lincoln Fellows as members of and constituting the Public Utilities Commission of the city and county of Denver.

No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant.
vs.
CITY and COUNTY OF DENVER, ROBERT W. SPEER, as Mayor of the City and County of Denver, W. F. R. Mills as Manager of Improvements and Parks of the City and County of Denver, Clair J. Pitcher as Manager of Revenue of the City and County of Denver, William H. Sharpley as Manager of Health and Charity of the City and County of Denver, Dewey C. Bailey as Manager of Safety and Excise of the City and County of Denver, James F. Markey as Auditor of the City and County of Denver, Charles A. Lammers as Clerk and Recorder of the City and County of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J.
1477 Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as Members of and Constituting the Council of the City and County of Denver; and Armour C. Anderson as sole member of and constituting the Public Utilities Commission of the City and County of Denver, Defendants.

Assignment of Errors.

Now come the defendants in the above entitled cause, and file the following assignment of errors upon which they will rely upon their prosecution of the appeal in the above entitled cause from the decree made by this Honorable Court on the 1st day of February, A. D. 1916.

I.

That the United States District Court for the district of Colorado erred in approving and confirming in and by said decree, the report filed in said cause October 7th, 1915, of the Special Master, and erred in approving and confirming in and by said decree each and every part of said report.

II.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 4 of said report of the Special Master filed in said cause October 7th, 1915; and that the said Special Master erred in making the said finding in said paragraph No. 4, because the said Special Master discloses that one of the questions determined by him was "the reason-
1478 able value of the property used by the Water Company in delivering water to the City and its inhabitants" and that in his said report as a whole he undertakes to and does find and return the figures by him determined to be the figures of reasonable value of the property used by the complainant company in delivering water to the City and its inhabitants; whereas the said Master ought to have found and determined the reasonable value only of the property used and useful in delivering water to the City and County and its inhabitants, and should have excluded the value of all property used which was not found by him useful and necessary to be used in so delivering water to the city and county and its inhabitants.

III.

That the United States District Court for the district of Colorado, erred in approving and confirming paragraph or finding No. 12 of said report of the Special Master filed in said cause October 7th, 1915; and that the said Special Master erred in making the said finding in said paragraph No. 12, because the said Special Master has in said report and in said paragraph or finding No. 12, and the table attached to said paragraph, stated and certified, and in the whole of said report has found, the reasonable value of the plant of the complainant company on May 1st, 1914, to be $13,415,-899.00, and in so finding has included the gross reproduction cost, including engineering and contingencies, less accrued depreciation, at the present reasonable value of said plant and property;
1479 whereas the Master ought to have used the fair contract cost new of the said property and plant; instead of the gross reproduction cost, less accrued depreciation, in determining the present reasonable value of the property of the complainant Company used and useful in supplying the city and county of Denver and its inhabitants with water, for that present reasonable value cannot in any event exceed the fair contract cost new of the property used in supplying the city and county of Denver and its inhabitants with water.

IV.

That The United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 14 of said report of the Special Master filed herein October 7, 1915; and that said Master erred in making said finding in said paragraph

No. 14, because in and by said finding the Special Master has included within the Class "A" items of the aforesaid Table No. 1, the item known as item No. 26, "Tail Race from West Denver Pumping Station, $10,731.00," and the item known as No. 27, "Lake Archer Lands, $208,306.00;" whereas the Special Master ought to have found that each of the said items was property not useful or necessary to be used by the complainant company in supplying to the city and county of Denver and its inhabitants; and therefore ought to have found that each of said items should not be included in fixing the valuation of the property of the complainant company for the purposes of this suit.

1480 V.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 18 of said report of the Special Master filed herein October 7th, 1915, and that the said Special Master erred in making said finding in said paragraph No. 18, because he finds items No. 1, Class "A," (Exhibit "C' pages 111-115), known as Lake Cheesman Reservoir lands, also referred to in paragraph or finding No. 14 of the Master's report, as of the reasonable value of $160,000.00, basing his valuation upon the cost of said lands to the complainant company; whereas the Master ought to have found that said lands were of a value not exceeding $40,799.00, because the cost of said land, as indicated by the evidence, was not indicative of the value thereof, but was in truth and in fact merely the price paid by the complainant Company to one of its subsidiary or interested companies, and in effect a price paid to itself.

VI.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 24 of said report of the Special Master filed herein October 7th, 1915, and that the said Special Master erred in making said finding in said paragraph No. 24, because he stated and certified therein that the complainant company owns the water rights claimed by it by original appropriation, being items Nos. 4, 5, 6, 7, 8, 9, 10 and 12 Exhibit "C," because of its diversion of waters under such
1481 appropriations from the natural streams of Colorado, used by it in supplying its consumers in the city and county of Denver, and because contracts between the Water Company and its private consumers have been simply permits or licenses upon which rates have been paid by the consumers; whereas the Master ought to have found that the city and county of Denver and its inhabitants as an entirety has been and is now the consumer of all water appropriated by means of said appropriations initiated by said complainant Company, and the owner of such water rights, and that for purposes of determining fair value for rate making purposes there should be taken into consideration only the cost of the structure and the cost of initiation of such appropriation.

VII.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 27 of said report of the Special Master filed herein October 7th, 1915, and that the said Special Master erred in making said finding in said paragraph No. 27, because he stated and certified therein that item No. 4, in group 1 should be included; whereas the Master ought to have found that item No. 4 should have been in part excluded, because said item No. 4 includes a claimed appropriation, and was of 3.14 cubic feet of water per second of time in the non-irrigating season; whereas in truth and in fact there is no such thing as the non-irrigating season, and the said amount of water and the appropriation thereof, the right and title thereto, rests in others than the complainant Company, towit, in the Lehow Estate.

1482 VIII.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 27 of said report of the special master filed herein October 7th, 1915, and that the said Special Master erred in making said finding in said paragraph No. 27, because he stated and certified that items 5 and 6, being the appropriations of predecessors of complainant Company described on page 16 of Exhibit "C," were of the value of $200,000.00, and has included said items and such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

IX.

That the United States District Court for the District of Colorado erred in approving and confirming paragraph or finding No. 27 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph No. 27, because he stated and certified that item 7, the Cherry Creek Galleries, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C," was of the value of $66,000.00, and has included said item and such valuation in his findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is
1483 in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

X.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 27 of said report of the Special Master filed herein October 7th, 1915; and that the Special Master erred in making said finding in said paragraph No. 27, because he stated and certified that item 8, the Platte Canon Filter Galleries, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C" was of a value of $65,000.00, and has included said item and such valuation in his findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

XI.

That the United States District Court of the district of Colorado erred in approving and confirming paragraph or finding No. 27 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph No. 27, because he stated and certified that item 9, Platte Canon 34 inch conduit, being the appropriation of
1484 predecessors of complainant Company described on page 16 of Exhibit "C," was of a value of $24,750.00, and has included said item in such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate making purposes no value ought to be assigned to such water rights as if owned by the complainant company.

XII.

That the United States District Court for the District of Colorado erred in approving and confirming paragraph or finding No. 27 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph No. 27, because he stated and certified that item 10, Platte Canon 40 inch conduit, being the appropriation of predecessors of complainant Company, described on page 16 of Exhibit "C," was of a value of $30,000.00, and has included said item in such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate making purposes no value ought to be assigned to such water rights as if owned by the complainant Company.

XIII.

That the United States District Court for the district of
1485 Colorado in approving and confirming paragraph or finding No. 27 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph No. 27, because he stated and certified that item 12, Lake Cheesman, being the appropriation of predecessors of complainant Company described on page 16 of Exhibit "C," was of a value of $1,611,117.00, and has included said item in such valuation in his said findings and in his whole report; whereas the Master ought to have found that the ownership of said water rights is in the city and county of Denver and its inhabitants, and that in the determination of fair value for rate making purposes no value ought to be assigned to such water rights as if owned by the complainant Company. And for the further reason that the appropriation of said right, made by the Denver Union Water Company, complainant herein, was expressly made for the use and benefit of the city and county of Denver and its inhabitants; and upon the representations made by said complainant Company, that its appropriations were for the benefit of said city and county and its inhabitants, and for no other purpose, the said complainant Company acquired valuable rights, privileges and concessions, and is estopped to deny ownership by the said city and county and its inhabitants of the water so appropriated for the benefit of said city and county and its inhabitants.

XIV.

That the United States district court for the district of Colorado erred in approving and confirming paragraph or finding No.
1486 28 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph 28, because he found and determined that the unit price of $55.00 per acre foot should be applied in determining the value of the water rights of complainant Company, and particularly applied to the so-called Lake Cheesman rights and to the estimated volume of water yielded by the water rights included on Group 1 of Class "B" (Exhibit "C" pages 117-118); whereas the Master ought to have found that a unit price of not to exceed $40.00 per acre foot should be used in determining the value of the water rights of the complainant Company actually owned by it, by applying such unit price of $40.00 per acre foot to the volume of water yielded by such rights, and ought not to have applied any such unit price to the volume of water yielded by those rights, ownership to which exists in the city and county of Denver and its inhabitants.

XV.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 29 of

said report of the Special Master filed herein October 7th, 1916; and that the said Special Master erred in making said finding in said paragraph No. 29, because he applied the unit price of $55.00 per acre foot to an estimate yield of 54,000 acre feet of such volume of water to be $2,970,000.00, and, after deducting the value of Lake Cheesman structures, previously found by him, finds a net
1487 value of Lake Cheesman water rights to be $1,611,117.00, which value he has assigned as their present value; whereas the Master ought to have found that the ownership of the water appropriated through the Lake Cheesman structure, and the appropriations therefor, is in the city and county of Denver and its inhabitants, and that the value thereof should be excluded from consideration in determining the fair value of complainant Company's property for rate making purposes.

XVI.

That the United States district court for the district of Colorado erred in approving and confirming paragraph or finding No. 30 of said report, of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph No. 30, because he stated and certified that he has applied the unit price of $55.00 per acre foot to the estimated yield of the water rights in Group 1 (Class "B", Water Rights Exhibit "C"); whereas the Master ought to have found that the unit price to be applied to the volume of yield of such rights should not in any event exceed the sum of $40.00 per acre foot, and that the estimated yield should not have exceeded 20,000 acre feet.

XVII.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 41 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding
1488 in paragraph No. 41, because he stated and certified that $805,000.00 should be allowed for interest during construction as reasonable and fair; whereas the Master ought to have found that no allowance whatever should be made for interest during construction in determining the present fair value of complainant's property for rate making purposes, if there is to be allowed also the item of "Going Concern" value, and because the plant of complainant company was not constructed as a new and complete plant, in the construction of which interest during construction might be an item for consideration, but was a plant constructed piecemeal and from time to time, and, except, for a very inconsiderable portion thereof, has been constructed out of income and with money derived through the payment of water rates in advance.

XVIII.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or finding No. 46 of said report of the Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding in said paragraph No. 46, because he stated and certified that $800,000.00 is a sum reasonable and fair to be allowed as the intangible element of "Going Concern Value" and proper to be included in the fair value of complainant's property for rate making purposes; whereas the Master ought to have found that, having previously fully allowed the item of interest during construction and
1489 engineering and contingencies, which items go to make up the principal portion of overhead charges, there should be nothing further allowed for "Going Concern Value", and further, should have found that in appraising the property of complainant Company at reproduction cost less accrued depreciation, including engineering, contingencies and interest during construction, the property had been appraised as an established and assembled plant, doing business and earning money, and that the intangible element of so-called "Going Concern Value" ought not thereafter to have been added, and ought not to be included in the determination of the present fair value of complainant's property for rate making purposes.

XIX.

That the United States District Court for the district of Colorado erred in approving and confirming the report of said Special Master and his allowance of valuations; and the said Special Master erred in making said report and findings and in his allowance of valuations therein, by duplicating certain values (as particularly appears from Table 1 of paragraph 12 of the report), in that he has included in the "Gross Reproduction Cost" an allowance of "12½% for Engineering and Contingencies", and an allowance of $699,545.00 for "Interest During Construction", and an allowance of $800,000.00 for "Going Concern Value"; whereas the said allowance of "12½% for Engineering and Contingencies", and the allowance of $699,545.00 for "Interest During Construction", are what are commonly known as overhead charges and go to make up the item of "Going Concern Value".

1490 XX.

That the United States District Court for the district of Colorado erred in approving and confirming the report of the said Special Master; and the Special Master erred in his finding in said report and making as great an allowance as $800,000.00, or any allowance at all for "Going Concern Value", (paragraphs 12 and 46 of the Master's Report), because, as appears by the uncontradicted evi-

dence in the case, the franchise of the complainant company has expired, and the complainant company had not on May 1st, 1914, and has not since, and has not now, any franchise to do business in the city and county of Denver.

XXI.

That the United States district court for the district of Colorado erred in approving and confirming the report of said Special Master; and the Special Master erred in his findings in said report because the Special Master has, throughout his entire report, attached undue weight and importance to the testimony of the witnesses Metcalf and Anderson, who were witnesses for the complainant, and has as the result thereof placed excessive values upon much of the property of the complainant company.

XXII.

That the United States district court for the district of Colorado erred in approving and confirming paragraph or finding No. 50 of said report of said Special Master filed herein October 7th, 1915; and that the said Special Master erred in making said finding
1491 in said paragraph No. 50, because he stated and certified that $140,000.00 is allowed for "Annual Depreciation," whereas the Master ought to have found that nothing should be allowed for "Annual Depreciation" as the same is included annually in the item of "Operating Expenses."

XXIII.

That the United States District Court for the district of Colorado erred in approving and confirming paragraph or findings Nos. 8 and 53 of said report of said Special Master filed herein October 7th, 1915; and that the said Special Master erred in making and finding in said paragraphs Nos. 8 and 53, because he found, stated and certified that the rate making ordinance, being Ordinance No. 26 of the Series of 1914, does not permit the Water Company to earn for the use of its property such compensation as is fair to it and to the City, and that the enforcement of said ordinance will result in the taking of the use of said property without just compensation and the said ordinance is invalid; whereas the Master ought to have found that said ordinance did permit the complainant Company to earn for the use of its property such compensation as is fair to it and to the City, and that the enforcement of said ordinance will not result in the taking of said property without just compensation, and that the same is valid.

XXIV.

That the United States District Court for the district of
1492 Colorado erred in overruling the exceptions of the respective

parties defendant to the report of the Special Master filed herein October 7th, 1915.

XXV.

That the United States District Court for the district of Colorado erred in changing the word "overruled" to the word "stricken" in the order of January 28th, 1916, by order and decree entered herein on the 1st day of February 1916.

XXVI.

That the United States District Court for the district of Colorado erred in making and entering the order in said cause of January 28th, 1916, that the exceptions of the parties defendant to the report of the special master filed herein October 7th, 1915, be stricken and for naught held.

XXVII.

That the United States District Court for the district of Colorado erred in making and entering the order in said cause of January 28th, 1916, that the report of the Special Master, W. J. Chinn, Esq., filed October 7th, 1915, be and is in all things confirmed, and that the cause pass to final decree for complainant in accordance with the findings and recommendations of the said Special Master.

XXVIII.

That the United States District Court for the district of Colorado erred in making and entering the order in said cause of
1493 January 28th, 1916, overruling the exceptions of the parties defendant to the report of said Special Master filed October 7th, 1915; and ordering and directing that the exceptions of the respective parties defendant to said report be stricken and for naught held, and that the report of said Special Master, W. J. Chinn, Esq., be and is in all things confirmed, and that the cause pass to final decree for complainant in accordance with the findings and recommendations of said Special Master.

XXIX.

That the United States District Court for the district of Colorado erred in making and entering the order of February 1st, 1916, in said cause, that the petition and each and every part thereof, filed herein February 1st, 1916, on behalf of defendants and each of them, asking that the order of May 21st, 1914, appointing the Special Master in said cause be modified and corrected by adding thereto after the word "consenting" in line 6 of said order the following: "to the individual selected as Special Master" be denied.

XXX.

That the United States District Court for the district of Colorado erred in making and entering the order of February 1st, 1916 in said cause, that the petition and each and every part thereof, filed herein February 1st, 1916, on behalf of defendants and each of them, asking that the defendants be permitted to file their objections and exceptions to the findings and conclusions of the Master be-
1494 fore the Master, and to direct that such objections and exceptions be passed upon by the Master, be denied.

XXXI.

That the United States District Court for the District of Colorado erred in making and entering the order of February 1st, 1916 in said cause, that the petition and each and every part thereof, filed herein February 1st, 1916, on behalf of defendants and each of them, praying the court to modify the order entered on January 28th, 1916, in said cause, directing "that the exceptions of the respective parties to said report be stricken and for naught held," by causing the same to read, "that the exceptions of the respective parties to said report be and the same are overruled," be denied.

Wherefore, defendants and appellants pray that said decree be reversed, and that said District Court for the said district of Colorado be ordered to enter a decree reversing the decree of the lower court in said cause.

J. A. MARSH,
F. W. SANBORN,
Solicitors for Defendants and Appellants.

(Endorsed:) No. 6274. United States District Court. The Denver Union Water Co., Complainant, vs. City and County of Denver, et al, Defendants. Assignment of Errors. Filed Jul. 29, 1916, Charles W. Bishop, Clerk.

1495 UNITED STATES OF AMERICA,
District of Colorado, ss.:

In the District Court of the United States for the District of Colorado.

In Equity.

No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,
vs.
CITY AND COUNTY OF DENVER, ROBERT W. SPEER as Mayor of the City and County of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver, Clair J. Pitcher as Manager of Revenue of the city and county of Denver, William H. Sharpley as Manager of Health and Charity of the

city and county of Denver, Dewey C. Bailey as Manager of Saftey and Excise of the city and county of Denver, James F. Markey as Auditor of the city and county of Denver, Charles A. Lammers as clerk and recorder of the city and county of Denver, Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Ryeraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the council of the city and county of Denver, and Armour C. Anderson as sole member of and constituting the Public Utilities Com-
1496 mission of the city and county of Denver, Defendants.

Petition for Appeal.

To the Honorable Robert E. Lewis, District Judge:

The above named defendants, and each of them, feeling aggrieved by the decree rendered and entered in the above entitled cause on the 1st day of February, A. D. 1916, do hereby appeal from said decree to the Supreme Court of the United States, for the reasons set forth in the assignment of errors filed herewith; and they, and each of them, pray that their appeal be allowed, and that citation be issued as provided by law, and that a transcript of the record proceedings and documents upon which said decree was based, duly authenticated, be sent to the Supreme Court of the United States, sitting at Washington, D. C., under the rules of such court in such cases made and provided.

And your petitioners, and each of them, further pray that the proper order relating to the required security to be required of them be made.

J. A. MARSH,
F. W. SANBORN,
Solicitors for Defendants.

Appeal allowed upon giving bond as required by law in the sum of $500.

ROBERT E. LEWIS, *Judge.*

1497 (Endorsed:) No. 6274. United States District Court. The Denver Union Water Co., Complainant vs. City and County of Denver, et al, Defendants. Petition for Appeal. Filed Jul. 29, 1916, Charles W. Bishop, Clerk.

SATURDAY, July 29th, A. D. 1916.

At Chambers, before the Honorable Robert E. Lewis, district judge, the following proceedings were had:

In Equity.

6274.

THE DENVER UNION WATER COMPANY

vs.

THE CITY AND COUNTY OF DENVER, ROBERT W. SPEER as mayor of the city and county of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver, Clair J. Pitcher as Manager of Revenue of the city and county of Denver, William H. Sharpley as Manager of Health and Charity of the city and county of Denver, Dewey C. Bailey as Manager of Safety and Excise of the city and county of Denver; Charles A. Lammers as clerk and recorder of the city and county of Denver, Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the council of the city and county of Denver, and Armour C. Anderson, as sole member of and constituting the Public Utilities
1498 Commission of the city and county of Denver.

Bill for Injunction and for Other Relief.

This cause comes on now to be heard, James A. Marsh, Esquire, appearing as solicitor for the defendants. And thereupon, the defendants pray an appeal to the Supreme Court of the United States which is hereby allowed to them, but upon the consideration nevertheless that they give bond on such appeal in the sum of five hundred dollars ($500.00).

UNITED STATES OF AMERICA,
District of Colorado, ss:

In the District Court of the United States for the District of Colorado.

No. 6274. In Equity.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,

vs.

CITY AND COUNTY OF DENVER, ROBERT W. SPEAR, as Mayor of the City and County of Denver; W. F. R. Mills, as Manager of Improvements and Parks of the City and County of Denver; Clair J. Pitcher, as Manager of Revenue of the City and County of Denver; William H. Sharpley, as Manager of Health and Charity of the City and County of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the City and County of Denver; James F. Markey as Auditor of the City and County of Denver; Charles A.

Lammers as Clerk and Recorder of the City and County
1499 of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Ryeraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as Members of and Constituting the Council of the City and County of Denver; and Armour C. Anderson, as Sole Member of and Constituting the Public Utilities Commission of the City and County of Denver, Defendants.

Bond on Appeal.

Know all men by these presents, That we, City and County of Denver, a municipal corporation, Robert W. Speer as mayor of the city and county of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver, Clair J. Pitcher as Manager of Revenue of the city and county of Denver, William H. Sharpley as Manager of Health and Charity of the city and county of Denver, Dewey C. Bailey as Manager of Safety and Excise of the city and county of Denver, James F. Markey as auditor of the city and county of Denver, Charles A. Lammers as clerk and recorder of the city and county of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Ryeraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the council of the city and county of Denver; and Armour C. Anderson as sole member of and constituting the Public Utilities Commission of the city and county
1500 of Denver, appellants in the above entitled cause, as principals, and *and* The Fidelity & Deposit Company of Maryland, a corporation of the state of Maryland, duly authorized to do business as a surety company in the state of Colorado, as surety, acknowledge ourselves to be jointly indebted to The Denver Union Water Company, a corporation, appellee in the above entitled cause, in the sum of five hundred dollars ($500.00), (as indicated by the judge allowing the appeal), conditioned that,

Whereas, on the 1st day of February, A. D. 1916, the district court of the United States for the district of Colorado in a suit depending in that court wherein The Denver Union Water Company, a corporation, was plaintiff, and the City and County of Denver, William H. Sharpley, Clair J. Pitcher, Alexander Nisbet, John B. Hunter, and Lewis C. Greenlee, as commissioners, members of and constituting the council of the city and county of Denver, William H. Sharpley as mayor and Commissioner of Social Welfare of the city and county of Denver, Clair J. Pitcher as Commissioner of Finance of the city and county of Denver, Alexander Nisbet as Commissioner of Safety of the city and county of Denver, John B. Hunter as Commissioner of Improvements of the city and county of Denver; Lewis C. Greenlee as Commissioner of Property of the city and county of Denver; James F. Markey as Auditor of the city and county of Denver; Armour C. Anderson and A. Lincoln Fellows, as members of and constituting the Public Utilities Commission of

the city and county of Denver, were defendants, (numbered on the Equity Docket as 6274), a decree was rendered against said defendants;

1501 And whereas, by order of court duly made and entered, the City and County of Denver, Robert W. Speer as Mayor of the city and county of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver, Clair J. Pitcher as Manager of Revenue of the city and county of Denver, William H. Sharpley as Manager of Health and Charity of the city and county of Denver, Dewey C. Bailey as Manager of Safety and Excise of the city and county of Denver, James F. Markey as auditor of the city and county of Denver, Charles A. Lammers as clerk and recorder of the city and county of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the council of the city and county of Denver; and Armour C. Anderson as sole member of and constituting the Public Utilities Commission of the city and county of Denver, were substituted for and in lieu of the defendants named in the next preceding paragraph hereof;

And whereas, said last named defendants have obtained an appeal to the Supreme Court of the United States, and a citation directed to said The Denver Union Water Company, complainant, citing and admonishing it to be and appear in the Supreme Court of the United States at the city of Washington, D. C. on the 28 day of August, A. D. 1916;

Now, therefore, if the said City and County of Denver and the other last named defendants and appellants, shall prosecute
1502 their said appeal with effect, and answer all costs if they fail to make their plea good, then the above obligation to be void; else to remain in full force and virtue.

Signed, sealed and delivered this 29th day of July, A. D. 1916.

CITY AND COUNTY OF DENVER,
By R. W. SPEER, *Mayor.*

Fidelity and Deposit Company of Maryland.

Home Office: Baltimore, Maryland.

Know All Men by These Presents: That the Fidelity and Deposit Company of Maryland, by Fred S. Axtell, its vice-president, and Wm. R. Bishop its assistant secretary, in pursuance of authority

granted by Section 3, Article VI, of the By-Laws of said Company, a copy of which section is hereto attached, does hereby nominate, constitute and appoint Frank L. Bishop, M. E. Minty, Sidney Moritz, Herbert W. Robinson, William G. Maitland, L. Ward Bannister, and Leroy McWhinney, all of the city of Denver, state of Colorado, its true and lawful agents, and attorneys-in-fact, to make, execute, seal and deliver for and on its behalf, as surety, and as its act and deed, any and all bonds or undertakings required in the states of Colorado, Wyoming and New Mexico.

Such bonds or undertakings to be executed for the Company by any two of said Frank L. Bishop, M. E. Minty, Sidney Moritz, Herbert W. Robinson, William G. Maitland, L. Ward Bannister and Leroy McWhinney, one signing the Company's name per his, as attorney-in-fact, and the other attesting as agent and affixing the seal of the Company.

And the execution of such bonds or undertakings in pursuance of these presents, shall be as binding upon said Company, as fully and amply, to all intents and purposes, as if they had been duly
1505 executed and acknowledged by the regularly elected officers of the Company at its office in Baltimore, Maryland, in their own proper persons. This power of attorney revokes those of October 20th, 1910, June 14th, 1912 and March 11th, 1913, in behalf of E. S. Kassler, et al.

In Witness Whereof, the said Fred S. Axtell, vice-president and Wm. R. Bishop, assistant secretary, have hereunto subscribed their names and affixed the corporate seal of the said Fidelity and Deposit Company of Maryland, this 12th day of May, 1913.

[CORPORATE SEAL.] FRED S. AXTELL,
Vice-President.

Attest:
W. R. BISHOP,
Assistant Secretary.

STATE OF MARYLAND,
City of Baltimore, ss:

On this 12th day of May, A. D. 1913, before the subscriber, a notary public of the state of Maryland, in and for the city of Baltimore, duly commissioned and qualified, came Fred S. Axtell, Vice President and Wm. R. Bishop, Assistant Secretary, of the Fidelity and Deposit Company of Maryland, to me personally known to be the individuals and officers described in, and who executed the preceding instrument, and, they each acknowledged the execution of the same, and being by me duly sworn, severally and each for himself deposeth and saith, that they are the said officers of the Company aforesaid, and that the seal affixed to the preceding instrument is the corporate seal of said Company, and that the said corporate
1506 seal and their signature as acknowledged by the regularly elected officers of the Company at its office in Baltimore, Maryland, in their own proper persons. This power of attorney

revokes those of October 20th, 1910, June 14th, 1912 and March 11th, 1913, in behalf of E. S. Kassler, et al.

In Witness Whereof, the said Fred S. Axtell, vice-president and Wm. R. Bishop, assistant secretary, have hereunto subscribed their names and affixed the corporate seal of the said Fidelity and Deposit Company of Maryland, this 12th day of May, 1913.

[CORPORATE SEAL.] FRED S. AXTELL,
Vice-President.

Attest:
W. R. BISHOP,
Assistant Secretary.

STATE OF MARYLAND,
City of Baltimore, ss:

On this 12th day of May, A. D. 1913, before the subscriber, a notary public of the state of Maryland, in and for the city of Baltimore, duly commissioned and qualified, came Fred S. Axtell, Vice President and Wm. R. Bishop, Assistant Secretary, of the Fidelity and Deposit Company of Maryland, to me personally known to be the individuals and officers described in, and who executed the preceding instrument, and they each acknowledged the execution of the same, and being by me duly sworn, severally and each for himself deposeth and saith, that they are the said officers of the Company aforesaid, and that the seal affixed to the preceding instrument is the corporate seal of said Company, and that the said corporate seal and
1507 their signature as such officers were duly affixed and subscribed to the said instrument by the authority and direction of the said corporation.

In Testimony Whereof, I have hereunto set my hand and affixed my official seal, at the city of Baltimore, the day and year first above written.

[NOTARIAL SEAL.] MILLARD LEONARD,
Notary Public.

Commission expires May 4, 1914.

Extracts from By-Laws of the Fidelity and Deposit Company of Maryland, Adopted by the Stockholders of Said Company on January 14th, 1913.

"Article VI, Section 3—The president, or any of the vice-presidents, elected by ballot from the members of the board of directors shall have power by and with the concurrence of the secretary or any of the assistant secretaries, to appoint any attorney-in-fact or to authorize any person or persons to execute on behalf of the Company, any bonds, recognizances, stipulations, undertakings, deeds, releases of mortgages, contracts, agreements and policies, and to affix the seal of the Company thereto."

I, Wm. R. Bishop, assistant secretary of the Fidelity and Deposit Company of Maryland, hereby certify that the aforegoing is a true

copy of Section 3, Article VI, of the By-Laws of said Company and is still in force.

In Testimony Whereof, I have hereunto subscribed my name as assistant secretary, and affixed the corporate seal of the Fidelity and Deposit Company of Maryland, this 12th day of May, A. D. 1913.

[CORPORATE SEAL.] W. R. BISHOP,
Assistant Secretary.

(Endorsed:) No. 6274. United States District Court. The Denver Union Water Co., Complainant, vs. City and County of Denver, et al., Defendants. Defendants' Appeal Bond $500.00. Filed Jul-29, 1916. Charles W. Bishop, Clerk.

1511 In the District Court of the United States for the District of Colorado.

In Equity. No. 6274.

THE DENVER UNION WATER COMPANY, a Corporation, Plaintiff,

vs.

CITY AND COUNTY OF DENVER, ROBERT W. SPEER as Mayor of the City and County of Denver; W. F. R. Mills, as Manager of Improvements and Parks of the City and County of Denver; Clair J. Pitcher, as Manager of Revenue of the City and County of Denver; William H. Sharpley, as Manager of Health and Charity of the City and County of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the City and County of Denver; James F. Markey, as Auditor of the City and County of Denver; Charles A. Lammers, as Clerk and Recorder of the City and County of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and Constituting the Council of the City and County of Denver, and Armour C. Anderson as Sole Member of and Constituting the Public Utilities Commission of the City and County of Denver, Defendants.

Plaintiff's Assignment of Errors on Cross Appeal.

Now comes the plaintiff above named and says that, insofar as under the order of reference in this case the report of the Special Master is in law conclusive as to any matters therein con-
1512 tained, the plaintiff does not by filing this assignment of errors, or by praying or prosecuting an appeal based thereon, consent to the review of said matters by this court or by the Supreme Court on appeal, but plaintiff files and presents this assignment of errors as a basis for its cross appeal, and will take and prosecute such cross appeal subject to such rulings as the court may make concerning the right and duty of the court to review such matters, said errors so assigned to be urged by the plaintiff and cross appellant with respect only to such findings and conclusions as the court may determine are so subject to review, and without waiver of or prejudice to all or any of plaintiff's rights or contentions in the premises.

With the foregoing reservation, plaintiff, as cross appellant, files and presents this its assignment of errors, as a basis for its cross appeal, and respectfully represents that in the records and proceedings of said district court in the above entitled cause, and also in the proceedings before the Special Master to whom said cause was

referred, and in the findings and report of said special master, there is manifest error, which error, in the event, and only in the event, that the Supreme Court should upon the appeal taken herein by the defendants sustain the assignments of error, or some of them, filed herein by said defendants as the basis of their said appeal, would be highly prejudicial to the said plaintiff, in the following particulars, towit:

1. The Special Master erred in finding (his report, paragraph 11) that "The evidence shows no material change in the
1513 plant between this day and the time when the evidence was heard," and the district court erred in overruling plaintiff's exception I thereto and in confirming and adopting said finding.

2. The Special Master erred in finding (his report, paragraph 12, Table 1, and paragraph 48) the reasonable value of all of the property used by the plaintiff on May 1, 1914, and useful as a part of its water plant for the delivery of water to the city and its inhabitants, to be only the sum of $13,415,899.00, whereas the evidence shows, without substantial dispute, that said valuation should have been a much larger amount, and the district court erred in overruling plaintiff's exception II to said finding and in confirming and adopting the same.

3. The Special Master erred (his report, paragraph 14) in allowing for the Lake Cheesman lands (Exhibit C, Class A, Item 1) only the sum of $160,000.00, whereas the evidence shows, without substantial dispute, that said allowance should have been at least the sum of $200,000.00, and the district court erred in overruling plaintiff's exception III to said finding and in confirming and adopting said finding.

4. The Special Master erred (his report, paragraph 14) in allowing only the sum of $765.00 for the Platte River Stone Placer claim (Exhibit C, Class A, Item 2), whereas the evidence shows, without substantial dispute, that said allowance should have been at least the sum of $3,600.00, and the district court erred in over-
1514 ruling plaintiff's exception IV to said finding and in confirming and adopting said finding.

5. The Special Master erred (his report, paragraph 14) in allowing for the Platte Canon Valley lands (Exhibit C, Class A, Item 3) only the sum of $3,065.00, whereas the evidence shows without substantial dispute, that said allowance should have been at least the sum of $7,500.00, and the district court erred in overruling plaintiff's exception V to said finding, and in confirming and adopting said finding.

6. The Special Master erred (his report, paragraph 14) in allowing for the Platte Canon filter station (Exhibit C, Class A, Item 5) only the sum of $1,000.00, whereas the evidence shows, without substantial dispute, that said allowance should have been at least the sum of $5,350.00, and the district court erred in overruling plaintiff's exception VI to said finding, and in confirming and adopting said finding.

7. The Special Master erred (his report, paragraph 14) in allow-

ing for the Platte Canon power house site (Exhibit C, Class A Item 6) only the sum of $1,000.00 whereas the evidence shows without substantial dispute that said allowance should have been at least $2000.00, and the district court erred in overruling plaintiff's exception VII to said finding and in confirming and adopting said finding.

8. The Special Master erred (his report, paragraph 14
1515 in allowing for the Marston Lake reservoir site (Exhibit C, Class A, Item 17) only the sum of $125,000.00, whereas the evidence shows, without substantial dispute, that said allowance should have been at least the sum of $168,000.00, and the district court erred in overruling plaintiff's exception VIII to said finding, and in confirming and approving said finding.

9. The Special Master erred (his report, paragraph 14) in allowing for the Cherry Creek galleries site (Exhibit C, Class A, Item 20) only the sum of $4,370.00, whereas the evidence shows, without substantial dispute, that said allowance should have been at least the sum of $8,500.00, and the district court erred in overruling plaintiff's exception IX to said finding, and in confirming and adopting said finding.

10. The Special Master erred (his report, paragraph 15) in refusing to consider, in determining the present fair value of the lands, anything on account of the actual or estimated consequential or severance damages necessarily incurred in the acquisition thereof, and the district court erred in overruling plaintiff's exception X to said conclusion and finding, and in confirming and adopting said conclusion and finding.

11. The Special Master erred (his report, paragraph 15) in refusing to consider, in determining the present fair value of the lands, or to include therein, anything whatever on account of overhead expenses necessarily incurred in connection therewith, which the evidence shows, without substantial dispute, would re-
1516 quire an addition of at least ten per cent to the present actual market value for ordinary purposes, and the district court erred in overruling plaintiff's exception XI to said finding and conclusion, and in confirming and adopting said finding and conclusion.

12. The Special Master erred in ignoring and refusing to allow any additional value whatsoever on account of the special availability and adaptability for certain uses of the Lake Cheesman and Lake Marston lands and of the specific tracts of land mentioned in paragraph 17 of his report, and the district court erred in overruling plaintiff's exception XII to said finding and conclusion, and in confirming and adopting said finding and conclusion.

13. The Special Master erred (his report, paragraph 18) in allowing for the Lake Cheesman lands as the present value thereof only the purchase price paid therefor by the Water Company in the year 1899, instead of a much larger amount, as the evidence without substantial disputes, requires, and the district court erred in overruling plaintiff's exception XIII to said finding, and in confirming and adopting said finding.

14. The Special Master erred (his report, paragraph 19) in refusing to include in his valuation of the Marston Lake reservoir lands (Exhibit C, Class A, Item 17) anything whatever on account of their peculiar availability and adaptability, although the evidence shows, without substantial dispute, that for said reason they possess a value largely in excess of their market value for ordinary purposes which alone the Master allowed, and the district court erred in over-
1517 ruling plaintiff's exception XIV to said finding, and in confirming and adopting said finding.

15. The Special Master erred (his report, paragraph 21) in excluding from the property valued by him as a rating base the following items listed in Exhibit C, Class A, towit: Item 9, the Phœbe Strong Ranch, which should have been valued in the sum of at least $18,080.00; Item 10, the William Strong Ranch, which should have been valued in the sum of at least $15,000.00 (deducting filter site); Item 11, the Becky Archer Ranch, which should have been valued in the sum of at least $13,100.00; Item 12, the Frank Archer Ranch, which should have been valued in the sum of at least $37,900.00, although the evidence shows, without substantial dispute, that the retention and operation of said ranches is essential to the full protection and preservation of the water rights necessary for the supplying of the City and its inhabitants, and the District Court erred in overruling plaintiff's exception XV to said finding, and in confirming and adopting said finding.

16. The Special Master erred (his report, paragraph 21) in deducting from and not including in the property valued by him as a rating base the following items of real estate listed in Exhibit C, Class A, towit: Item 13, Mountain Reservoir site, which should have been valued in the sum of at least $6,075.00; Item 20-a, Woodbury land, which should have been valued in the sum of at least $1,500.00; Item 23, DeLappe Place, which should have been valued in
1518 the sum of at least $676.00; Item 24, Cottage Hill tank site, which should have been valued in the sum of at least $5,-208.00; Item 30, Office and Superintendent's Residence, which should have been valued in the sum of at least $3,250.00; Item 32, Lots in Cottage Hill, which should have been valued in the sum of at least $6,808.00, although the evidence shows without substantial dispute, that said items of property and each thereof, if not in actual use, were provided and held for use in the reasonably near future in connection with the waterworks system and as a part thereof, and the district court erred in overruling plaintiff's exception XVI to said finding, and in confirming and adopting said finding.

17. The Special Master erred (his report, paragraph 21) in excluding from and not including in the property valued by him as a rating base the following item of real estate, towit: Exhibit C, Class A, Item 15, Harriman Lake site, which should have been valued in the sum of at least $8,450.00, although the evidence shows, without dispute, that the same and the structure thereon are presently useful and actually used in connection with the water-works system, and fulfilling a necessary and valuable function in that regard, and the district court erred in overruling plaintiff's exception

XVII to said finding, and in confirming and adopting said finding.

18. The Special Master erred (his report, paragraph 21) in excluding from and not including in the property valued by him as a rating base the following item of real estate, towit: Exhibit
1519 C, Class A, Item 19, Sullivan Reservoir site, which should have been valued in the sum of at least $2,000.00, although the evidence shows, without substantial dispute, that the same and the structures situate thereon, if not actually in use at the present time, are provided for use in the reasonably near future and are a valuable part of the water-works system or plant, and the district court erred in overruling plaintiff's exception XVIII to said finding, and in confirming and adopting said finding.

19. The Special Master erred (his report, paragraphs 25 and 26) in valuing the water rights of the Company upon the basis of their irrigation worth only, without consideration of their peculiar availability and adaptability for the purposes of city supply and without any addition to their value on that account, although the evidence shows, without substantial dispute, that they possess high additional value because of that fact, and the district court erred in overruling plaintiff's exception XIX to said finding, conclusion and method of valuation and in confirming and adopting the same.

20. Special Master erred (his report, paragraph 27) in allowing as the value of the Company's water rights only the sum of $2,947,-617.00, although the evidence shows, without substantial dispute, that such allowance should have been at least the sum of $3,530,000, and the district court erred in overruling plaintiff's exception XX to said finding and conclusion and in confirming and adopting the same.

21. The Special Master erred (his report, paragraphs 28
1520 and 29) in allowing for the Lake Cheesman water right only the sum of $1,611,117.00, although the evidence shows, without substantial dispute that the value of said water right is at least the sum of $2,000,000.00 and the district court erred in overruling plaintiff's exception XXI to said finding and in confirming and adopting the same.

22. The Special Master erred (his report, paragraph 28) in using as the unit price per acre foot upon which to determine the valuation of the Lake Cheesman water right the sum of $55.00, although the evidence shows, without substantial dispute, that such unit price or value, even for irrigation purposes, should not be less than $60.00 per acre foot, and the district court erred in overruling plaintiff's exception XXII to said finding and in confirming and adopting the same.

23. The Special Master erred (his report, paragraph 29) in finding only 54,000 acre feet to be the quantity of water storable in and available for delivery annually by the Cheesman Reservoir, although the evidence shows, without substantial dispute, that said quantity should be at least 57,016 acre feet, on the basis of an assured supply worth $60.00 per acre foot, and a greater quantity if, because of less certainty of supply on a larger draft, a unit price of less than $60.00 per acre foot be applied, and the district court erred in overruling

plaintiff's exception XXIII to said finding and in confirming and adopting the same.

24. The Special Master erred (his report, paragraphs 27 and 30) in allowing only the sum of $949,439.00 as the value of group 1 of the water rights, said group 1 consisting of the following
1521 items of Class B, Exhibit C, towit: Items 1, 2, 3, 4, 13, 14, 15, 16, 17 and 21, although the evidence shows without substantial dispute, that the value of said group of water rights is not less than the sum of $1,150,000.00, and the district court erred in overruling plaintiff's exception XXIV to said finding and in confirming and adopting the same.

25. The Special Master erred (his report, paragraph 30) in taking as the annual yield of said group 1 of water rights only the quantity of 37,000 acre feet, although the evidence shows without substantial dispute, that said yield for irrigation purposes, would be not less than 40,000 acre feet, and for purposes of city supply of much larger quantity, and the district court erred in overruling plaintiff's exception XXV to said finding and in confirming and adopting the same.

26. The Special Master erred (his report, paragraph 30) in employing the unit price or value of $55.00 per acre foot in arriving at the value of said group 1 of water rights, although the evidence shows without substantial dispute that said unit price or value should be at least $60 per acre foot, and the district court erred in overruling plaintiff's exception XXVI to said finding and in confirming and adopting the same.

27. The Special Master erred (his report, paragraphs 27 to 32 inclusive) in his valuation of water rights, and found too low a value therefor, in that after having determined their value for irrigation purposes only, ignoring their added value as sources of city supply, he deducted therefrom the reproduction cost of the water-works structures and lands appurtenant thereto, although the evidence
1522 shows, without substantial dispute, that such water-works structures and lands are much more costly than those used or useful for irrigation purposes, and although the evidence also shows, without substantial dispute, that the cost of reproduction and therefore the present value of such or similar water rights, equally available and as well adapted to the purposes of city supply, would be more than their total gross value for irrigation purposes without deduction for any structures, lands or other appurtenances whatsoever, and the district court erred in overruling plaintiff's exception XXVII to said finding and method of valuation and in confirming and adopting the same.

28. The Special Master erred (his report, paragraph 36) in excluding from and not including in the property valued by him for a rating base the Harriman Lake structures (Exhibit C, Class I, Item 6), which should have been valued in the sum of at least $11,858.00, although the evidence shows without substantial dispute, that said structures and the land upon which they are situate are presently useful and actually used as a part of the plant for supplying the City and its inhabitants with water, and the district court erred in overruling

plaintiff's exception XXVIII to said finding and in confirming and adopting the same.

29. The Special Master erred (his report, paragraph 37) in excluding from and not including in the property valued by him for a rating base the office and superintendent's residence at Littleton, (Exhibit C. Class J, Items 2-*b* and 6-*a*), which should have been valued in the sum of at least $8,050.00, and the district court
1523 erred in overruling plaintiff's exception XXIX to said finding and in confirming and adopting the same.

30. The Special Master erred (his report, paragraph 38) in excluding from and not including in the property valued as a rating base the structures at Sullivan Reservoir (Exhibit C, Class L, Item 5) which should have been valued at the sum of at least $122,534.00, and the district court erred in overruling plaintiff's exception XXX to said finding and in confirming and adopting the same.

32. The Special Master erred (his report, paragraph 39) is excluding and deducting from his estimate of reproduction cost, and consequent value, of the distribution pipe system the item of paving over mains (Exhibit C, Class S, Item 17), which should have been valued in at least the sum of $539,558.00, although the evidence shows, without substantial dispute, that the additional value in the plant arising therefrom is at least equal to the sum aforesaid, and the district court erred in overruling plaintiff's exception XXXI to said finding and in confirming and adopting the same.

32. The Special Master erred (his report, paragraph 39) *is* excluding and deducting from his estimate of reproduction cost, and consequent value, of the distribution pipe system items of added cost occasioned by railway tracks and other obstructions (Exhibit C, Class S, Items 19-*c*, 20-*a*, 20-*b*, 20-*c*, and 21-*a*), amounting to the sum of at least $109,992.00, although the evidence shows, without substantial dispute, that the value of the distribution system is enhanced
1524 because of said matters in an amount at least equal to the sum aforesaid, and the district court erred in overruling plaintiff's exception XXXII to said finding and in confirming and adopting the same.

33. The Special Master erred (his report, paragraph 39) in excluding and deducting from his estimate of reproduction cost of the distribution pipe system, and consequent value thereof, the item of taps for private consumers (Exhibit C, Class S, Item 25), which should have been valued in the sum of at least $140,038.00, although the evidence shows, without substantial dispute, that the value of the Company's distributing system is enhanced by reason of the existence of such taps, (which have become the property of the Company) by at least the sum aforesaid, and the district court erred in overruling plaintiff's exception XXXIII to said finding and in confirming and adopting the same.

34. The Special Master erred (his report, paragraph 40) in excluding from and not including in the property valued by him for a rating base the personal property on the Platte Valley ranches, used for farming purposes, (Exhibit C, Class T, Items 19 and 20), which should have been valued in the sum of approximately $28,159.00,

although the evidence shows, without substantial dispute, that the retention of said ranches and the conducting of farming operations thereon are necessary to the proper conservation and full preservation of the water rights used for city supply, and the district court erred in overruling plaintiff's exception XXXIV to said finding and in confirming and adopting the same.

1525 35. The Special Master erred (his report, paragraph 40) in excluding from and not considering in connection with his valuation of personal property (Exhibit C, Class T) all overhead expenses, amounting to not less than $25,000.00, although the evidence shows without substantial dispute, that such expense is necessarily incurred in assembling, arranging and distributing such property and making it available for use, and that it adds to the value thereof not less than the sum aforesaid, and the district court erred in overruling plaintiff's exception XXXV to said finding and in confirming and adopting the same.

36. The Special Master erred (his report, paragraph 42) in excluding from and not including in his estimate of reproduction cost and consequent value, of the entire plant the item of preliminary expense and cost of organization (Exhibit C, page 64), which should have been valued at the sum of at least $120,000.00, although the evidence shows, without substantial dispute, that such cost must necessarily be incurred, in addition to all overhead expense covered by other allowances, and that it adds value to the plant in at least the sum aforesaid, and the district court erred in overruling plaintiff's exception XXXVI to said finding and in confirming and adopting the same.

37. The Special Master erred (his report, paragraph 43) in wholly excluding from consideration and failing to make any allowance whatsoever for working capital, although the evidence shows without dispute, that it is necessary for the Company to supply a working capital of not less than $100,000.00, and the district court

1526 erred in overruling plaintiff's exception XXXVII to said finding and exclusion and in confirming and adopting the same.

38. The Special Master erred (his report, paragraph 46) in fixing the going value of the plant at only $800,000.00, whereas the evidence shows, without dispute, that said value should be at least $1,200,000.00, and the district court erred in overruling plaintiff's exception XXXVIII to said finding and in confirming and adopting the same.

GERALD HUGHES,
CLAYTON C. DORSEY,
Solicitors for Plaintiff and Cross-Appellant.

(Endorsed:) Court No. 6274. Div. Equity. In the U. S. District Court, district of Colorado. The Denver Union Water Company, Plaintiff, vs. City and county of Denver et al., Defendants. Plaintiff's Assignment of Errors on Cross Appeal. Filed Jul. 29, 1916. Charles W. Bishop, Clerk. Hughes & Dorsey, Attorneys for Plaintiff. No. —.

1175

UNITED STATES OF AMERICA,
District of Colorado, ss:

In the District Court of the United States for the District of Colorado.

No. 6274. In Equity.

THE DENVER UNION WATER COMPANY, a Corporation, Complainant,
vs.
CITY AND COUNTY OF DENVER, ROBERT W. SPEER, as
1527 Mayor of the City and County of Denver; W. F. R. Mills, as Manager of Improvements and Parks of the City and County of Denver; Clair J. Pitcher, as Manager of Revenue of the City and County of Denver; William H. Sharpley, as Manager of Health and Charity of the City and County of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the City and County of Denver; James F. Markey, as Auditor of the City and County of Denver; Charles A. Lammers, as Clerk and Recorder of the City and County of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock, and Harry Zimmerhackel, as Members of and Constituting the Council of the City and County of Denver; and Armour C. Anderson, as Sole Member of and Constituting the Public Utilities Commission of the City and County of Denver, Defendants.

Petition for Cross-Appeal.

The above named plaintiff, The Denver Union Water Company—in no wise complaining of the final decree in this cause which was in its favor—but conceiving itself aggrieved by certain orders and rulings of the Court, and certain rulings, findings and conclusions of the Special Master, approved, confirmed and adopted by the court, as more particularly specified in the assignment of errors which is filed herewith, only in the event that the Supreme Court of the
United States should, upon the appeal taken herein by the
1528 defendants, sustain the assignments of error made by said defendants, or some of them, seeks hereby to take a cross appeal in this cause to the Supreme Court of the United States to be considered in connection with and in opposition to the contentions of said defendants, as appellants in said appeal, to the Supreme Court taken in said cause by the said defendants—the reasons for said cross appeal being specified in the assignment of errors which is filed herewith, and your petitioner prays that said cross appeal may be allowed, to be considered in connection with and in opposition to said appeal of the defendants; and it is further prayed that a transcript of the record, proceedings and papers upon which said rulings and orders complained of in said assignments of error were made, duly authenticated, may be sent to the Supreme Court of the United States to the end that said rulings and orders, and plaintiff's objections thereto, may be before the Supreme Court for its consideration

and determination in connection with said appeal heretofore taken by said defendants, and in opposition to the reversal of the decree in favor of plaintiff heretofore entered herein.

GERALD HUGHES,
CLAYTON C. DORSEY,
Solicitors for Plaintiff and Cross-Appellants.

The foregoing claim of cross appeal is hereby allowed.
Dated at Denver, Colorado, this 29th day of July, A. D. 1916.

1529

ROBT. E. LEWIS,
District Judge.

(Endorsed:) Court No. 6274. Div. —. In the U. S. District Court, District of Colorado. The Denver Union Water Company, Plaintiff, vs. City and County of Denver, et al., Defendant-. Petition for Cross Appeal. Filed Jul. 29, 1916. Charles W. Bishop, Clerk. Hughes & Dorsey, Attorneys for Complainant. No. —.

SATURDAY, July 29th, A. D. 1916.

At Chambers, before the Honorable Robert E. Lewis, district judge, the following proceedings were had:

6274. In Equity.

THE DENVER UNION WATER COMPANY
vs.
THE CITY AND COUNTY OF DENVER, ROBERT W. SPEER, as Mayor of the City and County of Denver; W. F. R. Mills, as Manager of Improvements and Parks of the City and County of Denver; Clair J. Pitcher, as Manager of Revenue of the City and County of Denver; William H. Sharpley, as Manager of Health and Charity of the City and County of Denver; Dewey C. Bailey, as Manager of Safety and Excise of the City and County of Denver; Charles A. Lammers, as Clerk and Recorder of the City and County of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Ryeraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as Members of and
1530 Constituting the Council of the City and County of Denver; and Armour C. Anderson, as Sole Member of and Constituting the Public Utilities Commission of the City and County of Denver.

Bill for Injunction and for Other Relief.

In this cause, on motion of solicitors for the plaintiff and upon consideration of the assignment of errors and petition for cross appeal to the Supreme Court of the United States, heretofore filed herein by said plaintiff,

It is ordered that a cross appeal herein, as prayed in the petition

therefor and for the purposes therein specified be, and the same is hereby allowed to the said plaintiff; and it is further ordered that the bond on said cross appeal be, and the same is, hereby fixed at the sum of five hundred dollars.

6274.

Bond on Cross-Appeal.

UNITED STATES OF AMERICA,
District of Colorado, ss:

Know all men by these presents, That we, The Denver Union Water Company, a corporation, as principal and National Surety Company, as surety, are held and firmly bound unto the City and County of Denver, Robert W. Speer as Mayor of the city and county of Denver, W. F. R. Mills as Manager of Improvements and Parks of the city and county of Denver, Clair J. Pitcher as Manager of Revenue of the city and county of Denver, William H.
1531 Sharpley as Manager of Health and Charity of the city and county of Denver, Dewey C. Bailey as Manager of Safety and Excise of the city and county of Denver, James F. Markey, as auditor of the city and county of Denver, Charles A. Lammers as clerk and recorder of the city and county of Denver; Louis F. Bartels, J. A. Burnett, John Conlon, W. C. Danks, D. J. Monaghan, J. B. Rycraft, Thomas O. Spacy, Jesse M. Wheelock and Harry Zimmerhackel, as members of and constituting the council of the city and county of Denver; and Armour C. Anderson as sole member of and constituting the Public Utilities Commission of the city and county of Denver, in the full and just sum of five hundred & 00/100 dollars ($500.00) to be paid to the said obligees above named, their respective successors or assigns, for which payment well and truly to be made we bind ourselves, our successors and assigns, jointly and severally, firmly by these presents.

Sealed with our seals and dated this 29th day of July, in the year of our Lord One thousand nine hundred and sixteen.

Whereas, lately, at the November 1915 Term of the United States District Court for the District of Colorado, in a suit pending in said court between The Denver Union Water Company, plaintiff, and the obligees above named, as defendants, a decree was entered against said defendants and in favor of said plaintiff, and said defendants have obtained an appeal from said District Court to the Supreme Court of the United States to reverse the said decree in the aforesaid suit, and said The Denver Union Water Company has likewise obtained a cross appeal from said District Court to the Su-
1532 preme Court of the United States for the purpose of presenting to the Supreme Court certain rulings and orders of said District Court, and certain rulings, findings and conclusions of the Special Master herein, approved, confirmed and adopted by said district court, to be considered, however, only in connection with said appeal of the said defendants and in opposition to the reversal of

the decree heretofore rendered and entered herein by the District Court, and has likewise obtained a citation upon said cross appeal, directed to said defendants, citing them to be and appear in the Supreme Court of the United States at Washington, D. C. thirty (30) days from and after the date of said citation.

Now, the condition of this obligation is such, that if said The Denver Union Water Company shall prosecute said cross appeal to effect, and answer all costs if it shall fail to sustain said cross appeal then the obligation to be void, else to remain in full force and effect.

[CORPORATE SEAL.] THE DENVER UNION WATER COMPANY, *Principl,*
By W. P. ROBINSON, *President.*

Attest:
T. E. UNDERWOOD,
Assistant Secretary.

[CORPORATE SEAL.] NATIONAL SURETY COMPANY, *Surety,*
By C. H. TONCRAY,
Attorney in Fact.

The foregoing bond is approved this 29" day of July,
1533 A. D. 1916.

ROBT. E. LEWIS,
District Judge.

(Endorsed:) 6274. Plaintiff's Bond on Cross Appeal. $500.00. Filed Jul. 29, 1916. Charles W. Bishop, Clerk.

1534 *Stipulation.*

1537 *Præcipe.*

The Clerk of the above named United States District Court will please prepare copies of the following papers and proceedings in making up the transcript upon the appeal of defendants, and cross appeal of plaintiff, in the above entitled cause, to the Supreme Court of the United States, towit:

Bill of complaint.

Amendment to bill of complaint eliminating original paragraph 24.

Answer.

Order of Reference to Special Master, W. J. Chinn.

Second amendment to bill of complaint incorporating new paragraph 24.

Answer to amendment.

Amendment to answer.

Report of Special Master.

Narrative statement of evidence and exhibits as heretofore stipulated, including transcript of stenographer's notes of proceedings February 1st, 1916.

Order for filing exceptions and hearing on the same.

Exceptions of plaintiff to Master's Report.

Exceptions of defendants and each of them to Master's Report.

Order striking exceptions and confirming Master's Report, and ordering final decree.

Petition of defendants for correction of record.

1538 Order denying last named petition for correction of record.

Final decree.

Petition for substitution of parties defendant.

Order granting said last named petition.

Assignment of errors.

Petition of defendants for appeal.

Order granting said petition for appeal and fixing bond.

Bond.

Citation on appeal of defendants and acknowledgment of service thereof.

Plaintiff's assignment of errors on cross appeal.

Petition of plaintiff for cross appeal.

Order granting said petition for cross appeal and fixing bond.

Bond on cross appeal.

Citation on cross appeal and acknowledgment of service thereof.
Stipulation concerning record on cross appeal.
This præcipe.

JAMES A. MARSH,
F. W. SANBORN,
Solicitors for Defendants.

The complainant above named, by its solicitors, hereby acknowledges service of a copy of the foregoing præcipe at Denver,
1539 Colorado, this 10th day of August, 1916, and hereby waives its right to file an additional præcipe and to have 10 days time for that purpose as provided by Rule 8 of the U. S. Supreme Court and Equity Rule 75.

Both parties to this cause, by their respective solicitors, hereby waive the filing by plaintiff of a præcipe for a record upon its cross appeal, and the preparation, certification and filing of a separate record for that purpose; and hereby stipulate that the record prepared, certified and filed pursuant to the foregoing præcipe may serve as the record for the purposes of said cross appeal of plaintiff as well as for the purposes for said appeal of defendants.

You, and each of you, are hereby cited and admonished to be and appear in the Supreme Court of the United States, at the City of Washington, in the District of Columbia, thirty (30) days after the date of this citation, pursuant to a cross appeal allowed and filed in the Clerk's office of the United States District Court for the District of Colorado, wherein The Denver Union Water Company is cross appellant and you are cross appellees, to show cause, if any there be, why the various errors alleged and referred to in said cross appeal and specified in the assignment of errors filed in connection
1543 therewith, should not be corrected, and why speedy justice should not be done the parties in that behalf.

Witness, the Honorable Robert E. Lewis, Judge of the District Court of the United States for the District of Colorado, this 29th day of July, A. D. 1916.

ROBT. E. LEWIS,
Judge of the United States District Court for the District of Colorado.

The undersigned, solicitors for the cross appellees named in the foregoing citation, hereby acknowledge service of said citation upon said cross appellees, at Denver, Colorado, this 29th day of July, A. D. 1916.

J. A. MARSH,
F. W. SANBORN,
Solicitors for said Cross Appellees.

1543½ [Endorsed:] 6274. U. S. District Court, District of Colorado. The Denver Union Water Company vs. The City and County of Denver et al. Citation on cross-appeal. Filed Jul- 29, 1916. Charles W. Bishop, Clerk.

POOR COPY

UNITED STATES OF AMERICA,
District of Colorado, ss:

I, Charles W. Bishop, clerk of the district court of the United States for the district of Colorado, do hereby certify that the above and foregoing transcript, consisting of six (6) volumes; Volume No. I pages numbered from one (1) to two hundred twenty (220) inclusive; Volume No. II pages numbered two hundred twenty-one (221) to four hundred seventy-nine (479) inclusive; Volume No. III pages numbered four hundred eighty (480) to nine hundred seventy-eight (978) inclusive; Volume No. IV pages numbered nine hundred seventy-nine (979) to eleven hundred nineteen (1119) inclusive; Volume No. V pages numbered eleven hundred twenty (1120) to fourteen hundred twenty-six (1426) inclusive; Volume No. VI pages numbered fourteen hundred twenty-seven (1427) to fifteen hundred forty-three (1543) inclusive, to be a true, perfect and complete transcript and copy of the pleadings, and other matters set forth in the praecipe filed herein, together with a true copy of such prænipe, heretofore filed and entered of record in said court and in a certain cause lately in said court pending, wherein The Denver Union Water Company was plaintiff and the City and County of Denver, et al, were defendants, as fully and completely as the same still remain on file and of record in my office at Denver.

In testimony to the above, I do hereunto sign my name and affix the seal of said court, at the city and county of Denver, in said district, this twenty-seventh day of September, A. D. 1916.

[Seal United States District Court, District of Colorado.]

MOTION TO ADVANCE.

Come now the above appellants and appellees, and respectfully represent to the court that this is an appeal and cross-appeal from the United States District Court for the District of Colorado, the case below being entitled "The Denver Union Water Company, a Corporation, Plaintiff, vs. The City and

County of Denver, et al., Defendants. In Equity, No. 6274." The action was commenced April 29, 1914, by The Denver Union Water Company, plaintiff, by reason of the passage of an ordinance by the City and County of Denver on March 3, 1914 (the same being Ordinance No. 26 of the Series of 1914), which ordinance attempts to regulate and fix the charges to be made by the plaintiff for water furnished the City and County of Denver and its inhabitants, the effect of the ordinance being to make a reduction of twenty per cent of the rates then being charged the City and County of Denver and its inhabitants by plaintiff.

A temporary restraining order was granted by the United States District Court against the City and County of Denver and its officers, restraining it from enforcing said ordinance; and thereafter a special master was appointed by the court, to whom the matter was referred.

Upon the presentation of the master's report, which found in favor of the plaintiff, the court on February 1, 1916, entered final decree perpetually restraining defendants from enforcing the ordinance referred to, from which decree the defendants prayed an appeal to this court, and the record in said cause is now here lodged and is in process of printing by the clerk of this court.

All parties herein now respectfully move that the case be advanced for early hearing in this court because:

FIRST.

No appellate review was sought to review the action of the court below in granting the temporary injunction issued herein as is authorized by Section 7 of the Act of March 3, 1891, 26 Stats. 826, as amended; 28 Stats. 866; and again by 31 Stats. 160, now Section 129 Federal Code; Act of March 3, 1911, 36 Stats. 1134. However, we submit that prompt review of matters of this character are within the spirit and purpose of the provisions of the statutes referred to.

SECOND.

The City and County of Denver, and all its inhabitants, are solely dependent for water supply, at the present time, upon the plant of The Denver Union Water Company. The ordinance above referred to had the effect of reducing the amount that they should pay for water twenty per cent of the amount that they were then paying. Since the order and judgment of the court below granting the temporary restraining order, the City and County of Denver, and its inhabitants, have been paying to the said company the full amount of its charges and the rates prevailing before the ordinance was adopted, and in the event that the judgment of the court below is reversed by this court on appeal, the effect will be that during the interim between the granting of said temporary restraining order and the time that this court passes upon said cause, the City and County of Denver, and its inhabitants, will have paid to The Denver Union

Water Company twenty per cent more than under said ordinance they should have paid.

That the population of the City and County of Denver is about 225,000, which means that many thousands of different transactions with The Denver Union Water Company are involved. The population of the City and County of Denver is constantly changing,—people moving away and others filling their places,—and in the event of a reversal by this court of the said decree, it will be extremely difficult to adjust the rights claimed by the water users as between the Water Company and said water users, each day's delay will make it more difficult, and if this cause is not advanced the consequent delay will render it impossible.

THIRD.

Since the decision of this court in the case of City and County of Denver vs. New York Trust Company, consolidated with City and County of Denver vs. Denver Union Water Company, et al., 229 U. S. 123, in which case it was held that the City and County of Denver was at liberty, so far as any contract with The Denver Union Water Company was concerned, to erect and construct, or otherwise acquire, its own water system, the City and County of Denver has been attempting the acquisition of a municipal water system, either by acquiring the system of The Denver Union Water Company, the present company, or by the construction of a new and independent system. That the City and County of Denver has, by the making of extensive surveys, and

otherwise, made some progress in the acquisition of its own plant, but until this cause is decided by this court the City and County of Denver is unable to determine the most advantageous and feasible course to pursue in acquiring a water system, or in proceeding further in the construction of its own system.

The property constituting the plant of the Water Company is subject to certain mortgages given to secure bonds now outstanding and in the hands of the public in the aggregate amount of $12,000,000.00. Of these, bonds in the aggregate amount of $8,000,000.00 are now overdue. The unusual situation outlined above, and the chaotic condition resulting therefrom has rendered it impossible for the company to re-finance, or to secure an extension of said bonds, which, under normal conditions, it could readily have done. Suit has been brought by the trustee under the mortgage securing said bonds, and is now pending in the United States District Court for the District of Colorado, for the foreclosure of said mortgage. The equity of the Water Company, if any, and whatever its amount, and of its numerous stockholders in said properties, is by the present condition of uncertainty, seriously endangered, and if such condition continue, may be wholly lost. The securities of said Water Company are widely held, and its bondholders and stockholders numerous. All of them are seriously prejudiced by the present situation and further delay will be seriously detrimental to, if not wholly destructive of, their interests.

In the court below the master in his report, as a means of arriving at the rates to be charged, determined the value of the plant of The Denver Union Water Company, and found it to be of the value of $13,415,899.00 as of May 1, 1914. Exception was taken by the City and County of Denver, et al. to this finding, and to the allowance of several items going to make up the same, and this court in passing upon the questions involved will be asked to determine the value of appellee's property, or as to whether several items therein should be allowed, which determination will undoubtedly furnish a basis for further action on the part of the City and County of Denver in the acquisition of a municipal water plant.

The matter is one of great importance to a large and rapidly growing municipality. Much delay has already been caused on account of the pending of this and other controversies affecting the rights of the parties in the courts, and all parties will suffer by further delay unless the cause is advanced to early hearing and determination in this court.

BRIEF OF CITY AND COUNTY OF DENVER.

Statement of Case.

This case is in this Court on appeal from the judgment and decree of the United States District Court for the District of Colorado.

On April 9, 1914, the suit was begun by The Denver Union Water Company, appellee herein, to restrain the enforcement of a certain ordinance of the City and County of Denver, appellant, known as Ordinance No. 26 of the Series of 1914 (and hereinafter referred to as the Ordinance of 1914), on the ground that the enforcement of the ordinance would be in violation of amendments Nos. V and XIV of the Constitution of the United States, as being confiscatory of complainant's property. It was asked that the Ordinance of 1914 be declared unconstitutional, null and void, and that an injunction issue preventing its enforcement. It was further asked that the decree declare the complainant entitled to just, fair and reasonable compensation for its services in supplying water, based upon the value of the property of the complainant necessarily used for such purpose, and so as to yield sufficient income to pay operating expenses and taxes and a sum for annual depreciation of its property and water system and obsolescence, and to provide for the replacement of portions of its property, and for repairs, renewals, etc., and to yield in addition a net income in excess of 8 per cent on the valuation of such property. The bill of complaint asked for a determination of the value of the property and water system of complainant and the reasonable value of the services rendered and to be rendered by complainant to the City and County of Denver.

The case was referred to a Special Master, who after taking evidence, filed a report with the District Court holding and determining that the Ordinance

of 1914 was violative of the 5th and 14th amendments of the Constitution of the United States, and was invalid.

The report of the Master was approved and confirmed by the District Court, and the appellant was enjoined from attempting to enforce the ordinance in question.

The judgment and decree declared that the ordinance is in all respects invalid and of no force or effect whatsoever, in that it attempted to and does deprive complainant of its property without due process of law, and takes the private property of complainant for public use without just compensation. From this judgment and decree the City and County of Denver, and its officers who are parties, took this appeal to this Court, and The Denver Union Water Company has filed cross-errors. In this brief The City and County of Denver and its officers will be referred to as appellant and The Denver Union Water Company as the appellee.

The ultimate question in the case is that of confiscation of complainant's property if the ordinance is enforced.

In addition to the Transcript of Record to which reference will frequently be made throughout the course of this brief, there is, among other exhibits, an original exhibit, the same being known as "Exhibit C," which has been certified to this Court from the court below, to which frequent references will be made in this brief.

The City and County of Denver (formerly the City of Denver) is situated in a semi-arid region

upon the great plains a few miles east of the front range or continental divide of the Rocky Mountains. Its population, as shown by the United States Census for the year 1910, was 213,381.

In 1870, Denver having grown beyond the stage of a village, it became necessary to provide it with a plant or system for furnishing it and its inhabitants with water, and in that year The Denver City Water Company commenced operations (Trans., p. 5), and in 1871 constructed its first works looking toward the building of a system for supplying the city and its inhabitants with water. Thereafter and at different times down to the year 1894 about eight different water companies, in addition to the complainant company and The South Platte Canal & Reservoir Company, the last named being a subsidiary of the complainant company, were organized for the purpose of supplying with water certain parts of the then City of Denver, and certain surrounding small towns and villages, which towns and villages thereafter became consolidated and incorporated into one municipality which is the present City and County of Denver, the appellant herein.

In 1894 The Denver Union Water Company, appellee, was organized, and succeeded to the rights, property and business of the various companies hereinabove mentioned.

In 1894 there was also organized The South Platte Canal & Reservoir Company above referred to, as a subsidiary of The Denver Union Water Company, and in all the proceedings herein involved the property of this company has been treated as part and parcel of The Denver Union Water Company.

The system for the diversion, storage and carriage of waters used by the City and County of Denver was installed in part by The Denver Union Water Company and its predecessors, and in part by the South Platte Canal & Reservoir Company, so that the ages of the various parts of the system vary from shortly after the year 1870 down to the last installations of The Denver Union Water Company previous to the bringing of this suit (Exhibit "C," pp. 8 to 10, inclusive).

Among the assets taken over by The Denver Union Water Company from The Denver Water Company was a certain franchise evidenced by Ordinance No. 44 of the Series of 1890, and herinafter called the 1890 Ordinance (Trans., p. 941). The term of this franchise was 20 years. It granted the privilege of laying water pipes in the City of Denver, fixed the water rates to be charged by the company, and contained two clauses or paragraphs (11 and 12) which afterward became the source of much litigation between the City of Denver and the City and County of Denver on the one side, and The Denver Union Water Company on the other. The Denver Union Water Company exacted charges under the schedule of the 1890 ordinance down to the year 1895, at which time it voluntarily adopted a new schedule of charges which was more favorable to Denver and its inhabitants than the rates provided in the 1890 Ordinance, and the rates provided by this new schedule, called the "leaflet schedule," were substantially in force down to the bringing of this suit.

In 1890 the franchise of The Denver Union Water Company, transferred to it from The Denver

Water Company, expired; and at that time action was taken by the Water Company and the City and County looking to a possible purchase of the water plant and system by the City and County of Denver; but no purchase resulted from this action because of disagreement between the Water Company and the City and County as to the price to be paid therefor.

Section 11 of the 1890 Ordinance provided that on the expiration of 20 years after the passage of the ordinance the City should have the *right* to purchase the property of the Water Company at a price to be determined by a Board of Appraisers, and Section 12 of the ordinance provided that the City *might, if it saw fit*, extend the franchise of the Water Company for a further period of 20 years.

The City and County of Denver declined to exercise either of these alternatives, and in consequence a suit was begun by The New York Trust Company, Trustee, for the bondholders of the Water Company, to compel the City and County to purchase under the appraisement, and the Water Company filed a cross-bill to compel the City and County to renew the franchise, or rather that the right to a renewal of its franchise for another 20 years be established. This cause, entitled "New York Trust Company vs. City and County of Denver," 229 U. S. 123, was determined by this Court, which held that neither the claim of the Trust Company nor that of the Water Company was tenable.

During this same year, 1910, the City and County of Denver adopted a charter provision known as Section 264-A, under which a Public Utilities

Commission was created, having wide powers with reference to determining the further course of the City and County of Denver in dealing with the question of its water supply, and action was taken by this Commission toward the establishment for the City and County of Denver of a municipally owned water system.

Since 1910 The Denver Union Water Company, although without a franchise, has continued to serve the City and County of Denver and its inhabitants with water, charging for such service the rates prescribed in the "leaflet schedule" already mentioned.

In 1914 the City and County of Denver enacted Ordinance No. 26 of the Series of 1914 involved in this cause.

It is agreed that the effect of the Ordinance of 1914 is to reduce the rate charged under the "leaflet schedule" by approximately 20 per cent, and it is this ordinance which the appellee is seeking to have declared null and void, and its enforcement enjoined as violative of Amendments V and XIV of the Federal Constitution.

The bill of complaint of appellee (complainant below) is voluminous. It charges, among other things, that it and its predecessors have been furnishing water to the City and County of Denver since shortly after the organization of the earliest organized of its predecessors. It describes in great detail the growth of the company and its predecessors, the development of the City and County of Denver, the various disputes which have arisen between the Water Company and its predecessors and the City

and City and County, and charges that the 1914 ordinance (referred to in the bill of complaint as Exhibit "A") will so reduce the rate of return received by the Water Company as to net the company only 2.88% on the actual value of its property. The appellee further charges that the rate of return which will be received by the Company, in case the 1914 ordinance is enforced, is so small that the Company will be deprived of its property without due process of law, and that its property will be taken for public use without just compensation.

The answer of the appellants (defendants below) admits many of the matters set forth in the bill of complaint, particularly with reference to the history of complainant and its disputes and those of its predecessors with the City and City and County of Denver. It denies that the complainant has ever been engaged in "furnishing" water to the City or City and County, or its inhabitants, and alleges that the Water Company has acted merely as a *carrier* in transporting water from the place of its origin to Denver, and that the ownership of all water rights and rights to water carried through the Company's plant are the property of Denver and its inhabitants. It denies that the 1914 ordinance if enforced will result in complainant receiving only 2.88% return upon its investment, and alleges that the return will be far greater than this. It admits the adoption of the 1914 ordinance, but denies that the same has the effect of depriving complainant of its property without due process of law, or amounts to the taking of complainant's property for public use without just compensation. The answer denies the existence

either in whole or in part of many of the items making up the alleged valuation of complainant's plant which in the bill of complaint are alleged to exist.

By way of a fourth defense to the bill of complaint, the answer charges that the Company does not operate, and has not for many years operated, its plant in an economical manner, and charges that if the operations of the Company should be carried on economicaly and efficiently, the expenses of the Company would be thereby reduced, and that the rates and charges fixed by the Ordinance of 1914 will yield the Company a fair and adequate return upon the actual value of all the Company's plant and property used and useful in and about the business which it undertakes to perform for the City and County of Denver and its inhabitants.

Having referred briefly to the character of this action, the history of the appellee company and its antecedents, and to its status with reference to furnishing water at the time the ordinance complained of was passed, consideration will now be given to the questions that naturally present themselves as worthy of consideration in determining whether the Special Master and the court below erred in arriving at their conclusions.

The questions for discussion are as follows, and will be treated in the order named:

I.

When will courts forbid the enforcement of a rate making statute as violative of constitutional guaranties?

II.

Burden and extent of proof required.

III.

Fair value of complainant's plant and property.

(a) Water rights.

(b) Going concern.

(c) Overhead charges and interest during construction.

(d) General considerations.

IV.

Depreciation.

V.

Operating expenses.

VI.

Rate of return.

VII.

Conclusion.

ARGUMENT.

I.

When Will Courts Forbid the Enforcement of a Rate Making Statute as Violative of Constitutional Guaranties?

The answer to this question has been stated by this Court in the case of *Knoxville vs. Water Company*, 212 U. S. 1, and at page 8, as follows:

"The purpose of this suit is to arrest the operation of a law on the ground that it is void and of no effect. It happens that in this particular case it is not an act of the legislature that is attacked, but an ordinance of a municipality. Nevertheless the function of rate making is purely legislative in its character, and this is true whether it is exercised directly by the legislature itself or by some subordinate or administrative body, to whom the power of fixing rates in detail has been delegated. The completed act derives its authority from the legislature and must be regarded as an exercise of the legislative power. Prentis vs. Southern Ry. Co., 211 U. S. 210; Honolulu Transit Co. vs. Hawaii, 211 U. S. 282. There can be at this day no doubt on the one hand, that the courts on constitutional grounds may exercise the power of refusing to enforce legislation, nor on the other hand, that the power ought to be exercised only in the clearest cases. The constitutional invalidity should be manifest, and where that invalidity rests upon disputed questions of fact the invalidating facts must be proved to the satisfaction of the courts."

And again, at page 16, this Court says:

"The jurisdiction which is invoked here ought, as has been said, to be exercised only in the clearest cases. If a company of this kind chooses to decline to ob-

serve an ordinance of this nature and prefers rather to go into court with the claim that the ordinance is unconstitutional, it must be prepared to show to the satisfaction of the court that the ordinance would necessarily be so confiscatory in its effect as to violate the Constitution of the United States. In Ex parte Young, 209 U. S. 123, the last word of caution by this Court was said (p. 166):

'Finally it is objected that the necessary result of upholding this suit in the Circuit Court will be to draw to the lower Federal courts a great flood of litigation of this character, where one Federal judge would have it in his power to enjoin proceedings by state officials to enforce the legislative acts of the State, either by criminal or civil actions. To this it may be answered, in the first place, that no injunction ought to be granted unless in a case reasonably free from doubt. We think such rule is, and will be, followed by all the judges of the Federal courts.'

The same thought, in effect, was expressed in San Diego Land & Town Co. vs. National City, 174 U. S. 739, 754:

'Judicial interference should never occur unless the case presents clearly and beyond doubt, such a flagrant attack upon the rights of property under the guise of regulations as to compel the court to say

that the rates prescribed will necessarily have the effect to deny just compensation for private property taken for the public use.'

And in San Diego Land & Town Co. vs. Jasper, 189 U. S. 439, after repeating with approval this language, it was said (p. 441):

'In a case like this we do not feel bound to re-examine and weigh all the evidence, although we have done so, or to proceed according to our independent opinion as to what were proper rates. It is enough if we cannot say that it was impossible for a fair-minded board to come to the result which was reached.'

It cannot be doubted that in a clear case of confiscation it is the right and duty of the court to annul the law. Thus in Reagan vs. Farmers Loan & Trust Co., 154 U. S. 362, where the property was worth more than its capitalization, and upon the admitted facts the rates prescribed would not pay one-half the interest on the bonded debt; in Covington, etc. Turnpike Co. vs. Sandford, 164 U. S. 578, where the rates prescribed would not even pay operating expenses; in Smyth vs. Ames, 169 U. S. 466, where the rates prescribed left substantially nothing over operating expenses and cost of service; and in Ex parte Young, *supra*, where, on the aspect of the case which was before the court, it was not disputed that the rates prescribed were in fact confiscatory, injunctions were severally sustained.

But the case before us is not a case of this kind. Upon any aspect of the evidence the company is certain to obtain a substantial net revenue under the operation of the ordinance. The net income, in any event, would be substantially 6%, or 4% after an allowance of 2% for depreciation. See Stanislaus County vs. San Joaquin Company, 192 U. S. 201. We cannot know clearly that the revenue would not much exceed that return. We do not feel called upon to determine whether a demonstrated reduction of income to that point would or would not amount to confiscation. Where the case rests,, as it does here, not upon observation of the actual operation under the ordinance, but upon speculation as to its effect, based upon the operations of a prior fiscal year, we will not guess whether the substantial return certain to be earned would lack something of the return which would save the effect of the ordinance from confiscation. It is enough that the whole case leaves us in grave doubt. The valuation of the property was an estimate and is greatly disputed. The expense account was not agreed upon. The ordinance had not actually been put into operation; the inferences were based upon the operations of the preceding year; and the conclusion of the court below rested upon that most unsatisfactory evidence, the testimony of expert witnesses employed by the parties. The city authorities acted in

good faith, and they tried without success to obtain from the company a statement of its property, capitalization and earnings.

The courts, in clear cases, ought not to hesitate to arrest the operation of a confiscatory law, but they ought to refrain from interfering in cases of any other kind. Regulation of public service corporations, which perform their duties under conditions of necessary monopoly will occur with greater and greater frequency as time goes on. It is a delicate and dangerous function, and ought to be exercised with a keen sense of justice on the part of the regulating body, met by a frank disclosure on the part of the company to be regulated. The courts ought not to bear the whole burden of saving property from confiscation, though they will not be found wanting where the proof is clear."

In the Legal Tender cases, reported in 12 Wallace at page 531, this Court spoke as follows:

"An act of the legislature is not to be declared void unless the violation of the Constitution is so manifest as to leave no room for reasonable doubt."

In the case of Soon Hing vs. Crowley, 113 U. S., at page 710, the Court said:

"Courts will not inquire into the motives of legislators in enacting laws, except as they are disclosed on the face of the acts,

> or be inferable from their operations. The motives of legislators considered as to the purposes they had in view, will always be presumed to be to accomplish that which flows as the natural and reasonable effect of their enactment."

In the case of Chicago, Milwaukee & St. Paul vs. Tomkins, 176 U. S., at page 173, the Court said:

> "Upon any company seeking to challenge the validity of legislation rests the burden of proof that it infringes the constitional guarantee of protection to property. The case must be clear on behalf of the railway company or the legislation of the state must be upheld. Such being unquestionably the law, it is obviously of the utmost importance that the facts should be clearly and accurately found, * * * and that those facts shall sustain the conclusion reached."

The case of *San Diego Water Co. vs. San Diego*, 118 Cal. 556, is a rate making case which has attracted much attention. It has been frequently cited by this Court, and on this subject Judge Garoutte of the California Court, in the opinion of the Court, said (p. 581):

> "This court is not here to declare what are reasonable rates. The constitution has vested that power and duty in the Council of the City of San Diego, and the exercise of that power by the Council cannot be questioned by the courts unless constitutional rights are violated.

The question is not what rate this court would fix if the duty were cast upon it, of fixing rates. But, rather, will the owners of the plant be deprived of constitutional rights by an enforcement of the order of the Council fixing rates? If the rates fixed by a municipal council were twice too large, I know not what jurisdiction of the court could be invoked to right the wrong. Hence it is apparent that it is only in exceptional cases that an order fixing rates may be set aside by judicial decree. Taking the findings of fact as they stand, the schedule of rates fixed by the city should not be disturbed. The valuation of the plant is $750,000. The operating and current expenses are $40,000. The revenue from the sale of water under the schedule would be and actually was $65,000. This leaves a profit of $25,000 upon the investment. To be sure, it is not enough, and possibly not one-half the sum that could be earned in other business undertakings. But with these things we have nothing to do.

These are matters passed upon by the City in the exercise of a discretion granted by the constitution, and its decision as to the reasonableness of the amount of revenue to be derived by the company from the rates is conclusive upon the courts. While this sum is not enough upon this character of investment, still it is 3½%, and such return is a substantial profit. We mean it is so

substantial that a court of equity, in view of the law of the land, cannot say that the rates are so unreasonable as to be confiscatory in character, and thus violative of any principle of constitutional law. Mr. Justice Brewer, of the Supreme Court of the United States, has probably given this question more thought and investigation than any other jurist in this country, and he says in Chicago & N. W. R. Co. vs. Dey, 35 Fed. 866, 1 L. R. A. 744: 'Counsel for complainant urge that the lowest rate the legislature may establish must be such as will secure to the owners of the railroad property a profit on their investment at least equal to the lowest current rate of interest, say three per cent. Decisions of the Supreme Court seem to forbid such a limit to the power of the legislature in respect to that which they apparently recognize as a right of the owners of the railroad property to some reward; and the right of judicial interference exists only when the schedule of rates established will fail to secure to the owners of the property some compensation or income from their investment. As to the amount of such compensation, if some compensation or reward is in fact secured, the legislature is the sole judge.'

Subsequently the same question was again presented to him in Reagan vs. Farmers Loan & Trust Co., 154 U. S. 362, and also

> in Ames vs. Union Pacific R. Co., 64 Fed. 165, and in those cases neither he nor any other of the Justices of the Supreme Court retreated or advanced from that position."

And Mr. Justice Temple, in a special concurring opinion, said (p. 586):

> "The only proper judicial question is, whether compensating rates have been fixed. Whether they are too high or too low is not a judicial question. The judge cannot substitute his judgment for that of the body to whom the discretion is given by the constitution."

See also Minnesota rate cases, 230 U. S. 352, 433.

Many quotations might be made from numerous cases to the same general effect. They all speak strongly to the proposition that it is only in the clearest cases that courts will exercise their extraordinary powers to set aside the action of legislative bodies fixing rates.

Courts do not sit as rate making bodies, but when cases such as this case come before them, they are to determine only whether the rate complained of is manifestly a confiscation of property.

In theory, at least, courts have no control over legislative action except when the legislature has invaded rights guaranteed by our written constitutions. Within proper limits, the duties and responsibilities of the legislative branch of our government are as sacred as the duties imposed upon the judicial department, and while the courts will not shrink

from the performance of their duty when that duty is made clear, they certainly ought not to act unless the necessities of the case, the preservation of the rights of individuals, actually demand the exercise of the extraordinary powers which the American people have thus far been willing to entrust to the courts.

This leads to a discussion of the next feature of this case, which (for want of a better term) we have designated "Burden and Extent of Proof Required."

II.

Burden and Extent of Proof Required.

The cases cited in the preceding section express clearly the reluctance, indeed the entire unwillingness of the courts to substitute their judgment for the judgment of the legislature in determining what constitutes a fair rate of return, and the courts have made it clear that nothing short of confiscation of private property will induce them to intervene.

It is not enough that the rate of return may *prima facie* be inadequate. It must be established to the satisfaction of the court that the rates fixed by a legislature will result in confiscation. In other words, it is unquestionably the duty of a public utility asserting that its property is being confiscated to establish that fact in such a way as not to leave the matter open to any reasonable question; indeed, as the Master states in his report in this case, "beyond reasonable doubt." Particularly is this the case where the ordinance or statute, the enforcement of

which it is charged would result in confiscation, has never been actually put in operation, and where the result is dependent upon speculation.

This Court in the Knoxville case (212 U. S. 1) has taken pains to call attention to the danger of permitting a mere appraisement of the value of property made by experts, or alleged experts, to be used as a basis for the overturning of a legislative act, and in the case of *Chicago vs. Wellman*, 143 U. S. 345, one of the very earliest of the rate cases to come before this Court, Mr. Justice Brewer sounded a warning against the danger of courts being misled in matters of this character, which has not been and probably never will be disregarded.

> Chicago etc. Co. vs. Wellman, 143 U. S. 339, 342.

The valuation of a public utility for rate making purposes must necessarily consist of the examination of a variety of complicated elements, and each of these elements should be and ought to be established by convincing evidence. Otherwise, the ultimate determination becomes in effect valueless.

The complainant in such a case as this ought to establish the value of its plant, and to do this it must show the value of each item of property making up this plant; that is to say, its lands, its water rights, if any, its structures, and if the company is entitled to any allowance for intangible values those values should also be established by evidence which is not only preponderating, but such as will convince. Not only this, but it must show that the method by which the valuation of each of these items is reached is a proper and fair method.

It ought to disclose the amount of the gross return it receives, and it ought to show that such return is efficiently and economically collected, for by no other means is it possible to determine what return would be received from the investment under the ordinance.

It ought to establish what its expenses will be under the ordinance or statute if its operations are conducted in an efficient and economical manner, and on this phase of the question a mere showing of what its expenses have actually been, unaccompanied by any proof that these expenses were necessary, reasonable or proper, or even what they were for, goes but a little way toward establishing what its fair return is.

It ought to show that the rate of return which it receives will not merely be lower than the customary interest charge for moneys loaned in the vicinity, or lower than the usual return to similar public utilities in the same community, but that it will result in an actual deprivation of property.

And a failure to establish this leaves no basis for the conclusion that the ordinance is invalid.

It is a cardinal principle that courts are always entitled to the *best evidence*, and whenever a utility has direct or positive evidence as to some item of its expenditure or cost of construction, or original cost price, and substitutes therefor opinion evidence, it fails to sustain the burden cast upon it.

Of course, valuation is generally a matter of opinion, but the court, and not the witnesses, should

draw the conclusion, and where a public utility discloses to its expert witnesses items of cost in order that they may draw deductions therefrom as to the value of property, and fails to present the same evidence to the court which hears the testimony, that constitutes a failure on the part of the utility to sustain the burden cast upon it.

It is not fair for a utility which has figures showing the actual cost of construction of any element of its plant to disclose those facts to the expert witness it employs and withhold them from the court.

It is true that the cost of reproduction of a structure may not be equivalent to the original cost of that structure built at some past time, but surely nothing is more illuminating or persuasive in determining reproduction cost than a disclosure of the actual cost. With that for a guide, the court may then determine the reproduction cost, taking into consideration the advance or decline in the value of the elements and materials and the cost of labor; and surely such a determination would be more satisfactory than the estimate of what an engineer, no matter how capable, *thinks* the cost of reproduction might be.

It may be said that almost no evidence, except opinion evidence, was introduced by the complainant in this case, and for that reason the Court ought to be loath, as was suggested in the Knoxville case, to overturn legislative action on such evidence.

The evidence given by the witnesses Metcalf and Anderson, called by complainant, seems to have controlled the finding of the Special Master to a

large extent. Throughout his report he repeatedly asserts that in various particulars he has followed the testimony of the witness Metcalf or Anderson, or both, in preference to all other witnesses.

One of these witnesses states in his testimony (fol. 381, p. 279), that the original cost of the property of the company cannot be ascertained. If this applies to the property of the company as a whole, undoubtedly the witness is correct, but in the course of his further examination by Mr. Patterson, it appears that this witness made extensive use of the cost of various items of the plant when the same were available in determining his reproduction cost of the various structures. These, the witness says, were used by him as an aid to judgment. He says:

> "We gave great weight to the original contract and original cost of Lake Cheesman" (fol. 388, p. 285).

So that these items at least were available, yet we search the record in vain for any statement of what they were.

The witness Metcalf says that generally the construction cost could be segregated from the records of the company in order to apply it to particular items, but adds,

> "We got in the aggregate what were reported as construction cost of different parts of the plant since 1895."

Would not even this information have been an aid to the Court's judgment just as it was an aid to the judgment of the engineers? Yet, again we search the record in vain for this bit of information.

It seems hardly conceivable that the Company could have had no records of cost of the different units of its plant which were complete enough to give the Court aid in determining the value of these various elements.

Whatever may be the explanation, virtually no testimony was produced along the line we have stated. The Company was content to rest on the opinion of the expert witnesses which it had employed, and if that expert testimony leaves in the mind of the Court the same doubt which existed in the Court's mind at the time the decision was rendered in the Knoxville case, again it may fairly be said that the Company has not sustained the burden thrown upon it, and that the presumption which always exists in favor of the validity of legislative action should prevail.

III.

Fair Value of Complainant's Plant and Property.

The first thing to be considered in determining the fair rate of return is the value of the plant and property of complainant necessarily used in furnishing water to Denver and its inhabitants.

The Master found this value to be $13,415,899.00, and in his report has tabulated at page 122 of the record the various items making up this total valuation.

Following is a reproduction of said tabulation:

TABLE I.

	Class Nov. 1st, 1913	1 Fair contract cost, new.	2 Gross reproduction cost, including 12½% for engineering and contingencies.	3 Actual accrued depreciation.	4 Present reasonable value.
A.	Lands	.....	.....	.....	$ 637,814
B.	Water Rights	.....	.....	.....	2,947,617
C.	Lake Cheesman Division	$1,000,000	$1,125,000	$ 26,775	1,089,225
D.	Intake Platte Canon	56,089	63,100	814	62,286
E.	Raw Water Conduits	429,925	483,666	5,614	478,052
F.	South Platte Canon Division	523,737	589,204	68,040	521,164
G.	Raw Water Conduits and Filter	107,790	121,264	47,254	74,010
H.	Clear Water Conduits	962,012	1,082,263	182,102	900,161
I.	Bear Creek Division	395,361	444,781	48,213	396,568
J.	Littleton and Wynetka	34,190	38,464	6,399	32,065
K.	Bear Creek Division Conduits	325,021	365,648	13,360	352,288
L.	Cherry Creek Division	108,373	121,920	5,999	115,921
M.	Mississippi Avenue Division	135,885	152,871	23,553	129,318
N.	West Denver Station	290,628	326,957	125,160	201,797
O.	Capitol Hill Division	279,171	314,067	54,125	259,942
P.	Ashland Avenue Station	194,138	218,405	98,450	119,955
Q.	University Park Station	24,444	27,500	3,451	24,049

R. Montclair Booster Station.....	3,403	3,828	892	2,936
S. Distribution Pipe System.....	3,500,000	3,937,500	490,000	3,447,500
T. Personal Property, Supplies, etc.	190,000	.....	15,314	174,686
Interest during Construction.....	805,000	.....	105,455	699,545
Going Concern Value.....	.....	.....	.....	800,000
Value Water Works Plant November 1st, 1913.....				$13,475,899
Deduct depreciation from November 1st, 1913, to May 1st, 1914, less additions.				60,000
Reasonable Value of Plant May 1st, 1914				$13,415,899

(a)

Water Rights.

The Master found that $2,947,617 was the present reasonable value of such water rights, and in his report on page 130 of the record divides these water rights into groups as follows:

Group 1, being items 1, 2, 3, 4, 13, 14, 15, 16, 17 and 21	$ 949,500
Item 5, Denver City Water Company and Item 6, Mississippi Street (with 21 and 22)	200,000
Item 7, Cherry Creek Galleries	66,000
Item 8, Platte Canon Filter Galleries	65,000
Item 9, Platte Canon 34-inch Conduit	24,730
Item 10, Platte Canon 40-inch Conduit	30,000
Item 11, Northern Colorado Irrigation Co.	1,250
Item 12, Lake Cheesman	1,611,117
	$2,947,617

The appellant in its assignments of error, paragraphs 6, 7, 8, 9, 10, 11, 12 and 13, has made specific assignments of error as to the water rights acquired by the Company by diversion from the natural stream and the application of the use thereof by the City of Denver and its inhabitants.

It will be seen by an examination of the record at the places therein referred to that there are two classes of water rights:

1st. One class which the Company has acquired by purchase from others who had previously applied the water to beneficial uses outside of the City of Denver; and,

2nd. Water rights which had been acquired by the Company by impounding and diverting waters and where the City and its inhabitants have made the beneficial use of such water.

The value of the second class, placed upon the waters thus beneficially applied by the City and its inhabitants is found by the Master to be approximately $2,000,000.

It may be conceded that where the Company has purchased water rights outside of the City that have been applied to a beneficial use outside the City, thereby completing the right as given by the Constitution of Colorado to the use of such water, the Company is entitled, in arriving at the value of its property, to include the reasonable value of these water rights.

It will hereafter be shown that under the Constitution and statutes of the State of Colorado and the interpretation of its courts upon these constitutional and statutory provisions, where a company diverts water from a natural stream and the water is put to beneficial use by others, the one putting the water to a beneficial use is the owner and proprietor of the water right, and the company simply acts in the capacity of a carrier for hire, delivering the property of the owner to its place of use.

Therefore those items at least contained in the Master's report just referred to, and designated by him as

> "Appropriations originally initiated by the Water Company or its predecessors" (Trans., pp. 127 *et seq.*)

and amounting to $1,998,117.00 should not be included in determining the value of the Company's property.

The claim will not be questioned that in the State of Colorado the right of the application of the waters of the State to beneficial use when acquired is a property right. But where this right is acquired by a user who applies it to the use to which it was dedicated by the State, and he acquires it through the agency of a carrier, in such case, under the constitution and laws of the State of Colorado and the decisions of its courts construing such constitutional and statutory provisions, the property right thus acquired is in the *user* and not in the public carrier.

Prior to the time that Colorado became a sovereign State and adopted its Constitution, the Supreme Court of the Territory had held that while principles of law are undoubtedly of universal application, some latitude must be allowed to meet the various conditions of life in different countries; and that in arid countries where it is necessary in order to propagate crops to resort to the artificial use of water as a means of securing such crops, the physical laws of nature, whenever such laws exert a controlling influence, must be taken into consideration.

Yunker vs. Nichols, 1 Colo. 551.

And commencing with the decision above referred to, the Supreme Court of the Territory, and afterward the Supreme Court of the State, abrogated the common law doctrine of riparian ownership, and uniformly held that in view of the fact that much greater good would be derived from diverting water from the stream and applying it to the soil, than to follow the riparian doctrine and permit the waters to run in the streams past the land of riparian owners "undiminished in quantity and unpolluted in quality."

In the early history of this country, the vast territory now included within the boundaries of the State of Colorado and other western States, was commonly known and designated on geographical maps as the "Colorado Desert." On its plains and mesas, with the exception of short native grasses, little vegetation was grown. But when the resourcefulness and ingenuity of the early settlers saw a means of aiding nature by artificially contributing the only element that was lacking, Colorado, as well as other western States, became important contributors to the agricultural and horticultural products of the country. Consequently the framers of the Constitution of the State, in dealing with this water question, and in order that this limited element should be made to serve as great a purpose as possible, provided that:

> "The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is

dedicated to the use of the people of the State."

The right to divert any unappropriated water of any natural stream for beneficial use shall never be denied. Priority of appropriation shall give the better right as between those using water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over those using the same for manufacturing purposes."

Colo. Const. Art. XVI, Secs. 5 and 6.

The courts of the state have had occasion frequently to determine questions arising under these constitutional provisions, and it is submitted that since all rights existing and claimed in the cause now before this Court, have arisen since the adoption of the Colorado Constitution in 1876, the decisions of the Colorado courts, unless they conflict with the Federal constitution, are of great influence if not controlling of the situation.

These matters have been the subject of much thought on the part of text writers on the subject of water rights and irrigation. Mr. Wiel, author of "Water Rights in the Western States," 3d edition, 1908, at page 1235, says:

"The rule of the arid states is that the consumer from a ditch is, through the intermediate agency of the ditch, an appropriator from the natural stream from which the company's ditch heads. The water company is thus made merely a common carrier of water. • • •

The principle is that the right of the consumer is not merely a right of service (without any proprietory right in the water rights or water system), but is a proprietory right in the natural streams, as though the consumer had himself diverted the water from the natural source. The consumer *pro tanto* is the appropriator and proprietor of the water right, and the canal company but a common carrier, or agent."

In the case of *Thomas vs. Guiraud*, 6 Colo. 550, it is stated at page 533:

"The true test of appropriation of water is the successful application thereof to the beneficial use designed; and the method of diverting or carrying the same, or making such application, is immaterial."

It was further held in the Thomas case at page 532:

"The *locus* of its application does not in any way affect the doctrine; and a prior appropriator of water is entitled to it as against a subsequent settler upon the stream from which it is taken, although he carries

it over an intervening divide and uses it to cultivate lands adjacent to another stream."

To the same effect is the case of *Coffin vs. Left Hand Ditch Company*, 6 Colo. 443, where it is held (at p. 444):

> "The right to water acquired by prior appropriation is not in any way dependent upon the *locus* of its application to the beneficial use designed."

Another text writer has defined the rule as laid down by the Supreme Court of Colorado as follows:

> "The courts of Colorado were the first to advance the theory that an incorporated company organized for the purpose of furnishing water to others than to its stockholders for profit or hire, was merely the carrier of the water, sometimes analogous to what is known in law as a common carrier, and that the consumers of the water or persons to whom the company sold or rented the rights to the use of water, and who actually applied the same to the beneficial use or purpose, were the appropriators of the water, in whom the title to the water rights was vested."
>
> Kinney on Irrigation and Water Rights, 2nd edition, Sec. 1476, p. 2652.

Later at page 2655 of the same work Mr. Kinney says:

> "The Colorado rule of treating the consumer as the appropriator and the owner

of the water rights, and the corporation merely as a carrier of the water has been followed in other jurisdictions."

It was in 1887 that the Colorado Supreme Court first announced clearly and unequivocally the status of a mere carrier of water, in the case of *Wheeler vs. Northern Colorado Irrigation Company*, 10 Colo. 582. We quote from page 587, opinion by Justice Helm:

"We shall presently see that after appropriation the title to this water, save perhaps as to the limited quantity that may be actually flowing in the consumer's ditch or lateral, remains in the general public, while the paramount right to its use, unless forfeited, continues in the appropriator. But to constitute a legal appropriation, the water diverted must be applied within a reasonable time to some beneficial use. That is to say, the diversion ripens into a valid appropriation only when the water is utilized by the consumer; though the priority of such appropriation may date, proper diligence having been used, from the commencement of the canal or ditch.

The constitution unquestionably contemplates and sanctions the business of transporting water for hire from natural streams to distant consumers. The Colorado doctrines of ownership and appropriation (as declared in the constitution, statutes and decisions), necessarily give the carrier of water an exceptional status; a status dif-

fering in some particulars from that of the ordinary carrier. Certain peculiar rights are acquired in connection with the water diverted. It is unnecessary now, however, to enumerate these rights in detail. For the present, it suffices to say that they are dependent for their birth and continued existence, upon the use made by the consumer.

But giving these rights all due significance, I cannot consent to the proposition that the carrier becomes a 'Proprietor' of the water diverted.

A cursory reading of the statutes might convey the impression that the legislature regarded the carrier as possessing a saleable interest in this water. And the constitutional phrase 'to be charged for the use of water' relating to the carrier's compensation, might at first glance seem to recognize a like ownership in such use. But construing all the provisions of that instrument bearing upon the subject *in pari materia*, the doctrine of both these inferences must be denied."

In further declaration of the law of Colorado in its application to the ownership of water rights, and as showing that the only method of owning or acquiring a water right is by actual use of the water for beneficial purposes, the following is declared in the case of *Combs vs. Agricultural Ditch Company*, 17 Colo. 150:

"Those who construct ditches and divert water for general purposes of irrigation, must within a reasonable time apply the water to beneficial use; or else, upon proper application, and for proper consideration, they must dispose of the same to those who are ready to make beneficial use of it. If ditch companies are unwilling to be charged with such duties and responsibilities, they must leave the water in the natural stream. The mere diversion of the water is not an appropriation of it within the meaning of the constitution; there must be an application of the water to beneficial use within a reasonable time or the diversion is unlawful. See Farmers High Line C. & R. Co. vs. Southworth, 13 Colo. 111, and cases there cited.

In a carefully considered opinion recently delivered by Mr. Justice Hayt in the case of Strickler vs. City of Colorado Springs, 16 Colo. 61, this court held that a 'priority to the use of water for irrigation is a property right and may be sold and transferred separately from the land in connection with which the right ripened.'

It must not be inferred from this language that such priority may be secured by the mere acquisition of stock in an irrigating company without applying the water to beneficial use. An owner of irrigating stock cannot thus carry prior rights to the use of

> water in his pocket for an indefinite or unreasonable time, and thereby prevent others from acquiring a bona fide priority by actual use.
>
> The ownership of a prior right to the use of water is essentially different from the ownership of stock in an irrigating company. The ownership of the stock, like the title to other property, may be acquired by descent or purchase; the ownership of a prior right can be acquired originally only by the actual beneficial use of the water. The very birth and life of a prior right to the use of water is actual *user*."

The above is the law of Colorado, and by the decisions above quoted the rights of ditch companies (carriers) are fully explained. The ditch company is given the right to divert water from natural streams for the purpose of irrigating lands belonging to its stockholders, and to others whose lands are so situated as to be irrigable from the canal or conduit. The mere diversion, however, of water from a natural stream, of itself vests no rights of ownership in the company or its stockholders. The diversion is simply the initiation of a right which to be completed must be followed by the application of the water to one of the beneficial uses recognized by the constitution. Of course, the ditch company, using water on its own lands, or for its own "beneficial uses," diverted by it from a natural stream, becomes the owner of such water, not because of the diversion but because of the use; and this right is a property

right, and has been held in Colorado to be a freehold. If instead of applying the water thus diverted to beneficial uses of its own, this company supplies the water to others, the diverting and carrying company then becomes a carrier for hire, or an agency similar to a common carrier. It is then entitled to collect a reasonable charge for diverting and carrying the water from the stream to the place where it may be applied by another to a beneficial use.

This general principle is stated in the case of *Farmers Highline Canal Co. vs. Southworth*, 13 Colo. 111 (at p. 114), where it is said:

> "It is well established that no mere diversion of water from a stream will constitute the constitutional appropriation. To make it such it must be applied to some beneficial use, and in case of irrigation it must be actually applied to the land before the appropriation is complete."

And in a specially concurring opinion at page 120 Justice Helm puts it this way:

> "If the consumer applies water to a beneficial use within a reasonable time after the carrier's diversion, the appropriation relates for its priority back to such diversion. This proposition was in effect announced in Wheeler vs. Irrigation Co., supra. It is substantially a re-statement of the uncontroverted doctrine that the appropriator's right, proper diligence being employed, dates from the beginning of his ditch. There may of course be secondary

diversions (to which the rights of secondary consumers relate) through subsequent lawful enlargements of the quantity of water legally taken in the first instance. And I do not say that the legislature may not fix a reasonable period within which use must follow diversion in order to constitute a valid appropriation.

The foregoing view is not a recognition of ownership in the carrier, save of its canal; nor does it in the slightest manner detract from the consumer's constitutional right of user. The carrier in and of itself has no independent priority (though the irrigation statutes use language that might give this impression), and any rights it may hold in connection with the water diverted depend for their continuance upon the use made by consumers. The carrier becomes the consumer's agent, and its labors clearly inure to his benefit. By taking from its canal the consumer recognizes and ratifies its acts of construction and diversion, making them his own. *And the situation, so far as this question is concerned, is not different from what it would have been had the consumer in fact employed the carrier to construct the canal for himself alone.*" (Italics are ours.)

Only once has any appellate court of Colorado departed from this doctrine. In the case of *Wyatt et al vs. Larimer & Weld Irrigation Co. et al,* 1 Colo. App. 480, the Court of Appeals held that the canal

company was not a common carrier, and that the consumer was not an appropriator, and that the canal company was an appropriator as between it and the consumer. But this case was taken to the Supreme Court of this State on appeal, and was reversed on appeal, 18 Colo. 298. At page 307 the Supreme Court said:

> "The plaintiffs allege a right to have a certain quantity of water flow through the irrigation company's ditch. This right is an easement in the ditch. It is a right annexed to realty, and being a perpetual right, is an incorporeal hereditament descendable by inheritance to plaintiff's heirs, and hence a freehold estate.
>
> The subject matter of the action is the estate. The acts threatened by defendants will, if carried out, materially diminish this estate and permanently depreciate the value of the water rights.
>
> The object of the action being to enjoin or prevent diminution, or in other words, to preserve the estate of the plaintiffs, the necessary result of the decree will be, one party will gain and the other lose a material portion of such estate. The action, therefore, relates to a freehold, and this court under the statutory provisions above cited, has jurisdiction to review the judgment of the Court of Appeals.
>
> The decision of the Court of Appeals in this case was rendered by a divided court.

> We are unable to see wherein the discussion by the learned judge writing the majority opinion touching the constitutional status of irrigation companies in this state was essential to the decision of the questions involved in the case. But inasmuch as the views expressed in that opinion are so at variance with numerous decisions of this court, we feel impelled to express our disapproval thereof, and our adherence to the doctrine of canal companies organized for the purpose of carrying water for general purposes of irrigation. We adhere to the doctrine that such a canal company is not the proprietor of the water diverted by it, but that 'it must be regarded as an intermediate agency existing for the purpose of aiding consumers in the exercise of their constitutional rights, as well as a private enterprise prosecuted for the benefit of its owners. Wheeler vs. N. C. Irr. Co., 10 Colo. 582; Farmers H. L. C. & R. Co. vs. Southworth, 13 Colo. 111; Strickler vs. City of Colo. Springs, 16 Colo. 61; Combs vs. Agricultural D. Co., 17 Colo. 146."

Upon rehearing the Supreme Court at page 315, said:

> "That a valid appropriation of water from a natural stream constitutes an easement in that stream, and that such easement is an incorporeal hereditament, the appropriation being in perpetuity, cannot well be

disputed. Washburn in his work on Easements and Servitudes, in discussing the question of property in water, at page 276 says:

'As forming the subject of property in connection with the realty, water may be viewed in two lights—one as constituting one of the elements of which an estate is composed, and giving by its qualities and susceptibilities of use, a value to such estate; the other, as being valuable alone for its use, to be enjoyed in connection with the occupation of the soil. In the latter sense, it constitutes an incorporeal hereditament, to which the term easement is applied.'

Angell on Water Courses, Sec. 141, uses this illustration:

'If a miller, or manufacturer, purchases the land itself over which the water runs, it is evident he would then have a corporeal tenement, and the right which he would possess, in respect to his water course would be real; but if he should purchase a water privilege, or a portion of water power, without any part of the bed of the river, he, in that case, would gain an incorporeal hereditament, or easement.'

The right acquired to water by an appropriator under our system, is of the same character as that defined by the foregoing authorities as an incorporeal hereditament and easement. The consumer under a ditch

possesses a like property. He is an appropriator from the natural stream, through the intermediate agency of the ditch, and has a right to have the quantity of water so appropriated flow in the natural stream and through the ditch for his use."

Another case, and one which we have heretofore referred to, which illustrates the rule in Colorado that the right to the use of water is dependable upon the application rather than to diversion and carriage, is *Thomas vs. Guiraud et al*, 6 Colo. 530, where at page 533 the court says:

"If a dam or contrivance of any kind will suffice to turn water from the stream and moisten the lands sought to be cultivated, it is sufficient, though no ditch is needed or constructed. Or if land be rendered productive by the natural overflow of the water thereon, without the aid of any appliances whatever, the cultivation of such land by means of the water so naturally moistening the same is a sufficient appropriation of such water, or so much thereof as is reasonably necessary for such use. The true test of the appropriation of water is the successful application thereof to the beneficial use designed; and the method of diverting or carrying the same, or making such application, is immaterial."

This matter is again considered by the Colorado Supreme Court in *Wright vs. Platte Valley Irrigation Company*, 27 Colo. 322. We quote from page 329:

"It is true, as has been frequently announced by this court, that a ditch company is not the owner of the water it diverts through its ditch; neither is its status, in the strict legal sense of the term, that of a 'common carrier'. As was said in *Wheeler vs. Northern Colorado Irrigation Co.*, 10 Colo. 582:

'The carrier must be regarded as an intermediate agency existing for the purpose of aiding consumers in the exercise of their constitutional right, as well as a private enterprise prosecuted for the benefit of its owners.'

Its status is more like that of a private carrier, whose duties are measured by the obligations it assumes toward its consumers, and such as the law imposes by reason of the nature of the business in which it is engaged. While it may not impose conditions that operate to deprive consumers of the enjoyment of their constitutional rights, it may require them to exercise such rights under reasonable regulations and limitations. The consumer, by reason of his application of the water to a beneficial use, is said to be an appropriator, yet we do not think he occupies the exact status of one who appropriates the water directly from the public stream. *His contract with the company is not the purchase of a given volume of water, but the purchase of the right to use the canal as a means to conduct a given volume, or so much*

thereof as may be necessary to irrigate a certain number of acres.'' (Italics ours.)

This question is important here because the Master in his report has disposed of it as follows (trans., p. 129):

> ''Where the unappropriated water of a natural stream is diverted and carried to the place of use by one and applied to a beneficial use by another, the 'appropriation' is in Colorado 'perfected'. The ownership of the 'appropriation' under such circumstances, is or may be fixed by contract between the one who diverts and the one who beneficially applies such water. It is plain that such parties by contract between themselves may vest the ownership of the appropriation in whom they please. This I understand to be the rule adopted by the Supreme Court of Colorado in City of Denver vs. Brown, 56 Colo. 216.
>
> The application of this rule to the facts of this case, places the ownership of these water rights in the Water Company. There is no testimony in the voluminous record accompanying this report, from which it can be fairly inferred that any consumer of the Water Company at the time he paid his water rates and received his license, believed or claimed he was making an appropriation of the water of a natural stream of Colorado or was acquiring as against the Water Company any right of any nature to

the use of water except as stated in that license.

I find that these water rights are owned by the Water Company."

The Master's conclusion is erroneous because:

1st: No contract for vesting the ownership of water in the Denver Union Water Company ever existed between that company and the users of water.

2nd: The Brown case, referred to by the Master, does not establish the rule,

"that such parties by contract between themselves may vest the ownership of the appropriation in whom they please."

This case, *City of Denver vs. Brown*, 56 Colo. 216, is of such importance that a somewhat extended quotation from it is justifiable. We accordingly quote therefrom beginning at page 222:

"The original company was organized to divert and carry water for mechanical, agricultural, mining and city purposes, but so far as any question is involved in this case with respect to the priorities awarded it, we think it and its successors in interest, so far as the rights of the individual consumers are involved, must be treated as an irrigation canal company carrying water for hire. Such a company is a quasi-public carrier for the purpose of conveying water from natural streams to places where it may be applied to a beneficial use.

> It is not the proprietor of the water which it is entitled to divert, but must be regarded as an intermediate agency existing for the purpose of aiding consumers in the exercise of their rights to apropriate water, as well as a private enterprise prosecuted for its benefit. Farmers I. D. Co. vs. Agricultural D. Co., 22 Colo. 513, 45 Pac. 444, 55 Am. St. Rep. 149; Wright vs. Platte Valley Irr. Co., 27 Colo. 322, 61 Pac. 603; Wheeler vs. No. Colo. Irr. Co., 10 Colo. 582, 17 Pac. 487, 3 Am. St. Rep. 603; Wyatt vs. Larimer & Weld Co., 18 Colo. 298, 33 Pac. 144, 36 Am. St. Rep. 280.

And again at page 224 the Court says:

> "As previously noted, the object of a carrier company is two-fold, namely: To aid consumers in obtaining water, and for its private gain. When a mere contract consumer severs his relation with the carrier, the latter is not required, for that reason alone, to permit the volume which it had theretofore diverted from the stream for the benefit of the consumer to remain in the source of supply. If the rule were otherwise, and a contract consumer became an appropriator from the river, in the full meaning of that term, as held by the trial court, then the carrier would be compelled to await the pleasure of the contract consumer with respect to the use of water after once contracting

with him, and its revenues would be dependent upon his whim, while others in the interim would be deprived of the use of the volume which the prior contract consumer had once utilized, but had ceased to use. The law does not permit such unjust and anomalous results to grow out of the relation of carrier and simple contract users.

The priorities awarded a carrier ditch are for the benefit of those entitled to use the water which they represent. This means those who are entitled to be supplied with water from the ditch, to which the priorities are awarded. When these rights are evidenced by a contract between the consumer and carrier for a specified volume for a specified period, the obligation assumed by the carrier is to deliver that volume for the period and purpose named in the contract. That is all the consumer contracted for. Such a contract is in no sense illegal or against public policy, and the consumer will not be heard to say that his contract conferred greater or different rights than those specified, save and except that having once become a contract user, he will be entitled to continue the relation from year to year thereafter, without intermission, however, unless limited in the exercise of this right by a valid provision in his contract, upon tender annually of a lawful rate of carriage, and compliance with the reasonable regulations of the carrier.

The rights of the contract consumer as thus defined, afford full protection to all. When the consumer's contractual relations with the carrier are severed, the obligations of the carrier are ended, and the consumer cannot complain because the rights of others have intervened by contract with the carrier for the use of water. That is their right, when the carrier has water undisposed of; and if it refuses the requests of bona fide applicants, it can be compelled to comply with their needs to the extent it has water which it can lawfully control.

If a mere contract user becomes an unqualified appropriator of water from the river supplying a carrier ditch, then certainly he ought to be required to compensate the carrier for the carriage of water, whether he is using it or not; and yet, we apprehend that when his contract expired, if the carrier should undertake to exact such compensation, his complete defense would be that his contract did not impose any such an obligation. The unjust results which would follow in ruling that a mere contract user is an unqualified appropriator make it apparent that his right is limited by the terms of his contract, so far as valid, and that when he voluntarily ceases at the expiration of his contract, to exercise his right to continue his contractual relations with the carrier, or preserve the status growing

> out of that relation, that his future rights only date from the time he again contracts with the carrier for water, or makes a demand to be supplied with water in circumstances with which the carrier is legally bound to comply."

Now it may be possible (though it is not conceded) that a consumer's right is forfeited by his failure to comply with the provisions of his contract with the carrier company, and that the carrier company is no longer required to carry the water for him. But it cannot be (and certainly is not stated in the Brown case, nor is it a fair inference to be drawn from the opinion) that in such a case the water company acquires the right to the water, for unless the water is again applied to a beneficial use by some other consumer, it must be left in the natural stream.

As was said in the case of *Wright vs. Platte Valley Irr. Co.*, 27 Colo. 322 at page 329:

> "His contract with the company is not the purchase of a given volume of water, but the purchase of the right to use the canal as a means to conduct a given volume or so much thereof as may be necessary to irrigate a certain number of acres."

It is true that the complainant in dealing with the inhabitants of the City and County of Denver, to whom it brought water for their consumption, required under its regulations that the consumer make an application for the use of water, and issued a li-

cense to the consumer authorizing him to use water. This, however, is for the purpose of safeguarding the rights of the carrier, and is permissible in order that water may not be wasted where it is as precious as it is in Denver. In no way can it be held that in making this application and receiving such license, the user becomes any less the appropriator of water than he was before.

The Water Company has the right to safeguard its interests in various ways. It may demand that its services be paid for in advance. It may adopt and enforce rules for conserving the water, and impose a penalty for the violation of such rules to the extent of depriving the consumer of the right of service. But the fact that the carrier is given these rights, does not vest the ownership of the water in the company in case the consumer discontinues its use, nor is his right to the use of water forfeited by non-compliance with the company's rules. The Water Company is not the appropriator of water which it is entitled to divert, "It is an intermediate agency for the purpose of aiding consumers in their appropriation of water as well as a private enterprise carried on for its own benefit."

All this is clearly shown by a reading of the case of City of Denver vs. Brown, supra.

When a railroad company undertakes to transport goods for a shipper, it has the right to promulgate and enforce rules with reference to the commodities handled, and to require the performance of certain obligations on the part of the shipper. It may require the payment of shipping charges in ad-

vance. It may require that the goods be removed from the railroad company's property at the point of destination within a reasonable time; and in case these requirements are not observed it may impose reasonable penalties. But it cannot become the owner of the commodities handled merely because the shipper fails to comply with these rules, or even abandons the commodities.

The owner of water and water rights in Colorado, then, is the *user* of the water, or rather the actual user of the water is the owner of the water and water rights.

The relation existing between Denver and the Water Company is entirely different from that existing between a city and public service corporation of a different character. In the case of Lighting Companies, or Street Car Companies, for example, the municipality simply gives the utility company a license or franchise authorizing it to use the streets and alleys of the city so that the company's product or service may be furnished to its patrons. Other means of lighting or transportation are available; but such is not the case with a water supply. In the circumstances that exist in the case now under consideration, the Water Company has and must have a monopoly for supplying Denver and its people an absolute necessity of life. The municipality may provide for furnishing this necessity by constructing and operating a municipal plant, or it may contract with carriers for that purpose.

The original charter of the City of Denver, established by the State Legislature in 1889, provided among other things:

"Fifty-seven. To provide the city with water, to erect hydrants and pumps, to construct cisterns, to provide and regulate water for irrigation purposes and other purposes; to regulate and provide for the construction of ditches, canals, conduits and gutters for conducting and distributing water through the city, and to keep the same in repair; and to acquire and own stock in any ditch company, the ditch of which supplies any part of the city with water for irrigating or domestic purposes; to regulate the use of water by the inhabitants of the city for irrigating the soil; to build and construct reservoirs for the storage of water and ditches outside of the city limits, for the purpose of bringing water from streams and such reservoirs into the city for the use of the inhabitants thereof, in such way and in such manner as shall be deemed for the best interests of the city, and to keep the same in repair; and to acquire, by purchase or condemnation proceedings, under the general laws of the state, water and ditch rights, and sites for parks and public buildings within the city, or between the city and the source from which the water is taken; and to such condemnation proceedings the possession of franchises by any water or ditch company shall be no bar upon the legal compensation being tendered and paid; to bore artesian wells for the purpose of obtaining water for the city at such

> places within or without the city as may be procured for that purpose, and prevent the wasting of artesian water from private wells; to construct or purchase water works for the use of the city; and to enlarge their capacity from time to time and keep the same in repair, and generally do whatever may be needful and necessary to be done in order to supply the city with water for fire, irrigating, domestic and other purposes, and regulate the same."

This was charter provision existing when the franchise of 1890 was granted.

This being the condition, Denver has full power and duty to furnish water for the municipality and its people. The municipality was merely representative, whether it should acquire a water system municipally owned, or whether other arrangements were made such as were made with the complainant.

The source of Denver's water supply is the South Fork of the South Platte River, and the principal means which the Denver Union Water Company and its predecessors have constructed and used under its contract with Denver are reservoirs, into some of which water is pumped, and into others of which water flows by gravity, together with proper conduits and distributing pipes. An important means of storage of this water, perhaps the most important which the complainant controls, is what is known as Cheesman Lake, constructed by The South Platte Canal & Reservoir Company heretofore mentioned.

By the law of Colorado any person or company desiring to divert water from a natural stream, or to secure reservoir rights for impounding water, is required to file a statement of his claim, setting forth in detail the particulars with reference to the amount of water expected to be diverted, the location of ditches and reservoir sites and the purposes for which the water is to be used.

In initiating the right to impound water in Cheesman Lake, the South Platte Company filed its statement of claim (Trans. p. 926 on map), in which among other things it states its claim as follows:

> "and also claims the right to use such stored water for domestic purposes in the City of Denver and along the lines of its mains and the mains of The Denver Union Water Company."

The laws of Colorado also provide that there shall be a judicial determination of the right to appropriate water and the date of the priority of the appropriation according to the facts of the case, and, the South Platte Company seeking an adjudication of its right, a decree was entered in the District Court of Park County (Trans. p. 919) fixing these rights with reference to Cheesman Lake. The court determined that the South Platte Company had leased its reservoir to The Denver Union Water Company, and since its organization has, at all times, afforded Denver and its inhabitants protection against fire and drouth; indeed the only water supply; and the court also found and decreed that

all the waters so impounded in Lake Cheesman are needed for the domestic purposes claimed (Trans. 923-4).

It will be seen, then, that both by the statement of claim, and by the decision of the court and the decree adjudicating the rights, all was predicated upon the needs of Denver and its inhabitants.

Neither the complainant, nor any of its predecessors, nor any of its subsidiaries, has ever used water, except in insignificant quantities, for any other purpose except the Denver water supply. No one of them has ever acquired a right in itself to the use of this water. No one of them has ever used it for its own purposes. All that has been done by these various companies is to secure the right of diversion and to conduct the water to the people who will use it. The only claim to an adjudication and a decree was, and necessarily must have been, predicated upon the use of the water by some one else—Denver—and since the water right under the Colorado Constitution and laws and decisions is in the *user* of the water, the municipality is the legal owner and the inhabitants are the equitable owners. A municipality, Denver, through its statutory authorization to acquire water for the benefit of its inhabitants has become the owner of these water rights, and the company of the works necessarily employed in furnishing this water. It is entitled to receive a fair remuneration for its capital employed, but it is entitled to nothing more. It certainly ought not to be allowed to predicate a right to make rates for service based on the charge that it is the owner

of the water or the water right, for these have always been owned, and must always be owned, by the municipality in trust for its inhabitants.

In concluding this topic, brief references will be made to two different rules laid down in the western states concerning the respective rights that exist between consumers of water and the carriers of water with whom the consumers deal.

Mr. Kinney in his work on Irrigation and Water Rights (2nd ed.), at Section 1475, says:

> * * * "Therefore, where the water is furnished and distributed to consumers by incorporated companies, there has arisen in the different states a considerable divergence of opinion between the authorities, as to the ownership of the title of the water rights. In Colorado, and in some of the other states following its rule, it is held that the title to the water rights is in the consumer, and that the company is merely the carrier of the water. While in other states it is held that the consumers' relation to the company is that of contract only; and that such consumers have no proprietary right in either the water rights or in the works necessary for the utilization of the same."
>
> See also Ibid. Sec. 1476.

And Mr. Kinney, in Section 1477, in discussing this relationship existing between the carrier and the consumer says that in the one case for the purpose of making the appropriation from the natural

stream, the corporation becomes the agent of the consumer in making such appropriation, and under the other rule the consumer becomes the agent of the corporation. The states in which the rule has been adopted adverse to that of Colorado are Idaho, Nevada, Oregon and California.

In the case of *San Joaquin vs. Stanislaus County*, 233 U. S. 454 (which was a rate case), it was held by this Court that the water rights were owned by the public utility company, and that in determining the value of the company's property for rate-making purposes these water rights should be included, and cites in support of such theory the case of *Palmer vs. Railroad Commission*, 167 Cal. 163, 138 Pac. 997.

By examination of the Palmer case just referred to, the rule in California will be readily distinguished from that in Colorado. The court in its opinion in the Palmer case, 167 Cal. at 173, says:

> "The proposition that the waters of a non-navigable stream are in the nature of private property and not property primarily devoted to public use is not only established by authority; it is demonstrable from well established principles of the law of real property. The right to the waters of a stream is real property, a part of the realty of the riparian lands originally, and a part of the realty as an appurtenance to any other lands to which it may be rightfully taken when the riparian rights have been divested in favor of the user on non-ri-

parian land. This was decided as early as Hill vs. Newman, 5 Cal. 446, 63 Am. Dec. 140, where the court said:

'The right to water must be treated in this state as it has always been treated, as a right running with the land, and as a corporeal privilege bestowed upon the occupier or appropriator of the soil, and as such has none of the characteristics of mere personality.' * * *.

Until some change is made in natural conditions, there is no existent right to the water of a stream, except that vested in the riparian owners. They alone can lawfully have access to the stream, and therefore they only, in a state of nature, may lawfully use it or divert it from the stream. Hence the right to the water of flowing streams in this state, prior to any sale or disposition of lands by the state or by the United States, was vested in the state or in the United States, not in their respective governmental capacities as sovereign and for the common use of the people, but as riparian owners in their respective capacities as landed proprietors. These rights were and still are strictly proprietary and in their nature private. When land was disposed of by either, the riparian water right pertaining thereto passed to the purchaser as a part of that realty. It necessarily remained a private right, since the sale did not have the effect

of dedicating it to public use. All these rights belong primarily to the riparian owners, consisting of the United States, the state, and the purchasers from one or the other of them. They cannot be divested from these riparian owners, and have not been divested from them except by their consent, expressed, as by statute, or by actual grant or contract, or implied as by prescription, or by enforced taking for public use, as by condemnation. It follows that they remain private property when they pass to purchasers, and that when they pass from the riparian owner to others by prescription, grant or consent, they do not by that transfer become impressed with any public use, and it still remains true that there must be a dedication to public use to divest the private right. They are no more public than is the land to which they belonged and of which they formed a part."

On petition for rehearing in the above case the court says:

"In a petition for rehearing the plaintiffs quote the opening clause of the amendment of April 8th, 1911 (St. 1911, page 821), to section 1410 of the Civil Code. This section formerly read as follows:

'The right to the use of running water flowing in a river or stream, or down a canyon or ravine may be acquired by appropriation.'

By the amendment this was prefaced by the following declaration:

> 'All water or the use of water within the State of California.'

This, it is claimed, is contrary to the doctrine declared and followed in the opinion of the court herein. This section was not cited in the briefs upon which the case was submitted. We refer to it now solely in order to show that it has no application to the case. All the water rights which were in dispute in the case arose and were acquired by and under appropriations made long before the passage of the amendment aforesaid. It ought not to be necessary to remind any one that a law of this character is not retroactive, or that it cannot operate to divest rights already vested at the time it was enacted."

There is a clear distinction between the Constitution of California and that of Colorado. The California Constitution, Article XIV, among other things provides:

> "Section 1. The use of all water now appropriated or that may hereafter be appropriated *for sale, rental or distribution,* is hereby declared to be a public use, and subject to the regulations and control of the state in the manner prescribed by law."

(Italics ours.) 233 U. S. at p. 460.

Whereas, in Colorado, it is provided by Section 5

of Article XVI that the water of every natural stream is the property of the public, and dedicated to the use of the people, subject to appropriation. And Section 6 of Art. XVI provided that the right to divert the unappropriated waters of any natural stream to beneficial uses shall never be denied. There is no authority in the Colorado Constitution to "appropriate (water) for sale."

Colorado, as shown in the decisions that have been referred to, has construed these sections to mean that the only manner of acquiring the right to the use of water is by the application thereof to a beneficial use, and there is no property in water except the use thereof. Whereas, in California, waters are declared to be for public use, to the end of regulation and control by the State; nevertheless the water may be appropriated for "sale, rental or distribution."

There being such a marked difference between the constitutions of these two States, and the decisions of the courts of the respective States interpreting these constitutional provisions and their various statutory provisions, the distinction is easily drawn.

(b)

Going Concern.

In determining the value of the property used by the Water Company in furnishing water to Denver and its inhabitants, the Master in his report included the item of "Going Concern," and valued it at $800,000.00, which he included in the aggregate

in making up his total estimate of valuation of the property of complainant (Trans., pp. 122-3).

The appellants objected and do object to this allowance or any part thereof, as not being a proper allowance in this kind of a case.

The Master, in explaining this element of value in his report, at page 137 of the transcript, says:

> "Such valuation of the entire property has been made precisely as if the plant were about to commence serving the public, with its business yet to be established.
>
> The plant is one 'where its business is established' and is 'an assembled and established plant doing business and earning money.' It follows that the 'element of value'—the 'property right'—going concern value, remains to be appraised."

There have been a large number of cases, both in this Court and in the Federal and State courts of the United States, in which the question of "Going Concern" was either decided or discussed, and at least in so far as rate cases are concerned, the holdings have been almost uniform that "Going Concern" is an element that should not be considered in determining the value of property for rate making purposes. The courts have not been harmonious as to the reasons for making the disallowance, principally for the reason that hardly any two cases stand upon the same basis.

The question of "Going Concern" will now be considered as applied to the facts and conditions of

this particular case. The complainant company has a monopoly in the business of furnishing water to the City and County of Denver. Denver is situated in an arid or semi-arid country, and water is a prime necessity to the inhabitants of the City. It is also a legal necessity by reason of sanitary laws which make it necessary for residents to use water.

The only difference in value between a water system which is completed and ready for use, and a system which is completed and being used, is the expense of inducing the consumers to take the water —in building up the trade. There is even a distinction between the furnishing of water to the inhabitants of a city, especially in an arid state or city, and gas, electricity or other public service which is not a prime and legal necessity. Electricity and gas are not necessities. Yet it has been held in cases which will hereafter be referred to, that even where a company has a monopoly of the business of furnishing gas or electricity, nothing should be added in a rate making case for "Going Concern."

Water in a Colorado city is as necessary as air. It costs a company nothing to build up a trade except merely the clerical expense of issuing licenses to those who will inevitably apply for the use of the water. And the issuance of the licenses is no more than an easy means of collection of the dues owing to a public service company. The complainant Company issues these licenses twice yearly, and obviously for the purpose of being able to collect promptly its dues for service.

Suppose that tomorrow the City were to build a new system, or a new company were to build a new system, connecting the mains with the consumers' service pipes, and then suppose that the old company were to cease doing business without transferring its licenses and contracts, or its *good will*, to the new company, how long would it take the new company to build up the business and how much would the effort cost?

To ask this question is sufficient to show that this so-called "Going Concern" value, particularly in a case of this kind, has no support, but is purely mythical and exists only in the fond hopes of the corporate mind desirous of enlarging assets upon which to predicate a rate of income in keeping with its ideas as to the amount of return it should receive.

However the Master may have arrived at this amount of $800,000.00, it is plainly, indeed avowedly, adding to the valuation of the plant for rate making purposes this very substantial sum which is due to the single fact that the people who pay the rates have added this valuation to the actual value of the property.

Or to put it another way: The Denver Union Water Company has no customer except Denver and its inhabitants. It has no business except with Denver and its inhabitants. Whatever "business value" the plant has, call it "going concern value" or what you will, is the value of its business with Denver. Now to charge to the people of Denver, in addition to a fair rate on the actual value of the plant, an added return based on the business which Denver people

give to the Water Company, is to charge against the inhabitants of Denver, as something on which they should pay a return, an element which they themselves have created. In other words, it is asking the inhabitants of Denver to pay interest on what they themselves own.

In *Spring Valley Water Company vs. City and County of San Francisco*, 165 Fed. 657, at page 695, it is said:

> "The value of the franchise and going business depends upon their earning power. Their earning power depends on the rates, and the rates at the present time are regulated by the board of supervisors."

In the case of *Smyth vs. Ames*, 169 U. S. 466, the court, at p. 547 said:

> "What the company is entitled to ask is a fair return upon the value of that which it employs for the public's convenience."

The foregoing case was cited with approval and followed in *San Diego Land & Town Co. vs. National City*, 174 U. S. 739, and in *San Diego vs. Jasper*, 189 U. S. 439, and in neither of these cases was the item of "Going Concern" value allowed.

In the case of *Brunswick Water District vs. Maine Water Company*, 99 Me. 371, an unusually well considered and frequently cited case, the Court in its opinion, at p. 376, said:

> "As a structure it has value independent of any use or right to use where it is—a value probably much less than it cost, unless it can be used where it is * * * we speak

sometimes of a going concern value as if it is or could be separate and distinct from structure value—so much for structure and so much for going concern. But this is not an accurate statement. The going concern part of it has no existence except as a characteristic of the structure. If no structure, no going concern. If a structure in use, it is a structure whose value is affected by the fact that it is in use. There is only one value. It is the value of the structure as being used. That is all there is of it." (Citing Kennebec Water District vs. Waterville, 97 Me. 185.)

In the case of Spring Valley Company vs. San Francisco, 165 Fed. 667, the court, at p. 695 said:

"The plant is operated under a franchise, a legal right to collect water rates is more valuable than without such a right; and a plant with an established business, with customers who have connected their houses with the company's distributing pipes, is more valuable than it would be without such connections, and without such customers. These facts, as well as all other discoverable elements of value, should be weighed, but it must be remembered that while the rate fixing agency is in duty bound to establish rates which will afford a reasonable compensation for the use of this plant at a fair valuation as affected by the fact that it is a going business and operated un-

der its franchise, there is no duty to go beyond this and confer an additional value for these intangible elements, which is neither discoverable nor apparent."

And in a case between the same parties, Spring Valley Company vs. San Francisco, 192 Fed. 137, the court, at p. 167, said:

> "Probably nothing further is needed to demonstrate for this case at least, the utter futility of attempting to establish a separate and distinct valuation for a going business. * * * I shall consider the fact that complainant has an established business, not by fixing a definite value therefor, but along the lines suggested by the sound and practical utterances of Judge Savage in Brunswick Water District vs. Maine Water Company, 99 Me. 371, 376."

See also Contra Costa Water Company vs. Oakland, 159 Cal. 323, 113 Pac. 668, in which case "Going Concern" value was not allowed.

In the case of *Cedar Rapids Water Co. vs. Cedar Rapids,* 118 Iowa 234, the item of "Going Concern" value was disallowed. The court in its opinion, at p. 262, said:

> "It is proper here to say that in reaching these conclusions we have not attempted any estimate of the 'going value' of the water works as a distinct and severable item in the calculation. By 'going value' we understand is meant that value which arises

from having an established 'going' business. While not the exact equivalent of 'goodwill' as applied to ordinary business, it is of a somewhat similar nature, and attaches to the business, rather than to the property employed in such business. The fact that the business is established is, of course, a material fact in ascertaining the value of the plant, and especially is this true where the property is being estimated for the purpose of sale or condemnation; but as a basis for estimating profits its signification is less apparent. The merchant who sells an established business may properly place a high value on the goodwill which he relinquishes to the buyer; but so long as he continues in the enjoyment of the business he has created he does not add the value of the goodwill to his capital stock in estimating the percentage of his annual profits. So, also, we may say we see no reason why plaintiff, in addition to operating expenses, repairs and other ordinary charges, should be allowed to reduce the apparent profits by deductions for a restoration or rebuilding fund. The setting aside of such a fund may be good business policy, and, if the company sees fit to devote a portion of its profits to that purpose (though as we understand the record, no such fund has yet been created), no one can complain, but it is in no just sense a charge affecting the net earnings of the works. To hold otherwise

is to say that the public must not only pay the reasonable and fair value of the services rendered, but must in addition pay the company the full value of its works every 40 years—the average period estimated by plaintiff—for all time to come."

In *Cedar Rapids Gas Light Co. vs. Cedar Rapids,* 144 Iowa 426, the court, at p. 434, said:

"The value of the plant is to be estimated in its entirety, rather than by the addition of estimates on its component parts, though the latter course will materially aid in determining the value, * * * The fact that the plant is in successful operation constitutes an element of value. As said, the value of the system as completed earning a present income, is the criterion. * * * Save as above indicated, the element of value designated a 'going concern' is but another name for goodwill, which is not to be taken into account in a case like this, *where the company is granted a monopoly.*"

The case just quoted from was sustained by this Court in 223 U. S. 655.

In the case of *Consolidated Gas Co. vs. New York,* 157 Fed. 849, the court, at p. 872, said:

"I cannot perceive how this complainant can possess a goodwill answering that description. There is nothing in the nature of its business enabling it to acquire goodwill in the proper sense, or indeed

> in any other. It is required by law to furnish gas, * * * and it owns the mains, service pipes and meters. What induces a customer to remain with this company, its successor or vendee? Nothing that I can imagine except a desire to avoid the nuisance of street digging in front of his house. * * * Yet even this nuisance is in all human probability impossible of occurrence because of the beneficially monopolistic character of defendant's present occupancy of the streets of the city, * * * and I think it apparent that conceivable goodwill of a gas company in this city is about equal to that of the street cleaning department of the municipal government."

The decision of the court in the case just referred to in disallowing the claim for "Going Concern" or "Goodwill" came to this Court as *Willcox vs. Consolidated Gas Co.*, 212 U. S. 19, and the lower court's conclusion on this point was affirmed.

The witnesses in the case at bar in arriving at their estimates of value of the various properties owned by the water company, must have considered such valuation from the standpoint of a going concern. The witnesses practically agreed that the *scrap value* of the property would not exceed $6,000,000 (Trans., pp. 229-231), and therefore any value above its scrap value must be the value attributed by reason of the plant being in operation and earning money. The various reservoirs, conduits and distributing pipes are all valuable because they are

so situated that water can be furnished to consumers. Without this fortunate situs of the property, the property is of little value unless it could be employed for some other like or similar purpose, and it must therefore be assumed that the witnesses in testifying as to the value, testified as to a live concern rather than as to a dead one.

Furthermore, the Master in arriving at the value of complainant's property, took for a basis the cost of reproduction less depreciation. This is one of the methods recognized by courts and those scientifically familiar with the subject. However, this is no more than a medium in arriving at valuation for rate making purposes. The test, and the only true test, is the actual value of the plant, and the reproduction cost is only one means of arriving at this true test. This particular phase of our argument will again be discussed under the head of "depreciation," but at present we wish to call the attention of the Court to this feature under the head of "Going Concern."

In the case of *New York Trust Company vs. City and County of Denver*, 229 U. S. 123, this Court held, referring to this same water system, that the City and County of Denver was under no obligation to purchase the system from the company, or to renew the franchise of the company, but that it had complete authority to build an independent plant and to require the present plant to be removed from service.

It is, therefore, to say the least, questionable if the Master adopted the proper method of arriving at the value of complainant's property for the reason

that in view of the fact that the company's franchise had expired and it was furnishing water to the City of Denver and its inhabitants purely by sufferance. Therefore the cost of reproduction is not a fair method for determining the value of complainant's property. It is certain by reason of foregoing that the item of "Going Concern" should not have been added to the cost of reproduction.

In the case of *Appleton Water Works Co. vs. Railroad Commission*, 154 Wis. 121, which was one involving the appraisal of a water company which the city was purchasing under the provisions of the indeterminate franchise law of Wisconsin, the court with reference to the question of "Going Concern" at page 148 said:

> "However, the fundamental difficulty with the attempt to set a definite sum as the measure of going value, is that it is an attempt to divide a thing which is in its nature practically indivisible * * * It is not obtained by adding up a number of separate items, but by taking a comprehensive view of each and all the elements of the property, tangible and intangible, including property rights, and considering them all, not as separate things, but as inseparable parts of one harmonious entity, and exercising the judgment as to the value of that entity. In this way the going value goes into the final result, but it would be difficult for even an expert to say how many dollars of the result represent it."

In the case of *Cumberland T. & T. Co. vs. City of Louisville,* 187 Fed., 637 at 646, the court said:

> "It is insisted that $50,000 should have been included in the estimate as a distinct and additional enhancement of the value of the plant because of the fact that the company is a going concern. In valuing property of the character of that involved here it would indeed be looking only to the "bare bones" not to take into consideration the fact that the company is a going concern. That fact, however, though possibly somewhat unconsciously to themselves, must necessarily, we think, have been taken into account by the witnesses who testified as to values. Property underground or overhead, thinly strung out over many miles, would have very diminished value were it not in actual use for the purpose for which it was installed. The matter does not appear to have been passed upon in the report, nor, while it is argued in the brief, does any exception appear to be based on this phase of the case, but we have concluded that this element of value would hardly be susceptible of accurate measurement by and of itself, and we shall consider the fact to be that it was an inherent factor in the estimate made by each witness who testified as to values."

In the case of *Des Moines Gas Company vs. City of Des Moines,* 199 Fed. 204, the special master in chancery, Judge Robert Sloan, in passing upon the question of "Going Value" said:

"It also renders it extremely doubtful that 'going value' will be included in valuation of such a plant as the basis of return beyond the fact that it is in 'successful operation.' That would exclude the sum of $300,000 estimated in this case, on the grounds that *when the ordinance was enacted*, it already possessed a well developed and paying business.

In my judgment, after considering the able and thorough arguments of counsel, that it is decisive of the question, and holds that "going value" should not be considered in determining the basis upon which the complainant is entitled to have its return reckoned, and feel that it is my duty to so state.

The physical value as hereinabove determined, is reckoned upon the fact that the plant was in 'successful operation' when the ordinance was enacted, otherwise its value would be much less. The "going value" is that enhancement which results from a well developed and paying business. This would result in reducing the estimated deficits for each year $24,000, and yield a return to the complainant of at least six per cent on $2,100,000." 238 U. S. 170.

The foregoing excerpt from Judge Sloan's decision as Master was affirmed by the District Court in the case above referred to.

This same case came to this Court in *Des Moines Co. vs. City of Des Moines,* 238 U. S. 153, 35 Sup. Ct. Rep. 811 (which was a rate case), in which the question of "Going Concern" was the principal question discussed in the opinion of the Court, the Master had refused to allow as an independent item the sum of $300,000 for "Going Concern." After an exhaustive review of the authorities, this Court sustained the action of the Master and held that while the element of value represented by "Going Concern is a property right and should be considered in determining the value of property, that nevertheless in view of the fact that overhead charges had been allowed in estimating the value of the property of this gas company, that nothing should be allowed for the item of "Going Concern," this court in its opinion, at page 171, saying:

> "As pointed out in the Cedar Rapids case, if return is to be regarded beyond that compensation which a public service corporation is entitled to earn upon the fair value of its property, the right to regulate is of no moment, and income to which the corporation is not entitled would become the basis of valuation in determining the rights of the public. When, as here, a long established and successful plant of this character is valued for rate making purposes, and the value of the property fixed as the Master certifies upon the basis of a plant in successful operation, and overhead charges have been allowed for the items and in the sums already stated, it cannot be said, in view of

> the facts in this case, that the element of going value has not been given the consideration it deserves, and the appellant's contention in this behalf is not sustained."

In the present case, the Master as we view it, has made an allowance for overhead charges which is more than enough to take care of any so-called "Going Concern." He states in his report (trans. fol. 210) that "Going Concern" value is the value which inures in a plant where its business is established, as distinguished from one which has yet to establish its business. And again at folio 212, page 138, of the record, he said:

> "There is no absolute standard by which the fair value of this element can be determined, and I adopt $800,000 because no matter how often I have considered the evidence and the arguments, my mind always comes back to this amount as reasonable and fair to all parties."

There are approximately 40,000 service pipes in the City of Denver, and at the rate allowed by the Master about $20.00 each is allowed for getting the inhabitants of the city to take something that they have to take, and something which would not cost the company an extra $1.00 of expense; and while there are various misunderstandings as to the meaning of the term "Going Concern" the Master here has placed his meaning on the term clearly, that it is the *cost of establishing the business after the plant is fully completed.*

(c)

Overhead Charges and Interest During Construction.

The Master in his report, after allowing "fair contract cost new" for the structures composing the plant, allowed an additional amount of 12½ per cent for "engineering and contingencies," which amounts to $1,046,272. He also allowed $805,000 for "interest during construction." He also found that the total structural value of the property—that is, the contract price new of such structures—to be $8,370,167; this, of course, without allowance for depreciation. This question of an allowance for engineering and contingencies has been the subject of a wide range of discussion; but assuming that the proper method of arriving at fair value is the cost of reproduction less depreciation, it is no doubt proper in some cases to make an additional allowance for engineering and contingencies of some character. However, this case differs from a large number of cases we have examined on this same question, in this: The Master takes first the *contract* cost new of the structures, whereas in most of the cases, as we view it, the *cost of material and labor* has been taken as the basis and to this has been added a percentage for engineering and contingencies. Des Moines Gas Co. vs. Des Moines, 238 U. S. 153-166. There is also a distinction in determining overhead charges in a system such as this, which naturally constructs its works by piece-meal, and a company that has to complete its whole plant before it commences to earn money. This plant has been in process of construction since

1870. The original outlay was comparatively small as compared with the additions and extensions that have accrued from the time the plant was first started. As the city has grown, new conduits have been necessary, new reservoirs have been necessary, and these have been built as needed. Also the distributing systm is extended as new additions are laid out and as new demands are made for water, and necessarily this item of engineering and contingencies, which would be allowed in the construction of a plant that had to be wholly completed before it could be used, would be taken care of by operating expenses. A company, after it commences to construct a water plant, has an office force organized, it has its engineers, all paid out of the operating expenses of the company, and it is difficult to see how a definite basis can be assumed upon which to predicate this item. As was said by Judge Evans in the case of Cumberland Telephone and Telegraph Company vs. City of Louisville, 187 Fed. 637 at 646-7 the Court said:

> "First, what are called 'overhead charges,' which are made up of various items of expenses incurred in the organization of the company and its work, the details of which need not be stated, but which it is claimed could not be avoided, and which enter, as is insisted, into the present value of the plant. These charges amounted to $90,000.
>
> 'Overhead charges' consist of expenses much of which were incurred long ago.

> Probably those expenses may have aided very materially in increasing the present value of the plant. That present value we must ascertain, *but it does not follow that 'overhead charges' as a separate item should be included as such. It seems to us that they are too intangible to be available for that purpose.''* (Italics ours.)

Much that has been said with reference to this item of engineering and contingencies may also be said of the item of interest during construction. It might be considered that an allowance for interest during construction is proper, if it is shown that the money expended for structures is lying idle during the construction, but there is no basis here for computing any such interest. The Master bases this interest item on the money expended for the structure, but in arriving at the value of the structures he uses contract cost new as the method. If the company is to pay for these structures by contract price, and the structures are to be turned over to the company when completed, why the item of interest during construction? Let us illustrate, from the Master's return, the unreasonableness of both of these charges. He has given the contract price new, of the distribution pipe system as three million and a half, to this he has added 12½ per cent for engineering and contingencies and the pro rata share of the item of interest during construction. This pipe system, as said before, has been put in as the demands of consumers required it. Whatever engineering, or any other contingencies, would be expended as operating expenses.

It must furthermore be borne in mind that both of these items were predicated upon evidence of witnesses basing their opinions entirely upon estimates, and in the language of the Court in the Cumberland Telephone and Telegraph Company vs. City of Louisville case, supra, "It seems to us that they are too intangible to be available for that purpose."

It also appears that there has been a duplication of allowance, as in the case of *Des Moines Gas Co. vs. Des Moines*, 238 U. S. 153; at page 166, the Court defined "overhead charges" and enumerated thereunder seven different classes of charges, one of which is "interest during construction." All of the seven items included under "overhead charges" amounted to only 15 per cent upon the base value of the property exclusive of real estate, except a small item for organization expenses.

Whereas in this case the two items of "interest during construction" and "overhead charges" amount to $1,846,272.00, or 22.9 per cent of the contract price of the structures as found by the Special Master, and adding to this the sum of $800,000.00 found by the Master for "Going Concern" (which item of "Going Concern" was rejected in the Des Moines case just cited), would increase the percentage to over 32 per cent upon said structural cost. This is not only surprising, but to those uninitiated and unfamiliar with rate expert's resourcefulness is astonishing.

(d)

General Considerations.

Under this general topic of fair value, we have only so far discussed those items which appear to us as subject to legal objections, viz: water rights, going concern values, estimates for engineering and contingencies, and interest during construction; and we now wish to give briefly a general consideration to the methods used by the Master in arriving at the value of the other property involved. The Master says (Transcript, p. 121): "Lands and water rights are appraised at their present market value. Estimates of the cost of reproduction of the structures are made, and from such estimated reproduction cost deductions for accrued depreciation are made, so as to determine the estimated reasonable value of the structures in their present condition."

Assuming for the present that the reproduction method was a proper method for arriving at the fair value of the property, the only evidence upon which the Master had to arrive at his conclusions, was the evidence given by the experts, and the evidence of these experts based, not upon known facts, but upon *estimates*. It would be hard to conceive of a more unreliable way to determine facts, notwithstanding the rule is that these facts must be established clearly and beyond a reasonable doubt. There were five witnesses who testified for the complainant, basing their testimony as experts upon estimates as to the reasonable value of the entire plant. These witnesses were Freeman, Hazen, Metcalf, Anderson and

Holman (Master's Report, p. 138, transcript). Their testimony varied from $15,300,000, the lowest, to $16,614,719, the highest, or a difference between the highest and lowest of more than $1,300,000. There were two witnesses who testified for the defendants as to the cost of the reproduction of the structures of this plant, one was John Gaffy, who testified that he would undertake to reproduce the system for $10,109,789 (Transcript, p. 690). This of course was without any allowance for depreciation or interest during construction. The witness Bickel (p. 755, transcript) estimated the cost of reproduction, including promotion and executive expenses, at $9,915,388, and this also without deducting anything for depreciation or interest during construction. The last two witnesses named did not take into consideration the value of the water rights. It will therefore be seen that there is a range of over five million dollars in the estimates of the witnesses. True, the witnesses for complainant preponderated, but no doubt had the City deemed it advisable to employ enough experts, its witnesses would have preponderated. The witnesses for the City were both practical contractors, and while neither of them had undertaken as large a project as this, they were familiar with all of the matters necessary to be taken into consideration in arriving at the value of the plant, or rather, the cost of reproducing the same.

We realize full well that weight should be accorded to the findings of the Master upon matters involving questions of fact, where there is a material conflict in the testimony; but here the Master arrived at his conclusions, not from disputed questions of

fact related by witnesses, but upon various indefinite estimates which amounted to not much more than guesses.

The burden is upon the company to show the value of its property and to show it by satisfactory evidence, in order that the Court may be convinced before it will be authorized to set aside the act of a legislative body. There was an immense amount of testimony introduced in this case, and there are various discrepancies between the witnesses as to various elements in the case, but we think it would serve no good purpose to prolong this phase of the argument. We have pointed out some of the prominent characteristic features of the wide discrepancies of evidence for the purpose of illustrating the unsatisfactory showing made by the company in its endeavor to challenge the rate making body, and the evidence has wholly failed, leaving aside the evidence of the appellee, to establish matters with that clearness which courts demand in cases of this kind.

IV.

Depreciation.

The Master has charged against the income of the plant the sum of $140,000.00 as annual depreciation, and has added this to operating expenses and taxes, and then deducted the gross of these items from the gross revenue in order to arrive at what is called the net income of the complainant.

Evidently this $140,000.00 is allowed on the theory that it is a proper annual charge on this ac-

count. It is not clear just how this allowance for annual depreciation is arrived at, although it seems to be based on the testimony of the witness Hazen (Trans., p. 230).

There is much testimony in the record concerning the difference between the straight line method of depreciation and the sinking fund method, and which method the Master used in arriving at his conclusion is left wholly in doubt. But one thing is very evident, the future depreciation of the plant, if the Master has used the straight line method of depreciation, will continue the same, $140,000.00, or in excess of 1¾ per cent of the present revenue of the plant, including everything which is subject to depreciation, the same things taken into account by the Master as shown by his report; and if he used the sinking fund method of depreciation the future depreciation is each year to be larger than it was in the last preceding year by reason of the fact that compound interest will be added to the sum of $140,000.00 annually.

From a general view of the testimony it seems reasonable to say that the estimated life of the units, taking the average, will be fifty years from May 1, 1914. If the amount evidently included in operating expenses for repairs and renewals shall be continued in the future as in the past (and in the year ending October 31, 1914, this amount was in excess of $96,000). (See second tabulated statement following page 1080 of Transcript), there will certainly be some sort of a plant remaining at the end of whatever period may be fixed.

The Master, however, in determining the question of valuation, would seem to proceed on a different theory when he considers depreciation in the past as compared with the depreciation of the future. In determining the valuation of the plant on November 1, 1913, the Master made a deduction of actual accrued depreciation of $1,320,970.00 for the entire period of time beginning with the first construction or acquisition of any element or unit now going to make up the value of the plant, or a gross deduction of .1268 per cent. Calling the average age of these units on November 1, 1913, twenty years, this is an allowance of $66,048.50 annually, figuring by the straight line method of depreciation as distinguished from the sinking fund method of depreciation allowance, and if the sinking fund method were followed, the result of the annual allowance, of course, would be smaller at the beginning of this period and greater near its end. The Master then, for some reason, deducts $60,000.00 as depreciation for the six months from November 1, 1913, to May 1, 1914, which is practically double his allowance for previous depreciation, according to the above estimate (Trans., p. 122, Table 1).

Why the Master should have made an allowance for depreciation of $60,000.00 for a six-months period as against $66,048.50 *annual* depreciation theretofore, and why he should have placed the allowance for subsequent depreciation at $140,000.00 annually is a little difficult to understand.

Bearing in mind that the plant was begun in 1870, and every important unit except the Cheesman

dam had been installed and work on the Cheesman dam had been begun prior to 1897, an average age of 20 years would not seem unreasonable.

The witness in testifying regarding the sinking fund method of depreciation stated that this is an amount to be set aside annually, which, with interest at 4 per cent, compounded annually, will amount to the value of the plant at the end of the estimated period of its life. In other words, this allowance is to be figured so that at the end of the period there will be no plant and its full value will be provided for. Now $140,000.00 paid annually with interest at 4 per cent, compounded annually, will amount to $13,500,000.00 in about 39 years 7 months, while if we calculate what amount of money should be paid in annually so as to make $13,500,000.00 in 50 years, interest being calculated at 4 per cent, and compounded annually, we find that $85,028.00 so paid in annually would provide for this valuation.

Thirteen million, four hundred fifteen thousand, eight hundred ninety-nine dollars or $13,500,000.00 ought not in any event to be taken as the true value of the plant in estimating depreciation. The Master finds $13,415,899.00 to be the value of *everything* owned by the complainant, including water rights $2,947,617.00, lands $637,814.00, going concern value $800,000.00; a total of $4,385,431.00. If we deduct these items from $13,415,899.00, we have $8,030,468.00 as the value of all that could possibly be counted as subject to depreciation. One hundred forty thousand dollars annually with interest at 4 per cent, compounded annually, will amount to $8,000,000.00

in twenty-nine years. While if we calculate what amount of money should be paid in annually so as to make $8,000,000.00 in 50 years, with interest at 4 per cent, compounded annually, we find the sum of $50,386.00 so paid in will provide this valuation.

It should be noted that this 4 per cent interest allowance under the sinking fund method of determining depreciation is fixed by the witnesses for the complainant, and surely the complainant's estimate of what money is worth in these circumstances is at least persuasive in arriving at a determination of what would be a fair return on its investment under any schedule of rates; and if the complainant's estimate of the value of money when determining the amount which should be set aside to cover the depreciation in anticipation of the plant's total destruction is 4 per cent, and when, as is apparent, the schedule of rates complained of would yield a return much in excess of 4 per cent on the fair value of the investment, excluding water rights and excluding going concern value and excluding extravagant annual expenditures of money under the guise of operating expenses, the enforcement of the ordinance under consideration would not seem to be confiscation.

In the early part of Exhibit "C" appears a somewhat extended history of the business of the Water Company, in which is given the approximate date of the completion of the various units (Exhibit "C," pages 15-19), and it would appear that some of these units are quite old—for example, the South Platte Division, mentioned in the Master's Table

(page 122, Trans. of Rec.), was apparently completed in the year 1896—it is thus eighteen years old. The Master figures the reproduction cost of this unit at $589,204.00; he figures the accrued depreciation to date at $68,040. The percentage which the accrued depreciation bears to the reproduction cost is 0.115 and the annual depreciation would be 0.00638. The Cherry Creek Division would seem to have been completed, so far as can be ascertained from Exhibit "C," in 1887—it is twenty-seven years old. The Master fixes its reproduction cost at $121,920.00— he fixes depreciation to date at $5,999.00, or, in other words, at 0.049. For the period of its age the percentage of annual depreciation would be 0.0018. The Mississippi Division, the Master finds to be capable of being reproduced for $150,871.00 and to have depreciated up to the present time by the amount of $23,553.00. This division would seem to have been completed according to the statements in Exhibit "C," in 1884, its age is thirty years, accrued depreciation to date amounts to 0.154 and annual depreciation to date amounts to 0.0052.

Lake Cheesman is the newest large unit of the Company's plant, apparently completed in 1906, age eight years. The Master finds its reproduction cost to be $1,125,000.00. He finds depreciation to date to amount to $26,777.00, or a total accrued depreciation of 0.0237. Its annual depreciation during its age would amount to 0.0029.

We have examined the record with reference to a number of other units of the plant and subjected them to the same test, and in no case have we found

that the Master has allowed depreciation to date in the amount of 1¾ per cent per annum, or anything approaching this sum. Of course, we recognize that in making these calculations there may be errors, particularly in the date of the installation of the units. It is not improbable that the engineers who compiled the Water Company's Table which appears in Exhibit "C" at page 68 and following, were given more complete and detailed information concerning the age of the units than is ob tainable from the record, but, again, we must insist that the burden is upon the Company and that if the Company chooses to present instead of facts the testimony of engineers as to what they *estimate*, the Company is not sustaining the burden thrown upon it; this matter has already been discussed under the heading of Burden of Proof.

But why consider depreciation at all? If $96,-000.00 is expended annually for repairs and renewals, as was expended in 1914, and charged as operating expenses, is it conceivable that at the end of the plant's estimated life nothing of the plant will be left? Why should any such sum of money as $96,-000.00 be expended in a single year for repairing concrete dams, and repairing and replacing concrete conduits and wooden and iron pipes, except for the purpose of keeping the plant up to its present standard of adequacy and efficiency? Shall it be said that at the end of the period of life so estimated, the complainant shall have inhand in money the full value of theplant, and also own a plant such as will then be in existence and capable of furnishing Denver a sufficient water supply? If any such amount is to be

allowed on account of depreciation annually, then certainly some part of the amount expended for repairs and renewals should be deducted from the depreciation allowance, for it should be constantly borne in mind that the depreciation allowance which the witnesses discuss is intended to furnish an amount of money which, if placed at interest, will aggregate at the end of the plant's life its full value.

V.

GROSS RETURN AND OPERATING EXPENSES.

The Master at Section 49 of his Report (Trans.. p. 138) says:

> "I find that the Water Company's gross return for the year beginning May 1st, 1914, and ending April 30th, 1915, under the rates prescribed by Ordinance No. 26, Series of 1914, would have been $1,093,-615.45."

He does not state the basis of arriving at this gross return, nor how he computed it.

He does state that he adds the sum of $16,560.40 by reason of increased meter rates, but we assume from an examination of the record that he took the year 1914 as a basis for arriving at the gross returns of the complainant, as well as the basis for arriving at the operating expenses.

We submit that it was not proper to take the year 1914 as the basis of anticipating the gross returns of the company, or for anticipating its operat-

ing expenses, because by reference to Exhibit "A56" (Trans., p. 990), which contains a tabulation of the Company's gross earnings and operating expenses from the year 1895 to the year 1913, inclusive, and to Exhibit "C" (Trans., p. 1108) and Exhibit "D" (Trans., p. 1109), it will be seen that the gross earnings of the Company for the years 914 were $47,067.30 less than for the year 1913, and $48,341.66 less than for the year 1912.

It does not appear in the record why there should have been this great difference in gross returns in the year 1914 as compared with the years 1913 and 1912.

An examination of plaintiff's Exhibit "A-56" will show that there has been a steady increase in the gross earnings ever since 1895. The gross earnings in 1895 were $628,332.98, and they gradually increased until they have more than doubled, making an average annual increase of more than 5 per cent.

It is therefore absolutely unfair to the City to select that tabulation for the year 1914 as a basis of arriving at what the Company's gross earnings will be in the future. The only evidence we have in the record authenticating plaintiff's Exhibit "A-56" is that of the witness Thomas Cheyne (Trans., p. 347). He testified that Exhibit "A-56"

> "shows accurately the total gross earnings of the company for each year of the nineteen years,"

and this testimony of Mr. Cheyne and the exhibit itself is the only evidence in the record as to the gross earnings of the Company.

After having anticipated the future total gross earnings of the Company, the Master at paragraph 50 of his report (Trans., p. 139), estimates that the operating expenses for the period beginning May 1st, 1914, and ending April 30th, 1915, would be $347,845.00, but there is nothing in the record to justify this finding of the Master.

The complainant in its bill (Trans., p. 77) alleges that these operating expenses for the year mentioned would be $333,045.06. In other words, the Master has allowed as operating expenses, to be deducted from the gross earnings, $14,800.00 more than is claimed by the complainant Company. The only evidence in this record upon this question of estimating the operating expenses is that of the witness Thomas Cheyne, the accountant who prepared Exhibit "A-56," and he says (Trans., p. 347) that he estimates the expense for the year in question as $333,045.06, the identical amount claimed by complainant in its bill.

Had the Master taken the year 1912 as his basis for determining the rate of return, and used the valuation fixed by him on the plant of the Company, the rate of return would have been .0406 plus instead of .0364 plus; or had he taken the year 1913 the rate would have been .0374 plus.

As said before in this brief, it is encumbent upon the complainant in this case, not only to show fairly and clearly the value of the property employed by it in furnishing Denver with water, but it is also necessary for it to show the amount of its gross earnings and what it did with these earnings, and

this should be clearly and conclusively shown in order to justify this Court in interfering with an act of legislation.

In the case of *Chicago etc. Ry. Co. vs. Wellman,* 143 U. S. 339, Mr. Justice Brewer said at page 345:

> "It is agreed that the defendant's operating expenses for 1888 were $2,404,516.54. Of what do these operating expenses consist? Are they made up partially of extravagant salaries; fifty to one hundred thousand dollars to the President, and in like proportion to subordinate officers? Surely, before the courts are called upon to adjudge an act of the legislature fixing the maximum passenger rates for railroad companies to be unconstitutional, on the ground that its enforcement would prevent the stockholders from receiving any dividends on their investments, or the bondholders interest on their loans, they should be fully advised as to what is done with the receipts and earnings of the company; for if so advised, it might clearly appear that a prudent and honest management would, within the rates prescribed, secure to the bondholders their interest, and to the stockholders reasonable dividends. While the protection of vested rights of property is a supreme duty of the courts, it has not come to this, that the legislative power rests subservient to the discretion of any railroad corporation which may, by exorbitant and unreasonable

salaries, or in some other improper way, transfer its earnings into what it is pleased to call 'operating expenses.'

We do not mean to insinuate aught against the actual management of the affairs of this company. The silence of the record gives us no information and we have no knowledge outside thereof, and no suspicion of wrong. Our suggestion is only to indicate how easily courts may be misled into doing grievous wrong to the public, and how careful they should be to not declare legislative acts unconstitutional upon agreed and general statements, and without the fullest disclosure of all material facts."

See also:

Tucker vs. Missouri Pac. Ry. Co., 108 Pac. 89 (Kan.).

Wyman on Public Service Corporations, Sec. 1152.

Bearing this principle enunciated by Mr. Justice Brewer in mind, let us examine the record to see if we can of what these operating expenses consist.

The only evidence of operating expenses is contained in complainant's Exhibit "A-56" (Trans., p. 990), Exhibit "C"' (Trans., p. 1108) and Exhibit "D" (Trans., p. 1109), and the testimony of the witness Cheyne (Trans., p. 347), where this witness has but this to say:

"The items charged as operating expenses are in my judgment properly and fairly charged as such operating expenses,"

his reference being to Exhibit "A-56." This exhibit purports to contain a tabulation of operating expenses for the years 1895 to 1913, inclusive, and this exhibit, with the testimony of the witness Cheyne, is the only evidence offered by the Water Company on this important question of what the Company did with its money.

Exhibits "C" and "D" purport to give the operating expenses for the years 1913 and 1914. Taking these three exhibits, we will examine some of the items contained in the tabulation to see if they meet the requirements of the rule stated by Mr. Justice Brewer in the case just referred to.

The first item is "Pumping Works." In 1914 this is given as $68,702.67. No explanation is given as to the character of the expenditure, or as to what it was expended for, or as to why it was $15,000.00 more than for the year 1910 and $10,000.00 more than for the year 1912.

The next item is that of "Reservoirs." There is a charge of $42,700.46 in 1914; $25,814.14 in 1913, and $19,679.80 in 1910.

It is not stated whether it is for repairs of reservoirs, or what.

The next items is that of "Conduits"; $26,328.73 for 1914; $19,167.39 for 1913; and $13,168.20 for 1912. Whether this is for renewals or building of new conduits the evidence is silent. It is important to know this, because the Master has allowed the sum of $140,000.00 for annual depreciation, and the

Court should be able to determine from the evidence and not from the accountant's guess what these expenditures are for.

We will now pass down in the table to the item of "Office Expenses." In 1914 these were $81,-934.17; in 1913 they were $80,807.56; and in 1912 $67,482.10; and in 1911 and 1910 a little over $62,-000.00 for each year. Were these office expenses for exorbitant salaries? What did they consist of? Why should there be a difference of $19,000.00 between 1911 and 1914? The record shows that the Water Company furnished water to Denver in 1911 as much or more than in subsequent years. According to tables set out by complainant in its bill (Trans., p. 70) it furnished more water in 1910 and 1911 than it did in 1912 and 1913. The same identical works were employed in furnishing water to Denver in 1914 as in the years just preceding, therefore it becomes important to inquire whether this item of almost $82,000.00 of office expenses has been sufficiently explained to authorize this Court to allow this item as a proper expense of operation.

During the year 1914 there is charged in this tabulation for the item of "Stable Expenses" and "Stable and Auto Service" over $32,000.00; and in 1913 almost $30,000.00, with no explanation as to whether these services or any of them were required. It is hard to imagine how this large sum could have been expended for such service.

Mr. Justice Brewer in the Wellman case says that the Court should be fully advised as to what is done with the receipts and earnings of the company.

There is also an item of "Legal Expenses" for 1914, $31,597.00; in 1913 $45,716.00; in 1912 $34,-743.69; 1911, $39,348.14; and 1910, $33,453.95. But in 1909, the year preceding the time when the Water Company commenced its extensive litigation against the City and County of Denver, we find this sum for Legal Expenses is $16,503.29, and in 1908 $11,522.12.

While there is nothing in the record to show it, we have the right to assume that this more than doubling of legal expenses after litigation commenced with the City, was attributable to such litigation, and is not a proper charge against the City, notwithstanding that it may be a proper operating expense. Certainly the Water Company would not have the right to charge the City with money it expended in litigation with the City.

The last item we will refer to is the item of "General Expenses." In 1914 this is charged as $19,932.93; in 1913 $22,480.60; and in 1912 $20,575.10.

These general expenses may all be legitimate, but this Court, before it is asked to set aside and annul the acts of a legislative body fixing rates as confiscatory, should know what this money is being expended for.

This analysis with reference to the expenditure of money becomes important when viewed with reference to other matters in the case. The Master has allowed an annual depreciation of $140,000.00, which is allowed for the purpose of keeping the property of the Company in *statu quo*.

It is quite likely that a part of the items contained in the tabulation are items which have gone

to the repair of the Company's works, for replacements, betterments or extensions of its system; and how is this Court to know, unless the Company sees fit to be frank and explain, what these expenditures have been made for? It was certainly within the knowledge of the Company what these expenditures were made for, at least during the recent years of its existence, and inasmuch as it has not come forward and given this important information for the use of the City and the Court in determining this matter, it should be construed strongly against it.

It needs no argument to demonstrate the importance of this question of operating expenses. If $100,000.00 has been charged to operating expenses which is not a proper charge, this would make a difference of more than ¾ of one per cent upon the Company's income, even taking as a basis the sum of $13,415,899.00 found by the Master as the value of the property necessarily used.

VI.

RATE OF RETURN.

The Master found that the reasonable value of the plant on May 1, 1914, was $13,415,899; that the total annual operating expenses, taxes and depreciation was $604,795; he anticipated that the Company's earnings for the year ending April 30, 1915, would be $1,093,615.00, leaving the net earnings or return $488,820, and calculated that the rate of return on the value of the property, as found by him, would be .0364.

It has already been shown that the value of the plant as found by the Master was excessive, and was not justified by the evidence. It has already been shown that the operating expenses allowed by him were excessive, and that his estimate of the gross returns of the Company were too low; that the annual depreciation allowed was not in keeping with the depreciation that he charged against the reproduction of the plant. All of these matters will be taken into consideration in the discussion of this topic, but first we will consider, in the abstract, the general question of rate of return.

In the case of Reagan vs. Farmers' Loan & Trust Co., 154 U. S. 362, Justice Brewer said:

> "It is unnecessary to decide, and we do not wish to be understood as laying down an absolute rule, that in every case a failure to produce some profit to those who have invested their money in the building of a road is conclusive that the tariff is unjust or unreasonable."

Courts do not require the rates to be as high as rate making bodies may place them. The value of the services to the consumer must be considered, regardless of the value of the plant.

> Water District vs. Water Company, 99 Me. 371.

In the case of Minneapolis, St. Paul & Salt Ste. Marie R. R. Co. vs. Railroad Commission, 136 Wis. 146, 165; 116 N. W. 995, decided June 5, 1908, Justice Trimlin, in delivering the opinion, says:

"In reviewing the order of the Railroad Commission, the inqury is not whether the rate, regulation or service fixed by the commission is just and reasonable, but whether the order of the commission is unreasonable or unlawful. The nature of the inquiry is changed at this point and the court is not investigating for the purpose of establishing a fixed point. Whether or not the order is within the field of reasonableness, or outside of its boundaries, is the question for the court. It is quite a different question from that which was before the commission in this respect.

The order being found by the court to be such that reasonable men might well differ with respect to its correctness, cannot be said to be unreasonable. From this aspect, it is within the domain of reason, not outside of its boundaries. This is the viewpoint of the reviewing court."

The Supreme Court of California in the San Diego case, 118 Cal. 556, held that some margin over lowest rate of interest would not be unfair; and the Minnesota Supreme Court in the case of Steenerson vs. Great Northern Railway Co., 69 Minn. 353, held that 2½ per cent on terminals and 5 per cent on other property was not confiscatory.

In the case of Willcox vs. Consolidated Gas Company, 212 U. S. 19, the Court, at page 48 of the opinion, says:

"There is no particular rate of compensation which must in all cases and in all parts of the country be regarded as sufficient for capital invested in business enterprises. Such compensation must depend greatly upon circumstances and locality; among other things, the amount of risk in the business is a most important factor, as well as the locality where the business is conducted and the rate expected and usually realized there upon investments of a somewhat similar nature with regard to the risk attending them. There may be other matters which in some cases might also be properly taken into account in determining the rate which an investor might properly expect or hope to receive and which he would be entitled to without legislative interference. The less risk, the less right to any unusual returns upon the investments. One who invests his money in a business of a somewhat hazardous character is very properly held to have the right to a larger return without legislative interference, than can be obtained from an investment in Government bonds or other perfectly safe security. The man that invested in gas stock in 1823 had a right to look for and obtain, if possible, a much greater rate upon his investment than he who invested in such property in the city of New York years after the risk and danger involved had been almost entirely eliminated."

And in the same opinion at page 41, the court says:

> "The case must be a clear one before the courts ought to be asked to interfere with state legislation upon the subject of rates, especially before there has been any actual experience of the practical results of such rates. In this case the rates have not been enforced as yet, because the bill herein was filed and an injunction obtained restraining their enforcement before they came into actual operation."

And again on page 42:

> "Of course, there may be cases where the rate is so low, upon any reasonable basis of valuation, that there can be no just doubt as to its confiscatory nature, and in that event there should be no hesitation in so deciding and in enjoining its enforcement without waiting for the damage which must inevitably accompany the operation of the business under the objectionable rate. But where the rate complained of shows in any event a very narrow line of division between possible confiscation and proper regulation, as based upon the value of the property found by the court below, and the division depends upon opinions as to value, which differ considerably among the witnesses, and also upon the results in the future operating under the rate objected to, so that the material fact of value is left in much doubt, a court of equity ought not to inter-

fere by injunction before a fair trial has been made of continuing the business under that rate, and thus eliminating, as far as possible, the doubt arising from opinions as opposed to facts."

In the case of Knoxville v. Water Company, 212 U. S., 1, this court said at page 17:

"It cannot be doubted that in a clear case of confiscation it is the right and duty of the court to annul the law. Thus in Reagan v. Farmers' Loan & Trust Company, 154 U. S., 362, where the property was worth more than its capitalization, and upon the admitted facts the rates prescribed would not pay one-half the interest on the bonded debt; in Covington &c. Turnpike Co. v. Sandford, 164 U. S. 578, where the rates prescribed would not even pay operating expenses; in Smyth v. Ames, 169 U. S. 466, where the rates prescribed left substantially nothing over operating expenses and cost of service; and in Ex patre Young, supra, where, on the aspect of the case which was before the court, it was not disputed that the rates prescribed were in fact confiscatory, injunctions were severally sustained. But the case before us is not a case of this kind. Upon any aspect of the evidence the company is certain to obtain a substantial net revenue under the operation of the ordinance. The net income, in any event, would be substantially 6 per cent, or 4 per cent

after an allowance of 2 per cent for depreciation. See Stanislaus County v. San Joaquin Company, 192 U. S. 201. We cannot know clearly that the revenue would not much exceed that return. We do not feel called upon to determine whether a demonstrated reduction of income to that point would or would not amount to confiscation. Where the case rests, as it does here, not upon observation of the actual operation under the ordinance, but upon speculations as to its effect, based upon the operations of a prior fiscal year, we will not guess whether the substantial return certain to be earned would lack something of the return which would save the effect of the ordinance from confiscation. It is enough that the whole case leaves us in grave doubt. The valuation of the property was an estimate and is greatly disputed. The expense account was not agreed upon. The ordinance had not actually been put into operation; the inferences were based upon the operations of the preceeding year; and the conclusion of the court below rested upon that most unsatisfactory evidence, the testimony of expert witnesses employed by the parties."

The conditions in the present case are very similar indeed to the conditions in the Knoxville case and the Willcox case. There is here, as there, a large mass of testimony, consisting almost entirely of testimony of expert witnesses. The rates in the present

case have not yet been enforced, their enforcement has been enjoined and no actual trial has been had to see if the Company will not be able to operate under the rate fixed. The Master took the preceding year as a basis, as was done in the Knoxville case, the record in the present case also shows that the Company's business has rapidly increased ever since its organization.

In the case of Cedar Rapids Water Company vs. City of Cedar Rapids, 118 Ia. 234, the Court says at p. 263:

> "The net earnings upon this showing, if not large, are substantial. The Court cannot undertake to guaranty the company any fixed or certain return upon its investment. The exercise of such a power would work an utter destruction of the legislative right to regulate rates of water companies and other corporations operating works of public utility. We think the decisions have already gone to the verge of safety in nullifying legislative acts of this character; and to go further, and say that the courts will not only preserve property from confiscation and destruction by legislative power, but will also assure to its owners a definite and fixed rate of profit upon their investment, would be an act of judicial usurpation."

In determining the fair rate of return for an investment as large as this, the evidence of what banks charge for short-time loans of three months, or as to what rate of interest is charged for small

real estate loans, is not persuasive. The larger the amount of the investment, the smaller the return expected, and even the rate of .0364, as found by the Master, when the amount involved is taken into consideration, and the further fact that there is almost no hazard to be taken, is so close, at least, to a fair return, that it should not be disturbed. However, we think we have demonstrated that the Master and court below seriously erred in several particulars. There was an allowance of $1,988,177 for "water rights," which do not belong to the Company, also the sum of $800,000 for "going concern"; there was also an allowance of $1,046,272 for "engineering and contingencies," which should not have been allowed, and the sum of $805,000 for interest during construction, which, to say the least, is questionable. Then again, the Master took the year 1914 as his basis for arriving at the gross earnings of the Company and found them to be $1,093,615. Had he taken the year 1913, or even 1912, as the basis for determining such gross earnings, these gross earnings would have been increased by almost $40,000, which would have made them—taking into consideration this reduction of 20 per cent—$1,140,000. This is to say nothing of the difference in operating expenses in 1914, the year taken by the Master as a basis for his estimate, and the previous years.

Below follows tables showing the result of the above contentions.

TABLE SHOWING RATE OF RETURN BASED ON MASTER'S VALUATION, DEDUCTING VALUE OF WATER RIGHTS NOT PURCHASED, GOING CONCERN, ENGINEERING AND CONTINGENCIES, INTEREST DURING CONSTRUCTION, AND ADDING TO NET EARNINGS FOUND BY MASTER THE DIFFERENCE IN GROSS EARNINGS OF 1914 AND 1912 AND 1913.

Value of property by Master		$13,415,899	
Deduct:			
Water rights	$1,998,117		
Going concern	800,000		
Eng. and Cont.	1,046,272		
Int. Dur. Const.	805,000		
		4,649,389	
		$8,766,510	
Net earnings by Master			$488,820
Add for difference of earnings of 1912 and 1913 over 1914			40,000
			$528,820
Rate of return, .06+			

TABLE SHOWING RATE OF RETURN BASED ON THE VALUE OF PROPERTY AS FOUND BY MASTER, DEDUCTING WATER RIGHTS NOT PURCHASED, AND GOING CONCERN, AND ADDING TO NET EARNINGS BY MASTER, THE DIFFERENCE IN GROSS EARNINGS FOR 1914, AND 1912 AND 1913.

Value of property by Master	$13,415,899	Net earnings by Master	$488,820
Water rights	$1,998,117	Add for difference of earnings of 1912 and 1913 over 1914	40,000
Going concern	800,000		
	2,798,117		
	$10,627,782		$528,820

Rate of return, .0497+

TABLE SHOWING RATE OF RETURN BASED ON THE VALUE OF PROPERTY FOUND BY MASTER AND DEDUCTING WATER RIGHTS OTHER THAN PURCHASED WATER RIGHTS, AND ADDING TO NET EARNINGS, FOUND BY MASTER $40,000.

Value of property by Master	$13,415,899	Net earnings by Master	$488,820
Water rights	$1,998,117	Add for difference of earnings of 1912 and 1913 over 1914	40,000
	1,998,117		
	$11,417,782		$528,820

Rate of return, .046+

The foregoing tables are based on the face of the record. They do not take into consideration the apparently extravagant amounts charged for operating expenses, but do assume that the gross returns should have been found by the Master to be at least $40,000 more than he did find them. Neither do they take into consideration the conflict in testimony in regard to the value of the property; but it is simply sought to deduct from the Master's valuation those amounts to which there are strictly legal objections. As we have said before, if $100,000 too much has been charged to operating expenses, this would increase the rate of return more than ¾ of 1 per cent., and it is manifest that under this rate ordinance, taking a fair value of the property and giving full credit for the returns to the Company, a fair return will be realized.

Assuming that Denver continued to grow after 1914 at the same rate that it grew in the past, and assuming that the Company's increase in returns amounts to at least 5 per cent annually, is it wise to disturb this legislation until at least a fair opportunity can be afforded to determine whether or not the Company will receive a fair return? We only need to refer to two cases to determine this question, those cases are the Knoxville case and the Willcox case reported in the 212 United States Reports herein quoted from, to establish that the Master and the court below were in error.

VII.

CONCLUSION.

The function of rate making is purely legislative in character, whether exercised directly by the legislature itself or by some subordinate body. The courts will not arrest these legislative acts except in the clearest cases.

It therefore became the duty of the complainant to show by clear and convincing testimony that the act complained of was one that demands judicial interference. In other words, as said by this Court in *Knoxville vs. Water Company*, 212 U. S. 1:

> "The constitutional invalidity should be manifest, and where the invaldity rests upon disputed questions of fact the invalidating facts must be proved to the satisfaction of the court."

In determining whether or not the complainant has presented a case which comes within these requirements, the first thing to determine is the fair value of complainant's property. Exception has been taken to three different elements allowed by the Master in his report, viz: "Water Rights," "Going Concern," "Overhead Charges and Interest During Construction," and general considerations of the character of the testimony upon which the Master predicated his fiindings.

Under the subject of "Water Rights," we have contended that the City and its inhabitants are the owners of the water that has been diverted from the streams and applied to a beneficial use by the City

and its inhabitants. These water rights, leaving out the water rights which were purchased by the complainant Company and its predecessors, amount to approximately $2,000,000.00, and this item should be deducted from the total allowance of the Master's report.

The Master added to his estimate of the real value of the plant $800,000.00 for "Going Concern," notwithstanding the fact that it is apparent from the testimony of the witnesses that their estimates were based on the plant as a going concern. In fact, it was admitted by some of complainant's experts that were it not a going concern it would not be worth to exceed $5,000,000 or $6,000,000. It is apparent that in this case nothing should be allowed for the item of "Going Concern." It is questionable if it should ever be allowed for rate making purposes, but under the circumstances of this case where the Company exercises a monopoly, where they are dealing with a prime necessity, and where no expense can be anticipated for building up the trade, "Going Concern" should certainly be disallowed. And especially is this true where, as here, the company has no franchise.

The question of "Overhead Charges and Interest During Construction" is to be viewed in a somewhat different light from "Water Rights" and "Going Concern." There are cases in which overhead charges and interest during construction are proper items to be taken into consideration in arriving at the value of the plant, even for rate making purposes. These two items alone amount to $1,846,272.00, or 22.9 per cent of and added to the contract

price found by the Master for the structures. There is no attempt by the complainant Company to show any substantial basis for the allowance of either overhead charges or interest during construction. The evidence on these points is merely an academic discussion by the expert witnesses as to what should be allowed generally for such items. As said by Judge Evans in the case of *Louisville T. & T. Co. vs. Louisville*, 137 Fed. 637:

> "It does not follow that overhead charges as a separate item should be included as such. It seems to us that they are too intangible to be available for that purpose."

And now generally as to the question of the fair value of complainant's property. The evidence supporting this value is almost entirely expert testimony given by witnesses employed in the cause. There was a variation in the various estimates of the total value of the property of $4,000,000 or $5,000,000. As was said in the case of Knoxville vs. Water Company, *supra*:

> "We do not feel called upon to determine whether the demonstrated reduction of income to that point would or would not amount to confiscation. *Where the case rests as it does here, not upon observation of the actual operation under the ordinance, but upon speculations as to its effect based upon the operations of a prior fiscal year,* we will not guess whether the substantial return certain to be earned would lack

> something of the return which would save the effect of the ordinance from confiscation. It is enough that the whole case leaves us in grave doubt. The valuation of the property was an estimate and is greatly disputed." (Italics ours.)

So far as this particular question is concerned, there could not be two cases more nearly on all fours than the present case and the Knoxville case just referred to. The evidence in the present case is not of that character that courts demand when it is sought to set aside the act of a legislative body.

The Master allowed the sum of $140,000.00 annual depreciation to be deducted from the gross earnings of the company, and he calculated the sum of $1,320,970.00 as the depreciation of the plant since its commencement.

It is evident that under any system of determining depreciation when the reproduction theory is resorted to as a means of determining the value of the plant, the accrued depreciation deducted from the reproduction cost should be proportionate to the allowance for future annual depreciation. That is to say, if a certain allowance for depreciation has been made in the past in order to arrive at reproduction cost, the annual depreciation allowance should proportionately equal the depreciation of the past. But it appears from the report of the Master that he has allowed more than double for annual depreciation in the future than he has charged against the company for

depreciation in the past. Either the annual depreciation allowance is too large or the past depreciation allowance is too small. $70,000.00 or $75,000.00 should be deducted from the Master's estimate of annual depreciation or the depreciation to be allowed in the past should be doubled.

In determining what the rate of return is in any case, after finding the value of the property employed in the business and the gross income of the business, it is necessary to determine the operating expenses, and the company seeking the aid of the court when it claims its property has been confiscated, should freely and frankly show to the court what became of the gross returns it has received. In the present case the only evidence we have of what the operating expenses consisted of is the tabulation showing from 1895 to 1914 inclusive, the expenses of the company under a few general headings, without any explanation of these expenses, and under the rule laid down in the case of *Chicago etc. Ry. Co. vs. Wellman*, 143 U. S. 339, 345, it is incumbent upon the company seeking to set aside a rate that has been made, to show what it has done with the money it has received; the record discloses that the complainant has failed in this regard. It follows that the evidence was wholly insufficient to justify the Master in arriving at his findings or the court in making its decree.

Furthermore, it is seriously questioned that the rate of .0364 per cent, found by the Master, is confiscatory, even though the evidence had justified the Master in so determining the percentage. It may not

be as large a percentage of return as is desired, but there is a vast difference between a desired rate and a confiscatory rate.

This return is a substantial return, after taking care of all the operating expenses of the company, its taxes and a more than liberal allowance for depreciation, and upon a business where there is as little hazard or risk as in any business that can be imagined.

It is respectfully submitted, especially in view of the fact that the ordinance has not yet been tested and no opportunity afforded for such test, and that a previous unfavorable year was taken as a basis for estimating the earnings, that the language used in the Willcox case, 212 U. S. at p. 42, is peculiarly applicable and that this case is not one which justifies judicial interference.

In Smyth vs. Ames, 169 U. S. 466, this Court has mentioned certain matters which it says may be considered as guides in determining the value of a public utility's plant. In this list, reproduction cost is not even mentioned, and the Court, while it refers to original cost of construction, amount and market value of bonds and stocks, expenditures for improvements, probable earning capacity and operating expenses, as being things to be taken into consideration, adds:

> "We do not say that there may not be other matters to be regarded in estimating the value of the property. What the Com-

> pany is entitled to ask is a fair rate upon the value of that which it employs for the public convenience."

The Court thus recognizes that valuation of a public utility is not to be bound by hard and fast rules, but is to be governed by the circumstances of the particular case.

The reproduction cost theory seems to have gained ground in the last few years and has been applied to many cases, but the courts have never gone so far as to say that the reproduction cost is equivalent to the reasonable or fair value; it is merely a guide to judgment and not to be employed to the exclusion of all other methods, or where it leads to absurd results.

What is the reasonable value of the plant of the Water Company, taking all things into consideration? Let us concede, for purposes of argument, that its reproduction cost is $13,415,899.00. The City could produce a new plant, in all respects the same as the Water Company's plant, for that sum, plus the amount which has been allowed for depreciation to date. In other words, the value of the plant to the City is $13,415,899.00. What is its value to anybody else?

The witnesses produced by the Company have answered this question and have asserted that if the Company attempts to employ its works for any other purpose, the value will not even approach the reproduction cost, but will, as various witnesses have testified, be about $6,000,000.00 (Trans., p. 231).

This is not a junk value, but contemplates the use of all the Company's property for the next best purpose for which it might be employed, save that of furnishing Denver with water.

The fact that Denver is the only customer to which the Water Company can furnish water for domestic purposes should never be lost sight of. Denver is not bound to take water from the Water Company, but may at any time at its desire establish an independent plant of its own. In other words, the Water Company, from the day that the 1890 Ordinance expired in 1910, has been constantly subject to the danger of municipal competition, and to the danger of having to put its plant to its next most productive use. True it is that the City has not yet constructed a municipal plant and it may never do so, but the fact remains that from the day the franchise expired the danger that it might do so has been continually present.

Depreciation of the value of business and property on account of competition, or even the danger of competition, is a common incident of the business world from which none are exempt. Equally is it true that depreciation of property, other than physical depreciation, may result from a mere change in business conditions, or in the situation of the owners of such property. A man may build up a large and extensive business and construct a factory to manufacture some articles, protected by patent rights, for example. When his patent expires he may find his business depreciated in value and he may find his plant worth not even so much as it cost him or as it

would cost him to build it new, purely because he has lost what he previously had, to-wit, a monopoly in the production of the particualr article. Under these circumstances if he were to put his business and plant upon the market, he could not expect to get as much as he would have received while his patent was in force. Indeed, were the Water Company endeavoring to sell its plant to any person who should desire to step into its shoes and conduct its business in the City and County of Denver, it is highly improbable that the company could sell the plant to that person for its reproduction cost less physical depreciation, or anything near it.

So far as we are aware, municipal corporations are no more prohibited from driving "good bargains" or "hard bargains" than are individuals.

In the case of Denver vs. New York Trust Company, 229 U. S. 123, this court has said, referring to the plant of this very Water Company now being considered, at p. 141:

> "The next objection invokes the due-process-of-law clause of the 14th Amendment to the Constitution of the United States, and is, that the charter amendment subjects the water company to the alternative of accepting an inadequate price for its plant or of having its value ruinously impaired by the construction and operation of a municipal plant, and that this amounts to an unlawful deprivation of property. The objection is faulty in that it fails to recognize the real situation to which the charter

amendment applies. The Water Company, although the undoubted owner of the physical property constituting its plant, is without a franchise to maintain and operate it through the streets of the city, the prior franchise having expired; and the City not only is under no legal obligation to renew the franchise or to purchase the plant but is free to construct and operate a plant of its own. How, then, can it be said that the proposal, expressed in the amendment, to purchase the Company's plant at $7,000,000, and to devote $1,000,000 more to its betterment or else to construct a new one at a cost of $8,000,000 involves an unlawful deprivation of property or any right? See Madera Waterworks vs. Madera (228 U. S. 454); Detroit United R. Co. vs. Detroit (229 U. S. 39). Whether $7,000,000 is an adequate price for the Company's plant, and whether its value will be ruinously impaired by the the construction of a municipal plant, are beside the question. Being under no obligation to purchase, the City is free to name its own terms, and the Water Company is likewise free to accept or reject them. The latter is under no compulsion other than such as inheres in the nature of its property or arises from a proper regard for its own interests. That the City, mindful of its interests, offered $7,000,000 for the Water Company's plant, when it could have proceeded to the construction of a new plant of its

> own, without making any offer to the Company, affords no ground for complaint by the latter. Newburyport Water Co. vs. Newburyport (193 U. S. 561, 577).

The foregoing does not indicate that the right on the part of municipalities to bargain with a utility is cut off; indeed it is expressly asserted that such right exists. Let us, then, concede, for the purposes of this discussion, that the value of the plant is $13,415,899 for City purposes, and that the value of the plant for any other purpose is $6,000,000. Certainly any reasonable man who wanted to fix its "fair value" or "reasonable value" at the date of the passage of the ordinance would find it somewhere between these two figures weighing the probabilities of the plant continuing in the service of the City and the probabilities of its being devoted to its next most available use. Upon a valuation of $6,000,000 the rates under the ordinance would result in a return of over eight per cent. If the value was assumed to be half way between the two figures, that is, $9,700,000, the rate of return would be in excess of five per cent. In both cases we are assuming that the water rights actually belong to the Company, and are giving the Company credit for this item of property. If the water rights are not the property of the Company, the valuations would be to that extent lower and the rate of return substantially increased.

Is a rate on such basis fair to the Company? To answer this question we must ask another. Are public utilities to be by law exempted from the haz-

ards which inhere in every other business? Here is a corporation which was formed in 1894. It was formed for the purpose of absorbing a number of other corporations and such franchise rights as they possessed. Among these franchise rights (and there were several) was that granted by the 1890 ordinance. The franchise was in existence, its contents thoroughly known to the persons who incorporated the Water Company, and they, with full knowledge of all that it contained, adopted it. At the end of twenty years it expired, as it was bound to expire, and the Company was faced with the situation which now exists and which could throughout any of this period, or at any time during it, have been foreseen. It is unnecessary to enter into the reasons why Denver no longer desired to extend this franchise. It is enough that the fact is evidently so. Denver has not done any act or thing to impair the value of the Company's property, or to imperil the investment of its stockholders; it has simply taken advantage of a situation which was as inevitable as death; that is the depreciation in the value of the property which necessarily arose from the loss of the monopoly which the Company had theretofore enjoyed. Unquestionably it was the duty of the master to consider the circumstances of the Company at the time the 1914 ordinance was passed. But he seems to have entirely overlooked it.

If the master was to take, as he did in this case, the reproduction cost as his measure of value, he ought to have included in his estimate of accrued depreciation an additional amount over mere physical

depreciation, because of the Company's changed situation; for this changed situation has produced a depreciation in the value of the Company's property which is just as actual and just as real as the deterioration of the pipes which compose its distributing system. Had this been done the corporation would receive under the 1914 ordinance a very generous return; at least it would receive a very much higher return than it could receive if it should devote its plant to any other use.

The ordinance is not confiscatory. The judgment of the District Court should be reversed.

Respectfully submitted,

JAMES A. MARSH,
NORTON MONTGOMERY,
EDWARD C. STIMSON,
Solicitors for City and County of Denver, et al.

STATEMENT 1-36

1. What is involved 1
2. Historical review 5
3. Financial history of Company 18
4. Extent and condition of plant and character of service 21
5. Former valuations 24
6. Rate ordinance. Manner of its enactment, and what led to it. 29
7. Present litigation 32

ARGUMENT 37

I. CONSIDERATIONS LIMITING THE SCOPE OF THIS REVIEW. QUESTIONS ATTEMPTED TO BE ARGUED NOT OPEN TO APPELLANTS 37-55

1. The order of reference to the Master was by consent. His conclusions are not open to question 37
2. No exceptions to Master's report upon which contentions now made by appellants can be based 47
3. The assignment of errors does not present points sought to be raised on this appeal 49
4. Appellants' brief contains no specification of errors, and so fails to comply with the rule of this court 51
5. The record is incomplete, and was not prepared for the purpose of presenting points now urged 52

II. METHOD, MANNER AND MOTIVE OF PASSAGE OF RATE ORDINANCE RENDER IT WHOLLY INVALID. RATES CANNOT BE REGULATED BY INITIATIVE PETITION. THE ACT OF THE CITY COUNCIL WAS NOT LEGISLATIVE, BUT AUTOMATIC. THE ORDINANCE IS AIDED BY NO PRESUMPTION OF VALIDITY 56-92

Page

III. TO ESCAPE THE CHARGE OF CONFISCATION, THE RATES MUST WITH CERTAINTY YIELD SUFFICIENT, NOT ONLY TO COVER OPERATING EXPENSES, TAXES AND A PROPER DEPRECIATION ALLOWANCE, BUT ALSO TO PROVIDE, IN ADDITION, A FULL AND FAIR NET RETURN ON THE PRESENT FAIR VALUE OF THE PROPERTY DEVOTED TO THE PUBLIC USE. HOW THE NET RETURN WAS ASCERTAINED IN THIS CASE. APPELLANTS' CONTENTIONS IN THIS REGARD ANSWERED 92-157

1. The appellee Company has an absolute constitutional right to just compensation for the use of its property by the public, and to a reasonable net return therefor, which must be full and fair and commensurate with the value of the property devoted to the public use 95
2. The present is not one of those rare cases where fair rates, determined upon the foregoing principles, would exceed the value of the service to the consumer 105
3. Appellants' contention that any return, no matter how small, in excess of actual operating cost, will avoid the charge of confiscation, wholly untenable 108
4. Appellants' contention that gross and net earnings under the ordinance rates not sufficiently proven is wholly without merit and in conflict with the record 115
5. Appellants' contention that the ordinance rates should be submitted to a practical test, wholly untenable 124
6. Gross revenue 131
7. Operating expenses and taxes 135
8. Depreciation allowance 143
9. Net earnings 155

IV. ON THE ISSUE OF CONFISCATION, APPELLANTS' CONTENTIONS CONCERNING VALUATION ARE MOOT. THE AMOUNT OF NET RETURN HAVING BEEN CONCLUSIVELY DETERMINED, THE VALUATION MIGHT BE REDUCED TO ACCORD WITH EVERY CONTENTION OF APPELLANTS, AND YET THE RATE OF NET RETURN MEASURED THEREBY WOULD STILL REMAIN CONFISCATORY. EIGHT PER CENT. PER ANNUM IS THE LEAST RATE OF NET RETURN WHICH IN THIS CASE CAN ESCAPE THE CHARGE OF CONFISCATION 158-185

Page

1. Computations showing the rate of annual return upon various valuations contended for by appellants..... 160
2. Computations in appellants' brief, pages 109 to 111, erroneous and misleading 167
3. Eight per cent. per annum is the least rate of return which under the circumstances here presented can escape the charge of confiscation..... 171

V. VALUATION. GENERAL PRINCIPLES APPLICABLE. HOW THE MASTER'S VALUATION WAS DETERMINED. APPELLANTS' CRITICISMS ANSWERED.....185-227

1. To escape the charge of confiscation, the valuation or rating base must represent the present fair value of all the property owned by appellee and devoted to the public use. The Constitution is violated if any item of property or any element of value included or inherent in the plant be omitted 185
2. How the Master's valuation was determined. Nature and scope of appellants' criticisms thereof..... 195
3. The guiding rules adopted by the Master were correct and properly applied. As to present value of structures the Master rightly considered cost of reproduction less depreciation the most significant figure..... 204
4. The alleged variation in the estimates and conclusions of different witnesses does not exist..... 211
5. Appellants' contention that the proof concerning reproduction cost of structures was not sufficiently full, complete and specific, and their further contention that the actual original cost of structures was not sufficiently shown, are untenable and in conflict with the record..... 221

VI. WATER RIGHTS. THOSE INCLUDED IN THE MASTER'S VALUATION ARE THE PROPERTY OF APPELLEE AND USED BY IT FOR THE ACCOMMODATION OF THE PUBLIC. THEIR PRESENT FAIR VALUE CANNOT BE EXCLUDED FROM THE RATING BASE. THE MASTER'S VALUATION THEREOF WAS EXTREMELY MODERATE AND IS NOT OPEN TO QUESTION BY APPELLANTS...227-343

1. Scope and limits of appellants' contention. It has been conclusively determined against them by prior decisions of this court and of the Colorado Supreme Court..... 228

Page

2. Nature and ownership of the property-right valued by the Master 230
3. Colorado cases cited by appellants do not sustain their contention concerning nature and ownership of these water rights 277
4. The decision of this court in San Joaquin etc. Irrigation Co. v. County of Stanislaus, 233 U. S. 454, conclusively determines that water rights of the nature here involved are property rights held in private ownership, and that the valuation thereof must be included in the rating base. The fact that the case so determined arose in California affords no ground of distinction..... 299
5. The method of appropriation affords no ground upon which appellants' contention may be based..... 318
6. The evidence before the Master justified, if it did not require, a much higher valuation for the water rights than that which he allowed..... 334

VII. GOING VALUE. THE STATUS OF BEING A GOING CONCERN IS INHERENT IN THIS PLANT, AND IS, LIKE THE REST OF THE PLANT, THE PROPERTY OF APPELLEE, AND DEVOTED TO THE PUBLIC USE. ITS PRESENT FAIR VALUE CANNOT BE EXCLUDED FROM THE RATING BASE. THE MASTER'S VALUATION THEREOF WAS EXTREMELY MODERATE AND IS NOT OPEN TO QUESTION BY APPELLANTS.....344-379

1. Appellants' contention that, on principle, this element of value should not be included, is without merit..... 347
2. Appellants' contention that the allowances for engineering, contingencies and interest during construction included also an allowance for going value, is contrary to the Master's express finding, in conflict with the record, and wholly untenable 366
3. The evidence not only justified but required a larger allowance for going value than that made by the Master..... 374

VIII. COMPANY'S OVERHEAD COSTS, INCLUDING ENGINEERING AND CONTINGENCIES AND INTEREST DURING CONSTRUCTION MUST INEVITABLY BE INCURRED IN THE REPRODUCTION OF THE PLANT. THEY CANNOT BE EXCLUDED FROM DETERMINATION OF REPRODUCTION COST, WHICH IS A MEASURE OF PRESENT FAIR VALUE. THE MASTER'S ALLOWANCES THEREFOR WERE EXTREMELY MODERATE AND ARE NOT OPEN TO QUESTION BY APPELLANTS 380-391

Page

IX. FAIR VALUE. THIS WAS DETERMINED BY CONSIDERATION OF EVERY RELEVANT FACT. THE VALUATION FOUND WAS MOST CONSERVATIVE, AND ONE OF WHICH APPELLANTS CANNOT COMPLAIN. IF JUSTLY SUBJECT TO ANY CRITICISM, IT IS THAT THE VALUE FOUND WAS TOO LOW.....391-427

1. The Master's valuation was less than any previous valuation of the same property, and less than that resulting from the testimony of any witness in the case at bar..... 394

2. In the exclusion of items of property and elements of value, and in the reduction of values, the Master resolved every doubt against appellee and in favor of appellants..... 397

3. The cost to the city of providing a duplicate plant would greatly exceed the value of the present plant as found by the Master 405

4. Appellants' contention that present fair value as found by the Master should be reduced because of the lack of a definite franchise, or the possibility of municipal competition, is untenable and unconscionable..... 409

X. CONCLUSION 427

In the Supreme Court of the United States.

OCTOBER TERM, 1917.

No. 294.

CITY AND COUNTY OF DENVER, ET AL.,
APPELLANTS,
vs.
THE DENVER UNION WATER COMPANY,
APPELLEE.

No. 295.

THE DENVER UNION WATER COMPANY,
APPELLANT,
vs.
CITY AND COUNTY OF DENVER, ET AL.,
APPELLEES.

APPEALS FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF COLORADO.

BRIEF OF THE DENVER UNION WATER COMPANY.

STATEMENT.

1. *What is Involved.*

Throughout this brief the appellants in No. 294 and the appellees in No. 295 will be referred to as the appellants, and The Denver Union Water Company,

appellee in No. 294 and appellant in No. 295, as the appellee.

The object of this suit was to have declared invalid and to enjoin the enforcement of an ordinance of the City and County of Denver, designated as Ordinance No. 26 of the series of 1914, which ordinance by its terms required the reduction of all of the rates then being charged by the Water Company by at least twenty per cent., and further required the Water Company to furnish to the municipality free of charge large quantities of water, and to comply with other restrictions, conditions and positive mandates, which were equally burdensome. The validity of the ordinance was attacked upon two distinct and wholly independent grounds. These were as follows:

First: That the ordinance was enacted by process of the initiative and passed by the City Council automatically, on the theory that having been petitioned for under the initiative provisions of the City Charter, the duty to pass it at once, without deliberation, delay or amendment, was mandatory, and that it was so passed without consideration of any fact relevant to and without determining the question of its reasonableness or propriety, without any investigation whatsoever, in utter disregard of facts known to the Council or easily ascertainable, which conclusively demonstrated its confiscatory character, and in reckless, wanton, complete and deliberate disregard of its ruinous effect upon appellee's business and property; that the real motive of the proponents of said ordinance, who petitioned therefor, was not in good faith to regulate the rates of the Water Company, but to force the Water Company to sell its property to the City at far less than its real value,

and that the City Council deeming itself powerless by reason of the initiative provisions of the charter to do otherwise, nevertheless enacted the measure; that under these circumstances, said ordinance and its enactment do not constitute legislative action at all, but merely an arbitrary exercise of power, which the courts will not countenance.

Second: That the rates and practices required and imposed by said ordinance were and are confiscatory, in that said ordinance rates were and are so low as not to permit a net earning equivalent to a reasonable return upon the fair value of the property devoted to the public use, and in that said ordinance required the furnishing of large quantities of water without any compensation therefor whatsoever, and in that the provisions and requirements of said ordinance were otherwise so unreasonable and burdensome as to render it invalid.

Primarily, therefore, this was and is a rate case. But there is something else now involved, and we deem it fair that the court should know what it is.

In the motion to advance heretofore filed, presented and granted herein, counsel said (p. 6): "This court, in passing upon the questions involved, will be asked to determine the value of appellee's property, or as to whether several of the items therein should be allowed, which determination will undoubtedly furnish a basis for further action on the part of the City and County of Denver in the acquisition of a municipal water plant." In the statement quoted above, counsel had reference to the following facts:

On February 21, 1916, in less than a month after the confirmation of the Master's report and the

entry of final decree in the court below, the City and County of Denver obtained from The Denver Union Water Company an option to purchase the property included in the Master's valuation at a price equivalent to the value found by the Master, adjusted to the date of payment by adding the cost of additions, extensions and betterments thereafter made, and deducting depreciation thereafter accrued, and further adjusted "by the addition or subtraction of such sums, items or elements of value as the United States Supreme Court (upon this appeal) may find or determine should be so added to or deducted from the foregoing valuation embraced in the Special Master's report," if it should so find or determine, with the proviso that the purchase price under said option should in no event exceed the valuation found by the Master, plus the actual cost of additions, extensions and betterments thereafter made, and minus the depreciation thereafter accrued as aforesaid. This option is still in force and requires the City immediately after this appeal has been disposed of to submit to the duly qualified electors the question of purchase thereunder.

At the City election held in May, 1917, the people of Denver, by an overwhelming majority, adopted a charter amendment, providing means whereby the question of issuing the requisite bonds to purchase the water plant under said option might be readily and promptly submitted to the taxpaying electors, and whereby the management of the plant, after purchase by the City, was provided for.

It therefore appears that, as matters now stand, this is not only a rate case, but also a purchase case. For more than twenty years the controversy over Denver's water plant has continuously raged. Its

harmful effect not only upon the Company, but also upon the community, cannot be exaggerated. It is hoped that as a result of the determination of this cause, and the exercise of the option mentioned above, this controversy may be definitely and finally settled. Certainly, that would be a consummation devoutly to be wished by all concerned.

2. *Historical Review.*

It is believed that a clear, connected and chronological statement of the facts involved, and of the events which led to the present litigation, will greatly aid in the solution of the questions here presented. The value of such a statement has been recently emphasized.

Rowland vs. Boyle, 244 U. S., 106, 109.

Appellants' brief is introduced by what is termed a "Statement of Case," and throughout the brief numerous other statements purporting to be statements of fact occur. Such statements are in many respects fallacious, quite unsupported by any evidence, and often in direct conflict with undisputed evidence and specific stipulations and admissions embraced in the record. This may be due to the fact that none of the counsel who represent appellants in this court had any connection with the case until after the Master's report had been made and filed. None of them participated at all in the taking of the testimony (which consumed many months), nor in the exhaustive arguments before the Master. With one exception, they did not enter the case until after it had reached this court. The record in this court is very large. The

record in the court below was many times greater. Familiarity therewith can be obtained only by the most laborious effort. Possibly the lack of this has caused the misstatements and omissions to which we refer; but, however this may be, they are manifestly misleading and extremely prejudicial. Some of them are corrected in the statement which follows; others will be noticed and corrected when we come to discuss the various topics to which they relate.

The statement which follows is to be read in connection with the historical matters set forth in Exhibit C at pages 3 to 10. It is intended to supplement those portions of Exhibit C.

In 1870 Denver's population was about 5,000. In that year the first water company (The Denver City Water Company) was incorporated, and it and its successors to 1894 are hereinafter referred to as the Denver Company (Exhibit C, p. 3; Exhibit ZZ, Record, p. 927). This company began to supply water in January, 1872, with a plant having a capacity of 2,500,000 gallons daily, and a distribution system about 4 miles in length (Exhibit C, pp. 4 and 8; Record, p. 166). From this time until 1889 the plant was gradually enlarged, but the supply was taken directly from the neighboring streams, and no provision was made for storage.

In 1889 Denver's population was about 96,000 (Exhibit C, p. 39). It was realized that for a population of this size, and that which might reasonably be anticipated in the near future, a water supply taken directly from the neighboring streams was wholly inadequate. The flow of the streams was variable and insufficient at best. The need of water was greatest at times when the streams were usually

lowest. It was manifest that great storage reservoirs must be provided at points distant from the City, where the waters flowing in the streams at times of flood might be impounded and conserved as a source of supply when the streams were low (Record, pp. 166, 167). At this point a disagreement developed among the stockholders of the Water Company. Local stockholders residing in Denver insisted on going to the mountains for water and providing the necessary storage reservoirs. Foreign stockholders refused to co-operate. The local stockholders sold out their interest in the Company and proceeded to establish a competing company for the purposes aforesaid. They organized The Citizens Water Company, which on November 22, 1889, received a franchise from the City (Exhibit A-2; Record, p. 931).

The Citizens Water Company began at once to procure a water supply, and to construct its plant. There followed a period of fierce competition between the Denver Company and the Citizens Company. Both actively engaged in construction work (Exhibit C, pp. 5 and 9). The Citizens Company developed sources of supply distant from Denver, and mostly in the mountains, acquiring the necessary water rights therefor, built long conduits to convey the water to Denver, commenced the construction of several large storage reservoirs, built mechanical filtration plants for the purification of the water, constructed a pressure reservoir within the City limits, and also much distribution system, which was constantly enlarged until 1894.

The Denver Company reconstructed and greatly enlarged its distribution system, constructed a large storage and pressure reservoir near the City, and

greatly enlarged and improved its pumping facilities and sources of supply.

The two companies were in active competition until 1894. A fierce rate war resulted, water finally being supplied by both companies to all consumers without charge (Record, pp. 167, 174). The usual result followed. The Denver Company, then owned by The American Water Works Company of New Jersey, went into the hands of a receiver in suits to foreclose outstanding mortgages (Exhibit C, p. 9). During this period of competition the Denver Company applied for a new franchise and contract, although that which it then possessed had not expired. On April 10, 1890, a new franchise was granted and contract entered into by Ordinance 44, series of 1890 (Exhibit A-3; Record, p. 941). The ordinance provided for certain flat rates set forth in Schedule A. It also provided (Section 5) that after five years from date of the ordinance the City might require the Company to fix schedule rates equivalent to the average rates of Chicago, St. Louis and Cincinnati, and (Sections 11 and 12) that at the expiration of twenty years from the date of the ordinance the City might purchase the plant or renew the contract for an additional term. Many years later the ordinance last mentioned was the basis of litigation, which afterwards came to this court.

City and County of Denver vs. New York Trust Company, 229 U. S., 123.

Notwithstanding the provisions of the ordinance of 1890, the rates thereby authorized were not, prior to 1894, collected. Owing to competitive conditions, as stated above, water was supplied free.

In 1894 Denver's population was about 116,000 (Exhibit C, p. 39).

On October 20, 1894, The Denver Union Water Company, appellee herein, was organized (Exhibit C, p. 3). The new company purchased all of the property owned by both of the old companies, constituting all of the property and property rights then used to supply Denver and its inhabitants with water. It paid therefor $7,000,000 of its first mortgage bonds out of a total authorized issue of $8,000,000, and all of its capital stock ($7,500,000) issued full paid and non-assessable (Record, pp. 116, 355). Thereupon the rates authorized by Ordinance 44 of 1890 were put in effect. Immediately, however, and in the year 1895, controversies with the City began, the City claiming the right to a rate reduction under the provision of Section 5, Ordinance No. 44, relating to the average of three cities. The Company offered the Leaflet Schedule as a compromise. All offers of compromise were rejected by the City (Record, pp. 174, 175, 178). Nevertheless, with the hope of avoiding a controversy, the Leaflet Schedule which provided for lower rates than Schedule A, was put in effect by the Company. Still the controversy continued and became violent. The Mayor advised the people not to pay the water rates, offered to furnish keys with which to turn on water, if turned off to enforce payment. The City enacted ordinances providing penalties against officers and employees of the Company, should they attempt to enforce collections under the Leaflet Schedule, and a great many arrests were made. At suit of trustee in Company's mortgage the United States Circuit Court, through Judge Thayer, enjoined the City and its officers from enforcing these ordi-

nances, or interfering with the collection of the rates, and this injunction was eventually made perpetual.

At about this time (1895) Clarence H. Venner (Record, p. 175) began suit against the Company attacking the foreclosure proceedings upon which the Company's title depended. These suits were in the Federal court and in the state courts of Colorado and New Jersey. They continued until 1910, when finally decided in Company's favor by the Supreme Court of the United States.

Meanwhile the controversy with the City continued, and in 1897 the City began suit against the Company (Record, p. 175), attacking price, pressure and purity of Company's supply, and reasonableness of Company's rules and regulations; price contention based on Section 5 of Ordinance 44. Trial of case in District Court consumed nine months; decided in Company's favor. The City appealed to Supreme Court, which, in 1907, likewise decided in Company's favor (41 Colo., 77).

In 1900 the City authorized and was about to issue $4,700,000 in bonds to build a competing water plant. Issuance of these bonds was enjoined by the Federal court at the suit of a taxpayer, and later the bonds were destroyed (Record, pp. 175, 178). In the same year (1900) the first Cheesman dam, then being constructed to form a large storage reservoir in the mountains, was washed out (Exhibit C, p. 9), and suits were brought by the Colorado & Southern Railroad and others claiming heavy damages (Record, p. 175).

On July 1, 1907, the suit begun by the City in 1897, involving price, pressure and purity, and also

the Company's rules and regulations, was decided in the Company's favor (41 Colo., 77).

On October 2, 1907, at the instance and request of the City, and in view of approaching expiration of twenty-year period, when, under Ordinance 44 of 1890, the City might elect to buy the plant or renew the franchise contract, Ordinance 163 of 1907 was enacted, and contract between the City and the Company made pursuant thereto, providing for valuation of plant by five disinterested appraisers, and determination by them of questions relating to rates (Record, p. 15, *et seq.*). During the same month the appraisers were appointed—Messrs. M. L. Holman of St. Louis and Frederick P. Stearns of Boston, by the City; Messrs. John R. Freeman of Providence and C. L. Harrison of New York, by the Company; and Mr. Allen Hazen of New York, by the four so selected. All were men of the highest ability and attainments, and completely disinterested (Record, pp. 195, 196, 210, 226).

On November 8, 1907, the appraisers began their investigations, which were most exhaustive and complete. These continued until March 20, 1909, when their report was filed; it is set forth in full in this record (Record, p. 27, *et seq.*). During this investigation repeated hearings were held; both City and Company were represented by eminent counsel; much testimony was taken, and enormous expense incurred both by the City and by the Company in preparation and presentation to the Board of all relevant matters. By the report of these appraisers jointly selected the value of the plant as of January 1, 1908, was found to be $14,400,000. On the question of rates as between (1) the Leaflet Schedule (the one now in force), (2)

Leaflet Schedule, less 10 per cent., and (3) Leaflet Schedule, less 20 per cent. (these being the sole questions submitted to the Board), the Leaflet Schedule was held the nearest approach to fair rates both to the Company and to consumers for the remaining franchise period; but the appraisers were unanimous in thinking that the Leaflet Schedule did not give as much return as the Company was entitled to (Record, p. 209). The appraisers were unable to agree upon fair rates for ensuing twenty-year period.

In 1910 Denver's population was 220,000 (Exhibit C, p. 39). Because of the expiration of the twenty-year period provided by Ordinance 44 of 1890, the Company in 1910 presented a new franchise contract for the ensuing twenty-year period. At the same time the opponents of the Company proposed by initiative petition an amendment to the Denver charter, designated as Section 264-A; said charter amendment has heretofore been considered by this court.

City and County of Denver vs. New York Trust Company, 229 U. S., 123.

Said Section 264-A created the Public Utilities Commission and named Armour C. Anderson, Edwin Van Cise and A. Lincoln Fellows the members thereof. It offered the Water Company, appellee herein, $7,000,000 in bonds of the City for the same property jointly appraised in the previous year at $14,400,000. It provided that unless said offer was accepted on or before July 1, 1910, the City should proceed at once to construct its own independent municipal plant for $8,000,000, and that an election to authorize the bonds for that purpose should be held on the first Tuesday in September following.

At an election held on May 17, 1910, the Company's proposed new franchise was defeated, and said charter amendment Section 264-A adopted. The offer of $7,000,000 made by said Section 264-A, being less than one-half of the appraised value, and $5,000,000 less than the Company's outstanding bonds (then $12,000,000, including South Platte bonds, infra, page 19, 20), not to mention its outstanding stock, was not accepted (Record, p. 319).

On August 20, 1910, the Public Utilities Commission appointed by said Section 264-A issued and promulgated for the information of voters a statement (Record, pp. 628, 629) setting forth among other things, that the Company's property just jointly appraised at $14,400,000 was worth, including going value, not more than $4,400,000, and certainly not more than $6,405,000, and in any event less than $7,000,000, and that a complete, new, independent plant could be built by the City for not to exceed $8,000,000. This statement, as Mr. Fellows admits, was issued without any real investigation of either question, and was grossly erroneous both as to the value of the existing plant and the cost of building a new one (Record, pp. 620, 621).

On September 6, 1910, the bond election contemplated by said Section 264-A of the charter was held, and the $8,000,000 in bonds provided for thereby was authorized for the purpose of building a competing plant. Thereupon, at the suit of the New York Trust Company, trustee in the Water Company's mortgage (the Water Company itself being cross-complainant), the United States District Court enjoined the City and the Public Utilities Commission from issuing bonds, constructing a new plant or in any wise inter-

fering with the Water Company in the enjoyment of its franchise rights. This injunction remained effective until the decision of this court, which was announced May 26, 1913. Notwithstanding the attitude and acts of the City, there was expended by the Company for additions, extensions and betterments between the date of the joint appraisal in 1908 and March 31, 1914, upwards of $2,000,000, almost all of which was invested subsequent to May 17, 1910. (Ex. Z, Rec., p. 926.)

On May 19, 1911, the New York Trust Company case was decided by the Circuit Court of Appeals, on appeal from the order of the District Court, allowing the temporary injunction. The Circuit Court of Appeals affirmed the order, holding that under the terms of Ordinance 44 of 1890 the City must elect either to buy the plant or to renew the contract, and that it had no other option.

City and County of Denver vs. New York Trust Company, 187 Fed., 890.

On May 26, 1913, the New York Trust Company case was decided by this court, to which it had come on *certiorari* directed to the Circuit Court of Appeals. This court reversed the decisions of the lower courts and held that the City was not obligated either to buy or to renew, but, at least so far as Ordinance 44, Series of 1890, was concerned, might construct its own independent plant.

City and County of Denver vs. New York Trust Company, 229 U. S., 123.

From July 1 to October 1, 1913, correspondence passed between the Water Company, appellee, and the

Public Utilities Commission, in which the Company repeatedly offered to sell its plant to the City at its present fair value, to be determined by court proceedings or by any fair method of appraisal; and in which it also offered the Commission full information relative to its property, both for rating and for purchase purposes. These offers were not availed of (Record, p. 319).

On August 6, 1913, the Public Utilities Commission appointed a committee of engineers, consisting of one of its own members, Mr. Fellows, and Messrs. Van Diest and Allen, to investigate and report upon the value of the Company's plant and the cost to the City of building a new plant (Record, pp. 70 to 75, 409). The investigation made by these engineers was the first and only investigation of either of these questions up to that time ever made by or on behalf of the City, except the joint appraisal of 1908 hereinabove mentioned (Record, pp. 621 *et seq.*).

In October, 1913, Leonard Metcalf, of Boston, and George G. Anderson, of Denver, were engaged by the Water Company to make a complete and independent inventory and valuation of its property (Record, pp. 258, 259).

In December, 1913, the Retail Association of the Denver Chamber of Commerce prepared and proposed a plan for the settlement of the water question (Record, p. 32; Exhibit A-48). The proposal was that the City agree to buy and the Company to sell its plant to the City at a price to be fixed by arbitration, which price could be paid at once or payment deferred, as the City might elect; price to be paid and the plant taken over at any time at City's option, but in any event at expiration of 20 years. Upon initia-

tive petition this plan was submitted to vote at an election held February 17, 1914.

On January 16, 1914, the report of the Public Utilities' engineers—Fellows, Van Diest and Allen—was filed and made public. By this report the valuation placed on the Company's lands and structures only (as of November 1, 1913) was $10,183,518.09, or, after certain deductions of property not deemed essential, $10,044,778.31. In this figure nothing was included either for water rights or going value (Record, p. 72). In their report said engineers also gave an estimate of the cost of a new system, which, however, they stated was a mere approximation, because "necessary information, such as surveys and detailed plans would develop, is wanting in every essential element" (Record, p. 74). According to this estimate, the cost to the City to build a new plant would be not less than $12,750,000, if diversion made on the Eastern Slope of the Continental Divide, and not less than $16,250,000, if diversion made from the Western Slope (the latter being recommended), to which cost in either event must, according to their statement, be added loss of operating profit that would have accrued to the City during the five years' construction period had it purchased the existing plant instead of building a new plant; said engineers strongly recommended purchase of the existing plant (Record, pp. 71 to 74).

Moreover, these engineers in the course of the investigation which culminated in their report, had free access to the Company's records and from them determined the gross earnings, operating expenses and net earnings for each year of the Company's life (1895 to 1913, inclusive), and set forth these facts in

detail in the written report which they filed (Exhibits A-64 and A-106, neither of which is produced here). They likewise testified concerning them when called as witnesses in this case (Record, pp. 427, 428, 429, 902). Upon the facts so ascertained these engineers found, and stated in their written report, that the net return to the Company, even under the going rates and upon assumptions as to value and other basic facts which plainly did the Company injustice, had throughout its history been grossly inadequate, and in said report they strongly recommended against any present attempt to reduce rates, even though the City should, as they also strongly recommended, purchase the plant.

Almost immediately upon the filing of the report of the Public Utilities' engineers referred to above a petition was circulated for the initiation of the rate-reducing ordinance involved in this suit (Record, p. 320).

On February 9, 1914, this petition, with 5,593 signatures attached, was filed with the City Clerk (Record, p. 320).

On February 17, 1914, the special election occurred, at which the proposal of the Retail Association of the Denver Chamber of Commerce for settlement of the water question was voted upon and defeated (Record, p. 320).

On February 24, 1914, the rate-reducing ordinance, with accompanying petition, was presented to the Council; on March 2nd it was published once, and on March 3rd it was passed by the Council without investigation, consideration or discussion, without notice to the Water Company, and upon the theory that being an initiated measure, the Council was ob-

ligated automatically to pass the same as presented without deliberation or amendment (Record, p. 320). Appellants herein, through the City Attorney, expressly admitted and stipulated before the Master that such was the view of the Council and the provisions of the City charter; that being an initiated measure, the Council had only one duty to perform, namely, to pass it without any question of any kind or character, and that the Council did pass it without any investigation or determination as to whether it was reasonable or not; that such was the view the Council took of its duty, and such was the foundation and reason for its action (Record, p. 360).

During February, 1914, Messrs. Metcalf and Anderson completed their inventory, investigation and valuation of the Company's property, and found its value as of October 31, 1913, to be $16,038,379 (Exhibit C, p. 64; Record, p. 259).

On April 29, 1914, the City being about to apply the provisions of the new rate ordinance to the water rates payable on May 1, this suit was begun.

3. *Financial History of Company.*

As appears from the foregoing statement, The Denver Union Water Company, appellee here, was organized in October, 1894, and purchased all of the property and property rights of every description then used in supplying the City and its inhabitants with water, paying therefor $7,000,000 of its first mortgage bonds out of a total authorized issue of $8,000,000, and all of its capital stock ($7,500,000) issued full paid and non-assessable. The property thus acquired was very ex-

tensive; it consisted of the various supplies and sources of supply, including water rights, infiltration galleries, mechanical filtration plants, reservoirs, pumping stations, conduits and distribution pipe systems, then constituting the plant. The total mileage of distribution mains was 373.732 miles, of conduits 55.295 miles, or a grand total of pipe mileage of 429.027 miles (Record, p. 149).

Generally speaking, in addition to the distribution system, the property then acquired consisted of the Cherry creek, Mississippi street, and Platte canon infiltration galleries and conduits leading therefrom to the City (those from Platte canon being more than 20 miles in length), the conduit from Platte canon through the Willard filters to the City, the Willard mechanical filters, the Strong or mountain reservoir, partly constructed, Marston lake, partly constructed and in operation, the Marston lake mechanical filters, the conduit from Marston lake to Wynetka, the Sullivan reservoir, Archer lake and canal, West Denver pumping plant, Ashland avenue reservoir, Capitol Hill reservoir (1st unit) and pumping plant, and all the appurtenant property, with the necessary water rights, including the Platte canon, Bear creek, Marston lake, Mississippi street, 15th street and Cherry creek rights, being practically all of the water rights now owned, except the Lake Cheesman rights.

After the purchase of the property, in order to complete the construction then under way, and for other necessary additions and betterments, the Water Company issued and sold the remaining $1,000,000 of its authorized bond issue, devoting the proceeds thereof to the work mentioned (Record, p. 166).

In 1899 the Water Company purchased and has since owned all of the capital stock of its subsidiary, The South Platte Canal & Reservoir Company (Record, p. 162).

In July, 1903, it caused its subsidiary to issue bonds to the amount of $4,000,000 secured by a mortgage upon the property standing in its name, and all of the proceeds of these bonds were likewise devoted to additions, extensions and betterments. The bonds of the South Platte Company are guaranteed by The Denver Union Water Company (Exhibit C, pp. 7 and 8).

Since its organization in October, 1894, the Company has declared but three dividends of 5 per cent. each (Record, p. 354). The rates forced upon it and its predecessor in 1890 by conditions of fierce competition, and later by public compulsion, have yielded a revenue which, to say the least, has been very far from excessive or unreasonable. Even the Public Utilities' engineers admit, report and testify that these rates have afforded less than a reasonable return throughout the Company's history (Record, pp. 428, 429; Record, pp. 71, 72). Notwithstanding this, many millions of dollars otherwise available for dividends have, with the consent of the stockholders, been reinvested in the plant to make the necessary additions and extensions required by the rapid growth of the City (Exhibit Z; Record, p. 926; Exhibit A-55).

Since May 1, 1914, the date of the Master's valuation, the Company has expended for additions, extensions and betterments upwards of $900,000 (Record, p. 798).

All of the money invested in additions, betterments and extensions, except that realized from the

sale of the $1,000,000 of Water Company bonds and the $4,000,000 of South Platte bonds, has been furnished by the stockholders out of funds otherwise available for dividends. The $8,000,000 of Water Company bonds matured July 1, 1914. They have not as yet been renewed. The $4,000,000 of South Platte Company bonds will mature on July 1, 1923.

4. *Extent and Condition of Plant and Character of Service.*

In Denver, owing to its location, climate and surrounding conditions, a much larger investment is required to supply an adequate water plant than in eastern cities of like population. This is obvious and undisputed, and is explained by the witnesses in this case (Record, pp. 198, 208, 236). In this region water is a commodity which is scarce and costly, and water rights adequate and available for the supply of a city like Denver extremely valuable and expensive.

Owing to the variable character of the streamflows and their unreliability, vast storage reservoirs must be provided, located in the mountains and at great distances from the point of use. Conduits of unusual length must be constructed to convey the water from the point of diversion to the place of use. Denver's population (220,000 in 1910) is scattered over an area of 59 square miles. As a consequence the distribution system must be much more extensive than is usually necessary to serve a population of that size (Exhibit C, p. 11). Moreover, in Denver the water is furnished not only for domestic and manufacturing uses, but also for the irrigation of lawns, trees and gardens, which is extensively car-

ried on, and which in that climate is essential. As a consequence the works must be much larger than in eastern cities of corresponding size. The consumption of water in Denver is enormous, incomparably greater than in eastern cities of like size (Record, pp. 208, 236). The average daily consumption of water in Denver for the year is about 45,000,000 gallons, or approximately 200 gallons each day for each person within the City limits. The average daily consumption during the irrigation season exceeds 65,000,000 gallons (the highest prior to 1914 having been 72,300,000), although at certain hours of each day during the irrigation season it is necessary to furnish water at a rate greatly exceeding this (Record, pp. 794, 796; Exhibit C, p. 39). It is, of course, necessary to have a plant adequately equipped to meet the highest demand with a sufficient margin of safety. As a consequence all elements of the plant must be much larger and more expensive than would be necessary were the service rendered in a lesser quantity and at a uniform rate.

Such a plant has been supplied and is being maintained by The Denver Union Water Company and the necessary investment cost furnished.

The Master (Record, p. 139; finding 52) made an express finding as to the excellent condition of the Company's plant, and the thoroughly adequate service which it rendered. The effect of this finding is not only that the plant is in excellent condition, the quantity of water abundantly in excess of the needs of the community, the pressure under which it is furnished good, compari[illegible] very favorably with the records in the majority [illegible]ur American cities, and the service rendered in every way satisfactory, but

also that the waterworks plant in adequacy, reliability and efficiency is equaled by only one, and surpassed by none, out of forty of the larger waterworks plants in the country with which it was compared. All competent persons who have examined the property and considered the question have come to the same conclusion, and the fact is undisputed and indisputable.

The engineers of the Public Utilities Commission stated in their report (Record, p. 71):

> "We find the system to be generally in excellent working condition, well maintained and well managed, and adequate for supplying the City's present needs. * * * (Record, p. 73.) We cannot recommend the construction of a new system. * * * (Record, p. 74.) The economic waste involved in the destruction of the existing plant, which is in good operating condition, rendering adequate service, by the construction of a new municipal plant, is not to be contemplated except as a last resort, and until every reasonable method of securing the present plant for the City on an equitable basis has been exhausted. * * * It would be equally unjust to destroy at least the major portion of the value of the property which has been rendering satisfactory service, and can continue to render service to the public adequately and efficiently, by the construction of a competitive plant. To refuse a fair capital return to any public utility corporation is but to smother enterprise, limit development,

and prevent growth of the community and the welfare of its inhabitants."

The water furnished is remarkably pure, being obtained from distant sources of supply, which are carefully protected from pollution, and, in addition, subjected to processes of filtration and sterilization, which render it as pure as or purer than the water furnished in any other city in the country (Record, pp. 149, 150).

As to the condition and adequacy of the plant and the character of the service rendered, the witnesses in this case, both for appellee and appellants, bear similar testimony. By the expenditure of enormous sums, both for original cost and subsequent additions, the appellee Company's plant has kept pace with the growth of the City and been adequately maintained. All of this has been done in the face of bitter, repeated, continuous and unwarranted attacks.

5. *Former Valuations.*

The first of these is that made by the joint board of appraisers, who reported in March, 1909, valuing the property as of January 1, 1908, at $14,400,000. These appraisers were appointed and their valuation made pursuant to Ordinance 163, series of 1907, and the contract between the Company and the City made in conformity thereto (Record, pp. 15 *et seq.*). This was entered into at the instance and request of the City, so that an agreed valuation might be arrived at, to be used as a basis of purchase in the event that the City should elect to purchase the plant, or as a basis for rates in the event that the City should elect to renew the franchise and contract as

provided in Sections 11 and 12 of Ordinance 44 of the series of 1890, or should grant a new franchise. The appraisers were selected with the utmost care. Those selected by the appellee Water Company were John R. Freeman, of Providence, Rhode Island, and C. L. Harrison, of New York City. Those selected by the appellant City were Frederick P. Stearns, of Boston, Massachusetts, and M. L. Holman, of St. Louis, Missouri. The fifth appraiser selected by the other four was Allen Hazen, of New York City. These appraisers were disinterested men, of national eminence, and by experience, ability and training in the highest degree qualified to perform the duties assumed (Record, pp. 25, 26). Four of them (Messrs. Freeman, Stearns, Harrison and Hazen) were connected with the planning of the works of the Panama canal, under appointments by the President of the United States (Record, pp. 195, 226). Three of them (Messrs. Freeman, Holman and Hazen) testified as witnesses in this case (Record, pp. 195, 210, 226). Their investigation was impartial, fair and complete. Repeated hearings were had, at which both the City and the Company were represented by counsel. Voluminous evidence was offered by both parties and considered by the appraisers. The contentions of either side were presented in argument by eminent counsel, and the report of the appraisers and arbitrators was filed on March 20, 1909, the investigation and consideration of the matters submitted having consumed about 18 months. The report of the appraisers and arbitrators is set forth at length in this record (Record, p. 27). It is fully explained by the three members of the board who testified. The property was valued by these appraisers

as of January 1, 1908. Between that date and May 1, 1914 (the date to which the Master's valuation related) the Water Company made large additions, extensions and betterments to the plant. The actual cost of the labor and materials required therefor (not including any overhead) was $1,784,618.82 (Exhibit Z, following page 926 of record). Including the overhead costs actually incurred, the cost of these additions, betterments and extensions exceeded $2,000,000. Messrs. Freeman, Holman and Hazen brought their valuation of 1908 down to date by consideration of these additions, and deduction of depreciation since accrued. Mr. Freeman (Record, p. 199) found the present value to be $15,370,000, without consideration of the increase in value of the water rights, although he was of the opinion that such an increase had occurred. Mr. Holman (Record, p. 213) by the same process, but making due allowance for the increase in value of water rights, found the present value to be $16,259,078. And Mr. Hazen (Record, p. 230) by the same process, but, like Mr. Freeman, without giving consideration to the increase in value of water rights, which he had not investigated, found the present value to be $15,300,000.

The evidence shows without dispute (Record, pp. 213, 510) that the increase in value of water rights since 1908 has been not less than 25 per cent. Upon the basis of the value of the water rights found by the appraisers in 1908, this would bring the present value of the plant, as found by Messrs. Freeman and Hazen, to approximately $16,000,000.

Beginning in October, 1913, Leonard Metcalf, of Boston, and George G. Anderson, of Denver, engineers of the highest standing, and particularly well versed

in matters pertaining to water works and water rights, made a complete and independent inventory and valuation of the Company's property. They, with a large force of assistants, were engaged continuously upon this work until the middle of February, 1914. The result of their labors is set forth in detail in Exhibit C, their Inventory and Report which, in its original form, is before this Court. Both testified as witnesses in this case (Record, pp. 258 *et seq.*, 302 *et seq.*). It does not admit of doubt that the work of these able and experienced men was in the highest degree thorough, conscientious and impartial. They found the value of the plant as of October 31, 1913, to be $16,038,379 (Exhibit C, p. 64). Exhibit C, setting forth, as it does, in the utmost detail, every relevant item concerning the Company's property, is itself conclusive evidence of the thorough character of the work done.

On August 6, 1913, the Public Utilities Commission of Denver appointed a committee of engineers to investigate and report upon the value of the Company's plant. These engineers were Mr. A. L. Fellows, of Denver, himself a member of the Commission, and Messrs. Edmond C. Van Diest, of Colorado Springs, and Charles P. Allen, of Denver. All of them testified as witnesses for defendants (appellants) (Record, pp. 408, 565, 684), although, in the main, Mr. Van Diest was their spokesman. To say the least, they were not friendly to the Water Company. It may be fairly stated that they were adversary and representatives of an unfriendly interest. They were engaged upon their work until January 16, 1914, when their report was made. Extracts from their report are set forth in the bill of complaint (Record, pp. 71 to 75). This

report was in many respects incomplete, as they themselves admitted. It was principally incomplete because it entirely omitted any valuation of water rights, and any allowance for going value. Some of the items included were grossly undervalued. Nevertheless, the value found upon those items which were valued at all was, according to the revised report of the Public Utilities' engineers, $10,021,681 (Exhibit 54, sheet 6-A; Record, p. 1080, original page 1380). If to the result thus arrived at by the Public Utilities' engineers we add what they omitted, to-wit, going value, and the value of water rights, the figures are interesting. Using the values on these items included in the joint appraisal of 1908, we add for going value $1,100,000, and for water rights $2,845,925, making a total $13,967,606. Using the values upon the omitted items as found by Metcalf and Anderson, we add for going value $1,200,000, and for water rights $3,530,000, making the total $14,751,681. Using the value of the omitted items as found by the Master (Record, pp. 122, 123), we add for going value $800,000, and for water rights $2,947,617, bringing the valuation, based upon the estimate of the Public Utilities' engineers, to $13,769,298.

The total valuation found by the Master (Record, p. 123) was $13,415,899.

From the foregoing it appears that there is a close correspondence between the total valuations as found by the City and the Company jointly in the appraisal of 1908, as found by Metcalf and Anderson in their appraisal of 1913, and as found by the engineers of the Public Utilities Commission of the City, when their figures are corrected, as they must be, to include omitted items valued by the others.

And it also appears that the total valuation as found by the Master is considerably less than any of these previous valuations. This is largely accounted for by the fact that the Master excluded certain items of property and elements of value which the others had included. This we shall presently demonstrate.

The valuations hereinabove referred to are all that have ever been made of appellee's plant. Appellants, at page 84 of their brief, refer to the figures of the witnesses Gaffey and Bickel, who testified on their behalf in the court below. But these figures, as the record conclusively shows, and as we shall presently point out, covered only the reproduction cost of structures, and nothing else, and are therefore not comparable with valuations of the entire property. As to the items which they covered, they corresponded very closely with the figures of the board of appraisers and of Metcalf and Anderson.

6. *Rate Ordinance, Manner of Its Enactment, and What Led to It.*

The events which preceded the enactment of the rate ordinance are summarized in the foregoing "Historical Review." (*Supra*, pp. 5 to 18.) Without repeating what is there set forth, it is obvious that the motive of the proponents of the ordinance was not fair regulation of the Water Company's rates, but something ulterior. This ordinance was the culmination of years of strife, marked by constant and unwarranted attack upon the Water Company, and accompanied by the most extravagant and unfounded assertions concerning the low value of its property, and continuous and conscienceless efforts to obtain it for less than its worth. It followed on the heels of the

decision of this court in the New York Trust Company case (229 U. S., 123), and therefore marched hand in hand with the constant threat made by Section 264-A of the City charter of a municipal plant and expulsion of the Company, unless it sold for $7,000,000. The ordinance was initiated in the midst of the campaign which preceded the vote upon the proposal of the Retail Merchants Association for settlement of the water question and purchase of the Company's plant at an arbitrated figure. At the time of its enactment there was available to the City and the City Council the valuation jointly found by the appraisers in 1909. There was also available the result of the recent investigation made on behalf of the City by the engineers of the Public Utilities Commission, which result, when due consideration be given to omitted items, was substantially equivalent to the finding of the board of appraisers. Both of the foregoing findings, with all of the data which supported them, were in the possession of the City as part of its official records. There was also available the result of the investigation of Metcalf and Anderson, which had just been completed.

Shortly prior to the initiation and the adoption of the ordinance the Company had furnished to the City, at its request, a statement of the Company's gross earnings, operating expenses and fixed charges for the preceding three years. At the same time the Company had tendered to the City and its officials all data in its possession, and any information which the City might require relative to said matters. The data in the City's possession and available to it clearly demonstrated the confiscatory character of the proposed ordinance.

Moreover, the engineers appointed by the Public Utilities Commission (Fellows, Van Diest and Allen), in the course of the investigation which culminated in their report of January, 1914, which had just been filed, had free access to the Company's records and from them determined the gross earnings, operating expenses and net earnings for each year of the Company's life (1895 to 1913 inclusive), and set forth these facts in detail in the written report which they filed (Exhibits A-64 and A-106, neither of which is produced here). They likewise testified concerning them when called as witnesses in this case (Record, pages 427, 428, 429, 902). Upon the facts so ascertained these engineers found, and stated in their written report, that the net return to the Company, even under the going rates and upon assumptions as to value and other basic facts which plainly did the Company injustice, had throughout its history been grossly inadequate, and in said report they strongly recommended against any present attempt to reduce rates, even though the City should, as they also strongly recommended, purchase the plant.

The City Council ignored it all. The ordinance was proposed by a petition, bearing 5,593 signatures, pursuant to the provisions of the City Charter relating to the initiative. The City Council passed it without notice to the Water Company, without giving it an opportunity to be heard, without any consideration or determination of the question of its reasonableness or propriety, without deliberation, and solely because it deemed itself bound by the provisions of the Charter relating to initiated measures to pass it automatically, immediately and without consideration of any ques-

tion except whether the petition was sufficient in form and signed by the requisite number of petitioners.

These facts are alleged in the complaint (Record, p. 76, paragraph 16th), were the subject of express admission and stipulation before the Master (Record, p. 360), and are covered by a distinct and detailed finding of the Master (Record, p. 119, finding 7). This finding is not excepted to, and the facts are not open to question.

7. *Present Litigation.*

The complaint was filed on April 29, 1914, the issues were speedily made up, and on May 21, 1914, the cause was, by consent of all parties, referred to W. J. Chinn, a prominent and able lawyer of Colorado Springs, as Special Master, "for the purpose of taking all testimony in the suit and reporting to the court said testimony, his findings of fact, and such conclusions of law as he may deem essential to the proper advisement of the court" (Record, p. 112).

The proceedings before the Master commenced on June 3, 1914, and continued with only minor interruptions until March 13, 1915 (Record, p. 141). In addition to the city attorney and the attorney for the Public Utilities Commission (which employed separate counsel), the defendants (appellants here) were represented by the Honorable T. M. Patterson, who, by consent of all parties, appeared as counsel for the Water Consumers' League. Many witnesses were examined on behalf of both parties. The testimony, all taken in the presence of the Master, was extremely voluminous, that for the plaintiff covering

3,882 typewritten pages, and that for the defendants, 4,356 typewritten pages (Record, page 142). In addition, each party introduced numerous exhibits. On behalf of defendants (appellants here) there were 72 exhibits, and on behalf of the plaintiff (appellee here) 160. Many of these exhibits were very extensive, and one of them, Exhibit C, which in its original form is produced in this court, is a library in itself. The exhibit last mentioned is a detailed inventory of the Water Company's property and report upon its valuation, prepared by Metcalf and Anderson. In addition to this, the Special Master, by consent of the parties, personally inspected the entire water plant (Record, p. 141). After the conclusion of the testimony, oral arguments of counsel before the Special Master consumed ten days. In addition, counsel for both parties filed with the Special Master elaborate printed arguments.

From April 10 to July 1, 1915, the Master devoted his entire time to a study of the record and the briefs and arguments of counsel. Thereafter he prepared his report, which was dated October 5, 1915, filed October 6, 1915, and is set forth in this record beginning at page 117. An inspection thereof is convincing proof of the fair and conscientious manner in which the Special Master performed his duties. It does not admit of doubt that every contention made by either party was duly considered, carefully weighed and decisively disposed of. It is equally evident that from the standpoint of the defendants (appellants here) every conceivable issue and contention of fact and of law was before the Master and in the court below presented and ably argued. In

short, the investigation was comprehensive, complete and impartial, and the result undoubtedly just.

In due time the defendants (appellants here) filed exceptions to the Master's report (Record, p. 1131 *et seq.*).

Thereupon, in view of the filing of defendants' exceptions and to protect the rights of plaintiff (appellee here), if the court should deem the points raised by defendants' exceptions open for consideration, plaintiff also (appellee here) filed exceptions to the Master's report, preceded, however, by this express reservation (Record, p. 1121):

> "In so far as under the order of reference in this case the report of the Special Master is in law conclusive as to any matters therein contained, the plaintiff does not consent to the review of such matters by the court, but files these exceptions, subject to such rulings as the court may make as to its right and duty to review such matters, to be urged, with respect only to such findings and conclusions as the court may find are so subject to review, and without waiver or prejudice of any and all of plaintiff's rights in the premises."

On January 28, 1916 (Record, pp. 1137, 1138), the exceptions of both parties to the report of the Special Master were overruled, said report was in all things confirmed, and it was ordered that "the cause pass to final decree for complainant, in accordance with the findings and recommendations of said Special Master."

On February 1, 1916 (Record, pp. 1140, 1141), final decree in favor of plaintiff was duly entered, whereby the report of the Special Master was again in all particulars approved and confirmed, and plaintiff (appellee here) granted the relief prayed in its complaint.

On July 29, 1916, defendants (appellants here) filed in the court below their assignment of errors (Record, p. 1147) and petition for appeal (Record, p. 1158), which appeal was granted and duly perfected.

Thereafter, in view of the appeal taken by defendants (appellants here), the plaintiff (appellee here), out of an abundance of caution, and so that it might not be precluded from presenting in this court certain contentions in opposition to those which the defendants sought to present, filed its assignment of errors on cross-appeal (Record, p. 1168), and its petition for cross-appeal (Record, p. 1176), which cross-appeal was likewise granted and duly perfected. Appellee's said assignment of errors on cross-appeal incorporated (Record, p. 1168) a reservation similar to that contained in plaintiff's (appellee's) exceptions to the Master's report, and expressly stated (Record, p. 1169) that the errors assigned would be prejudicial, and were to be considered "in the event, and only in the event, that the Supreme Court should upon the appeal taken herein by the defendants sustain the assignments of error, or some of them, filed herein by said defendants, as the basis of their said appeal." And in the petition for cross-appeal (Record, p. 1176) it was specifically stated that in praying said appeal, and in prosecuting the same, the appellee and cross-appellant was "in no wise complaining of the final decree in this cause, which was

in its favor." And it was further stated that said cross-appeal was to be considered by this court "only in the event that the Supreme Court of the United States should upon the appeal taken herein by the defendants sustain the assignments of error made by said defendants, or some of them." And it was further stated that said cross-appeal was taken, to the end that certain rulings of the Special Master and plaintiff's (appellee's) objections thereto might "be before the Supreme Court for its consideration and determination, in connection with said appeal heretofore taken by said defendants, and in opposition to the reversal of the decree in favor of plaintiff (appellee) heretofore entered herein."

The appeal of the defendants below is No. 294 in this court, and the cross-appeal of the plaintiff below (appellee in the principal appeal) is No. 295.

The record before this court does not contain, nor purport to contain, all of the evidence presented to the Special Master. This record contains only an abstract of the oral testimony of witnesses, and relatively few of the many exhibits. Of course, it does not set forth the result of the Master's personal inspection of the property. It was prepared by appellants for the sole purpose of presenting certain limited questions of law, as is evident from the stipulation by which it is accompanied (Record, p. 1120).

In due course the record on appeal was filed in this court and printed. And thereafter motion to advance, concurred in by both parties, was filed and granted, and the case set for the first day of the October Term, 1917.

ARGUMENT.

In this argument we shall not pursue the order in which the points are presented in appellants' brief. We shall follow an arrangement which seems to us more logical, and will take up and answer the various contentions of appellants in connection with our discussion of the topics to which they relate.

I.

CONSIDERATIONS LIMITING THE SCOPE OF THIS REVIEW. QUESTIONS ATTEMPTED TO BE ARGUED NOT OPEN TO APPELLANTS.

Although the record is large, the questions, if any, open to review by this court are few in number and limited in scope. This appellants overlook, and attempt to argue many points concerning which they are upon this record certainly foreclosed.

1. *The Order of Reference to the Master Was by Consent. His Conclusions Are Not Open to Question.*

Beyond doubt, the order of reference to the Master was by consent of all parties. It expressly so states upon its face (Record, p. 112). It covered the entire case and required the Master not only to take the evidence, but also to report his findings of fact and conclusions of law thereon. As is well known, an order of this nature cannot be made except by consent of all parties. It was so construed by the Master, as is evident from the very complete report

which he made embracing his findings of fact and conclusions of law upon the entire case, and upon every issue involved (Record, p. 117 *et seq.*). It was so construed by the parties, as is evident from their submission to the Master, in the long hearing which ensued, of every issue in the case and their failure to except because he determined the entire controversy. It was so construed by the court below, as is evident from the action taken at the time of the confirmation of the report (Record, pp. 1137, 1138, 1139, 1140). Under such circumstances the effect of the Special Master's report is well settled.

In Kimberly vs. Arms, 129 U. S., 512, a similar situation was presented and fully considered and the question conclusively determined. Speaking through Mr. Justice Field, the court says (p. 524):

> "It is not within the general province of a master to pass upon all the issues in an equity case, nor is it competent for the court to leave the entire decision of a case to him without the consent of the parties. It cannot of its own motion, or upon the request of one party, abdicate its duty to determine by its own judgment the controversy presented and devolve that duty upon any of its officers. But when the parties consent to the reference of a case to a master or other officer to hear and decide all the issues therein, and report his findings both of fact and of law, and such reference is entered as a rule of the court, the master is clothed with very different powers from those which he exercises upon ordinary refer-

ences without such consent; and his determinations are not subject to be set aside and disregarded at the mere discretion of the court. A reference by consent of parties of an entire case, for the determination of all its issues, though not strictly a submission of the controversy to arbitration—a proceeding which is governed by special rules—is a submission of the controversy to a tribunal of the parties' own selection, to be governed in its conduct by the ordinary rules applicable to the administration of justice in tribunals established by law. Its findings, like those of an independent tribunal, are to be taken as presumptively correct, subject, indeed, to be reviewed under the reservation contained in the consent and order of the court when there has been manifest error in the consideration given to the evidence or in the application of the law, but not otherwise."

In Davis vs. Schwartz, 155 U. S., 631, it appeared (p. 633) that:

> "The case was referred by consent of parties to a master 'to hear said causes and report to this court his findings of facts and conclusions of law.'"

This court, speaking through Mr. Justice Brown, said (p. 636):

> "As the case was referred by the court to a master, to report not the evidence

> merely, but the facts of the case, and his conclusions of law thereon, we think that his finding, so far as it involves questions of fact, is attended by a presumption of correctness, similar to that in the case of a finding by a referee, the special verdict of a jury, the findings of a Circuit Court, in a case tried by the court under Revised Statutes, Section 649, or in an admiralty cause appealed to this court. In neither of these cases is the finding absolutely conclusive, as if there be no testimony tending to support it; *but so far as it depends upon conflicting testimony, or upon the credibility of witnesses, or so far as there is any testimony consistent with the finding, it must be treated as unassailable.*" (Italics ours.)

In Schwartz vs. Duss (C. C. A., 3rd Cir.), 103 Fed., 561, the Circuit Court of Appeals, speaking through his Honor Judge Gray, held, as stated in the syllabus:

> "Where a circuit court, with the consent and agreement of parties, appoints a master with authority to take testimony and find all issues of law and fact, findings of fact made by the master and confirmed by the court are conclusive on appeal *unless plain error is unmistakably shown;* and unless such plain error is found, the appellate court will not review questions of law *which could only arise on a state of facts different from that found.*" (Italics ours.)

In Schwartz vs. Duss, 187 U. S., 8, 27, this court affirmed the decision last mentioned.

In Adamson vs. Gillilland, 242 U. S., 350, decided within the present year, these rules have been reaffirmed, the court, speaking through Mr. Justice Holmes, saying (p. 353):

> "The case is pre-eminently one for the application of the practical rule that so far as the finding of the master or judge who saw the witnesses 'depends upon conflicting testimony, or upon the credibility of witnesses, *or so far as there is any testimony consistent with the findings*, it must be treated as unassailable.' Davis vs. Schwarts, 155 U. S. 631, 636." (Italics ours.)

These rules have been time and again applied in the lower federal courts, including the Circuit Court of Appeals for the Eighth Circuit.

> Spring Garden Insurance Co. vs. Amusement Synd. (C. C. A., 8th Circuit), 178 Fed., 519, 521, 531.
>
> Moline Plow Co. vs. Carson (C. C. A., 8th Cir.), 72 Fed., 387, 388.
>
> Paine vs. Standard Plunger Elevator Co. (C. C. A., 3rd Cir.), 203 Fed., 242, 246.
>
> Westall vs. Avery (C. C. A., 4th Cir.), 171 Fed., 626, 629, 630.
>
> Murphy vs. Southern Ry. Co. (C. C. A., 5th Cir.), 115 Fed., 257.

Hattiesburg Lumber Co. vs. Herrick (C. C. A., 5th Cir.), 212 Fed., 834, 836, 841 to 844.

Connor vs. U. S. (C. C. A., 9th Cir.), 214 Fed., 522, 525, 526, 527.

In re Senoia Duck Mills, 193 Fed., 711, 719.

The fact that appellee (plaintiff below), as well as appellants (defendants below), filed exceptions to the Special Master's report does not, in view of the express reservations and conditions (Record, p. 1121) under which said exceptions were filed, in any manner affect the rule.

Hattiesburg Lbr. Co. vs. Herrick (C. C. A., 5th Cir.), 212 Fed., 834, 844.

Upon the foregoing authorities we respectfully submit that at least upon questions of fact, or upon mixed questions of law and fact, the Master's conclusions are unassailable, unless it can be conclusively shown that there was no evidence whatever to support the Master's finding. This burden rests upon appellants. Every question which they seek here to present is either wholly or partially a question of fact, on which the Master's finding is against them. The reluctance of an appellate court to disturb a finding of fact made in a lower court is axiomatic. Even before the new equity rules, when, in the absence of a reference by consent, the facts were found by the chancellor upon consideration of written depositions, the rule was well settled that:

> **"Where a chancellor has considered conflicting evidence and made his finding and decree thereon, they must be deemed to be presumptively correct in an appellate court; and unless an obvious error has intervened in the application of the law, or some serious mistake has been made in the consideration of the evidence, they will not be disturbed."**
>
> Thallman vs. Thomas (C. C. A., 8th Cir.), 111 Fed., 277, 283, and cases there cited.

And even in the absence of an agreed reference, but where, as here, and as is now required in ordinary cases under the new equity rules, the original finding has been made upon the testimony of witnesses adduced in the presence of the trier of the fact, the rule is still stronger.

In Harper vs. Taylor (C. C. A., 8th Cir.), 193 Fed., 944, the Circuit Court of Appeals, after quoting what had been said in Thallman vs. Thomas, *supra*, said:

> "This is the settled doctrine of this court (citing cases), and this rule is especially applicable when the evidence was taken orally in the court, and the chancellor had an opportunity to see the witnesses, observe their demeanor while testifying, judge of their candor and intelligence, and thus was able to determine more accurately their credibility and the weight to be given their testimony than an appellate court, which

must determine the facts upon a printed record."

But when, as here, it appears not only that the evidence upon which the findings were based consisted of the testimony of witnesses who appeared before the Master, but also that the reference to the Master covered the entire case and was by consent, the rule limiting the power of the appellate court to re-examine questions of fact is the same as that which controls the appellate court in considering a fact found by the verdict of a jury or by the trial judge in a law case. Such findings cannot be reversed or disregarded unless the parties seeking such reversal can conclusively show that there was no evidence whatever to support them; and such showing cannot be made unless the record brought to the appellate court contains and is shown to contain all of the evidence considered by the original trier of the fact.

In the case at bar the record confessedly does not contain all of the evidence which was before the Master. There is no certificate to that effect, and none could truthfully be made. The abstract of the oral testimony, though lengthy, is relatively very brief when compared with the 8,238 typewritten pages of transcript covering the original testimony. Of the 232 exhibits filed with the Master only 52 are produced here. The Master saw the witnesses, heard them testify, and was therefore able to judge of their credibility and of the weight to be given their testimony. Moreover, as the Master and the parties construed the order of reference, it empowered the Master to personally inspect the property involved, and thus gain first-hand evidence upon the issues pre-

sented. This he did (Record, p. 141). Of course such evidence cannot be incorporated into a transcript. To sum up: The record before this court does not contain, nor purport to contain, all of the evidence upon all of the issues, nor all of the evidence upon any issue decided by the Special Master. Under such circumstances the court must assume that every finding of fact was supported by sufficient evidence, and is not at liberty to presume otherwise; and in considering the questions of law, if any, rightly presented upon this record, the court must assume the absolute correctness of every finding of fact upon which the Master's conclusions of law, in whole or in part, rest.

In Sheffield etc. Co. vs. Gordon, 151 U. S., 285, it was held, as stated in the syllabus:

> "In the absence of a certificate by a master that the entire evidence taken by him was sent up with his report, it is impossible to impeach his conclusions upon it."

And the court, speaking through Mr. Justice Brown, said (p. 293):

> "In the absence of any certificate that the entire evidence taken by the master was sent up with his report, it is impossible to impeach his conclusion in this particular. (Citing authorities.) There is no presumption that all the testimony was sent up."

See also:

> United States vs. Copper Queen Mining Co., 185 U. S., 495, 497.
>
> Hansen vs. Boyd, 161 U. S., 397, 403.

Nashua Savings Bank vs. Anglo-American Co., 189 U. S., 221, 231.

Collier vs. United States, 173 U. S., 79, 82.

Texas & Pacific Ry. Co. vs. Cox, 145 U. S., 593, 606.

In Wheeler vs. Abilene National Bank Bldg. Co. (C. C. A., 8th Cir.), 159 Fed., 391, 392, the Circuit Court of Appeals, speaking through his Honor Judge Sanborn, said:

> "A master's finding of facts upon evidence taken by him cannot be impeached, in the absence from the record of his certificate or other competent proof, either that the evidence presented is the entire evidence taken by him or that it contains all the evidence which was before him relative to the specific finding or findings challenged. (Citing many authorities.)"

The fact that the evidence in part consists of that gained by actual inspection is deemed conclusive against the right of review.

Rebillard vs. Minneapolis etc. Ry. Co. (C. C. A., 8th Cir.), 216 Fed., 503, 505.

Christy vs. Schwartzchild etc. Co. (C. C. A., 7th Cir.), 160 Fed., 657.

Goldsmith Silver Co. vs. Savage (C. C. A., 1st Cir.), 229 Fed., 623.

2. *No Exceptions to Master's Report Upon Which Contentions Now Made by Appellants Can Be Based.*

Equity Rule 66 provides, in part:

> "The parties shall have twenty days from the time of the filing of the (master's) report to file exceptions thereto, and if no exceptions are within that period filed by either party, the report *shall stand confirmed.*" (Italics ours.)

Clearly, the purport of this rule, as of that which preceded it, is that the master's report shall be in any event conclusive, except as to those points attacked by specific exceptions filed in apt time.

> 2 Street's Fed. Eq. Prac., Secs. 1476, 1485, 1486.

In Medsker vs. Bonebreak, 108 U. S., 66, at 72, the court said:

> "The findings of the master are *prima facie* correct. Only such matters of law and of fact as are brought before the court by exceptions are to be considered, and the burden of sustaining the exceptions is on the objecting party."

In Sheffield, etc., Ry. Co. vs. Gordon, 151 U. S., 285, 289, 290, it was held that a master's report could not be reviewed unless exceptions thereto had been filed; that the exceptions must be specific, and general exceptions would be disregarded, and that the

review would be confined to the precise points indicated by the specific exceptions.

To the same effect see:

Story vs. Livingston, 13 Pet., 359, 366.

Brockett vs. Brockett, 3 How., 690.

Burns vs. Rosenstein, 135 U. S., 449, 455.

Coghlan vs. South Carolina R. R. Co., 142 U. S., 101, 115.

In 2 Street's Fed. Equity Practice, Sec. 1486, the whole matter is thus summed up:

> "A general exception to the master's report will not be considered. The report is presumed to be correct, and the party who disputes that correctness must clearly and specifically designate the errors of which he complains. He should clearly indicate what the report ought to have been on the point to which the exception is directed. An exception is insufficient that merely expresses dissatisfaction with the report in the form of general objections to the conclusions of the master upon the evidence, or to the results arrived at by him, and that is in substance and effect nothing more than an appeal from the determination of the master to the court to revise and reverse his decision. 'Cases are referred to a master not on account of his presumed superior wisdom, but to economize the time and labor of the court; and as exceptions are usually filed to his report, if they are so general as to require a rehearing of the entire case, there is really nothing

> saved by a reference.' (Quoted from Sheffield vs. Gordon, 151 U. S. 285, 291.)"

Many, if not all, of the points attempted to be raised by appellants are not supported by the proper exceptions to the Master's report. We shall notice these in detail when the topics to which they relate are discussed.

3. *The Assignment of Errors Does Not Present Points Sought to Be Raised on This Appeal.*

Revised Statutes, Sections 997 and 1012 (U. S. Compiled Statutes, Secs. 1653 and 1673), make an assignment of errors essential to a review by this court, either of a judgment at law or a decree in equity.

Rule 21 of this court, subdivision 4, provides that:

> "When there is no assignment of errors, as required by Section 997 of the Revised Statutes, counsel will not be heard except at the request of the court; and errors not specified according to this rule will be disregarded; but the court, at its option, may notice a plain error not assigned or specified."

The case at bar is a direct appeal from the District Court to this court, under Section 238 of the Judicial Code. Rule 35 of this court, relating to such appeals, requires the appellant to "file with the clerk of the court below, with his petition for the writ of error or appeal, an assignment of errors,

which shall set out separately and particularly each error asserted and intended to be urged." (Here follow provisions as to the specific character of the assignment.) "Such assignment of errors shall form part of the transcript of the record and be printed with it. When this is not done counsel will not be heard except at the request of the court; and errors not assigned according to this rule will be disregarded; but the court, at its option, may notice a plain error not assigned."

The provisions of these statutes and rules have been rigidly enforced. The power which the rules purport to reserve to the court, i. e., at its option to notice a plain error not assigned, is rarely, if ever, exercised. Certainly, it has never been exercised under such circumstances as are presented by this record.

In Grand Trunk Ry. Co. vs. Ives, 144 U. S., 408, 414, 415, 416, the matter is fully discussed, and the necessity of a specific assignment of error, definitely and precisely presenting the exact point sought to be urged in this court, strongly emphasized. It is there held that only those questions distinctly raised by such an assignment can be examined here.

To the same effect see:

Wood vs. Wilbert, 226 U. S., 384, 386.

Southern Ry. Co. vs. Gadd, 233 U. S., 572, 580.

George vs. Wallace (C. C. A., 8th Cir.), 135 Fed., 286, 295.

Same case affirmed, 201 U. S., 230, 244, 245.

Paraiso vs. U. S., 207 U. S., 368, 372.

Ryan vs. Koch, 17 Wall., 19.
Stevenson vs. Barbour, 140 U. S., 48.

The reluctance of the court to exercise the power which its rules purport to reserve (to notice a plain error not assigned) is illustrated in a recent decision.

San Antonio etc. Ry Co. vs. Wagner, 241 U. S., 476, 480.

In the case at bar the assignment of errors follows verbatim the exceptions to the Master's report, and is subject to the same criticisms and objections (Record, pp. 1131, 1147).

4. *Appellants' Brief Contains No Specification of Errors, and so Fails to Comply with the Rule of This Court.*

Rule 21 of this court, relating to the brief of appellant, requires that it shall contain, among other things (subdivision 2, paragraph 2), "a specification of the errors relied upon, * * * in cases brought up by appeal the specification shall state as particularly as may be in what the decree is alleged to be erroneous. * * * When the error alleged is to a ruling upon the report of a master the specification shall state the exception to the report and the action of the court upon it. * * * (Subdivision 4.) Errors not specified according to this rule will be disregarded; but the court, at its option, may notice a plain error not assigned or specified."

We submit that upon this record there is no plain error which would justify the court in exerting its reserved power to notice such plain error, though not specified.

The foregoing rule has been rigidly enforced, and precludes the review which appellants seek.

Portland Co. vs. United States, 15 Wall., 1.
Treat vs. Jemison, 20 Wall., 652.
Benites vs. Hampton, 123 U. S., 519.
Rowe vs. Phelps, 152 U. S., 87.

In Camden vs. Stuart, 144 U. S., 104, 115, the court said:

> "A suggestion is made in the brief of Mr. Camden's counsel that the expert erred in charging certain items to the account of expenses; but in view of Rule 21 of this court, which requires that 'When the error alleged is to a ruling upon the report of a master the specification shall state the exception to the report and the action of the court upon it,' we do not feel called upon to examine into the minor details of this report. There is a presumption of its correctness, which overrides any effort that has been made to show an error in this particular."

5. *The Record Is Incomplete, and Was Not Prepared for the Purpose of Presenting Points Now Urged.*

A strict adherence to the foregoing rule is particularly important, in view of the change in the equity practice concerning records on appeal. As we have hereinbefore pointed out (*supra*, p. 44), this record is obviously and admittedly not complete.

Under Rule 8 of this court, and Equity Rules 75 and 76, the purpose is clear to limit the record on

appeal to those portions only of the record in the lower court essential to the presentation in the appellate court of the questions properly reserved in the court below. Thus Rule 8 of this court states that it is promulgated "for the purpose of reducing the size of transcripts of record in cases brought to this court by appeal or writ of error, by eliminating all papers not necessary to the consideration of the questions to be reviewed." And Equity Rule 75, subdivision (b), requires that all parts of the evidence "not essential to the decision of the questions presented by the appeal" be omitted.

The rules referred to impose upon the appellants primarily the duty of preparing the record.

In the case at bar, in view of, and in attempted compliance with, these rules, appellants prepared the record now before this court, and appellee refrained from objecting thereto. The appellants had filed in the court below certain exceptions to the Master's report, and a certain assignment of errors repeating those exceptions. Thereby the points which might be presented upon this appeal were limited and specified. It is, to say the least, doubtful whether there are any questions open for consideration upon this appeal. If there be any, they are, at most, confined by the exceptions and the assignment of errors to a few naked questions of law. Obviously, the appellants prepared the record with this in view, and included only those parts of the evidence deemed by them "essential to the decision of the questions presented by the appeal." It is equally obvious that for the reason aforesaid appellee refrained from objecting to the record thus prepared. Notwithstanding this, appellants attempt to present and undertake to argue

in their brief numerous questions not raised at all by any exception to the Master's report or by any assignment of error, and refer to this incomplete record in support of their contentions. Clearly, such a course, if permitted, would result in manifest injustice. It is prohibited by the rules of this court and by well-settled principles of law.

In Grand Trunk Ry. Co. vs. Ives, 144 U. S., 408, 414, the court said:

> "We should bear in mind, however, that it is not for this court to say that the entire evidence in the case is set forth in the bill of exceptions, for that would be to presume a direct violation of a settled rule of practice as regards bills of exceptions, viz.: that a bill of exceptions should contain only so much of the evidence as may be necessary to explain the bearing of the rulings of the court upon matters of law in reference to the questions in dispute between the parties to the case, and which may relate to exceptions noted at the trial. A bill of exceptions should not include, nor, as a rule, does it include, all the evidence given on the trial upon questions about which there is no controversy, but which it is necessary to introduce as proof of the plaintiff's right to bring the action, or of other matters of like nature. If such evidence be admitted without objection, and no point be made at the trial with respect to the matter it was intended to prove, we know of no rule of law which would require that even the substance of it should

> be embodied in a bill of exceptions subsequently taken. On the contrary, to encumber the record with matter not material to any issue involved has been repeatedly condemned by this court as useless and improper."

By express rules the principles above stated are now applicable to the record on an appeal in an equity case.

In this state of the record the court must conclusively presume that every finding and determination of the Master and of the court below was based upon and supported by sufficient competent evidence, although that evidence be not included in the record brought to this court. (See cases cited *supra*, p. 45, 46.)

We do not at this time attempt to specify the particular contentions of appellants, which are foreclosed by the incompleteness of the record and by the lack of proper exceptions to the Master's report and a proper assignment of errors. This we shall do in discussing the topics to which they relate. Of course, the total lack of any specification of errors in appellants' brief will, if the rule be enforced, preclude consideration of any of appellants' contentions.

II.

METHOD, MANNER AND MOTIVE OF PASSAGE OF RATE ORDINANCE RENDER IT WHOLLY INVALID. RATES CANNOT BE REGULATED BY INITIATIVE PETITION. THE ACT OF THE CITY COUNCIL WAS NOT LEGISLATIVE, BUT AUTOMATIC. THE ORDINANCE IS AIDED BY NO PRESUMPTION OF VALIDITY.

The manner of the enactment of the rate ordinance, and the events which preceded and led to it, have been hereinbefore narrated, with appropriate references to the record (*supra*, pp. 5 *et seq.*, and 29 *et seq.*). The facts are undisputed and indisputable. The ordinance was initiated in the midst of the bitter campaign which preceded the vote upon the proposal of the Retail Association of the Denver Chamber of Commerce for a settlement of the water question, doubtless as a campaign measure by those opposed to the Retail Association plan. It was the culmination of a controversy which had continued unceasingly for many years. The obvious purpose of its proponents was not fair regulation of rates, but arbitrary reduction of earnings and consequent destruction of values. The act was in line with and part of a consistent plan to acquire the Water Company's property at much less than its real value, and to make the situation so intolerable that the Company would be forced to sell.

Pursuant to provisions of the Denver charter, an ordinance was initiated by a pefition privately circulated, to which, when it was filed, 5,593 signatures were attached.

Pursuant to this petition, and in compliance with the letter of the Denver charter, the City Council passed the ordinance. In so doing the members of the Council confessedly acted not in their legislative capacity, but automatically, as part of the machinery of the initiative process, set in motion by the petition, and merely as the register of the will of the 5,593 persons who signed said petition. The City Council did not give to the Water Company any notice of its proposed action, nor afford it any opportunity to be heard. The City Council did not make, nor attempt to make, any determination as to the reasonableness or propriety of the ordinance, or of any of its terms, nor did it at all investigate that question. The City Council utterly ignored facts in its possession, which were city records, and other information easily available, from which it conclusively appeared that the ordinance was confiscatory. The engineers of the Public Utilities Commission had just filed their report in which they set forth in detail the result of their investigations as to the Company's revenue and net earnings with the data upon which their conclusions were based, and in which they found and reported that the net return to the Company, even upon the going rates had, throughout the Company's history, been grossly inadequate, and in which they strongly recommended against any present attempt to reduce rates, even though the City should, as they also strongly recommended, purchase the plant. Even if the City Council had investigated these facts and had determined that the ordinance was confiscatory, it is clear that it would nevertheless have passed the same without amendment and in the exact form proposed by the petition, because the members of the City Council re-

garded themselves as bound to do so by the letter of the charter provisions relating to initiated measures.

A short time before, the Supreme Court of Colorado, in a case arising under the Denver charter had, by a divided court, held that where a measure had been initiated by petition, the duty of the City Council in respect thereto was merely ministerial and not legislative, and that even though the proposed measure was plainly unconstitutional, it was nevertheless the absolute duty of the City Council to at once pass it without amendment, or to promptly submit it to vote of the people.

Speer vs. People, 52 Colo., 325, 343 to 348.

These matters are the subject of an express finding by the Master. This finding is as follows (Record, p. 119):

> "7. Ordinance No. 26, series of 1914, was enacted by the City Council, as alleged in paragraph sixteenth (16th) of the bill (this record, page 76). The following additional facts concerning the enactment of this ordinance are established by uncontradicted evidence:
>
> On July 26th, 1913, the Public Utilities Commission, by letter (Exhibit A-46), asked the Water Company on what basis the going (leaflet) schedule of rates had been fixed, and requested a statement of its gross earnings, operating expenses and fixed charges for the preceding three years. The Water Company, by letter dated August 16th, 1913 (Exhibit A-47) gave the information requested. This letter also explained the basis of the Leaflet

Schedule of rates, and concluded as follows: 'We will be pleased to aid you in investigating these matters, and therefore desire to tender to your Commission and to the City Attorney all data in our possession, and any information which you may require.'

The Public Utilities Commission did not seek or obtain any additional information from the Water Company. The ordinance was drafted at the instance of the Public Utilities Commission, and then 'regularly initiated by the people under the terms of the charter' of the City. It was passed by the City Council and approved by the mayor March 3, 1914 (Volume 5-c, pp. 2311 to 2315; this record, p. 320). The Water Company had no notice from the defendants of the proposal to draft or enact the ordinance other than that given by its publication in a newspaper on March 2, 1914, although, as a matter of fact, it undoubtedly knew of the entire proceeding. When the ordinance came before the City Council for consideration the members of that body were of the opinion that it was their legal duty to pass it, without making any attempt to determine whether the rates prescribed by it were reasonable (Volume 6-c, p. 2822; this record, p. 360). The defendants, including the members of the City Council and of the Public Utilities Commission, state in paragraph thirteenth (13th) of the answer (this record, p. 101) that they have not 'sufficient knowledge or information upon which to base a belief' as to 'the gross

> earnings, operating expenses, taxes, net income,' etc., of the Water Company for any of its fiscal years from 1908 to 1913, inclusive, or as to 'the allowances made or should be made for depreciation, obsolescence or unusual contingencies.'"

The first paragraph of the foregoing finding adopts as the Master's finding and conclusively determines to be true the allegations of paragraph sixteenth of the bill. These, therefore, are to be deemed incorporated in the Master's finding, as a part thereof. The allegations relating to the passage of the ordinance are as follows (Record, p. 76):

> "Said ordinance No. 26 of the Series of 1914, was prepared and enacted without consultation or conference with complainant; without any notice to complainant or any opportunity afforded complainant to be heard in reference to the matters therein contained, and the effect thereof on the income and properties of the complainant. Neither the defendant, the city and county of Denver, or the Public Utilities Commission, or any member thereof, or the Council of the city and county of Denver, or any member thereof, attempted, prior to the enactment of said ordinance, to investigate the fairness or justness of the rates therein provided to be adopted by complainant, or the effect thereof on the income or properties of complainant. Said ordinance was conceived, prepared, drafted and enacted without reference to the fairness of the rates therein prescribed, or

> the effect on the properties and income of complainant, but for the purpose of crippling and hampering complainant in the operation of its water system and to depreciate the earning capacity and value of the properties and water system of complainant, in order to enable defendant, the city and county of Denver, and said Public Utilities Commission, to purchase and acquire the properties of complainant at less than fair actual present value, and less than the value heretofore fixed and determined through the joint appraisement of 1907 aforesaid, and the values ascertained by the engineers appointed by said Public Utilities Commission."

The foregoing finding was not excepted to, nor is it made the basis of any assignment of error. It is not open to question. True, the Master deemed it unnecessary to draw from the facts thus found the legal conclusion which inevitably followed, for, as stated in the paragraph of his report which immediately followed (Record, p. 120, paragraph 8), he was so clearly convinced that the ordinance rates were confiscatory that he refrained from declaring the ordinance invalid upon the other ground.

The attitude and action of the City Council was expressly conceded by the defendants (appellants) at the hearing before the Master, in the following words of the City Attorney (Record, p. 360):

> "'Another thing that must be borne in mind in this whole procedure is that it (the ordinance under attack) was not an ordinance passed by the City Council of the City

> and County of Denver. It was an ordinance initiated by the people of the City and County of Denver, and the Council had only one duty to perform under the charter, and that was to pass it without any question of any kind or character.' * * * Mr. Dorsey: 'Do you mean to say that the Council of the City and County of Denver passed this ordinance without any determination as to whether it was reasonable or not?' Mr. Stevens (City Attorney): 'Absolutely. They had no discretion in the matter. The charter says that when these measures come before the City Council, that within a certain time they shall submit them to the people; but this, as I understand it, was initiated and presented to the Council under the section which provides that when presented, with the signatures of a sufficient number of the citizens of Denver, it is mandatory upon the Council to pass it. In any event, that was the view that the Council took of its duties.'"

As to the finding of the Master (Record, p. 120) that "the ordinance was drafted at the instance of the Public Utilities Commission," it is sufficient to say that under Section 264-a of the Charter, from which alone that commission derives all its authority, the Commission is wholly without power to regulate the rates of any utilities except those which are owned and operated by the City.

Wheeler vs. City and County of Denver (C. C. A., 8th Cir.), 231 Fed., 8, 13, par. 3.

The City and County of Denver was created and is governed by Article XX of the Constitution of the State, which article was adopted in 1902 (see Colorado Session Laws 1901, pp. 97, *et seq.*; 1 Mills' Annotated Statutes (1912), p. c-269, *et seq.*). By Section 1 of said Article the City and County of Denver was created. By Sections 4 and 5 of said Article the people of said city and county were vested with exclusive power to make, alter, revise or amend their charter, or to adopt a new charter, and the machinery and method thereof was prescribed. By these sections it was provided that whenever any charter was adopted, or any amendment thereto made, certified copies thereof should be filed with the Secretary of State. And by Section 5 of said Article it was also provided that:

> "Each charter shall also provide * * * for the initiative by the qualified electors of such ordinances as they may by petition request."

It has been conclusively determined that the purpose of Article XX was to grant Home Rule to Denver, and its effect was to enlarge the powers of the municipality beyond those usually granted by the Legislature, and to confer not only the powers specially mentioned, but also to give to the people of Denver every power possessed by the Legislature in respect to the making of a charter for Denver.

> City of Denver vs. Hallet, 34 Colo., 393, 398.

It has also been determined that the Charter convention of the City and County of Denver, assembled

pursuant to Article XX to make a charter for the City, had all the powers with reference to the making of such charter which had been possessed by the State Legislature prior to the adoption of said Article XX.

People vs. Lindsley, 37 Colo., 476, 480.

Pursuant to said Article XX, and by the method there prescribed, the people of Denver adopted their own charter, which became effective March 29, 1904. Section 268 thereof (Section 270 of the revision of 1914) provided:

> "All power to regulate the charges for service by public utility corporations is hereby reserved to the people, to be exercised by them in the manner herein provided for initiating an ordinance."

Section 22 thereof, as amended May 17, 1910 (Sec. 265 of the revision of 1914), provided, in part:

> "Any proposed ordinance may be submitted to the Council by petition therefor of qualified electors equal in number to at least five per cent. of the last preceding vote for mayor, and such proposed ordinance shall be passed without alteration by the Council, and if vetoed by the mayor, shall be passed over his veto within thirty days after such petition is filed; or the Council shall refer such proposed ordinance to the qualified electors at the next municipal election held not less than sixty days after such petition is filed."

Certified copies of these charter provisions were duly filed with the Secretary of State, as required by Article XX of the Constitution.

By an amendment to the Constitution of the State, adopted at the general election in November, 1912, and now appearing as Section 6 of Article XX, it was provided:

> "All provisions of the charter of the City and County of Denver, * * * as heretofore certified to and filed with the Secretary of State, * * * are hereby ratified, affirmed and validated as of their date." (See 1 Mills' Ann. Stats. (1912), p. c-281-a; Colo. Sess. Laws, 1913, p. 671.)

By an amendment to the Denver Charter adopted February 14, 1913, and numbered Section 353-B (262-B of the revision of 1914), it was provided:

> "Whenever petitions under this charter are required to be based on the vote for mayor, the same shall be based on the vote of the commissioner who at the preceding general city and county election received the highest number of votes."

The foregoing constitutional and charter provisions were in effect at the time the ordinance here in question was initiated by petition and passed by the Council.

The provisions of the Denver Charter authorized by Article XX, and ratified by the constitutional amendment of 1912, clearly purport to confer upon the people of the city and county the power and right

to regulate by process of the initiative the charges for service made by public utility corporations. The method pursued in the present instance was in strict compliance with the letter of these provisions.

It is our earnest contention that so delicate and important a function as the regulation of rates for service cannot within constitutional limitations be delegated directly to the people, to be by them performed through process of the initiative.

In the case before us the Council did not, as it might have done, submit the ordinance to vote of the people at a general election. If it had done so the situation would be no better. But instead of doing so, the Council passed the ordinance because, and solely because, it was "submitted to the Council by petition therefor of qualified electors" in the requisite number, and because, and solely because, the Charter provided that an ordinance so submitted "shall be passed without alteration by the Council." Who the 5,593 signers of this petition were, nobody knows. They were not officers of the City, but irresponsible members of the general electorate. It does not even appear that they were taxpayers. Under the Charter it was unnecessary that they should be.

When we consider that the population of Denver is approximately 230,000, and the number of service connections to the Water Company's plant approximately 44,000, it certainly must be obvious that the mere fact that 5,593 unidentified and irresponsible persons saw fit to sign said petition ought not and cannot be permitted to operate as a regulation of the water rates, not only for the Water Company, but for all the other inhabitants of Denver.

The utter absurdity of the conclusion that 5,593 persons can, by signing their names to a petition, validly regulate rates for 230,000, is clearly evident when we consider that the power ostensibly reserved to the people by section 268 of the Charter is not merely to reduce rates, but to "regulate the charges." The power to regulate includes the power not only to lower but to raise. It follows that if the theory here acted upon by appellants be correct, any five thousand persons, by merely signing their names to a petition, can effectively *raise*, as well as effectively *lower*, the rates by twenty per cent. or any other amount which may please them and impose their will in that regard upon all the rest of the 230,000 consumers.

And when we further consider the circumstances under which, and the manner in which, this thing was done, and the fact that the ordinance rates effect a horizontal cut of more than twenty per cent. in the gross earnings, and of a much larger percentage in the net earnings of the Company, it seems to us clear beyond question that the act cannot stand.

In Home Telephone Co. vs. Los Angeles, 211 U. S., 265, this court, after remarking that the rates there in question had been fixed by the City Council, after due investigation, each member acting "under his personal responsibility as an officer," said (p. 280):

> "The charter of the City also contains a provision that upon petition of 15 per cent. of the voters of the City, any ordinance proposed must be submitted to the people and may be by them adopted. It is said, therefore, that the power of rate regulation

might be in this manner exercised directly by the electorate at large. It may well be doubted whether such a result was contemplated by the Legislature. There are certainly grave objections to the exercise of such a power, requiring a careful and minute investigation of facts and figures, by the general body of the people, however intelligent and right-minded. But the ordinance was not adopted in this manner in this case, and it will be time enough for the courts of the states and of the United States to consider, when that is done, whether the objections only go to the expediency of such a method of regulation, or reach deeper and affect its constitutionality."

The court is now confronted with such a case, and upon this record must decide whether the method of rate-regulation here followed can receive its sanction. True it is that since the decision in the Los Angeles case, *supra*, the court has refused to declare invalid the provisions of certain state constitutions relating to the initiative and referendum.

Pacific States Tel. & Tel. Co. vs. Oregon, 223 U. S., 118.

Kiernan vs. Portland, 223 U. S., 151.

Davis vs. Ohio, 241 U. S., 565.

But the attack there made was solely upon the ground that such provisions violated Section 4 of Article IV of the Constitution of the United States, in that they destroyed in the states in question a re-

publican form of government, and this court, in refusing to consider the contention, held that the question was not judicial, but solely legislative; that it rested exclusively with Congress to decide what government is the established one in a state, and whether or not it is republican in form, and that its decision is binding on every other department of the Government, and cannot be questioned by the judiciary.

The objection here raised, however, is altogether different from that considered in the foregoing cases. It is here asserted that the power to regulate rates has been exerted in an unconstitutional manner, and in such a way as to amount to a deprivation of property without due process of law, and a denial of the equal protection of the laws. The distinction is clearly pointed out in the first of the cases hereinabove cited, wherein the court, speaking through Mr. Chief Justice White, said (223 U. S., 150):

> "How better can the broad lines which distinguish these two subjects be pointed out than by considering the character of the defense in this very case? The defendant company does not contend here that it could not have been required to pay a license tax. It does not assert that it was denied an opportunity to be heard as to the amount for which it was taxed, or that there was anything inherent in the tax, or involved intrinsically in the law, which violated any of its constitutional rights. If such questions had been raised they would have been justiciable, and therefore would have required the calling into operation of judicial power. Instead,

> however, of doing any of these things, the attack on the statute here made is of a wholly different character. Its essentially political nature is at once made manifest by understanding that the assault which the contention here advanced makes it not on the tax as a tax, but on the state as a state. It is addressed to the framework and political character of the Government, by which the statute levying the tax was passed. It is the Government, the political entity, which (reducing the case to its essence) is called to the bar of this court, not for the purpose of testing judicially some exercise of power assailed, on the ground that its exertion has injuriously affected the rights of an individual because of repugnancy to some constitutional limitation, but to demand of the state that it establish its right to exist as a state, republican in form."

No court has yet held that the rates of a public utility can be regulated and reduced by process of the initiative, or by direct action of the people themselves, who are consumers of the product of the utility; and we respectfully submit that within constitutional limitations no court ever can so hold. Particularly has no court ever yet held that the rates of a public utility can be regulated and reduced or raised by the mere fiat of a petition, and by the simple act of a small fraction of its consumers in signing their names to such petition, and we respectfully submit that no court within the limitations of the Constitu-

tion, of reason or of sound common sense, ever can so hold.

The delicate nature of the function of rate-regulation, and the care with which it should be exercised, have been frequently recognized.

In Knoxville vs. Knoxville Water Co., 212 U. S., 1, 18, this court said:

> "It is a delicate and dangerous function, and ought to be exercised with a keen sense of justice on the part of the regulating body, met by a frank disclosure on the part of the company to be regulated. The courts ought not to bear the whole burden of saving property from confiscation, though they will not be found wanting where the proof is clear. The legislatures and subordinate bodies, to whom the legislative power has been delegated, ought to do their part. Our social system rests largely upon the sanctity of private property, and that state or community which seeks to invade it will soon discover error in the disaster which follows. The slight gain to the consumer, which he would obtain from a reduction in the rates charged by public-service corporations, is as nothing compared with his share in the ruin which would be brought about by denying private property its just reward, thus unsettling values and destroying confidence."

In Cleveland Gas Light & Coke Co. vs. City of Cleveland, 71 Fed., 610, Circuit Judge Jackson, delivering the opinion of the court, said (page 612):

> "It would be a fearful proposition—monstrously absurd and outrageous—if the Legislature were to undertake to confer upon a citizen of Cleveland the right to say at what price services should be rendered to him, or what he should pay for goods and articles furnished him. There is hardly any law in this land that would make the party being furnished the judge of the price that he should pay, or would say that his arbitrary decision should fix the rights of the parties."

In *ex parte* Farnsworth, 61 Tex. Cr., 342, 353; 135 S. W., 535 and 539, there was involved an ordinance regulating telephone rates, which had been adopted under the initiative and referendum provisions of the city charter. The ordinance was for this reason held to be entirely invalid. The case was twice considered. In the course of the first opinion the court says (135 S. W., 537):

> "To hold that a law could be suspended by the referendum, or enacted by the referendum, would or might easily result in the deprivation of our citizenship, of life, liberty or property without due process of law. The ordinance in question may be a fair illustration and verification of that statement. Such a proceeding would condemn without charges or specifications, without a hearing or the forms of a trial, in the absence of evidence, without a jury, and even without a court, to be exercised only by the secret in-

quisition of the ballot box. The referendum not only sets at defiance these constitutional guaranties, but it as well destroys the purpose and authority of the legislative department, or, on the other hand, may make that body omnipotent and superior to the constitution from which its authority is derived. It would reinvest the people with the functions of legislation conferred upon that department of government. It is also a direct attack upon the judicial system provided by the Constitution. The courts were ordained for the purpose of the trial of causes, awarding to the citizenship tribunals in which their matters may be tried and adjusted. Referendum refuses a hearing. It takes the place of the constituted judiciary, and tries the rights of property through the ballot-box. * * * The property of the citizen may be confiscated, and he made a bankrupt, without a hearing and without due process of law. * * * (p. 538). If what has been stated is correct, then the ordinance in question is void. It deprives those whom it affects of their constitutional rights and their rights as citizens to be heard when their property is sought to be taken or hampered, with such rates and charges as would prove destructive. Any law, state or municipal, which would undertake to deprive a man of his life, liberty or property without giving him a hearing, or in any manner affect his rights without a hearing, would necessarily be vicious

and unconstitutional. Ours is a country of law, and whenever a man is affected in his life, liberty or property, he has the right to resort to some legal tribunal where those matters can be honestly and fairly adjudicated."

In the second opinion the court said (135 S. W., 539):

"It is contended, in effect, that under the initiative and referendum provisions of the Charter of Dallas the voters, in the manner that it was done, had the right and power to enact the said ordinance, and that it is valid and binding, notwithstanding it was neither enacted by the Board of Commissioners, nor prior to its submission to the voters, the said board had provided rules and regulations for hearing said Telephone Company, and thereunder given it a fair hearing as to the provisions of said ordinance before it was enacted. We cannot sustain this contention. As is shown above, the said ordinance was passed by the voters and not by the Board of Commissioners, and that, too, without a hearing of any kind, under rules and regulations prescribed and adopted by the board. Therefore said ordinance is invalid and not effective in the City of Dallas."

In Southwestern Tel. & Tel. Co. vs. City of Dallas, 104 Tex., 114; 134 S. W., 321, 323, the court said:

"In the exercise of the power to regulate and fix rates, etc., there must be a body who

> can hear evidence and decide upon the reasonableness or unreasonableness of the rate or regulation, and if that cannot be done by the initiative—the popular vote—then the authority cannot be exercised in that manner. Can it be necessary to offer argument to show to any man that such hearing as the law provides could not be had in a campaign before the electorate of the city? It is too manifest for controversy."

And the court held a rate-regulating ordinance adopted by process of the initiative invalid for that reason.

In the case at bar, by the act here under consideration, the rates were actually regulated, and reduced by more than 20 per cent., through the naked fiat of 5,593 unknown individuals. They were self-chosen and represented no one but themselves. They constituted a very small fraction of the 230,000 consumers of water from appellee's plant. Doubtless, they themselves were users of the water and payers of the rates. They drafted the ordinance, and their act alone put it in effect. The letter of the Denver Charter seems to authorize such procedure. Whether it does or not, nevertheless, it was so regarded by the City Council, and the result is the same. We submit that such an ordinance cannot be upheld.

In Agua Pura Co. vs. Las Vegas, 10 N. M., 6; 60 Pac., 208, the court declared invalid an act giving the City Council power to fix water rates without investigation, holding that the power to regulate rates must either be exercised by the legislature itself di-

rectly, or if delegated to any subordinate authority, it must be under provisions which will insure its exercise in a reasonable manner, and with some provision by which the rights of parties to be affected may have the protection of judicial determination. In the course of the opinion it is said:

> "If the method of regulating rates by a commission, provided for in the Minnesota case (134 U. S., 418), is invalid because without due process of law, for how much stronger reason must an act be invalid which undertakes to delegate the legislative power, not to an impartial commission, but to one of the parties in interest? It is one of the oldest maxims of law that no one can be judge in his own case. Here not only is the city council the direct representative of the inhabitants of the community, the supplying of whom constitutes the greater part of the business of this and similar companies, but as to the supply of water for municipal purposes it is itself a consumer, and is the actual and direct party in interest, with which the Water Company is obliged to contract. To say that the party which is itself the purchaser should have the absolute power to fix the price at which the owner of a commodity shall sell it to him, would be to state a proposition that no member of the community would for a moment admit, if applied to his own business. It is not to be supposed, judging from the known rules of human conduct, that a

> regulation of price by the purchaser himself would be fair or reasonable."

A fortiori is this true where, as here, the delegation of unrestricted power is assumed to be to any 5,000 out of 230,000 consumers of the Company's product.

The necessity of fair investigation and deliberate legislative action in good faith has in rate cases been frequently emphasized, and in their absence rate-regulations held invalid.

> C. M. & St. P. Ry. Co. vs. Minnesota, 134 U. S., 418, 456.
>
> San Diego Land Co. vs. National City, 174 U. S., 739.
>
> Budd vs. New York, 143 U. S., 517, 546.
>
> Chesapeake & Potomac Tel. Co. vs. Manning, 186 U. S., 238, at 245.

In the foregoing cases the distinction between legislative action and that which is not legislative, and between the presumptions which attach in the former case, and are absent in the latter, are clearly pointed out.

In Missouri Pacific Ry. Co. vs. Nebraska, 217 U. S., 196, the court, in considering a statute which compelled carriers to put in spur switches, said (p. 207):

> "If the statute makes the mere demand (for spur switches) conclusive, it plainly cannot be upheld. If it requires a side-track only when the demand is reasonable,

> then the railroad ought at least to be allowed a hearing in advance, to decide whether the demand is within the act. Sometimes when summary action is necessary, the property owner's rights are preserved by leaving all questions open in a subsequent suit (citing cases). But in such cases the risk is thrown on the destroyer of property. In this case there is no emergency, yet, at the best, the owner of the property, if it has any remedy at all, acts at its risk, not merely of being compelled to pay both the expense of building and the costs of suit, but also of incurring a fine of at least $500 for its offense in awaiting the result of a hearing."

In the case at bar the mere demand of the signers of the petition for the passage of the ordinance in question, and the reduction of rates which it required, was deemed by the City Council conclusive under the terms of the Denver Charter, and was so acted upon. This ordinance, like the statute involved in the case last cited, provided heavy penalties for its violation (Record, p. 90, sec. 4).

In Oregon R. R. & N. Co. vs. Fairchild, 224 U. S., 510, the court, in construing a statute giving the railroad commission power to order the installation of switch tracks, said (p. 524):

> "It complains that the statute did not afford it the means of making a defense before the commission, and yet required it to attack the reasonableness of the order on such evidence as it might have been able to pro-

duce before the administrative body. If this were true, the defendant's position would be correct, for the hearing which must precede the taking of property is not a mere form. The carrier must have the right to secure and present evidence material to the issue under investigation. It must be given the opportunity, by proof and argument, to controvert the claim asserted against it, before a tribunal bound not only to listen, but to give legal effect to what has been established."

In *ex parte* Young, 209 U. S., 123, at 147, the court said:

> "If the law be such as to make the decision of the legislature, or of a commission, conclusive as to the sufficiency of the rates, this court has held such a law to be unconstitutional. Chicago, etc., Ry. Co. v. Minnesota, 134 U. S. 418."

And this statement was approved in Missouri Pacific Ry. Co. vs. Tucker, 230 U. S., 340.

But in the case at bar it was assumed by the City Council that the decision of 5,593 persons, out of 230,000 persons concerned, evidenced by their signatures to a petition, was "conclusive as to the sufficiency of the rates," and the ordinance was passed upon that assumption.

Even though the provisions of the Denver Charter had been other than they plainly were, and, properly construed, had not permitted the regulation of

rates in the manner here attempted, yet the City Council construed them otherwise, and so construing, acted confessedly in an arbitrary manner. That the proponents of the measure likewise acted arbitrarily and for an ulterior and sinister purpose, does not admit of doubt. The case is clearly ruled by many prior decisions of this court.

In Yick Wo vs. Hopkins, 118 U. S., 356, the ordinance in question was so framed as to leave room for the play of arbitrary action in its administration, and consequently was held invalid. In the course of the opinion the court says (p. 369):

> "When we consider the nature and the theory of our institutions of government, the principles upon which they are supposed to rest, and review the history of their development, we are constrained to conclude that they do not mean to leave room for the play and action of purely personal and arbitrary power. Sovereignty itself is, of course, not subject to law, for it is the author and source of law; but in our system, while sovereign powers are delegated to the agencies of government, sovereignty itself remains with the people, by whom and for whom all government exists and acts. And the law is the definition and limitation of power. It is, indeed, quite true, that there must always be lodged somewhere, and in some person or body, the authority of final decision; and in many cases of mere administration the responsibility is purely political, no appeal lying except to the ultimate tribunal of the

public judgment, exercised either in the pressure of opinion or by means of the suffrage. But the fundamental rights to life, liberty, and the pursuit of happiness, considered as individual possessions, are secured by those maxims of constitutional law which are the monuments showing the victorious progress of the race in securing to men the blessings of civilization under the reign of just and equal laws, so that, in the famous language of the Massachusetts Bill of Rights, the government of the commonwealth 'may be a government of laws and not of men.' For, the very idea that one man may be compelled to hold his life, or the means of living, or any material right essential to the enjoyment of life, at the mere will of another, seems to be intolerable in any country where freedom prevails, as being the essence of slavery itself.

* * * * * * * *

(P. 371): The same principle has been more freely extended to the quasi-legislative acts of inferior municipal bodies, in respect to which it is an ancient jurisdiction of judicial tribunals to pronounce upon the reasonableness and consequent validity of their by-laws. In respect to these, it was the doctrine, that every by-law must be reasonable, not inconsistent with the charter of the corporation, nor with any statute of Parliament, nor with the general principles of the common law of the land.

particularly those having relation to the liberty of the subject or the rights of private property. Dillon on Municipal Corporations, 3d ed., Sec. 319, and cases cited in notes. Accordingly, in the case of The State of Ohio ex rel. etc. v. Cincinnati Gas Light and Coke Company, 18 Ohio St. 262, 300, an ordinance of the city council purporting to fix the price to be charged for gas, under an authority of law giving discretionary power to do so, was held to be bad, if passed in bad faith, fixing an unreasonable price, for the fraudulent purpose of compelling the gas company to submit to an unfair appraisement of their works."

In Knoxville Water Co. vs. Knoxville, 189 U. S., 434, the court was considering a rate ordinance duly and properly enacted by the City Council. Nevertheless, in the course of the opinion it was said:

"It is argued here that the reduction of rates is not reasonable, and is or may be taking a first step towards a compulsory purchase of the Company's plant at an unfairly low price, by cutting down its value. We may assume, with the Supreme Court of Tennessee, that if rates were reduced unreasonably, a judicial remedy would be found. We may assume, further, that an attempt to affect the price of the Company's plant in that way, if the city should elect to purchase, would not be allowed to succeed."

In San Diego Land & Town Co. vs. Jasper, 189 U. S., 439, 443, the court said:

> "Of course, as we indicated the other day in Knoxville Water Co. vs. Knoxville, ante p. 434, if an attempt had been made to cut down values by the reduction of rates, the courts would know how to meet it."

In San Diego Water Co. vs. San Diego, 118 Cal., 556, the Supreme Court of California, referring to the section of the statute by which the legislative power to regulate rates had been delegated to the City Council, said (p. 566):

> "The meaning of the section is that the governing body of the municipality, upon a *fair investigation and with the exercise of judgment and discretion*, shall fix reasonable rates and allow just compensation. If they attempt to act *arbitrarily, without investigation or without the exercise of judgment and discretion*, or if they fix rates so palpably unreasonable and unjust as to amount to arbitrary action, they violate their duty and go beyond the powers conferred upon them." (Italics ours.)

In Dobbins vs. Los Angeles, 195 U. S., 223, the court had under consideration an ordinance duly enacted by the City Council and fair on its face. It was nevertheless found to be arbitrary, because passed without due consideration, or sufficient reason, and for an ulterior purpose, and so declared invalid. The question is fully discussed, and many prior de-

cisions of this court cited and quoted from. In the course of the opinion the court says (p. 240):

> "In some of the States, perhaps in most, the right to build and maintain gasworks is derived from the State, but subject to municipal control as to the use of the streets and the prices to be charged to consumers. In Ohio this price is regulated for stated periods. Could it be successfully maintained that after the erection of the works and the fixing of prices for a term of ten years, at the expiration thereof and exercising the right to fix prices for a new term, the council could arbitrarily, and with a view of compelling the sale of the works to the municipality or a rival company, fix the rate at a price below the cost of gas to the producer and at such a rate as to be ruinous to the business? In State ex rel. The Attorney General v. The Cincinnati Gas Light & Coke Co., 18 Ohio St. 262, it was held to be the legislative intention, in empowering city councils to regulate the price of gas, to limit such companies to fair and reasonable prices, and if in the colorable exercise of this power a majority of the members of the council, for a fraudulent purpose, combine to pass an ordinance fixing the price of gas at a rate at which they well know it cannot be manufactured and sold without loss, such an ordinance would impose no obligation on the company. This case was cited with apparent approval by Mr. Justice Matthews in de-

livering the opinion of this court in Yick Wo v. Hopkins, supra, and see Dillon Mun. Corp., 4th ed., Sec. 311."

In the recent case of Wilson vs. New, 243 U. S., 332, involving the validity of the act of Congress commonly referred to as the Adamson Act, it was assumed that even an act of Congress would be invalid, as wanting in due process of law, if it appeared that it had been enacted arbitrarily and without due consideration. On this subject the court says (p. 355):

> "The contention virtually is that, conceding the legislative power under the circumstances stated, to fix a standard of wages, such authority necessarily contemplates consideration before action, and not a total and obvious disregard of every right of the employer and his property—a want of consideration and a disregard which it is urged appear on the face of the statute, and which cause it therefore to amount to a decision without a hearing, and to a mere arbitrary bestowal of millions by way of wages upon employes, to the injury not only of the employer but of the public, upon whom the burden must necessarily fall. Upon the assumption that unconstitutionality would result, if there be ground for the propositions, let us test them."

Thereupon the court narrated the events which preceded, and the circumstances and conditions which surrounded the enactment of the statute, and

found, as a matter of fact, that due and deliberate consideration had been given, and an opportunity to be heard afforded, and that therefore the statute represented proper legislative and not merely arbitrary action.

In Manufacturers Light & Heat Co. vs. Ott, 215 Fed., 940, involving the validity of an order of the public service commission of West Virginia, it was said (p. 946):

> "The complainants contend with earnestness that they were denied due process of law, in that (1) their leading counsel was required by the commission to retire from the case, and in that (2) the governor of the state improperly interfered in the hearing, and the commission acted in subservience to his will. If these charges be established, then the hearing was inadequate and manifestly unfair, and it would be the imperative duty of the court to enjoin rates based on it. Interstate Commerce Commission v. L. & N. R. R. Co., 227 U. S. 88; Interstate Commerce Commission v. Baird, 194 U. S. 25."

Congress has delegated to the Interstate Commerce Commission the power to regulate rates, but this court has repeatedly held that a rate order made by that commission without due investigation, proper notice and hearing, and sufficient evidence to support it, is wholly void as an arbitrary and unconstitutional exercise of power, and without regard to the question whether the rates prescribed thereby are or are not confiscatory.

In Interstate Commerce Commission vs. Louisville & Nashville R. R. Co., 227 U. S., 88, 91, the court said:

> "A finding without evidence is arbitrary and baseless, and if the government's contention is correct, it would mean that the commission had a power possessed by no other officer, administrative body, or tribunal under our government. It would mean that, where rights depended upon facts, the commission could disregard all rules of evidence and capriciously make findings by administrative fiat. Such authority, however beneficently exercised in one case, could be injuriously exerted in another, is inconsistent with rational justice, and comes under the Constitution's condemnation of all arbitrary exercise of power. In the comparatively few cases in which such questions have arisen it has been distinctly recognized that administrative orders, quasi-judicial in character, are void if a hearing was denied; if that granted was inadequate or manifestly unfair; if the finding was contrary to the 'indisputable character of the evidence' (citing cases), or if the facts found do not, as a matter of law, support the order made (citing cases)."

In Interstate Commerce Commission vs. Illinois Central R. R. Co., 215 U. S., 452, 470, the court said:

> "Beyond controversy, in determining whether an order of the commission shall be

> suspended or set aside, we must consider * * * a proposition which we state independently, although in its essence it may be contained in the previous one, viz., whether, even although the order be in form within the delegated power, nevertheless it must be treated as not embraced therein, because the exertion of authority which is questioned has been manifested in such an unreasonable manner as to cause it, in truth, to be within the elementary rule that the substance, and not the shadow, determines the validity of the exercise of the power."

To the same effect see:

> Interstate Commerce Commission vs. Union Pac. R. R. Co., 222 U. S., 541, 547.
>
> Louisville & Nashville R. R. Co. vs. Garrett, 231 U. S., 298, 308.

The appellants, at pages 10 to 20 of their brief, cite authorities intended to indicate the reluctance of courts to declare confiscatory rates established by legislative action, and the presumption that rates so established are reasonable and non-confiscatory. But in the case at bar the act under consideration, as we have demonstrated, was not legislative but confessedly arbitrary. For this reason the authorities cited by appellants are wholly without application. That there is no presumption of the validity of this ordinance, or of the rates which it prescribes, is demonstrated by the authorities hereinbefore cited. Even though the act of the city council had been legisla-

tive in character (which it clearly was not), nevertheless, under the facts here presented, neither the ordinance nor the rates which it prescribes would be aided by any presumption of validity.

In Pennsylvania R. R. Co. vs. Philadelphia County, 220 Penn. Sta., 100; 68 Atl., 676, 679, the court, speaking of a rate prescribed by an act of the legislature, said:

> "The presumption in favor of the prescribed rate is no more than the ordinary presumption in favor of the constitutionality of acts of assembly. It has no special strength or sanctity; and in view of the public history of the passage of the Act of 1907, without investigation and in obedience to a popular agitation for the same rate, not only in Pennsylvania, but over the whole country, it might well be said that very slight evidence would rebut the presumption in this case."

In Henry L. Doherty, et al. vs. Toledo Railways & Light Co., and City of Toledo, the United States District Court for the Northern District of Ohio, on September 12, 1914, delivered an opinion, which has not been reported but is deemed of sufficient interest and importance to justify us in attaching to this brief, as Appendix A, p. 429, a reproduction, in print, of a certified copy thereof. The court was considering an ordinance enacted by the city council of Toledo reducing street railway rates. Upon the subject of presumption the court said (*infra*, p. 432):

> "This measure, not to go into effect for four months and not for three months after

the incoming of a new council and a new administration, was passed to adoption through three readings at one sitting by a council and urged by an administration whose friends had just suffered defeat at an election.

These circumstances suffice to start speculation upon the value of the presumptions. When, however, we find, as the testimony here shows without dispute, that, at the time this ordinance was passed and signed, the executive of the city was not only possessed of statistical information in most illuminative detail from its trusted expert, which, properly considered, showed that a three-cent fare was confiscatory, but that also the force of such statistics to this effect was pointed out in advice privately given in writing and orally by this expert to the executive, with reasons why a three-cent ordinance should not be passed, and, further, that the city had, in November, 1913, no evidence or light whereon to base a fixing of rate except that given it by its own chosen expert to the above effect, it does not take a very acute mind to see that these vaunted presumptions descend nearly to the level of mere legal figments."

We respectfully submit that the ordinance here in question and the rates which it prescribes are wholly void for the reason first assigned, and without regard to whether the rates are or are not so low as to be for that reason confiscatory.

Plainly, the Master was much impressed with the force of these contentions. But he found it unnecessary to determine them (Record, p. 120, finding 8). In reference thereto he said: "I do not deem it necessary to consider or decide this question, because the evidence clearly requires a finding that the ordinance is invalid even when the ordinary rules of law as to its validity are applied to the evidence," and thereupon stated that in considering the pleadings and evidence he had been guided by the following rules:

(a) That the ordinance and the rates fixed by it are presumed to be valid, reasonable and fair, and

(b) That the Water Company "has the burden of proving beyond any reasonable doubt" that said rates are in fact confiscatory.

We submit that said ordinance, and the rates which it prescribed, are, to say the least, aided by no presumption of validity. Nevertheless, on the issue of confiscation appellee met and amply sustained the heavy burden of proof which the Master thus laid upon it, and as the Master expressly held, established the fact of confiscation "beyond any reasonable doubt" and by evidence which "clearly requires a finding that the ordinance is invalid."

We submit, however, that if the contentions advanced in the foregoing portion of our brief are well founded, the issue of confiscation becomes in all its aspects merely moot, for the ordinance is, in any event, wholly invalid, and the decree to that effect must, in any event, be affirmed. If we are correct in this, then it also follows that it is quite unnecessary for this court to enter upon the serious and burdensome task involved in the investigation and determi-

nation of the respective contentions concerning the issue of confiscation.

III.

TO ESCAPE THE CHARGE OF CONFISCATION, THE RATES MUST WITH CERTAINTY YIELD SUFFICIENT, NOT ONLY TO COVER OPERATING EXPENSES, TAXES AND A PROPER DEPRECIATION ALLOWANCE, BUT ALSO TO PROVIDE, IN ADDITION, A FULL AND FAIR NET RETURN ON THE PRESENT FAIR VALUE OF THE PROPERTY DEVOTED TO THE PUBLIC USE. HOW THE NET RETURN WAS ASCERTAINED IN THIS CASE. APPELLANTS' CONTENTIONS IN THIS REGARD ANSWERED.

It is obvious that in the computation by which the net earnings are ascertained, the basic figure is the gross revenue obtainable under the ordinance rates, from which must be deducted (1) operating expenses, including the cost of repairs and ordinary maintenance; (2) taxes, and (3) an allowance for depreciation, to offset the loss caused by the wearing out and obsolescence of portions of the plant, which necessarily occurs in spite of proper repairs and adequate maintenance.

All of the factors of this problem were the subject of most careful and detailed investigation by the Master, were covered by the most comprehensive and specific proof, and each is disposed of by a definite finding in the Master's report (Record, p. 124, finding 13, and pp. 138 and 139, findings 49, 50 and 51).

The appellants (defendants below) did not file any exception nor assign any error directed to the Master's findings concerning either (1) the gross revenue under the ordinance rates; (2) the operating expenses; (3) the taxes, or (4) the net earnings. And their only exception or assignment of error relating to the depreciation allowance is that the allowance should not have been made, "as the same is included annually in the item of 'operating expenses'" (Record, p. 1136, exception 21st, p. 1155, assignment XXII), although the Master had necessarily expressly found that the same is not included annually, or at all, in the item of operating expenses, as to which finding there is no exception and no assignment of error. Appellants' contentions respecting these matters are mainly set forth at pp. 92 to 112 of their brief, although repeated references thereto will be found at many other places in their printed argument.

Briefly summarized, appellants' contentions appear to be as follows: (1) That any net return, no matter how small, in excess of the actual cost of conducting the business, is sufficient to escape the charge of confiscation; (2) that the proof respecting the several factors entering into the ascertainment of the net return was not sufficiently full and specific to justify the Master's findings. We submit that appellants are foreclosed upon both of these contentions. On the first, by repeated decisions of this and other courts; and on the second, because the facts have been found against them by the Master in a reference by consent. Those findings have not been attacked by any exception or assignment of error, and the evidence relating to these issues which was before the Master has not been brought to this court (see *supra*, pp. 37 *et seq.*).

Moreover, we submit with respectful confidence that even though this were a case (which it is not) wherein the presumption in favor of the validity of legislative action was operative, the proof submitted to the Master upon these issues was so overwhelming, specific and conclusive as not only to satisfy the Master "beyond a reasonable doubt" (Record, p. 120, Finding 8), but even to convince defendants (appellants) themselves. Doubtless this is the reason why no exception or assignment of error relating to these subjects was filed. It is not too much to say that defendants in the court below were so clearly convinced of the propriety of these allowances and determinations that they were conceded and became matters of agreement. Under these circumstances it comes with ill grace from counsel who have recently entered the case, and who did not participate at all in the proceedings before the Master, and are plainly unfamiliar therewith, to assert upon the confessedly incomplete record which they have brought to this court that these matters were not sufficiently proven. And yet appellants' brief is filled with such assertions, all of which are merely gratuitous, in direct conflict with the facts and utterly inexcusable. If counsel had participated in the proceedings before the Master, or had taken the pains to read the lengthy record of those proceedings, such assertions could not possibly be made in good faith. If counsel had even made themselves familiar with the incomplete record which they have brought to this court, they could not conscientiously advance these contentions. It follows that these assertions of counsel are either deliberately misleading, and intended so to be, or else they are the result of inexcusable ignorance, and so made with reckless disregard as to their truth or falsity.

1. *The Appellee Company Has an Absolute Constitutional Right to Just Compensation for the Use of Its Property by the Public, and to a Reasonable Net Return Therefor, Which Must Be Full and Fair and Commensurate with the Value of the Property Devoted to the Public Use.*

The Fifth Amendment to the Constitution of the United States provides, *inter alia:*

> "Nor shall private property be taken for public use without just compensation."

This, of course, is a limitation upon Congressional action only. But the Colorado Constitution contains a like provision in Article II, Section 15 (Revised Statutes 1908, p. 24) which provides, *inter alia:*

> "That private property shall not be taken or damaged for public or private use without just compensation."

And the Fourteenth amendment to the Constitution of the United States provides, *inter alia:*

> "Nor shall any state deprive any person of life, liberty or property without due process of law; nor deny to any person within its jurisdiction the equal protection of the laws."

These are the constitutional provisions which limit the power of public authority, whether it be state or federal, to take private property for public use. Whether the taking be physical seizure of the

corpus of the property, or whether it consist in leaving physical possession with the owner and requiring the use thereof to be furnished to the public at a fixed compensation, is immaterial; in either event the property is taken for public use, and such taking is prohibited unless accompanied by *just compensation*.

It amounts to a denial of the equal protection of the laws guaranteed by the Fourteenth amendment, because it results in the failure to afford to certain private property the protection which the Colorado Constitution quoted above requires to be extended to all. It is a deprivation of property without due process of law, contrary to the Fourteenth amendment, because it amounts to the transfer by legislative fiat (in this case by an arbitrary fiat not legislative in character) of the property of one citizen to the ownership or use of another, or to the public at large, without the return of any just equivalent, which is tantamount to confiscation.

For all of these reasons such taking, either of the corpus of the property or of its use, is, so far as state action is concerned, prohibited by the Fourteenth amendment. No distinction is made between the physical seizure of the property and the taking of the use thereof. They are controlled by the same principles and governed by identical provisions of the Constitution. In either event the compensation must be *just*. There can be no doubt that the just compensation required by the Constitution must be a full and perfect equivalent for the property taken, or for its use, if that alone be taken.

In cases of condemnation or seizure the just compensation is measured by the value of the property taken and is equivalent thereto. In cases where the

use of the property is taken (possession and title being left with the owner), just compensation is again measured by the value of the property whose use is taken, and is equivalent to a fair and full net return upon such value. It follows that the owner of the property whose use is taken has an absolute constitutional right, not only to *some* net return, but to a *fair* and *full* net return upon the entire value of all of his property devoted to the public use. Anything less than this would result in the taking of private property for public use without *just* compensation, and therefore a denial of the equal protection of the laws and a deprivation of property without due process of law.

These principles are conclusively determined by repeated decisions, and are no longer open to question. Our apology for again restating them, and for citing authorities in their support, is found in the fact that appellants in this case have again questioned them and advanced inconsistent doctrines long since exploded.

From the beginning there has been no doubt that the constitutional provisions quoted above prohibited the actual physical taking by public authority of the corpus of private property without due process of law, or without making full compensation for the entire value of the property so taken. But the application of these constitutional provisions to the efforts of public authority to regulate and reduce the charges imposed by the owners of private property for its use in the service of the public, is a matter of relatively recent development. This is not because any different principle was involved in such application, but because the effort of public authority to regulate and

reduce such charges is relatively modern. When the matter first came to the attention of this court there was some hesitation in applying these constitutional provisions in their full scope to the new situation.

Munn vs. Illinois, 94 U. S., 113.

The Granger Cases; Chicago, etc. R. R. Co. vs. Iowa, and other cases following, 94 U. S., 155.

But in reality, as this court has observed in later decisions, these early cases went only to the point of determining that the right of legislative control of rates actually existed. The extent of that control was not decided.

In the Railroad Commission cases, 116 U. S., 307, 331, while the right of legislative control of rates was reaffirmed, a limitation on that right was plainly indicated when it was held that the legislative power does not extend to doing that "which in law amounts to a taking of private property for public use *without just compensation*, or without due process of law."

In Chicago, etc., Ry. Co. vs. Minnesota, 134 U. S., 418, 458, it was held that "if the Company is deprived of the power of charging *reasonable rates for the use of its property*," it is actually deprived of the property itself without due process of law, and "in so far as it is thus deprived while other persons are permitted to receive reasonable profits upon their invested capital, the Company is deprived of the equal protection of the laws."

In Reagan vs. Farmers' Loan & Trust Co., 154 U. S., 362, decided May 26, 1894, this court, speaking through Mr. Justice Brewer, made the matter very

clear. The previous decisions of the court were thoroughly reviewed, and it was held that the principles applicable to a rate case are the same as those which govern in a condemnation case, or when the seizure is of the corpus of the property. The fact that the railroad business, once entered upon, cannot be abandoned at will, was emphasized (this, of course, is equally true of the waterworks business), the contention that the railroads, if they did not like the rates imposed, could withdraw from the business, was sternly rebuked (p. 409), and the court concludes as follows (p. 410):

> "The equal protection of the laws, the spirit of common justice, forbids that one class should by law be compelled to suffer loss that others may make gain. If the state were to seek to acquire the title to these roads under its power of eminent domain, is there any doubt that constitutional provisions would require the payment to the corporation of just compensation—that compensation being the value of the property as it stood in the markets of the world, and not as prescribed by an act of the legislature? Is it any less a departure from the obligations of justice to seek to *take not the title but the use for the public benefit at less than its market value?*" (Italics ours.)

In Ames vs. Union Pacific, 64 Fed., 165, 176, decided November 12, 1894, Mr. Justice Brewer was within a few months after his decision in the foregoing case called upon to determine at Circuit another

rate litigation. He restated in even more emphatic language the doctrine enunciated in the preceding case, again held that a rate case is governed by exactly the same principles as a condemnation case, and that the owner of property taken or used is entitled to full and just compensation therefor, which, in either event, is measured by its value, no matter how or at what cost the property was acquired, and even though it may have been originally donated by the Government and so acquired without cost; and the learned Justice again emphasized the permanent character of a railroad investment, and the fact that it cannot be abandoned at will.

In Smyth vs. Ames, 169 U. S., 466, decided March 7, 1898, the foregoing decision of Mr. Justice Brewer was, on appeal, in all things affirmed. Mr. Justice Harlan delivered the opinion of the court, and after a full review of the authorities, announced in the most definite and unmistakable language the doctrine to which the court has ever since consistently and by repeated decisions unswervingly adhered. Among other things, the court says (p. 546):

> "But it is equally true that the corporation performing such public services, and the people financially interested in its business and affairs, have rights that may not be invaded by legislative enactment, in disregard of the fundamental guaranties for the protection of property. The corporation may not be required to use its property for the benefit of the public without receiving *just compensation* for the services rendered by it." (Italics ours.)

And as is clearly evident from the remainder of the opinion, what is meant by "just compensation" is a full and fair net return upon the present value of the property devoted to the public use.

As is manifest, the underlying thought in the foregoing decisions is that the property of a public utility, although embarked in a service in which the public is interested, nevertheless remains private property, as this court has frequently decided. (Interstate Commerce Commission vs. Chicago Great Western Ry., 209 U. S., 108, 118, 119.) The owners of a property may not be deprived thereof without due process of law, and neither the corpus of the property itself, *nor its use*, can be taken under public authority, or under guise of regulation, without due process of law, or without just compensation. The fact is emphasized that the private property necessary to afford the public service is invariably extensive, costly and permanently installed. Once embarked in the enterprise, it cannot be withdrawn without the loss of practically the entire investment, and without imposing upon the community served a hardship which in the case of a water-works plant would amount to a public calamity and possibly communal extinction. Moreover, the permanency and cost of the necessary plant are particularly emphasized in a water-works. That is conspicuously true in this semi-arid region. Therefore the principle of the foregoing decisions is peculiarly applicable. Once invested, the property cannot be withdrawn. When public authority reduces rates below a point where they afford a reasonable net return upon the fair value of the property devoted to the public use, such use is necessarily taken for the benefit of the public

without due process of law and without just compensation.

As was said by Mr. Justice Brewer in an early case (Chicago & Northwestern Ry. Co. vs. Dey, 35 Fed., 866, 880):

> "For a government, whether that government be a single sovereign or one of the majority, to say to an individual who has invested his means in so laudable an enterprise as the construction of a railroad, one which tends so much to the wealth and prosperity of the community, that, if he finds that the rates imposed will cause him to do business at a loss, he may quit business, and abandon that road, is the very irony of despotism. Apples of Sodom were fruit of joy in comparison."

In Shepard vs. Northern Pacific (Minnesota Rate Cases), 184 Fed., 765, it was said:

> "The value of property, of investment in every form, is measured by the value of its use, not by its use divorced from the value thereof."

In the Minnesota Rate Cases, 230 U. S., 352, the principle thus enunciated was affirmed, the court saying (p. 434):

> "But the state has not seen fit to undertake the service itself; and the private property embarked in it is not placed at the mercy of legislative caprice. It rests se-

> cure under the constitutional protection, which extends not merely to the title, but to the right to receive *just compensation* for the service given to the public." (Italics ours.)

And from the remainder of the opinion it is plainly evident that what is meant by "just compensation" is a fair and full return upon the reasonable value of the property devoted to the public use.

We do not attempt to cite the many cases in which this doctrine has been repeatedly reaffirmed.

In Cole & Coke Ry. Co. vs. Conley, 67 W. Va., 129; 67 S. E., 613 (a case which has received the approval of this court: Norfolk & Western Ry. Co. vs. Conley, 236 U. S., 605, 608), the principle is thus stated:

> "The taking of private property for public purposes without compensation to the owner thereof, is termed 'confiscation,' and the right to confiscate property can be legally exercised only against the public enemies, as a military measure. Citizens are protected from it in this country by the constitutional guaranties, just referred to. An attempt on the part of the state to take the corpus of a citizen's property for public use, without compensating him therefor, under color of law, is a void and wrongful act, confiscatory in form only, not in reality, because contrary to law, but called confiscatory for convenience. As the right to use property for any lawful purpose to *the ex-*

tent of the realization therefrom of a return or reward, commensurate with the reasonable and just value of such use, is an element of property, property itself pro tanto, since, without the right of such use, it would be wholly or partially valueless, according to the extent of the restraint upon its use, *deprivation of the use thereof, or denial of the power to earn such reasonable and just return or reward,* by the use thereof, in whole or in part, without compensation therefor, amounts to such wrongful taking thereof, and, therefore, to confiscation within the meaning of the decisions in cases of this kind. To constitute such confiscation, the taking need not extend to the corpus of the property nor total deprivation of reward for the use thereof. If the law renders it impossible to obtain from the use of the property *a reasonable and fair return,* it is confiscatory in its operation and effect, though valid on its face. The extent of such deprivation is not the test. Whether a statute is thus confiscatory does not depend upon the *amount it takes,* in violation of the Constitution, or the extent to which it interferes with the right of use of property, guaranteed by the organic law. *It is void, if it so takes any at all or so interferes to any extent whatever.* It is condemned, not by the extent of the pecuniary injury wrought, but by its transgression of constitutional limits, its invasion of a constitutional right, as sacred to corporations as to the humblest citizen of the

> land, and justly so, for the reason, among others, that the property of corporations is in fact the property of citizens, and the law cannot and ought not, in its ultimate results, to favor one citizen or class of citizens over another." (Italics ours.)

It follows inevitably, and has been determined by conclusive judicial precedent, that appellee is, as a matter of constitutional right, entitled to receive just compensation in the form of a fair and full net return upon the fair value of its property devoted to the public use. If the rates in question here afford less than this they are beyond doubt confiscatory. What rate of return is the least which will escape the charge of confiscation is a question which we shall take up later on.

2. *The Present Is Not One of Those Rare Cases Where Fair Rates, Determined upon the Foregoing Principles, Would Exceed the Value of the Service to the Consumer.*

The Master found (Record, p. 140, finding 53):

> "The evidence shows the service of the Water Company is of such value as to render fair to the public rates which are sufficient to yield a fair return on the reasonable value of the property devoted to the use of the public."

This finding was not excepted to, nor is any error assigned thereon. It is therefore conclusive.

In the preceding portion of this brief we have demonstrated that under rates prescribed by public authority, the utility has an absolute constitutional right to a fair and full net return upon the value of the property devoted to the public use. To this rule there is but one possible exception.

In Wilcox vs. Consolidated Gas Co., 212 U. S., 19, at 52, and in San Diego Land & Town Co. vs. Jasper, 189 U. S., 439, 442, 446, 447, the court intimated, but did not hold, that to the foregoing absolute rule there could be only one exception, applicable to those cases where the property constituting the plant had so enormously increased in value, or the plant was so overbuilt or misplaced as to render rates determined upon the foregoing principle greater than the value of the service to the consumer.

But this is not such a case. The Master's finding quoted above conclusively so determines. No claim is here made that this plant is overbuilt or misplaced, or that its value, as determined by the Master, is so great as to render fair rates measured thereby greater than the value to the public of the service which it gives.

The Master's finding is amply sustained by undisputed evidence.

The evidence shows without dispute that the rates which were being imposed by the Company at the time when the present attempt to reduce them was made, were far less than the reasonable value of the service to the consumer.

Mr. Allen Hazen, chairman of the former board of appraisers, whose qualifications are stated in the record (Record, p. 226), gave careful study to the

question of Denver rates, that being one of the duties imposed upon the former board of appraisers by the ordinance and contract under which they were acting. His extended experience in such matters, his intimate knowledge of conditions prevailing in Denver and in other cities, and the eminent fairness which he displayed in his testimony in this case, render the statements of this distinguished engineer of controlling importance. Speaking of Denver rates, he says (Record, p. 234):

> "The actual value of water service rendered is enormously greater than the rates charged. Rates could be established to amortize nine or ten million dollars in from 5 to 7 years, and still be fair to the consumers."

> (p. 236): "Existing rates would have to be nearly doubled to amortize the loss of nine or ten million dollars which will occur from the city's building its own plant."

Moreover, the engineers appointed by the Public Utilities Commission (Fellows, Van Diest and Allen), in the course of the investigation which culminated in their report of January, 1914, had free access to the Company's records, and from them determined the gross earnings, operating expenses and net earnings for each year of the Company's life (1895 to 1913, inclusive), and set forth these facts in detail in the written report which they filed (Exhibits A-65 and A-106, neither of which is produced here). They likewise testified concerning them when called as witnesses in this case (Record, pp. 427, 428, 429,

902). These engineers found, reported and testified that the net return to the Company even upon the going rates, and upon assumptions as to value, and other basic facts which plainly did the Company injustice, had throughout the Company's history been grossly inadequate and they strongly recommended against any present attempt to reduce the rates, even though the City should, as they also strongly recommended, purchase the plant. The present attempt to reduce the rates followed immediately upon the heels of this report.

Upon this subject the evidence is all to one effect, and the fact is established beyond peradventure of doubt.

3. *Appellants' Contention that Any Return, No Matter How Small, in Excess of Actual Operating Cost, Will Avoid the Charge of Confiscation, Wholly Untenable.*

In appellants' brief the assertion is made, and frequently reiterated, that if the ordinance rates afford any return, no matter how small, in excess of actual operating cost, the rates are compensatory and not confiscatory, and the court is not at liberty to determine whether such net return is in fact insufficient. (See appellants' brief, pp. 10, 17, 19, 22, 89, 94, 100 to 112.)

If counsel really mean what they apparently in plain words say, the assertion is amazing. It is an astonishing thing that one who is intellectually honest can at this date advance such a doctrine.

Since 1894, when Reagan vs. Farmers' Loan & Trust Co., 154 U. S., 362, was decided, and, beyond

question, since 1898, when Smyth vs. Ames, 169 U. S., 466, was decided, no doubt whatever has existed that what the utility was entitled to receive was not only *some* net return upon the present value of its property, but a *fair and full* net return thereon. The authorities cited in subdivision 1 of this portion of our brief (*supra*, p. 95), as well as a multitude of other decisions which might be cited, and with which all should now be familiar, demonstrate this to a certainty.

The courts have clearly recognized that confiscation could as well occur by permitting an unfairly low rate of return upon a fair valuation as by permitting a fair rate of return upon an unfairly low valuation. Fair rate of return is as important as fair value, and for precisely the same reason.

The theory that any reward in excess of actual cost of operation was sufficient to escape the charge of confiscation was entertained in certain quarters in the era of the Granger cases, but was entirely exploded more than twenty years ago.

What that fair rate of net return upon the present fair value must in the case of the Denver Union Water Company be, to avoid a charge of confiscation, is more fully dealt with in a later portion of this brief. What that fair rate of return should in any particular case be is dependent upon circumstances, many of which are recited by this court in Wilcox vs. Consolidated Gas Co., 212 U. S., 19, decided in 1909. In that case it was expressly held that the Consolidated Gas Company of New York, recognized by the court as the most favorably situated and least hazardous public utility investment in this country, was

entitled to a net return upon the present value of the entire property, at the rate of 6 per cent. per annum, and that anything less than that would be confiscatory. If this be true of the Consolidated Gas Company, having practically a perpetual monopoly of the gas business in the largest city in America, what must be the necessary rate for The Denver Union Water Company under the conditions prevailing here? To say that a net return of at least 8 per cent. is requisite, is to make an extremely modest claim.

The authorities cited and apparently relied upon by appellants in this connection either do not at all support appellants' contention, or else are decisions made by the lower Federal courts or by the state courts, prior to the time when the doctrine which is now firmly settled had been clearly enunciated by this court.

The cases of Reagan vs. Farmers' Loan & Trust Co., 154 U. S., 362, and Water District vs. Water Co., 99 Maine, 371, refer to the fact that the value of the service to the consumer must be considered. As we have already demonstrated, this was considered in the case at bar, and it was conclusively shown and expressly found that rates sufficiently large to produce a fair net return upon present fair value certainly would not exceed the value of the service to the consumer.

San Diego Water Co. vs. San Diego, 118 Cal., 556, is several times cited by appellants and is quoted from at page 16, *et seq.*, of their brief. Appellants' quotation and their deductions therefrom are taken not from the opinion of the court but from a specially concurring opinion which, upon the proposi-

tion here involved, was in fact a dissenting opinion. The San Diego case was decided by the Supreme Court of California in 1897. The court consisted of seven members. As shown by the head-notes (118 Cal., 558), four of the judges, being a majority of the court, concurred in holding:

> "The question of just compensation is a judicial question, to be determined in the ordinary course of judicial proceedings, and the Water Company is entitled to a net compensation at least equal to the lowest current rate of interest on the basic value of its plant properly ascertained."

Three of the judges, being a minority of the court, concurred in holding:

> "The court has no power to determine any limit of just compensation, but only to inquire whether some compensation, however small, is allowed, and the question of the extent or limit of such compensation is for the municipal body alone to determine."

It is upon the latter or minority opinion that appellants rely, and from which they quote. Not only is the opinion relied upon that of the minority, and in effect a dissenting opinion, but it was delivered prior to the decision of this court in Smyth vs. Ames, and the principle which it announces is in direct conflict with that decision and many later decisions of this court.

Wilcox vs. Consolidated Gas Co., 212 U. S., 19, is referred to by appellants, but the reason therefor

is not apparent. In that case this court, after commenting on the safety and desirability of the investment, in which the element of risk was reduced to the minimum, said (p. 49):

> "Under the circumstances, the court (below) held that a rate which would permit a return of six per cent would be enough to avoid the charge of confiscation, and for the reason that a return of such an amount was the return ordinarily sought and obtained on investments of that degree of safety in the City of New York. Taking all facts into consideration, we concur with the court below on this question, and think complainant is *entitled* to six per cent on the fair value of its property devoted to the public use." (Italics ours.)

The decision last mentioned is, of course, destructive of appellants' contention, and is the foundation of our argument to the contrary.

Knoxville vs. Knoxville Water Co., 212 U. S., 1, much relied upon by appellants, is cited in support of this proposition, at page 105 of their brief. The Knoxville case and the Consolidated Gas case were decided on the same day, and the two opinions must be read together to determine the attitude of the court.

In the Knoxville case the decree was reversed, not because the court below had required too large a rate of net return, but because the proof as to the value of the property and as to the amount of the net return under the ordinance rates had been in-

sufficient and unsatisfactory. The court does not rule at all upon the question as to what rate of return is requisite, but expressly refrains from so ruling. All that is said upon this point is (212 U. S., 17):

> "The net income in any event would be substantially six per cent, or four per cent after an allowance of two per cent for depreciation. * * * We cannot know clearly that the revenue would not much exceed that return. We do not feel called upon to determine whether a demonstrated reduction of the income to that point would or would not amount to confiscation."

Moreover, in the Knoxville case it appeared (p. 9) that in determining valuation no deduction whatever had been made for accrued depreciation. Manifestly, this deduction should have been made, as this court held. And as this court also held, if the least possible deduction on that account had been made, the net return as found by the court below would have been equivalent to a rate of return in excess of 6 per cent.

Upon this subject the court said (p. 10):

> "It is enough to say that there should have been a considerable diminution, sufficient at least to raise the net income found by the court above six per cent. upon the whole valuation thus diminished. If, for instance, the master's valuation should be diminished by $50,000 allowed for depreciation, the net

> earnings *found by him* would show a return of substantially 6.5 per cent."

And in the succeeding portions of the opinion it is plainly demonstrated that the net earnings found by the Master were certainly much lower than those which would be actually realized.

In the Knoxville case it is perfectly evident that with the valuation decreased and the net earnings increased to the extent required by this court's demonstration, the resultant net return would have been very much greater than the 6.5 per cent.

But it is plain, from what was held by this court on that very day in the Consolidated Gas case (212 U. S., 49, 50), quoted above, that if in the Knoxville case it had been clearly shown that the net return would not have been at least 6 per cent, the rates would have been declared confiscatory.

Chicago & Northwestern Co. vs. Dey, 35 Fed., 866, cited and quoted from at page 18 of appellants' brief, was a decision by Mr. Justice Brewer at Circuit, rendered in 1888. It is in many respects an instructive and valuable opinion, and has hereinbefore been referred to by us. But upon the point now under discussion it is in direct conflict with later decisions of this court, including some announced or participated in by Mr. Justice Brewer himself.

In preceding pages we have traced the growth of the present doctrine, and the progress of the decisions by which it has been firmly fixed (*supra*, pp. 95 *et seq.*).

Cedar Rapids Water Co. vs. City of Cedar Rapids, 118 Ia., 234; 91 N. W., 1081, was decided in 1902, long prior to the decision of this court in the Con-

solidated Gas case (212 U. S., 19), and its many other decisions by which the prevailing doctrine has been fully settled. It is sufficient to say that the decision of the Iowa court, in so far as it tends to support appellants' contention, which it does but slightly, is in conflict with these.

Steenerson vs. Great Northern Ry. Co., 69 Minn., 363; 72 N. W., 713, cited at page 102 of appellants' brief, was decided in 1897, and is therefore prior even to the decision of this court in Smyth vs. Ames (169 U. S., 466). It is in the same situation as the Iowa decision last mentioned, and the same comments are applicable.

We submit that appellants' contention mentioned in the foregoing headline is without the slightest foundation or excuse either in principle or authority.

4. *Appellants' Contention that Gross and Net Earnings under the Ordinance Rates Not Sufficiently Proven Is Wholly without Merit and in Conflict with the Record.*

Upon this phase of the case the contention outlined in the foregoing heading is the principal, if not the only, contention made by appellants. The method of argument pursued is to assert baldly, without any reference to the record, that this or that was or was not shown by the evidence, followed by the challenging demand that if such be not the case, it is the duty of appellee to point it out. The basis of the argument is the false assumption that because rates were prescribed by a municipal ordinance, therefore a strong presumption of their validity exists which can only be overcome by the most complete, specific and

convincing proof. As we have already pointed out (*supra*, pp. 56 *et seq.*), the ordinance here involved is, to say the least, aided by no such presumption.

But we are now in an appellate court, wherein appellants are the moving parties, and are seeking to have set aside and reversed the finding and decree of the Special Master and of the court below. The presumption is that such finding and decree are correct. Certainly, there is no presumption that they are erroneous. The burden rests upon the appellants to clearly point out and amply demonstrate the errors which they claim. That burden is not satisfied by making an unfounded assertion in emphatic language, and then calling upon appellee to disprove it. And yet such is the method pursued throughout appellants' argument.

As we have already demonstrated, the objections which appellants seek to make are not open upon this record; but if they were, the result must be the same.

We submit with respectful but perfect confidence that every detail pertaining to the gross earnings and the net return under the ordinance rates was shown by proof which was specific to the most minute particular and conclusive in every respect. The Master found that it demonstrated the fact "beyond any reasonable doubt." (Record, p. 120, Finding 8.)

For the purpose of collecting and presenting to the Master the facts pertaining to this branch of the case, appellee employed Thomas Cheyne, a certified public accountant connected with the firm of Haskins & Sells of New York City. He made a careful study of the financial records of the Water Company covering the entire period of its existence from the date of its organization in 1894 to the date when Mr.

Cheyne testified before the Master. This investigation consumed more than eight months (Record, p. 346). Mr. Cheyne's conclusions were based upon the Company's vouchers, which he had carefully examined and checked, and which constituted the original sources of information. The facts ascertained in this way by Mr. Cheyne were set forth in a series of carefully prepared, elaborate and detailed exhibits, only a few of which have been brought to this court. These exhibits were:

Exhibit Z (Record, p. 926), a detailed statement of the actual cost, not including overhead charges, of additions, extensions and betterments made since the appraisement of 1908.

Exhibit A-55 (not included in this record), a detailed statement, by years, of expenditures, covering the actual cost of additions, extensions and betterments to the property of the Water Company in each year from the organization of the Company in 1894 to March 31, 1914. This exhibit showed with great particularity the precise items. And in each instance the exact nature and cost of the work.

Exhibit A-56 (Record, p. 990), a detailed statement of gross earnings, operating expenses, taxes and net earnings, without the deduction of any depreciation allowance, for the 19 years ending October 31, 1913.

Exhibit A-57 (not included in this record), a detailed statement of gross and net earnings under the ordinance rates for calendar year ending April 30, 1915, based on the business done, and the operating expenses and taxes actually paid by the Company in the preceding fiscal year, which ended October 31, 1913. This exhibit was prepared and produced be-

fore the results of the fiscal year ending October 31, 1914, were known. Months later, when Mr. Cheyne testified in rebuttal, Exhibits A-73, A-74 and A-107 were prepared and presented by him after the actual results of the fiscal year ending October 31, 1914, had been ascertained. The exhibits last mentioned show the actual results during a period of six months (May 1 to October 31, 1914), to which the ordinance rates were applicable and are based upon the business actually done, and the operating expenses and taxes actually incurred and paid during said period.

Exhibit A-58 (not included in this record), a detailed statement of gross earnings, operating expenses, taxes, and consequent net earnings for the six-months period ending April 30, 1914, and also for the six-months period ending April 30, 1913.

Exhibit A-73 (not included in this record). As stated above, this exhibit was prepared and presented after the actual result of the first six months' operation under the ordinance rates was ascertainable. It sets forth in detail for said six-months period ending October 31, 1914, the gross earnings, both under the leaflet or Company rates, and under the ordinance rates, the operating expenses and taxes actually incurred and paid, and the resultant net revenue for said six-months period, both under the leaflet or Company rates and under the ordinance rates.

Exhibit A-74 (not included in this record), a detailed statement of the gross earnings, operating expenses, taxes, and consequent net earnings for the fiscal year ending October 31, 1914, and also for the fiscal year ending October 31, 1913.

Exhibit A-107 (Record, p. 1080), a detailed statement of gross earnings, operating expenses, taxes and net earnings for the fiscal year ending October 31, 1914; also a detailed statement of the gross and net earnings under the ordinance rates for the year beginning May 1, 1914, and ending April 30, 1915, based, as to the first six months of said year, upon the business actually done, and the operating expenses and taxes incurred and paid during said period; and as to the second six months of said year, based upon the business done, and the operating expenses and taxes incurred and paid during the corresponding six months of the preceding year.

Exhibit A-108 (Record, p. 1080), a complete and detailed statement by years for the five years ended October 31, 1914, of the cost of repairs charged to and included in the operating expenses as set forth in the other exhibits which had been presented by Mr. Cheyne.

Exhibit 17 (not included in this record), an itemized statement of office, legal and general expenses of the Water Company, charged to operating accounts, and to addition, extension and betterment accounts, in each of the twenty years of the Company's life. Exhibit 17 was prepared at the request of and introduced by the appellants.

An inspection of these exhibits would demonstrate the care with which they were prepared and the detailed information which they furnished.

Mr. Cheyne was called as a witness, and the exhibits mentioned were presented by him and fully explained. His testimony in chief begins at page 346 of the record. His testimony in rebuttal, given months

later, will be found at pages 798 and 898 of the record.

As stated above, these exhibits were based upon the original vouchers of the Company, all of which had been inspected by Mr. Cheyne. Obviously, these vouchers, covering, as they did, a period of more than twenty years, were exceedingly numerous. It was not possible, nor would it have been permissible, to produce them all before the Master. Consequently, while Mr. Cheyne was on the stand, and as these exhibits were being introduced, the offer was made and constantly kept open to produce the voucher or vouchers covering any charge or item embraced in these exhibits which the defendants (appellants here) might see fit to question or call for. The defendants took advantage of this offer and made many such requests, all of which were promptly complied with. This the record now before the court demonstrates (Record, pp. 351, 352, 801).

In addition to that, at the conclusion of Mr. Cheyne's testimony, and after the detailed exhibits which he had prepared were introduced, counsel for defendants (appellants here) requested, and plaintiff (appellee here) promptly consented, that the Special Master should appoint a competent accountant of his own selection, who should, as the representative of the defendants, examine the books, accounts and vouchers of the Water Company upon which Mr. Cheyne's exhibits and testimony had been based, and so check and determine the accuracy of said testimony and said exhibits (Record, p. 801). Accordingly, the Master selected and appointed Horace Hilton Mitchell, a certified public accountant, residing at

Colorado Springs, who made said investigation and check, filed a written report thereof and testified as a witness for defendants. His testimony will be found at page 902 of the record. His report, which is specific, detailed and comprehensive, is Defendants' Exhibit No. 72, and with its attached exhibits covers pages 1101 to 1114 of this record. The result of Mr. Mitchell's examination of the vouchers was to verify in every respect the testimony and the exhibits proffered by Mr. Cheyne. Mr. Mitchell concludes his written report as follows (Record, p. 1102):

> "In conclusion I would state that I have not experienced or noticed the slightest inclination or disposition on the part of anyone connected with the Company to conceal anything appertaining to the accounts in question. I wish here to record my appreciation of the universal courtesy extended to me, and the assistance rendered in the way of information, when requested, by all the officers and employes while making the examination and verification."

In addition, Mr. Metcalf, whose high qualification as an operator and administrator of water works are set forth in the record, made an investigation of the gross revenue, operating expenses and net earnings under the going rates for each year of the entire period of the Company's life; also a forecast respecting like items for ensuing years, to and including 1923; and the result is set forth in Exhibit C, at pages 105 to 107. He also prepared and produced another exhibit (not included in the present record), giving

the same information in great detail, with the items fully particularized (Exhibit A-20, Record, p. 269). Moreover, the engineers appointed by the Public Utilities Commission (Fellows, Van Diest and Allen), in the course of the investigation which culminated in their report of January, 1914, had free access to the Company's records, and from them determined the gross earnings, operating expenses, and net earnings for each year of the Company's life (1895 to 1913, inclusive), and set forth these facts in detail in the written report which they filed (Exhibits A-64 and A-106, neither of which is produced here). They likewise testified concerning them when called as witnesses in this case (Record, pp. 427, 428, 429, 902).

These engineers found, and stated in their written report, that the net return to the Company, even under the going rates and upon assumptions as to value, and other basic facts, which plainly did the Company injustice, had throughout its history been grossly inadequate, and in said report they strongly recommended against any present attempt to reduce the rates, even though the City should, as they also strongly recommended, purchase the plant.

The record demonstrates beyond peradventure of doubt that all facts pertaining to the inquiry were brought before the Master; that everything pertinent to this subject shown by or obtainable from the records of the Company, was freely produced, and that all of them were thoroughly investigated and checked by the defendants, through an expert accountant representing the defendants, but at their request, and, with the consent of the plaintiff, chosen by the Master, who was given free access to every record which the Company possessed. How else can

such facts as these be proven? In what respect is evidence thus adduced lacking in particularity? In what respect has appellee sought to conceal or failed to disclose any item of information relevant to the inquiry or sought by defendants? In the face of this record, how can counsel for appellants conscientiously make the extravagant assertions upon this subject with which their brief abounds? We submit that the evidence more than sufficed to satisfy the strictest rule concerning the burden of proof. It is certain that it not only plainly justified the Master's findings, but also that it served to convince the defendants and those who represented them in the court below.

The authorities cited by appellants and relied upon in this connection are wholly inapplicable.

Chicago, etc., Ry. Co. vs. Wellman, 143 U. S., 339, cited at page 21, and again cited and quoted from at page 95, of appellants' brief, involved a friendly suit, wherein there was no evidence whatsoever upon the subject here involved, the whole matter being covered by a stipulation of facts between friends, both interested in reaching the same result. It was obvious that the suit had been devised and was brought as a test case, in the interest of the railroad. Neither the state nor the public participated therein, and the proceeding was not adversary in any sense of the word. Under such conditions it is no wonder that Mr. Justice Brewer, speaking for this court, employed the language quoted at page 95 of appellants' brief. But what has that to do with such a situation as is here presented? Here the proceeding was in every sense adversary and bitterly contested at every step. The City, the Public Utilities Commission and the

public were represented by able counsel. Nothing was conceded, and every fact was shown by the most specific proof which could be produced. The records of the Company were thrown open to the defendants and carefully checked and examined on their behalf. The result is the Master's finding. What more can appellants ask, and what better or more specific proof could possibly have been made?

5. *Appellants' Contention that the Ordinance Rates Should Be Submitted to a Practical Test, Wholly Untenable.*

The contention outlined above is repeatedly urged by appellants (their brief, pp. 21, 106, 107, 112, 118). It is without the slightest foundation or excuse, and in direct conflict with the findings of the Master, and with express admissions by defendants and stipulations of the parties in the court below.

Appellants ignore the fact that nine months had elapsed between the date when the new rates by the terms of the ordinance were effective and the date when the evidence before the Master was closed, and that the result of the operations during this period was clearly shown and the Master's finding expressly based thereon (Exhibits A-73, A-74, A-107, Record, p. 1080, and Finding 50, Record, p. 139). The exhibits referred to above show the actual revenues which would have accrued under the ordinance rates for the first six months during which they would have been in effect.

Appellants ignore the fact that by paragraph eighteenth of the bill of complaint (Record, p. 77) it was expressly alleged that the number of con-

sumers, the quantity of water consumed, and the consequent gross revenue will be no greater, and the operating expenses, taxes and other costs no less in the future than in the past, and that these allegations are not at all denied in the answer, and therefore stand confessed. (Equity Rule 30.)

Appellants ignore the fact that when appellee undertook to prove the truth of said allegations in its bill, by the testimony of witnesses, defendants (appellants here) objected to such testimony as immaterial and irrelevant, because the fact was not disputed, and expressly stipulated and agreed in the presence of the Master "that no contention is made, or will be made, that a reduction of the schedule of rates would cause an additional consumption of water or a larger income even at the lower rates." Upon this concession, and because of this stipulation, the Master excluded the testimony (Record, p. 792; side number 989).

It must be borne in mind that in Denver, water is furnished, and by the new ordinance was required to be furnished, under a flat schedule of rates, whereby the consumer, upon the payment of a certain sum, is entitled to take all the water he needs for a specified period. It is obvious that under this plan increased consumption does not result in increased revenue.

Under such circumstances, and in view of the fact that the net return, shown as an absolute certainty to be the result of the reduced rates, is so far below what is necessary to escape the charge of confiscation, we respectfully submit that there is no possible excuse for requiring the plaintiff to sacrifice its

property for the purpose of useless experiment. It must be remembered that such an experiment is to be made solely at the expense of the plaintiff and at a cost to it of several hundred thousand dollars per annum, which it can never recover back. Upon any fair value which it is possible to spell out of the testimony in this case, the yield of the ordinance rates is far below the line of confiscation. There is no possible justification for further experiment.

In support of this contention appellants refer to Knoxville vs. Knoxville Water Co., 212 U. S., 1, but that case is distinguishable from this upon almost every conceivable ground. There the decree was reversed because of obvious and gross errors which had occurred in determining the valuation, and also in determining the yield of the new rates. There the ordinance became effective March 30, 1901 (p. 6). The suit was begun nine months after its effective date and tried considerably later. In the meantime the company's gross income had largely increased. Notwithstanding this, the decision of the court below was based solely on the operations of the fiscal year preceding the enactment of the ordinance (p. 14).

Here the Master, after having been fully informed concerning the result of the Company's operations for every year during the twenty years of its life, including its operations for the first six months after the effective date of the ordinance rates, reached his conclusions, basing them largely upon the result of operations during said six months' period. Moreover, the evidence here shows that during said six months the gross revenue did not increase, but, on the contrary, remained stationary, or possibly de-

creased; and it is fair to state that said condition continues to the present day.

In the Knoxville case (p. 9) value was determined without the deduction of any accrued depreciation, and this court found (p. 10) that if the most reasonable deduction for accrued depreciation had been made, the net earnings found by the Master "would show a return of substantially 6.5 per cent."

In the case at bar an ample deduction for accrued depreciation was made, the sufficiency of which appellants do not question, with the result that the net earnings found by the Master (Record, p. 139, Finding 51) show a return of only .0364.

In the Knoxville case (p. 12) it appeared that in determining the net earnings under the ordinance rates the Master had improperly reduced them, in a large amount, by deducting a discount not required or permitted by the ordinance. Of course, no such thing occurred in the case at bar.

In the Knoxville case it appeared (p. 12) that the Master in determining the reduction in earnings caused by the ordinance had improperly applied such reduction to rates paid by users outside of the city, not affected by the ordinance. In the case at bar (Record, pp. 138, 139, Finding 49) the Master took the opposite and proper course, and in addition took into account a possible increase of revenue on certain items to the amount of about $16,000.00, which the new ordinance was said to permit, although it was very doubtful whether it would result or could be collected.

In the Knoxville case (p. 15) there was no attempt to show the result of operations during the

period succeeding the enactment of the ordinance, although many months had elapsed. In the case at bar the evidence was full and complete concerning the period which had elapsed since May 1, 1914, the date when the ordinance by its terms became effective.

We submit that under no possible circumstances can the Knoxville case be regarded as a precedent supporting appellants' contention.

Appellants likewise refer to Wilcox vs. Consolidated Gas Co., 212 U. S., 19. This also was a case in which no evidence whatsoever was given concerning the result of operations subsequent to the date when the rates complained of were prescribed. It concerned a gas company whose product was sold at a fixed price per thousand cubic feet, and so required to be sold under the new rates, which reduced the price. Obviously, in such a case an increased consumption necessarily results in increased revenue. Moreover, after the valuation had been reduced, as this court held that it must be, the net return, as found by the court below, substantially equalled, if it did not exceed, six per cent. per annum. Under these circumstances the court suggested that the case was an appropriate one for a practical test of the rates, but said (p. 42):

> "Of course, there may be cases where the rate is so low upon any reasonable basis of valuation that there can be no just doubt as to its confiscatory nature, and in that event there should be no hesitation in so deciding and in enjoining its enforcement, without waiting for the damage which must inevitably accompany the operation of the business under the objectionable rate."

Plainly, the case cited affords no support for appellants' contention.

Both this court and the lower Federal courts have repeatedly refused to subject the utility to the inevitable loss which must result from the so-called practical test.

Seaboard Airline Co. vs. Railroad Commission, 155 Fed., 792, 808.

Central of Georgia vs. Railroad Commission, 161 Fed., 925, 991.

Love vs. A., T. & S. F. Ry. Co. (C. C. A., 8th Cir.), 185 Fed., 321, 326.

Ames vs. Union Pacific, 64 Fed., 165.

Smyth vs. Ames, 169 U. S., 466.

Arkansas Rate Cases, 187 Fed., 290, 309.

Arkansas Rate Cases, 230 U. S., 553.

In the Minnesota Rate Cases (230 U. S., 352) there had been no practical test of the rates. When the cases came to this court the decrees were reversed as to certain of the railroads, because of manifest errors which had been made in the determination of value and in the apportionment of said values, and of operating expenses between interstate and intrastate business. But the lack of a practical test was in no wise criticised.

But in the case of the Minneapolis & St. Louis Railroad Co. (230 U. S., 469), where, also, there had been no practical test, and where the valuation had been determined, and it and the expenses apportioned in exactly the same way as in the other cases, this court nevertheless affirmed the decree enjoining the

new rates, because (p. 472) the rate of net return which they permitted was manifestly very low. It is interesting to observe that the rate of net return so condemned was approximately that found to exist and condemned as confiscatory in the case at bar.

In Lincoln Gas & Electric Light Co. vs. City of Lincoln, 223 U. S., 349, suit was brought before the ordinance became effective, and, of course, without trial of the rates. The trial court (182 Fed., 926) denied the injunction. But this court (223 U. S., 357) reversed the decision and approved the continuance in effect of the temporary injunction which had been allowed at the beginning.

In the recent Arkansas Rate Cases (Boyle vs. St. L. & S. F. R. Co., 222 Fed., 539; Rowland vs. Boyle, 244 U. S., 106) suit was brought before there had been any practical test of the rates. They were never actually put in effect. But a test period of two months (November and December, 1913) was employed for the purpose of determining the effect of the prescribed rates upon the company's net return. (In the case at bar the test period was six months.) Upon the result of this test the rates were adjudged confiscatory by the lower court.

When the case reached this court (244 U. S., 106) the decree was affirmed, the sufficiency of the test and the propriety of the method adopted by the court below being in all respects approved. Upon this subject the court said (p. 109):

> "We agree with the District Judge that the two months of investigation afforded a basis for argument as to constant conditions. * * *

(P. 110.) The railroad, after getting the actual returns at the three-cent and two and one-half-cent passenger rate, and the freight rates allowed by the court, deducted the sums necessary to bring the revenue down to what it would have been had the state rates been followed. It is objected that this does not allow for the increase of travel that would follow the reduction. The railroad replies, and the court below found, that the increase is mainly at the expense of interstate revenue, when the combined local rates are less than the interstate one. Whether this exhausts the matter or not, we are of opinion that upon this record the supposed increase is too conjectural properly to affect our conclusion. The direct effect of the reduction is plain. The remote one is at best a guess."

The test applied in the case at bar was more extensive and therefore more conclusive than in the case last cited. It covered a period of six months instead of two months, and, as pointed out above, there is no room for the contention that the lowering of the rates would result in an increase of revenue.

6. *Gross Revenue.*

The Master found (Record, p. 138, finding 49) that the gross return for the year beginning May 1, 1914, and ending April 30, 1915, under the ordinance rates, would have been $1,093,615.45. In arriving at this figure he excluded the slight revenue from the

ranches, because he had excluded the value of the ranches from the rating base. In this figure he included all uncollected earnings which had accrued during the year in question. Moreover, so that no possible injustice might be done to appellants, he added the sum of $16,560.40, which possibly, though not probably, might, under the new ordinance, have been collected on certain items. He included without reduction all sums paid by consumers, or under rates, not affected by the new ordinance.

This finding of the Master is not excepted to, nor is it the subject of any assignment of error. We submit that it is conclusive and not open to question by appellants.

But passing this, the Master's finding is supported by most positive and convincing proof, which in the court below was entirely undisputed.

The sole criticism here made is that the Master took the year 1914 as the only basis of anticipating the gross returns of the Company. The Master had before him the entire financial history of the Company, including the result of its operations, for each of the 20 years of its life, and including also a forecast made by experienced and informed witnesses, extending for several years into the future. Doubtless the Master, in reaching his conclusion, gave consideration to all of these matters.

Even if we assume, as appellants do, that the Master's finding was based upon the business done in the fiscal year 1914, it is clear that appellants' criticisms are totally unjustified. The year 1914 means the fiscal year ending October 31, 1914. The ordinance here in question was effective May 1, 1914.

Obviously, therefore, the fiscal year in question included six months of the period during which the ordinance would have operated. The other six months of said year immediately preceded the date when the ordinance became effective. What more appropriate period could be adopted for the test in question?

Appellants say (their brief, p. 93) "that the gross earnings of the Company for the year 1914 were $47,067.30 less than for the year 1913, and $48,341.66 less than for the year 1912." This is absolutely untrue.

Exhibit A-107 (Record p. 1080) shows for the fiscal year ending October 31, 1914, gross earnings on the leaflet or Company rates of $1,323,366.65. Exhibit A-56 (Record, p. 990) shows gross earnings upon the same rates for the fiscal year ending October 31, 1913, of $1,354,242.33, and for the fiscal year ending October 31, 1912, of $1,368,558.90. These were the gross earnings from water service, and, obviously, they alone are to be considered. The Master's finding was required to be and was confined to such gross earnings. The figures set forth above indicate that the gross earnings for 1914 were $30,879.68 less than for 1913, and $45,192.25 less than for 1912; but, as is shown by said Exhibit A-56, they equalled those for 1911 and exceeded those for any previous year in the Company's history. But the evidence shows without dispute (Record, pp. 800, 801, Exhibit A-107, note (a), Record, p. 1080) that the delinquent water license payments at the end of the fiscal year 1914 amounted to $37,619.70, as compared with $6,152.55 at the end of the fiscal year 1913, the latter amount being about the normal amount of such delinquencies. In the note at the foot of said Exhibit A-107 it is stated:

> "Had the amount of such delinquent water license payments been the same at the close of such fiscal year (1914) as it was at the beginning, and the difference been collected by the Company during the intervening period, the gross earnings from water licenses, and consequently the net earnings for the year ending October 31, 1914, would appear approximately $31,467.15 greater, and those for the fiscal year ending April 30, 1915, (under the new ordinance rates) approximately $25,173.72 greater."

It is therefore clear that to make a just comparison between the gross earnings for 1914, as shown by Exhibit A-107, and the gross earnings for the year 1913 and preceding years, as shown by Exhibit A-56, $31,467.15 must be added to the gross earnings for 1914. With this addition made, the result is $1,354,833.80 as gross earnings under the Company's leaflet rates for the year ending October 31, 1914. This sum slightly exceeds the gross earnings for the year 1913, approximately equals those for the year 1912, and is substantially in excess of those for any preceding year in the Company's history.

In determining net earnings under the ordinance rates the Master added the sum of $25,173.72, on account of delinquent water license payments, in accordance with said note at the foot of said Exhibit A-107 (Record, p. 138, Finding 49).

It thus appears that appellants' assertion is in direct conflict with the facts. This is a fair example of the many reckless and baseless statements with which appellants' brief abounds.

Appellants also say in this connection that the only evidence concerning gross earnings is Exhibit A-56, and the testimony of Thomas Cheyne authenticating said exhibit. This also is untrue, as we have demonstrated in that portion of our brief which immediately precedes. The facts were shown not only by Exhibit A-56, but also by Exhibits A-73, A-74, A-107 and by a number of others. These exhibits were fully explained by Mr. Cheyne and other witnesses, and they and the Company's records upon which they rested were carefully investigated and checked by Mr. Mitchell, the expert chosen by the Master, at the request of the defendants and as their representative. Mr. Mitchell's testimony and his report appear in this record (p. 902, Exhibit 72, pp. 1101, 1114). Mr. Mitchell by his testimony and his report sustained in every particular the facts shown by plaintiff's (appellee's) exhibits, and the testimony of its witnesses.

7. *Operating Expenses and Taxes.*

The Master found (Record, p. 139, finding 50) that the reasonable and necessary allowance for normal operating expenses for the year beginning May 1, 1914, and ending April 30, 1915, was $347,845, and for taxes, $116,950. This finding of the Master was not excepted to, nor is it made the subject of any assignment of error. We submit that it is conclusive and not open to question by appellants. Nevertheless appellants (their brief, pp. 94 to 100) vigorously attack the allowance for operating expenses. That for taxes is left untouched.

Speaking of the allowance for operating expenses, appellants say (their brief, p. 94):

"There is nothing in the record to justify this finding of the Master."

This statement is wholly untrue. In the portion of this brief which immediately precedes (*supra*, pp. 115 *et seq.*) the method by which these facts were determined, and the conclusive proof submitted to the Master, have been discussed in detail. We need not here repeat what was there said. Appellants' assertion quoted above is in direct conflict with the facts shown by the record, totally unjustifiable and quite inexcusable.

Appellants point out that for the year beginning May 1, 1914, and ending April 30, 1915, the bill of complaint estimated the probable operating expenses as $333,045.06, whereas the Master found the actual operating expenses for said year to be $347,845. The bill was filed on April 29, 1914, before the commencement of the year in question, at a time when, of course, the actual facts could not be known. The statement in the bill was a mere estimate. The Master's finding was made after the expiration of the year in question, and in the light of specific evidence concerning actual results during said year.

Appellants assert that the only evidence in the record upon the question of operating expenses is that of Mr. Cheyne, evidenced by Exhibit A-56, and that said witness estimates the operating expenses for the year in question at the same amount mentioned in the bill of complaint. This is absolutely untrue. Exhibit A-56 was prepared and presented at an early stage in the proceedings before the Master, and prior to the time when it was possible to get actual results for any portion of the year in question.

Months later Cheyne testified in rebuttal and presented other exhibits (A-73, A-74, A-107, A-108), which cover the subject fully and show the operating expenses, based upon actual results. These were checked by Mr. Mitchell, and the exhibits attached to his report (Exhibit 72) show the same facts. The actual operating expenses thus shown for the year in question are $473,276.99. From this is deducted $114,751.15, covering certain extraordinary expenses incurred in that year, which must be paid for out of the proceeds of the rates, but which were assumed to be properly chargeable to a depreciation and contingent reserve fund. This leaves actual net operating expenses for the year in question $358,525.84 (Record, p. 1080, Exhibit A-107). The Master's allowance on this account was $347,845 (Record, p. 139). In view of the undisputed testimony, the Master's allowance was extremely conservative.

Upon this subject the witnesses all agree that a much larger allowance than that made by the Master would be reasonable.

Mr. Freeman said (Record, p. 200):

> "I believe that the sum of $350,000 a year would be a fair allowance for the ordinary operation and maintenance expenses, exclusive of taxes and depreciation, on this plant for the next four or five years."

Mr. Holman said (Record, p. 213):

> "From my experience in operating water works, I should want to spend at least $400,000 a year for ordinary operation and

maintenance of this property. That does not include any allowance for depreciation or for taxes."

Mr. Hazen said (Record, p. 230):

"It is my judgment that the ordinary normal operation and maintenance of the plant can be conducted for $350,000 a year at the present time, not including extra expenses for litigation and in connection with special troubles, which might run anywhere from $20,000 to $100,000 a year.

In looking over the accounts of the company, I am satisfied that there are some accounts in the last few years that have not been charged into operation, that really should have been, such as special litigation, and matters of that kind, of which it has had an unusual amount in the last few years."

Mr. Hazen's allowance for operating expenses was exclusive of taxes, and also exclusive of an allowance for depreciation, which he thought should be not less than $150,000.

Appellants assert (their brief, p. 94) that had the Master taken the year 1912 as his basis, the rate of return would have been .0406, or had he taken the year 1913, the rate would have been .0374. This assertion is based upon the assumption, already shown to be erroneous, that the gross revenue in those years exceeded that in 1914.

Appellants (their brief, pp. 96 and 97) again reiterate the totally false and utterly inexcusable

statement that the evidence concerning the Company's operating expenses was lacking in completeness and detail. This we have sufficiently discussed.

Appellants, at pages 97 to 100 of their brief, discuss certain items appearing in what they designate as Exhibits C and D. These exhibits are not those of appellee (plaintiff below), but of appellants (defendants below). They were prepared and presented by defendants' expert accountant witness, Mr. Mitchell, and appear in the record as a portion of his report (Record, pp. 1101, 1108, 1109).

In so far as appellants' criticisms are based upon an alleged lack of detail, our answer thereto is hereinbefore set forth (*supra*, pp. 115 *et seq.*).

As to the item "Pumping Works," it is said that no explanation is given as to why this cost is greater in 1914 than in some preceding years. The statement is untrue. The difference was fully explained as being due to the increased cost of coal and labor (Record, p. 801).

As to the item "Reservoirs," it is asserted that it is not stated whether it is for repairs of reservoirs, or what. This is untrue. Exhibit A-107 (Record, p. 1080) explains in detail what this item is for, and to what extent it consists of repairs and replacements, and the testimony is even more specific (Record, p. 799).

Moreover, Exhibit A-108 (Record, p. 1080) clearly sets forth in detail the exact amount for repairs included in each of the items referred to, for each of the years 1910 to 1914, inclusive.

As to the item "Conduits," it is asserted, "Whether this is for renewals or building of new conduits, the evidence is silent." This is absolutely

untrue. Exhibits A-107 and A-108 (Record, p. 1080), the testimony of Mr. Cheyne (Record, pp. 798, 802, and pp. 898 to 900), concurred in by the defendants' expert, Mr. Mitchell (Record, p. 902, Exhibit 72, pp. 1101 *et seq.*), completely refute it.

Appellants' criticisms of the items "Office Expenses," "Stable Expenses," "Stable and Auto Service," "Legal Expenses" and "General Expenses" (their brief, pp. 98 and 99) consist, in the main, of the reiterated assertion that the proof in respect to these was not sufficiently specific. This we have already fully answered (*supra*, pp. 115 *et seq.*).

As to the intimation here and elsewhere made that possibly exorbitant salaries were paid, we call attention to the fact that this was one of the questions which Mr. Mitchell, defendants' expert accountant, carefully investigated, and his finding is set forth in his report (Record, p. 1102), from which it appears that the total of all salaries of executive officers is $60,100. In addition to this, as appellants' counsel would have known if they had participated in the hearing below, the details of the salaries paid, how much to each, and for what services, were fully ascertained by Mr. Mitchell and reported to the Master and to the defendants. They were so plainly moderate that the defendants did not see fit to question them in any way.

As to appellants' comments on the item "Legal Expenses" (their brief, p. 99), it is sufficient to say that the details of this item were ascertained by Mr. Mitchell and reported (his report, Exhibit F, Record, p. 1113). From this report and Exhibits F and G thereto, it is obvious, as had been shown by the evi-

dence, that none of the expenses of this rate case had been charged into operating expenses (see Exhibit B, pp. 1106 and 1107, and Exhibit A-107, Record, p. 1080), but had been eliminated therefrom as more properly payable out of a fund furnished by the annual allowance for depreciation and contingent reserve. Plainly, however, they were proper operating expenses, and some part at least, if not all of them, should have been covered by the operating expenses charged as such in the year in which they were incurred.

But appellants say that said item "Legal Expenses" may include some part of the expenses of the litigation which eventually came to this court (229 U. S., 123). This the record fails to show. However, upon the assumption that such is the case, appellants say:

> "Certainly, the Water Company would not have the right to charge the City with money it expended in litigation with the City."

Why not? Certainly, the Company has a right to defend its property against unwarranted attack, or that which it in good faith believes to be unwarranted attack, and would be remiss in its duty if it failed so to do.

The decisions of the two lower courts in the litigation mentioned conclusively establish the Company's good faith. The expenses of such litigation must be paid. How are they to be paid except out of the earnings of the plant? And if they are so paid,

is it not clear that they are properly expenses of operation? The authorities definitely so hold.

> In re Third Avenue Bridge Co., Public Utilities Repts. Ann., 1916-A, 942.
>
> Citizens of La Junta vs. Arkansas Valley Ry. Light & Power Co. (Colorado Public Utilities Commission), Public Utilities Repts. Ann., 1916-D, 1076, 1088.

As to the statement that the operating expenses allowed by the Master were greater than those which had occurred in some of the preceding years, as shown by Exhibit A-56 (Record, p. 990), it is sufficient to say that the witnesses in this case all testified to the increase in cost of labor, supplies, and almost every other item which goes to make up operating expenses. It is a matter of common knowledge, of which this court will take judicial notice, that this increase of cost has been progressing for several years, and still continues. Not only this, but the plant which was operated in 1914 was greater than that which the Company had in 1911. As shown by Exhibit Z (Record, p. 926), between October 31, 1910, and March 31, 1914, more than a million dollars had been invested in additional construction, and, as is obvious, the larger the plant the greater the cost of operation.

Finally appellants assert (their brief, pp. 99, 100) that:

> "It is quite likely that a part of the items contained in the tabulation (of operating expenses) are items which have gone to the repair of the Company's works, for

> replacements, betterments or extensions of its system."

It is certainly proper that operating expenses should include the cost of repairs and ordinary maintenance. On the other hand, replacements are properly chargeable to depreciation, and betterments and extensions to the capital account. But the evidence before the Master clearly demonstrated that the operating expenses contained no charges for replacements, betterments or extensions (Exhibit A-107, notes B, C, D and E, Record, p. 1080; Exhibit B, notes B, C, D and E, Record, pp. 1105, 1106; Record, pp. 898, 899, 900). Exhibit A-108 (Record, p. 1080) is a complete and detailed statement of the cost of repairs charged into operating account.

We submit that the Master's allowance for operating expenses is not only conclusive, but also that it is fully sustained by the evidence, and that appellants' criticisms thereof are totally without justification.

8. *Depreciation Allowance.*

The Master found (Record, p. 139, finding 50) that the reasonable and necessary allowance for normal depreciation of the plant of the Water Company for the year beginning May 1, 1914, and ending April 30, 1915, was $140,000. This finding was not excepted to, nor was it made the subject of any assignment of error, except as follows:

> "Nothing should be allowed for 'Annual Depreciation,' as the same is included annually in the item of 'Operating Expenses.'"

(Record, p. 1137, exception 21st, p. 1155, assignment XXII.)

The limited character of this exception and assignment is manifest. By its express terms the allowance for depreciation is not objectionable, nor is it objected to, unless its allowance constitutes a duplication of what has already been allowed by way of operating expenses. But appellants do not argue this exception or assignment at all. The reference thereto is merely casual (appellants' brief, pp. 91, 92). The argument upon the subject of depreciation allowance (appellants' brief, pp. 85 to 90) is of an entirely different character, and consists of criticism of the amount allowed and of the supposed method by which it was determined. These questions are not open to appellants. If they were, appellants' contentions are wholly untenable.

The nature of the depreciation allowance, and the necessity that rates should provide it, is no longer open to question.

> "Before coming to the question of profit at all, the Company is entitled to earn a sufficient sum annually to provide not only for current repairs, but for making good the depreciation and replacing the parts of the property when they come to the end of their life. The Company is not bound to see its property gradually waste, without making provision out of earnings for its replacement. It is entitled to see that from earnings the value of the property invested is kept unimpaired, so that at the end of any

> given term of years the original investment **remains as it was at the beginning.** It is not only the right of the Company to make such a provision, but it is its duty to its bond- and stockholders, and in the case of a public-service corporation, at least, its plain duty to the public."
>
> Knoxville vs. Knoxville Water Co., 212 U. S., 1, 13.

In the Knoxville case the allowance for depreciation was two per cent. upon the entire valuation of the property. The allowance made by the Master here is about one per cent. The allowance made by the Master is amply supported by the testimony of many witnesses, including those for the defendants. Mr. Freeman (Record, p. 200) fixed it at $168,112; Mr. Holman (Record, p. 213), at $180,000; Mr. Hazen (Record, p. 230), at $150,000, *"with no allowance for contingencies;"* Mr. Metcalf (Record, pp. 263, 282, 900), at $168,000.

All of these witnesses stated definitely that the allowances testified to by them did not at all cover the cost of repairs or ordinary maintenance. All of them made a clear distinction between the depreciation allowance and operating expenses, and all testified that operating expenses did and depreciation allowance did not cover the cost of current repairs and ordinary maintenance, and that the depreciation allowance did and operating expenses did not cover the cost of replacements and renewals. (Record, pp. 347, 348, 799-801, 896, 898, 899-901.)

The testimony of defendants' witnesses was equally definite. The engineers of the Public Utilities

Commission stated in their report (Record, p. 71) that one per cent. upon the entire valuation was a fair annual allowance for depreciation, in addition to a net return of seven per cent. Mr. Van Diest, their spokesman, testified to the same effect when called as a witness for defendants (Record, pp. 428, 438).

This rate of one per cent. per annum, if applied to the net valuation found by the Master, after deduction of accrued depreciation ($13,415,899, Record, p. 123), results in an annual allowance of more than $134,000, or substantially the same as the Master's allowance. But the engineers of the Public Utilities Commission applied this rate of one per cent. to the gross reproduction cost or gross value, without deduction of accrued depreciation, and, as so applied, testified to the fairness of the allowance. The gross reproduction cost, or gross value, as found by the Master, without deduction of accrued depreciation, is $14,736,869 (Record, pp. 122, 123). Applied to this figure, as the engineers of the Public Utilities Commission say it should be, the annual rate of one per cent. testified to by them produces an annual allowance of $147,368, which is substantially in excess of the allowance made by the Master.

At pages 86 to 91 of their brief appellants discuss supposed objections to the Master's allowance for depreciation, which are not covered by any exception or assignment or specification of error. Moreover, this discussion is based upon assumptions of fact, not only unsupported by the record, but quite in conflict therewith. For example, on page 86 they assert:

> "It seems reasonable to say that the estimated life of the units, taking the average, will be fifty years from May 1, 1914."

There is no such evidence in this record. The testimony before the Master was quite to the contrary.

Again, on the same page it is asserted that in the year ending October 31, 1914, the amount "evidently included in operating expenses for repairs and renewals" was in excess of $96,000. This is untrue, as the exhibit to which they refer clearly shows (Record, p. 1080, Exhibit A-108). According to that exhibit, and Exhibit A-107 which immediately precedes it (Record, p. 1080), the actual amount charged into operating expenses in the year 1914 for repairs and maintenance was $68,661.39, arrived at by deducting from the figure mentioned by appellants the sum of $27,505.11 for items of replacement and renewal, properly chargeable to the depreciation account.

At page 87 of their brief appellants present a computation, in which they divide the total accrued depreciation, deducted by the Master from the gross reproduction cost of the existing units, by 20, which they assume to be the average age, in years, of those units, from which they conclude that, during said 20 years, depreciation in said units has actually progressed at the average annual rate of $66,048.50. But this computation is based upon false assumptions and is utterly misleading. There is no foundation in this record for the assumption that the average age of the units is 20 years. Such assumption is in direct conflict with the evidence which was before the Master. It may fairly be assumed from such evidence that the

average age of the whole investment in the plant is about, though considerably less than, 20 years, but this is quite a different thing from the average age of the units now existing, for said total investment has produced not only the existing units of the plant, but also many others which have heretofore utterly disappeared, because they were worn out or became obsolescent.

The accrued depreciation found by the Master ($1,320,970) relates only to elements of the plant which now exist. To determine the entire depreciation which has actually occurred, we must add to this the value of the property hitherto totally depreciated, and therefore eliminated. This is obviously true and was fully explained. (Record, pp. 263, 273, 301.) In the court below this was shown by undisputed evidence to be not less than the sum of $1,261,000 (Exhibit C, pp. 98 to 100; Defendants' Exhibit 14, not produced here, and Record, pp. 273, 301). If this be added, as it must be, a total accrued depreciation of at least $2,581,970 is shown, which would give to appellants' computation a very different result.

Assuming that the average age of the investment has been 20 years, this gives an average annual depreciation of $130,000. But this ignores the fact that this plant is constantly growing and is much larger now than it was 20 years ago, and also ignores the fact that the more extensive the plant the greater the amount of annual depreciation, even though the rate in percentage remains the same. (Record, p. 278.) It also ignores the fact that the units of the plant depreciate more rapidly toward the end of their useful life than at the beginning. This was conclusively

shown by the testimony before the Master (Record, p. 900).

Giving due weight to these considerations, it clearly appears that while, as the result of such computation, $130,000 per annum appears to be the average rate of actual depreciation, yet, to reach that average, the actual amount of depreciation in each of the early years of said twenty-year period, when the plant was less extensive and the units young, must have been much less than that, and the actual amount of depreciation in each of the later years of such twenty-year period, when the plant was much more extensive, and many of the units older, must have been and must be much greater. It follows that appellants' computation, applied to correct bases, clearly demonstrates that the Master's allowance of $140,000 for the year beginning May 1, 1914, and ending April 30, 1915, was extremely conservative.

Appellants at page 87 of their brief ask why the Master, in bringing down his valuation from November 1, 1913, to May 1, 1914 (Record, p. 123), deducted as depreciation for said six-months period only the sum of $60,000, when his annual allowance on account of depreciation was $140,000. The reason for this clearly appears on the face of the Master's report, for, as he states, this is the amount of the depreciation actually occurring in said six-months period, "less additions" to the plant actually made during the same six-months' period. (See also Record, p. 138, Finding 47.) And the evidence before the Master clearly demonstrated that the cost of these additions had been approximately $10,000. (See Exhibit Z, Record, p. 926.)

Appellants at pp. 88 and 89 of their brief present other computations, based upon these assumptions: (1) That the average remaining useful life of the units of this plant is fifty years; (2) that the Master's depreciation allowance was upon the sinking fund basis, with interest at four per cent., compounded annually. As to the first assumption, as we have already pointed out, it is not only unsupported by this record, but in direct conflict with abundant and undisputed testimony which was before the Master. As to the second assumption, the Master's report does not indicate that his annual allowance for depreciation was calculated upon the sinking fund basis; on the contrary, it appears to represent the actual amount of depreciatioon which, in his judgment, would occur in said year. In his Finding No. 13, Table 2 (Record, p. 124), it is referred to as "Actual Depreciation." And in bringing down his valuation from November 1, 1913, to May 1, 1914, he determines the accrued depreciation for said six-months period by deducting from $70,000 the sum of $10,000, which was the actual cost of additions, extensions and betterments made during said period (Record, p. 123; also Exhibit Z, Record, p. 926; also Finding 47, Record, p. 138).

Appellants at page 89 of their brief comment on the fact that the witnesses who described the sinking fund method of determining depreciation, did so upon the assumption that the moneys in the sinking fund would draw interest at the rate of four per cent. per annum, compounded annually, and then assert that if this is a sufficient return upon such an investment, it ought to be a satisfactory rate of net return, when

we come to consider the charge of confiscation made against the ordinance rates. The suggestion is clearly without force. The assumption in respect to the sinking fund is that it will be invested so safely as practically to eliminate the element of risk. Money so invested, as is well known, will not command more than four per cent. per annum, and such an investment is radically different from an investment in the business of supplying Denver and its inhabitants with water.

Appellants at pages 89 to 91 of their brief present further computations of like character to that set forth on page 87, relating to certain selected classes of the property embraced in the plant. From these they attempt to draw the conclusion that the average annual rate of depreciation applied by the Master to these respective classes was less than the rate of depreciation for the year in question, as measured by his annual depreciation allowance. But these computations are based upon the same false assumptions, and are subject to the same criticism as the one on page 87. Moreover, they relate to certain selected classes, and not to the whole property. It may well be that the classes so selected embrace the longest-lived property in the plant, and that which suffers the least annual depreciation. It may also well be that the abandoned property which, as we have shown, must be taken into account, largely came from these selected classes.

Finally, at page 91 of their brief, appellants devote less than half a page to the only point covered by any exception or assignment of error, i. e., that the Master's allowance for depreciation is already

covered by his allowance for operating expenses, and therefore constitutes a duplication of costs.

Appellants in this connection make no references to the record. Their argument, if it may be called such, consists merely of a bald statement, and is in fact of such slight force and so inconsequential, as fairly to indicate an abandonment by them of the only point which, in any event, they are entitled to urge relative to the depreciation allowance.

In this connection they again assert that in the year 1914, $96,000 was expended for repairs and renewals, and charged into operating expenses. As we have already shown, this is absolutely false (Record, p. 1080, Exhibit A-107, notes (b), (c) and (d); Exhibit A-108). As a matter of fact, the evidence before the Master demonstrated abundantly and without dispute that the charges made to operating expenses in the exhibits presented for his consideration, included nothing whatever for renewals or replacements, and covered only current repairs and ordinary maintenance. (Record, pp. 347, 348, 799-801, 896, 898, 899-901.)

The witnesses who testified concerning the necessary annual allowance for depreciation repeatedly stated that the amounts mentioned by them did not at all cover current repairs and ordinary maintenance, and were intended to cover only the loss caused by such depreciation as constantly and necessarily occurs in spite of proper current repairs and adequate ordinary maintenance. (Record, pp. 200, 213, 230, 263, 282, 900.)

The distinction between current repairs and the depreciation which they do not prevent has been clearly pointed out by this court.

> Knoxville vs. Knoxville Water Co., 212 U. S., 13.

This subject was most thoroughly gone into before the Master, and the evidence was comprehensive, complete and conclusive. It was shown without dispute, and established beyond question, that the separate allowances made by the Master for operating expenses and for depreciation allowance do not overlap, and constitute no duplication of costs. Indeed, the fact that the Master has made separate allowances is tantamount to an express finding that no such overlapping exists, and we respectfully submit that such finding is conclusive.

As pointed out above, the Master's allowance for depreciation is approximately one per cent. of the depreciated value of the property as found by him. It is considerably less than one per cent. of the value of said property, without deduction for depreciation.

In Knoxville vs. Knoxville Water Co., 212 U. S., 1, the allowance for depreciation was two per cent. upon the gross value of the property as found by the Master, without deduction for accrued depreciation. This court did not criticise the amount of said allowance.

In Lincoln Gas & Electric Light Co. vs. City of Lincoln, 223 U. S., 349, this court reversed the decision of the court below which (p. 360) had allowed a sum for annual depreciation equivalent to more than one and one-half per cent. upon the entire value of the

whole plant, including non-depreciable elements. The company claimed that this allowance was too small. Evidently this court was impressed with the claim, for it reversed the decree, remanding the case, with directions to refer it to a skilled Master, and saying (p. 364):

> "It can be readily seen that the amount to be annually set aside may be such as to forbid rate reductions, because of the requirement of such a fund."

In Cedar Rapids Gas Co. vs. Cedar Rapids, 223 U. S., 655, the court below (144 Ia., 426; 120 N. W., 966, 973) had provided for an annual depreciation allowance on sinking fund basis of 1.7 per cent. of the entire value of the whole plant. This court affirmed the decision of the state court (which had dismissed the company's bill without prejudice), but said (p. 670):

> "We, perhaps, should have adopted a rule as to depreciation somewhat more favorable to the plaintiff; or, it may be, might have allowed this or that item that the state court struck out. But there is nothing of which we can take notice in the case that could warrant us in changing the result, or in saying that the plaintiff did not get as much as it could expect, when leave was reserved for it to try again."

In Van Dyke vs. Geary, 244 U. S., 39, 48, it appeared that:

> "The Commission decided that the net return to the owner upon the value of the property employed should be at the rate of at least ten per cent., after allowing an annual depreciation charge of *three and one-half per cent.*" (Italics ours.)

In Whitten on Valuation of Public Service Corporations, Vol. 1, Secs. 480 *et seq.*; Vol. 2 (1914), Secs. 1323 to 1334, the authorities upon this subject are collected and quoted from, which show the sums and percentages provided by way of depreciation allowance by various courts and commissions. These demonstrate that the allowance here made by the Master is extremely conservative.

9. *Net Earnings.*

The Master found (Record, p. 139, Finding 51) that the net earnings, or net return, possible under the ordinance rates would be $488,820. To this finding there was no exception, nor is it made the subject of any assignment of error. We submit that it is conclusive. But, beyond that, we submit that it was shown with the accuracy and certainty of a mathematical demonstration that the net return under the ordinance rates could not possibly exceed the amount stated in the Master's findings. Every factor entering into the ascertainment of the net return was conclusively established by positive, definite and specific proof taken from the Company's records, which were checked and verified by the defendants. None of these factors was made the subject of any exception or assignment of error. So conclusive was the proof that this phase

of the case was not even debated by defendants (appellants here) in the extensive arguments before the Master and in the lower court. Plainly, the result was so certain and so positively shown that it was not open to debate. It is not too much to say that defendants themselves, and their counsel in the court below, were convinced of the accuracy of the items and the propriety of the charges and allowances. We are therefore justified in asserting that the Master's findings as to gross earnings, operating expenses, taxes, depreciation allowance and the consequent net earnings were so clearly right that, before the Master, in the lower court and in this court, until appellants' brief was filed, they were concurred in by defendants.

In arriving at his conclusions in this regard the Master resolved every doubt in favor of the defendants (Record, p. 138, Finding 49). He included in gross earnings not only that which was earned and collected, but also the sum of $25,173.72, which was earned but not collected, and possibly not collectible. He included in gross earnings the further sum of $16,560.40, because under the new ordinance certain rates might possibly be increased so as to yield that amount, although it was, to say the least, doubtful whether such increase could be made. He included in gross earnings the entire amount paid or payable by consumers outside of the city, under the leaflet or going rates, without application of the reduction prescribed by the ordinance. He eliminated from operating expenses items aggregating more than $114,000 (Record, p. 1080, Exhibit A-107), and did not take them into account in fixing his depreciation allowance, although they were plainly and properly chargeable to one or the other of these accounts. His

total allowance for operating expenses was substantially less than that testified to by experienced and well-informed men as the necessary and proper amount. His allowance for annual depreciation was substantially less than the sums which these same witnesses testified would be necessary for that purpose, and completely left out of account the obvious necessity of providing a contingent reserve fund to cover unusually large expenditures made in any one year, properly chargeable to operation, but which it was advisable to distribute over a series of years. Illustrations of this occurred in said Exhibit A-107. In short, he made the gross earnings as large and the deductions therefrom as little as the evidence would possibly permit. If injustice was done, it was not the defendants who suffered. Certain it is that the amount found by the Master ($488,820) is the greatest amount of net earnings which by any possibility could have been realized under the ordinance rates. Therefore, this important factor in the computation by which the confiscatory or non-confiscatory character of the ordinance rates is to be determined should be and will be hereinafter dealt with as conclusively determined and finally fixed.

IV.

ON THE ISSUE OF CONFISCATION, APPELLANTS' CONTENTIONS CONCERNING VALUATION ARE MOOT. THE AMOUNT OF NET RETURN HAVING BEEN CONCLUSIVELY DETERMINED, THE VALUATION MIGHT BE REDUCED TO ACCORD WITH EVERY CONTENTION OF APPELLANTS, AND YET THE RATE OF NET RETURN MEASURED THEREBY WOULD STILL REMAIN CONFISCATORY. EIGHT PER CENT. PER ANNUM IS THE LEAST RATE OF NET RETURN WHICH IN THIS CASE CAN ESCAPE THE CHARGE OF CONFISCATION.

This court does not sit to hear or determine moot questions. Whenever it appears that a judgment or decree must in any event be affirmed, the court goes no further, and will not investigate or decide other issues, either of law or of fact

As was said in Glasgow vs. Baker, 128 U. S., 560, 577:

> "Other questions have been argued by counsel in this case, and we have been urged in the brief to decide them; but as this proposition is a broad one, which covers the whole case, and is sufficient to dispose of it, we pursue our uniform course of declining to consider other matters not necessary to a determination of the issue."

See also:

Brobst vs. Brock, 10 Wall., 519, 528.

Lancaster vs. Collins, 115 U. S., 222, 227.
Meeker vs. Lehigh Valley R. R. Co., 236 U. S., 434, 439.

The sole question before this court is whether the decree of the court below, which declared the ordinance invalid and enjoined its enforcement, should be affirmed or reversed. In the court below the validity of the ordinance was assailed upon two grounds. The first of these we have hereinbefore discussed (*supra*, pp 56 *et seq.*). We submit that upon this ground alone the decree was right, and should be affirmed; if so, all questions relating to the issue of confiscation, which was the second ground upon which the ordinance was attacked, are moot. But even if this were not so, and the ordinance had been attacked solely upon the charge that the rates were confiscatory, it is manifest, from what has already been said, that, upon the issue of confiscation, all questions relating to valuation have become moot. This is so because the amount of the net earnings or return possible under the ordinance rates has been conclusively determined and is not open to any question. It is therefore a fixed factor.

Appellants' contentions respecting valuation are that certain items included therein ought to be eliminated or reduced in amount. We do not, of course, concede any of these contentions. On the contrary, all of them are vigorously contested, as is evident from the succeeding pages. But we now submit that it is wholly unnecessary for the court to enter upon the burdensome and necessarily laborious task of considering those contentions, and our answers thereto.

The issue of confiscation has now come merely to a matter of arithmetic. Even though we should take as the rating base the lowest valuation, which by any possibility could result from appellants' contentions, and apply thereto the net earnings under the ordinance rates (now a fixed and known quantity), a simple computation would demonstrate that the resultant rate of annual return is far below that which this court has repeatedly held necessary to escape the charge of confiscation.

1. *Computations Showing the Rate of Annual Return upon Various Valuations Contended for by Appellants.*

As a preliminary to this discussion, we desire to point out that, tested by the findings of the Master concerning operating expenses, taxes and depreciation allowance, even the going rates now and for many years assessed by the Water Company produce a net return which is certainly inadequate.

According to the report of Mr. Mitchell, the defendants' expert accountant, the gross income under said going rates for the fiscal year ending October 31, 1914, was $1,323,368.65 (Record, p. 1109, Exhibit D).

According to the Master's findings, operating expenses, taxes and depreciation allowance aggregate $604,795 (Record, p. 139). The resultant net earning or return is $718,573.65, which, measured by the valuation found by the Master ($13,415,899), is equivalent to .052 as the rate of annual return. We submit that this is far less than this utility ought to be permitted to earn, and is certainly far less than

similar utilities in other cities of like population do earn. It demonstrates beyond question that the going rates, in which the ordinance attempted to make a reduction of more than twenty per cent., are, to say the least, not excessive.

Appellants' contentions relative to the Master's valuation are these, and only these:

First: That water rights to the value of "$1,998,117 should not be included in determining the value of the company's property" (appellants' brief, p. 30).

Second: That going value, fixed by the Master at $800,000, should be eliminated, because whatever of such value existed had already been included in other portions of the Master's valuation, particularly in his allowance of overhead charges and interest during construction (appellants' brief, pp. 63 to 78). Appellants are limited to this contention by their exception (Record, p. 1136, Exception 17th), and by their assignments of error (Record, p. 1154, Assignment XVIII).

Third: That as to overhead charges and interest during construction, which were allowed by the Master in determining reproduction cost, these should be reduced by the amount allowed for going value, as aforesaid, in the event, and only in the event, that the allowance of going value as made by the Master is permitted to stand; this upon the theory that in making the above allowances the Master has permitted a duplication of values (appellants' brief, pp. 79 to 82). Appellants' contention in this regard is clearly limited, as aforesaid, by their exceptions (Record, p. 1135, Exception 16th; p. 1136, Exception 18th), and

by their assignments of error (Record, p. 1153, Assignment XVII; p. 1154, Assignment XIX).

Upon the whole valuation as found by the Master, the rate of net annual return, as also found by him, was .0364 (Record, p. 139, Finding 51). To what extent would this be increased if the deductions from the Master's valuation sought by appellants were made? The following computations answer that question:

(a) If from the Master's valuation ($13,415,899) we should deduct all of the items of property and elements of value, concerning which appellants have raised any question whatsoever, to-wit, water rights, $1,998,117; going value, $800,000; engineering and contingencies, $912,916 (the net amount allowed); interest during construction, $699,545, the resultant rating base would be $9,005,321. Measured by this rating base, the rate of net annual return would be .054. But the deductions made in the foregoing computation carry us far beyond any contention which appellants are at liberty to make, and, indeed, far beyond any contention which they actually do make.

(b) If from the Master's valuation ($13,415,899) we deduct water rights, as claimed by appellants ($1,998,117), and going value ($800,000), the resultant rating base is $10,617,782. Measured by this rating base, the rate of net annual return would be .046. In the foregoing computation appellants' contentions have really been carried to their extreme limit. Since going value has therein been entirely excluded, it follows that interest during construction, and engineering and contingencies must be included, because the alleged duplication of values has been entirely avoided.

(c) If from the Master's valuation ($13,415,899) we deduct water rights only, according to the claim of appellants ($1,998,117), the resultant rating base is $11,417,782. Measured by this rating base, the rate of net annual return would be .042.

(d) If from the Master's valuation ($13,415,-899) we deduct going value ($800,000), the resultant rating base is $12,615,899. Measured by this rating base, the rate of net annual return is .038.

Each of the foregoing computations is based, as it must be, upon the amount of net earnings ($488,820), found by the Master.

These computations demonstrate to a mathematical certainty that the rates prescribed by the ordinance in question are, in any event, confiscatory. No contention is made, or can be made, in this court by appellants which requires the assumptions upon which the first computation, (a), *supra*, is based. Those assumptions go far beyond anything that could possibly be done in the way of reduction of the valuation. Yet, even upon such assumptions, the rate of net annual return is conclusively shown to be less than five and one-half per cent. Obviously, no such result is possible here.

The actual limit to which appellants can by any possibility go, even in asserting their contentions, is measured by the assumptions upon which the second computation, (b), *supra*, is based, and upon those assumptions the rate of net annual return is conclusively shown to be .046. That is the best result for which appellants upon this record are at liberty to or do contend for. If they succeeded beyond their fondest hopes they would show a net return of only .046.

If they failed in any of their contentions respecting value, the rate of net return would, of course, be less than this, gradually diminishing as the extent of their failure increased, until it again coincided with the finding of the Master (.0364), if, as we confidently expect, all of their contentions respecting value should be rejected.

We submit respectfully, but with confidence, that each of these rates of annual net return is so far below that which will escape the charge of confiscation as to render it absolutely certain that the ordinance rates are confiscatory, without further consideration of any question relating to values.

But there is another method of computation, by which the same conclusion is made inevitable. The net earnings as found by the Master, and now conclusively established, are $488,820. The capitalization of this sum at any rate of net annual return at all within reason, gives interesting results.

1. Capitalized at eight per cent., the net earnings produce a capital sum of $6,110,250. The difference between this capital sum and the Master's valuation ($13,415,899) is $7,305,649. If the Master's valuation be correct, and eight per cent. per annum the requisite rate of return, it follows that under the ordinance the use of property having a value of more than $7,300,000 is taken without just or any compensation.

By similar computations, and with the same assumption as to the rate of return, if deductions from the Master's valuation are made as assumed in computation (a), *supra*, the property value taken without compensation would be $2,895,071; or if deductions be made as assumed in computation (b), *supra*, $4,507,-

532; or if deductions be made as assumed in computation (c), *supra*, $5,307,532; of if deductions be made as assumed in computation (d), *supra*, $6,505,649.

2. The net earnings aforesaid, capitalized at seven per cent., produce a capital sum of $6,983,143. This means, if the Master's valuation is correct, and seven per cent. per annum is an adequate rate of return (which, under the conditions here, it certainly is not), that property to the value of $6,432,756 is taken for public use without just or any compensation.

Upon the same assumption as to rate of return (which appellee earnestly contends is unduly low), and making the deductions from the Master's valuation assumed in the various computations, *supra*, the results are as follows:

Making the deductions assumed in computation (a), *supra*, it results that property of the value of $2,022,178 is taken without just or any compensation; or making the deductions assumed in computation (b), *supra*, property of the value of $3,634,639 is so taken; or making the deductions assumed in computation (c), *supra*, property of the value of $4,434,639 is so taken; or making the deductions assumed in computation (d), *supra*, property of the value of $5,632,756 is so taken.

3. The net earnings aforesaid, capitalized at six per cent., result in a capital sum of $8,147,000. Six per cent. is an unduly low rate of return. Under the circumstances presented by this record, it is, we submit, certainly confiscatory. It is used here merely by way of illustration. Even at that rate of return, and assuming that the Master's valuation is correct, prop-

erty having a valuation of at least $5,268,899 would be taken without just or any compensation.

Using the same rate of return (six per cent.), and making the deductions from the Master's valuation assumed in the several computations hereinabove set forth, the results are as follows:

Making the deductions assumed in computation (a), *supra*, property of the value of $858,321 would be taken without just or any compensation. Making the deductions assumed in computation (b), *supra*, property of the value of $2,470,782 would be so taken. Making the deductions assumed in computation (c), *supra*, property of the value of $3,270,782 would be so taken. Making the deductions assumed in computation (d), *supra*, property of the value of $4,468,899 would be so taken.

The foregoing computations demonstrate clearly the unconstitutionality of the ordinance, without further consideration of appellants' contentions relative to the Master's valuation. It is not open to question that appellee is entitled to a fair net return upon each dollar's worth of property, the use of which is taken by the public. But it is clear to a mathematical certainty that appellants might succeed in all of their contentions respecting valuation to the uttermost limit, and beyond, and yet property of appellee to the value of millions of dollars would have been taken for the use of the public without just or any compensation. It follows inevitably that all of appellants' contentions respecting the Master's valuation are merely moot and need not and should not be considered.

2. *Computations in Appellants' Brief, Pages 109 to 111, Erroneous and Misleading.*

Appellants' computations referred to above are intended to indicate the result on the rate of annual net return, if appellants' contentions respecting valuation, or some of them, should be upheld. They are erroneous and misleading, because based upon false assumptions, both as to valuation and the result of appellants' contentions thereon, and also as to net earnings.

The table on page 109 of appellants' brief is as to valuation or rating base, compiled upon the assumption that from the Master's valuation there be deducted not only water rights and going concern, according to appellants' contention, but also the Master's allowances for engineering and contingencies and interest during construction. The two items last mentioned are usually referred to as overhead costs.

As we have already demonstrated, appellants' contentions respecting overhead costs and going value are inseparably connected. Those contentions go to the extent, and only to the extent, of claiming that by the allowance both of going value and of overhead costs the Master has permitted a duplication of values, in that the overhead costs necessarily include and cover the going value. Considering the nature and limit of these contentions, obviously, they amount to this: that if going value be allowed, the Master's allowance for overhead costs should be diminished by the amount allowed for going value; but that if the allowance for going value be eliminated, the Master's

allowance for overhead costs must stand undiminished (see *supra*, pp 161, 162).

But beyond this, the table on page 109 of appellants' brief is further erroneous, in respect to the assumptions concerning valuation or rating base, in that the deductions made on account of what is claimed to have been allowed by the Master for "Eng. and Cont." (overhead costs) is stated as $1,046,272, when in fact it should be only $912,916. This is readily demonstrable. The Master's allowance for engineering and contingencies was twelve and one-half per cent. of the gross reproduction cost of structures (Record, p. 122, Table 1, Column 2; also Record, p. 136, Finding 44). It was not in his report set forth as a separate figure, but was included in said gross reproduction cost. Thereafter it, like the rest of the gross reproduction cost, was depreciated (Record, p. 122, Column 3), and the result given as the present reasonable value, from which the Master's total valuation or rating base was determined. According to the Master's report (Record, p. 122, Column 4), the depreciated reproduction cost or present reasonable value of the structures (Classes C to S) is $8,216,237. But this represents net reproduction cost, including 12½ per cent. for overhead costs, and is therefore 112½ per cent. of net reproduction cost, without overhead. From these factors a simple mathematical computation demonstrates that the amount of overhead costs (Eng. and Cont.) included in the Master's present reasonable value of structures is $912,916 instead of $1,046,272, as given in the table on page 109 of appellants' brief.

But in said table on page 109 the amount deducted from the Master's valuation, on account of in-

terest during construction, is $805,000, which is the Master's determination of the gross amount of interest during construction, without deduction for depreciation. But from this sum the Master deducted depreciation to the amount of $105,455, and the amount included in his valuation on account of interest during construction was only the sum of $699,545 (Record, p. 122, Table 1, Columns 1, 3 and 4).

Correcting these obvious mistakes in the table on page 109 of appellants' brief, in respect to the deductions there made from the Master's valuation, and ignoring the manifest error in deducting not only going value, but also overhead costs (including interest during construction), the resultant rating base is $9,005,321 instead of $8,766,510, as given in the table.

Turning now to the opposite column of said table, wherein the net earnings are set down, we find that appellants have added to the net earnings as determined by the Master ($488,820) the arbitrary sum of $40,000. They have done the same thing in the tables which follow, on pages 110 and 111 of their brief. This arbitrary addition is made upon the erroneous assumption that the business done, the consequent gross earnings, and the resultant net earnings in the years 1912 and 1913 were to that extent greater than in the year 1914.

As we have already shown, this is entirely untrue, as the record conclusively demonstrates (*supra*, pp. 133, 134).

The business done and the consequent gross earnings and resultant net earnings in the year 1914 were greater than in the year 1913, and substantially

the same as in 1912. Beyond doubt, therefore, the net earnings appearing in said table on page 109, and in those which follow, should be $488,820, instead of $528,820. Measuring these net earnings by the rating base corrected as above ($9,005,321), the resultant rate of net annual return is .054 instead of .06+, as given by appellants. The basic figures and the result are the same as in our computation (a), *supra*, page 162.

But as we have already said, the table just commented upon illustrates a situation which cannot possibly occur as the result of any contention, or series of contentions, which the appellants can, or in reality do, make.

Turning now to the table on page 110 of appellants' brief, we find the same arbitrary addition of $40,000 to the net earnings. This is wrong, as we have already shown. Eliminating, as we must, this erroneous addition to net earnings, appellants' table on page 110 of their brief is precisely the same as one of the computations which we have already made (Computation (b), *supra*, p. 162), and the resultant rate of return is .046 instead of .0497, as stated in appellants' table.

Coming now to the table on page 111 of appellants' brief, we find the same obvious and unmistakable error in adding the arbitrary sum of $40,000 to the net earnings. Eliminating this, as we must, the table on page 111 of appellants' brief is exactly the same as one of the computations hereinbefore made by us (Computation (c), *supra*, p. 163, and the resultant rate of return is .042 instead of .046 as given in appellants' table.

It follows that if all of appellants' contentions were conceded to their farthest possible limit (and, of course, none of them is conceded at all), the utmost that could under any circumstances be expected by way of net annual return is .046. This appellants' own tabulations, rightly considered, demonstrate.

3. *Eight Per Cent. per Annum Is the Least Rate of Return Which under the Circumstances Here Presented Can Escape the Charge of Confiscation.*

The Master's finding upon the subject of fair return is as follows (Record, p. 140):

> "The Water Company is entitled to a fair return upon the reasonable value of the property used by it for the convenience of the public unless, considering the nature of the service rendered by it, such a return is not fair and just to the public.
>
> The rule in this regard is stated in the case of Willcox v. Consolidated Gas Co., 212 U. S. 19 at 48 as follows:
>
> 'There is no particular rate of compensation which must, in all cases and in all parts of the country, be regarded as sufficient for capital invested in business enterprises. Such compensation must depend greatly upon circumstances and locality; amoung other things, the amount of risk in the business is a most important factor, as well as where the business is conducted, and the rate expected and usually realized there upon investments of a somewhat similar nature with regard to the risk attending them.'

The evidence shows that the going rate of interest for loans on business and residence properties in Denver is about six (6) per cent. and on ranch property near Denver about seven (7) per cent. The interest rate provided by the Colorado statute is eight (8) per cent. The current bank rate on good risks is about six and one-half (6½) per cent. According to Exhibit A-59, the average rate of interest paid by the Company for money received for sale of its bonds between 1901 and 1913, was over six per cent., although nominally five per cent.

I find that 3.64 per cent. is not a fair or just return for the use of the property of the Water Company by the public.

The evidence shows the service of the Water Company is of such value as to render fair to the public, rates which are sufficient to yield a fair return on the reasonable value of the property devoted to the use of the public."

The Master expressly finds that 3.64 per cent. is not a fair or just rate of net return, but does not expressly find what is the least rate of net return which would escape the charge of confiscation. He does, however, what amounts to the same thing, by finding expressly that the prevailing interest rates on well-secured real estate loans are six and seven per cent., and the current bank rate on good risks about six and one-half per cent. It is plain that the Master did not regard such investments as being "of a somewhat similar nature with regard to the risk attending

them" as a private investment in the Denver water-works. Clearly, an investment in the Denver water-works, particularly in view of what has occurred and is occurring there respecting municipal competition, and like matters, is in point of safety not to be compared with loans on business and residence properties in Denver, or on ranch property near Denver, or with bank loans on good risks. Certain it is that the private investment in the water-works must command and, as against public regulation, is entitled to have, a rate substantially greater than six or six and one-half or seven per cent., and certainly not less than eight per cent. per annum.

The Master also finds that the money borrowed by the Company on its long-term bonds has cost it over six per cent. per annum. It is plain that a utility is, as against public regulation, entitled to earn a substantial margin over the actual hire of money which it is required to pay to obtain the funds with which to construct its works. If the capital of the utility costs it as much as said capital can be made to earn in the business of the utility, there is obviously no profit whatever in the business, but only a repayment of what it actually costs to carry it on.

This was clearly demonstrated by the witnesses both for plaintiff and defendants. (Record, pp. 236, 438.)

The Master refers to the Colorado Statute (Revised Stats. 1908, p. 859, Sec. 1361), which provides an interest rate of eight per cent. per annum, applicable where there is no different agreement between the parties. This reference clearly indicates that in the Master's judgment the rate of net return to this util-

ity must, to escape the charge of confiscation, be at least as much as the statutory rate.

Appellants' contention upon this subject is thus stated in their brief (p. 107):

> "In determining the fair rate of return for an investment as large as this,the evidence of what banks charge for short-time loans of three months, or as to what rate of interest is charged for small real estate loans, is not persuasive. The larger the amount of the investment the smaller the return expected, and even the rate of .0364, as found by the master, when the amount involved is taken into consideration, *and the further fact that there is almost no hazard to be taken,* is so close at least to a fair return that it should not be disturbed." (Italics ours.)

The rate of net return as found by the Master is substantially less than that at which the recent enormous bond issue of the United States—the largest in the history of the nation—was marketed. The subscribers thereto were largely actuated by patriotic motives. The bonds themselves and the income therefrom were tax free, rendering the actual net return substantially 3.9 per cent. per annum. The element of hazard was nil. The purchasers were promised the benefit of any increase in interest rate which might attach to subsequent issues. Is it possible that an investment in the Denver water-works can fairly be said to stand upon the same basis as one in such a Government bond issue? Can it be that one who has invested his money in the Denver water-works

is, as against public regulation, entitled to no greater rate of return than one who has invested his money in Liberty Bonds? Does the investor in the Denver water-works take no greater risk than the purchaser of Liberty Bonds? These questions answer themselves. Appellants' contentions which are quoted above, are outrageously absurd.

The leading and conclusive authority (quoted and relied upon by the Master) is Willcox vs. Consolidated Gas Co., 212 U. S., 19. There the subject is thoroughly discussed in every aspect. Following that portion of the opinion quoted in the Master's finding, and set forth above, the court said (p. 48):

> "There may be other matters which in some cases might also be properly taken into account in determining the rate which an investor might properly expect or hope to receive and which he would be entitled to without legislative interference. The less risk, the less right to any unusual returns upon the investments. One who invests his money in a business of a somewhat hazardous character is very properly held to have the right to a larger return without legislative interference, than can be obtained from an investment in Government bonds or other perfectly safe security. The man that invested in gas stock in 1823 had a right to look for and obtain, if possible, a much greater rate upon his investment than he who invested in such property in the city of New York years after the risk and danger involved had been almost entirely eliminated.

In an investment in a gas company, such as complainant's, the risk is reduced almost to a minimum. It is a corporation, which in fact, as the court below remarks, monopolizes the gas service of the largest city in America, and is secure against competition under the circumstances in which it is placed, because it is a proposition almost unthinkable that the city of New York would, for purposes of making competition, permit the streets of the city to be again torn up in order to allow the mains of another company to be laid all through them to supply gas which the present company can adequately supply. And, so far as it is given us to look into the future, it seems as certain as anything of such a nature can be, that the demand for gas will increase, and, at the reduced price, increase to a considerable extent. An interest in such a business is as near a safe and secure investment as can be imagined with regard to any private manufacturing business, although it is recognized at the same time that there is a possible element of risk, even in such a business. The court below regarded it as the most favorably situated gas business in America, and added that all gas business is inherently subject to many of the vicissitudes of manufacturing. Under the circumstances, the court held that a rate which would permit a return of six per cent would be enough to avoid the charge of confiscation, and for the reason that a return of such an amount was the return ordi-

narily sought and obtained on investments of that degree of safety in the city of New York.

Taking all facts into consideration, we concur with the court below on this question, and think complainant is entitled to six per cent on the fair value of its property devoted to the public use."

Six per cent. per annum is therefore the basic figure below which it is impossible to go. But applying the principles clearly enunciated by this court to the situation in Denver, in respect to the investment in the Denver water-works, it does not admit of doubt that a net return of six per cent. per annum is far too low to escape the charge of confiscation. If six per cent. per annum is, as plainly held by this court, the least amount to which such a utility as The Consolidated Gas Company is entitled in the City of New York, what must be the least rate for such a utility as the Water Company in such a community as Denver?

In the case of The Consolidated Gas Company one of the points chiefly emphasized by this court was the fact that risk was reduced almost to a minimum, because the utility had what was practically a perpetual monopoly of a public necessity in the largest city in America. Special emphasis was laid upon the complete absence of the possibility of municipal or other competition. But in the case of The Denver Union Water Company, not only is its investment subject to the usual risks ordinarily incident to the public utility business in a western city, but, in addition, it has always been, and is now, subject to the risk of municipal competition, which is a real and most seri-

ous menace. As is obvious, and is clearly demonstrated by the evidence in this case, municipal competition would result in the practical destruction of the Water Company's entire investment (Record, pp. 200, 205, 207, 231, 235, 283, 284, 295, 901). And yet, as is evident from the "Historical Review" with which this brief is introduced (*supra*, pp. 5 *et seq.*), this menace, as well as other conditions greatly affecting the risk involved, has been constantly present. Bonds with which to construct a competing municipal plant have been twice voted, once in 1900 and again in 1910. Moreover, in the latter year, Section 264-A of the charter was adopted, which offered the Company the choice between taking $7,000,000 for its plant or being forced out of business by the municipal plant, which, if the Company refused said offer, was required to be built. Concerning these matters the court already has some knowledge.

City and County of Denver vs. New York Trust Co., 229 U. S., 123.

In 1914, when the rate ordinance was enacted, the situation in this regard was, and thereafter continued to be, particularly acute, and the menace to the investment especially serious. This situation has not yet been relieved, nor the menace removed.

Wheeler vs. City and County of Denver, 231 Fed., 8.

We submit with respectful confidence that the decision of this court in the Consolidated Gas case is ample and conclusive authority to sustain our claim that under the circumstances presented by this record

eight per cent. per annum is the least rate of return which can escape the charge of confiscation.

In Shepard vs. Northern Pacific Ry. Co. (Minnesota Rate Cases), 184 Fed., 765, Judge Sanborn in the lower court considered the matter fully, referred to the fact that the legal rate of interest on a debt in Minnesota, in the absence of contract, is six per cent. (in Colorado eight per cent.), pointed out the risks to which investments in railroads are in Minnesota subjected (which are clearly not so serious as those prevailing here), and concluded as follows (p. 816):

> "It is an axiom in economics that the greater the risk the greater must the return be upon invested capital, and the conclusion is irresistible that a net return of seven per cent. per annum upon the respective values of the properties of these Companies in Minnesota devoted to transportation is not more than the fair return to which they are entitled under the Constitution of the United States."

When the Minnesota Rate Cases came to this court the decrees in some of them were reversed, though that in one was affirmed, but these reversals occurred because of errors in the determination and apportionment of values and expenses. The conclusion of the court below upon the subject of the requisite rate of return was not criticized, and evidently met with this court's approval.

Minnesota Rate Cases, 230 U. S., 352.

In the Arkansas Rate Cases, 187 Fed., 290, the question was fully discussed (pp. 344 to 348), and the conclusion reached that the least rate of return upon a railroad investment in Arkansas, which, under public regulation, could escape condemnation as confiscatory, would be seven and one-half per cent. per annum.

When the Arkansas cases came to this court, the decrees were reversed for the same reason as in the Minnesota Rate Cases; but the conclusion of the court below concerning the requisite rate of return was not criticized, and evidently met with the approval of this court.

Allen vs. St. Louis etc. Ry. Co., 230 U. S., 553.

In Boyle vs. St. Louis & S. F. R. Co., 222 Fed., 539, which involved the same rates as those considered in the previous Arkansas Rate Cases, the lower court (558) again decided that the requisite rate of net return was seven and one-half per cent. per annum.

In Rowland vs. Boyle, 244 U. S., 106, the case last cited was on appeal considered by this court and the decree of the court below, which had held the rates confiscatory, was in all respects affirmed. The conclusion is inevitable that this court agreed with what had been decided in the lower court concerning the requisite rate of return.

The Public Utilities Commission of Colorado, which since 1914 has, under the direct authority of a state statute, exercised the power to regulate the rates of utilities, has uniformly held that the rate of annual

net return, after liberal allowances for operating expenses, taxes and depreciation, should be fully eight per cent., and has consistently refused to reduce rates of public utilities in Colorado below a point where they would yield at least that much.

In re Rates and Service of The Colorado Springs Light, Heat & Power Co., Vol. 1, Decisions of the Public Utilities Commission of Colorado, p. 159, was decided in December, 1915. The Commission held (p. 168) that before coming to the question of net return at all the utility was entitled, in addition to operating expenses and taxes, to depreciation allowances, as follows: 4.25 per cent. on the *cost new* of its depreciable electric property, 2.8 per cent. on the *cost new* of its depreciable hydro property, and 3 per cent. on the *cost new* of its depreciable gas property.

In the case at bar the Master's allowance for depreciation ($140,000) is approximately one per cent. upon his present valuation of the entire plant ($13,415,899), less than one per cent. upon his gross valuation thereof, without deduction of depreciation ($14,736,869), and 1.3 per cent. upon the cost new of the depreciable property only ($10,221,438).

After making these allowances, the Colorado Commission in the case above cited (p. 180) refused to reduce the rates for electric service below a point where they would "yield a return in excess of seven and one-half per cent. per annum upon the present value of the electric and hydro properties of the defendant corporation," and suggested (p. 192) an increase in the gas rates.

In re Mountain States Telephone & Telegraph Co., Vol. 3, Decisions of the Public Utilities Commission of Colorado, p. 122, decided January 5, 1917, is an elaborate opinion by the Commission, setting forth its conclusions concerning the valuation and the earnings of the company named above, which is the utility corporation furnishing the telephone service of Denver and of the State of Colorado. After determining the present fair value of the property ($14,698,414), and after making very liberal allowances for operating expenses and taxes, the Commission determined (p. 285) that as a depreciation allowance the company "should be allowed to set aside annually an amount equal to approximately 5.65 per cent. of its investment in depreciable property" (in the case at bar this allowance was 1.3 per cent.); and that in addition to the operating expenses, taxes and the depreciation allowance mentioned above, the company should be permitted to make net earnings equivalent (p. 291) to eight per cent. per annum.

It is important to observe that the utility involved in the case last cited serves the same community which is served by the appellee in this case. But neither of the utilities considered by the Colorado Commission in its two decisions cited above was subject to any such risks as those which beset The Denver Union Water Company.

The decision of this court in the Consolidated Gas case (212 U. S., 19) was announced in January, 1909. It is significant that since that decision the rate of net return which marks the line separating confiscatory regulation from that which is not confiscatory, has been, by the courts, constantly raised.

In Whitten on Valuation of Public Service Corporations (Vol. 1, Secs. 731 to 785; Vol. 2, Secs. 1433 to 1445), the decisions upon this question, arranged chronologically, to and including 1914, are reviewed and quoted from. From these it is evident that the requisite rate of net return has been constantly increased, particularly since 1909, and in the western states the rate usually now required is eight per cent. per annum. A few of the recent decisions, with their respective dates, and the rate of return required in each, are given below:

1907, Cumberland Tel. & Tel. Co. vs. R. R. Commission, 156 Fed., 823, 833, seven per cent.

1908, Pennsylvania R. R. Co. vs. Philadelphia County, 220 Pa. Sta., 100; 68 Atl., 676, 679, legal rate of interest, six per cent. the minimum.

1908, Central of Georgia Ry. Co. vs. R. R. Commission, 161 Fed., 925, 993, 995, 996, eight per cent.

1909, Lincoln Gas & Electric Light Co. vs. City of Lincoln, 182 Fed., 926, 929 (223 U. S., 349), six per cent. the minimum.

1909, C. H. Venner Co. vs. Urbana Water Works, 174 Fed., 348, 352, six per cent. the minimum.

1909, City of Owensboro vs. Cumberland Tel. & Tel. Co., 174 Fed., 739, 742, six per cent. the minimum.

1911, Shepard vs. Northern Pacific Ry. Co., 184 Fed., 765, 815, seven per cent. the minimum.

1911, Cumberland Tel. & Tel. Co. vs. City of Louisville, 187 Fed., 637, 658, seven per cent. the minimum.

1911, In re Arkansas Rate Cases, 187 Fed., 290, 346, 347, seven and one-half per cent.

1911, Des Moines Water Co. vs. City of Des Moines, 192 Fed., 193, 198, eight per cent.

1912, Louisville & Nashville R. R. Co. vs. R. R. Commission of Alabama, 196 Fed., 800, eight per cent.

1912, Western of Alabama Ry. vs. R. R. Commission of Alabama, 197 Fed., 954, 959, eight per cent.

In the case at bar it is perfectly obvious that having regard to the risk attendant upon the investment, eight per cent. per annum is the least rate of net return which will enable the rates to escape condemnation as confiscatory.

It follows inevitably that the rates prescribed by the Denver ordinance here in question are beyond doubt confiscatory, no matter what view might be taken of appellants' contentions concerning valuation.

The conclusion is unavoidable that the decree of the court below must be, in any event, affirmed.

We therefore submit that all questions arising upon appellants' contentions concerning valuation are merely moot, and need not and should not be considered.

V.

VALUATION. GENERAL PRINCIPLES APPLICABLE. HOW THE MASTER'S VALUATION WAS DETERMINED. APPELLANTS' CRITICISMS ANSWERED.

1. *To Escape the Charge of Confiscation, the Valuation or Rating Base Must Represent the Present Fair Value of All of the Property Owned by Appellee and Devoted to the Public Use. The Constitution Is Violated if Any Item of Property or Any Element of Value Included or Inherent in the Plant Be Omitted.*

We have already called attention (*supra*, pp. 95 *et seq.*) to the constitutional principles governing such a case as this, and to the established doctrine that they have like application both to rating and to condemnation cases.

To determine whether the reward which the state allows for the use of private property by the public constitutes just compensation for the taking, renders it necessary to determine (1) the value of the property so required to be devoted to the public use, (2) the rate of return upon such value to which the owner is justly entitled as compensation for its use by the public, (3) the net earnings and consequent rate of return possible under the prescribed rates. It follows that whether the taking by public authority

consists in the actual seizure of the corpus of the property, or whether it consists in a taking of the use, leaving the possession and title in the owner, it is nevertheless necessary at the outset of the judicial inquiry to determine the value of the property itself. In cases of condemnation or seizure the value so ascertained is the purchase price which the public must pay. In rating cases the value so ascertained is the basis with respect to which must be determined the justness of the return afforded by the regulated rates. But in either case the value of the property is the basic fact to be ascertained, and its determination is controlled by the same principles, for it is that property and its value which lie within the protection of the constitutional provisions to which we have referred.

Early in the history of rate litigation this court laid down the fundamental principle, to which it has since steadily adhered, that the present fair value of the private property used or useful in affording the public service is the measure of the reward to which the owner of that property is entitled for the service rendered, just as it is the measure of the price which the owner is entitled to receive if the corpus of the property itself be seized and taken for the public benefit. That the valuation thus to be determined in a rating case is the same as that to be determined in a condemnation proceeding has been repeatedly held.

Some of the cases so holding are listed below:

Reagan vs. Farmers Loan & Trust Co., 154 U. S., 362, 410.

Ames vs. Union Pacific, 64 Fed., 165, 177.

Smyth vs. Ames, 169 U. S., 466, 546.

San Diego Land & Town Co. vs. National City, 174 U. S., 739, 757.

Chicago, Milwaukee & St. Paul Ry. Co. vs. Tompkins, 176 U. S., 167, 173.

San Diego Land & Town Co. vs. Jasper, 189 U. S., 439, 442.

The Consolidated Gas Co. vs. Mayer, 146 Fed., 150.

The Consolidated Gas Co. vs. City of New York, 157 Fed., 849.

Wilcox vs. The Consolidated Gas Co., 212 U. S., 19.

Lincoln Gas & Electric Co. vs. Lincoln, 223 U. S., 349, 357.

Cumberland Telephone & Telegraph Co. vs. City of Louisville, 187 Fed., 637, 641.

Louisville vs. Cumberland Telephone & Telegraph Co., 225 U. S., 430.

Shepard vs. Northern Pacific (Minnesota Rate Cases), 184 Fed., 765, 802, 803.

The Minnesota Rate Cases, 230 U. S., 352, 434, 454.

San Joaquin etc. Irrigation Co. vs. Stanislaus County, 191 Fed., 875, 895.

San Joaquin etc. Irrigation Co. vs. Stanislaus County, 233 U. S., 454, 459 (reversing the above).

Cotting vs. Kansas City Stock Yards Co., 82 Fed., 850, 853.

Missouri K. & T. Ry. Co. vs. Love, 177 Fed., 493, 494-496.

Love vs. A. T. & S. F. Ry. Co. (C. C. A., 8th Cir.), 185 Fed., 321, 326, 327.

Re Arkansas Railroad Rates, 163 Fed., 141 (opinion by Mr. Justice Van Devanter).

Des Moines Water Co. vs. City of Des Moines, 192 Fed., 193, 197.

Chicago & N. W. Ry. Co. vs. Smith, 210 Fed., 632.

Louisville & Nashville Ry. Co. vs. Railroad Commission, 196 Fed., 800, 818, 820, 821.

Spring Valley Water Works Co. vs. San Francisco, 124 Fed., 574, 590, 594, 595.

Spring Valley Water Co. vs. San Francisco, 165 Fed., 657, 680.

Spring Valley Water Co. vs. San Francisco, 192 Fed., 137, 144, 145.

Bonbright vs. Geary, 210 Fed., 44, 48.

We apologize for citing so many cases upon a point which is now so well settled. They are here listed chronologically and merely as a matter of convenience in case the court should wish to trace the development of the doctrine. These cases hold that the valuation to be ascertained is the same, and the principles upon which it is determined identical, whether the purpose be rating or condemnation; that in either event present fair value, not original cost,

is the determining factor, and that in either event the constitution is violated if any item of property or any element of value be omitted. It makes no difference how the property was acquired or what it cost, or whether it cost anything at all. The sole questions are, Is it owned and taken or used, and, if so, what is its present fair value?

In Ames vs. Union Pacific, 64 Fed., 165, there was involved the right of way of the Union Pacific Railroad Company, which, as is well known, had been granted by the Act of Congress known as the Pacific Railroad Act. The contention was made that, therefore, it should not be included in the valuation, but Mr. Justice Brewer said (64 Fed., 176): "No inquiry is open as to whether the owner has received gifts from state or individuals, or whether he has as owner managed the property well or ill, or so as to acquire a large fortune therefrom. It is enough that he owns the property—has the legal title; and so owning, he must be paid the actual value of that property." That decision was affirmed by this court (169 U. S., 466, 546).

In the Consolidated Gas case there was involved the right to lay, maintain and operate in the streets of the City of New York the necessary pipes for the distribution of gas. These rights (referred to as franchises) had been granted to the company without cost. It was contended that for that reason they should not be valued. In the lower court the contention, after full discussion, was expressly negatived, and a value assigned of $12,000,000 (157 Fed., 875 *et seq.*).

When the Consolidated Gas case reached this court, the determination that said franchises must be val-

ued and included, though they had cost nothing, was expressly affirmed. This court, however, reduced their valuation from $12,000,000, as found by the lower court, to $7,781,000, a sum which had at one time been agreed to by the companies. Upon this subject the language of the court was in part as follows (212 U. S., 43):

> "They each had the right to use the streets of certain portions of the city for the purpose of laying their mains and service pipes in order to furnish gas to the city and the citizens. Not one of the companies had ever been called upon to pay a penny for such right, but the grant to each was in that aspect a gratuity. It was not at the time of granting franchises such as these the custom to pay for them. * * * (p. 44). It cannot be disputed that franchises of this nature are property and cannot be taken or used by others without compensation. Monongahela vs. United States, 148 U. S. 312; People vs. O'Brien, 111 N. Y. 1, and cases cited. The important question is always one of value, * * * (p. 52) and we concur with the court below in holding that the value of the property is to be determined as of the time when the inquiry is made regarding the rates. If the property which legally enters into the consideration of the question of rates has increased in value since it was acquired, the company is entitled to the benefit of such increase."

In the Minnesota Rate Cases there was involved the right of way of the Northern Pacific which had been granted by Act of Congress without cost to the company. There were also involved the rights of way of other railroads which had been likewise acquired without cost under the General Right of Way Act of 1875. It was contended in those cases that, therefore, these rights of way ought not to be included in the valuation. Said contention was clearly negatived both in the lower court and in this court. In the lower court (184 Fed., 803) Judge Sanborn said: "A large part of the right of way of the Northern Pacific Company was granted to it by the nation." Nevertheless, its present fair value was ascertained and included in the valuation. When the cases reached this court, said determination was expressly affirmed, this court saying (230 U. S., 454):

> "It is clear that in ascertaining the present value we are not limited to the consideration of the amount of the actual investment. If that has been reckless or improvident, losses may be sustained which the community does not underwrite. As the company may not be protected in its actual investment if the value of its property be plainly less, so the making of a just return for the use of the property involves the recognition of its fair value if it be more than its cost. The property is held in private ownership, and *it is that property* and not the original cost of it of which the owner may not be deprived without due process of law."

In San Joaquin etc. Irrigation Co. vs. County of Stanislaus, *supra*, the lower court (195 Fed., 895) had omitted from the valuation certain water rights, upon the theory that they had been acquired by the company merely as agent for the consumer and that their acquisition had been without cost. That determination was reversed by this court, and somewhat sternly rebuked (233 U. S., 459, 460).

In the Consolidated Gas case (212 U. S., 44) this court refers to the decision in Monongahela Navigation Co. vs. United States, 148 U. S., 312, a proceeding in condemnation, as determining the principles which should govern in a rate case. In the case thus cited this court, speaking through Mr. Justice Brewer, said (p. 325):

> "But we need not have recourse to this natural equity, nor is it necessary to look through the Constitution to the affirmations lying behind it in the Declaration of Independence, for, in this Fifth Amendment, there is stated the exact limitation on the power of the government to take private property for public uses. And with respect to constitutional provisions of this nature, it was well said by Mr. Justice Bradley, speaking for the court, in Boyd v. The United States, 116 U. S. 616, 635: 'Illegitimate and unconstitutional practices get their first footing in that way, namely, by silent approaches and slight deviations from legal modes of procedure. This can only be obviated by adhering to the rule that constitutional provisions for the security of person

and property should be liberally construed. A close and literal construction deprives them of half their efficacy, and leads to gradual depreciation of the right, as if it consisted more in sound than in substance. It is the duty of courts to be watchful for the constitutional rights of the citizen, and against any stealthy encroachments thereon. Their motto should be *obsta principiis.'*

The language used in the Fifth Amendment in respect to this matter is happily chosen. The entire amendment is a series of negations, denials of right or power in the government, the last, the one in point here, being, 'Nor shall private property be taken for public use without just compensation.' The noun 'Compensation,' standing by itself, carries the idea of an equivalent. Thus we speak of damages by way of compensation, or compensatory damages, as distinguished from punitive or exemplary damages, the former being the equivalent for the injury done, and the latter imposed by way of punishment. So that if the adjective 'just' had been omitted, and the provision was simply that property should not be taken without compensation, the natural import of the language would be that the compensation should be the equivalent of the property. And this is made emphatic by the adjective 'just.' There can, in view of the combination of those two words, be no doubt that the compensation must be a full and perfect equiva-

lent for the property taken. And this just compensation, it will be noticed, is for the property, and not to the owner. Every other other clause in this Fifth Amendment is personal. 'No person shall be held to answer for a capital, or otherwise infamous crime,' etc. Instead of continuing that form of statement, and saying that no person shall be deprived of his property without just compensation, the personal element is left out, and the 'just compensation' is to be a full equivalent for the property taken. This excludes the taking into account, as an element in the compensation, any supposed benefit that the owner may receive in common with all from the public uses to which his private property is appropriated, and leaves it, to stand as a declaration, that no private property shall be appropriated to public uses unless a full and exact equivalent for it be returned to the owner."

Similar views are expressed in Boom Co. vs. Patterson, 98 U. S., 403, 405, 408, 410; and in United States vs. Chandler-Dunbar Co., 229 U. S., 53, 75, *et seq.* In the Minnesota Rate Cases, 230 U. S., 352, 451, all of the foregoing decisions were reaffirmed and their applicability to a rate case expressly adjudged.

In Bonbright vs. Geary, 210 Fed., 44, 48, the court said:

> "The inquiry will also be aided by another rule, that if the valuation of any one

of the necessary elements of the public service plant is fixed by the rate-making authorities at an amount unjustly and unreasonably low in a substantial amount, or if the value of an element of substantial value used and useful in maintaining or operating such a plant is entirely omitted by the rate-fixing authority, such unreasonable and unjust valuation or omission of valuation is the taking of private property for a public use without just compensation."

2. *How the Master's Valuation Was Determined. Nature and Scope of Appellants' Criticisms Thereof.*

The Master's valuation and the principles upon which it was ascertained are clearly set forth and fully explained in his comprehensive report (Rec., pp. 120 to 138; Findings 9 to 47, inclusive). It appears that, for convenience, the Master adopted the classification of property as set forth in the Company's inventory, which is Exhibit C. A glance at this exhibit will demonstrate the painstaking care with which it was prepared. It was introduced at an early stage of the hearing before the Master, and, although many times checked and re-checked by the witnesses for the defendants, no error in the inventory was discovered or claimed. In said Exhibit C, at pp. 62 to 64, the totals as to each general class are set forth; on pp. 65 to 97 the totals as to each subclassification under each general class are given; and at pp. 111 to 395 the property constituting each subclassification of each class is itemized with great particularity, and each item separately valued. At pp.

399 to 872 is given a precise description and enumeration of the articles entering into each item in each sub-classification under each class of said inventory. This is carried to the most minute detail, includes nothing which was not there, but omits nothing which was. (For illustration see Class T, Personal Property, Exhibit C, pp. 821 *et seq.*) The classification thus adopted by the Master was as follows: Class A, Lands (Exhibit C, pp. 111 to 115; Details, pp. 399 to 427). Class B, Water Rights (Exhibit C, pp. 117 and 118; Details, pp. 15 to 19). Classes C to S, inclusive, Structures, classified according to location (Exhibit C, pp. 119 to 390; Details, pp. 429 to 815). Class T, Personal Property (Exhibit C, pp. 391 to 395; Details, pp. 819 to 872).

As to Class A, Lands, the Master appraised them (Finding 11, Rec., p. 121) at their present market value, measured (Finding 15, Rec., p. 125) by "the present normal market value of similar lands in the same locality." The Master's valuation of lands was made in view of and in compliance with the rules recently laid down by this court in the Minnesota Rate Case, 230 U. S., 352, 449 to 456, which case was before the Master and cited by him in his report (p. 125). The total land values found by him ($637,814) appear in the table embraced in his report (Rec., p. 122), and the detail thereof in Findings 14 to 21, inclusive, of his report (Rec., pp. 124 to 127). The value claimed by the Company was $920,103 (Exhibit C, p. 64). The Master excluded from consideration a number of parcels of real estate of great value which had been included in the valuation of Metcalf & Anderson, and of the former board of appraisers—this upon the theory that said parcels were not indis-

pensably necessary elements of the plant. The Master also excluded from his valuation of lands increased values on account of special adaptability or availability for particular uses, although the former board of appraisers and Metcalf & Anderson had included such values and testified to them in this case. It is clear that, to say the least, no injustice was done to the defendants in the matter of land valuation. For obvious reasons, the Master's valuation of lands is not criticized by appellants, nor was it the subject of any exception or assignment of error by them. Appellee contends that it is unduly low.

As to Class B, Water Rights, these, like the lands, were appraised by the Master "at their present market value" (Finding 11, Rec., p. 121). The total value found by him ($2,947,617) is set forth in Table 1 of his report (Rec., p. 122), and the details thereof in his Findings 22 to 32, inclusive (Rec., pp. 127 to 132). The value claimed by the Company and testified to by its witnesses was $3,530,000 (Ex. C, p. 64). The method adopted by the Master as to Class B was to measure their value by the present market value of similar water rights in the same locality *for irrigation purposes* (Findings 25 and 26, Rec., p. 129), although the evidence showed without dispute that they were specially adapted and peculiarly available for the purpose of city supply and had a much higher value for that use. Having determined the gross value of the particular source of supply by that method, the Master deducted therefrom the value, as found by him, of the lands and waterworks structures appurtenant to such source of supply (Findings 29 to 32, Rec., pp. 131 and 132). In this also he erred in favor of the defendants, because the evidence showed, without dis-

pute, that the structures necessary for waterworks purposes such as those which he had valued were of a different character and much more costly than those required and used when the purpose was irrigation. As a result the Master's valuation of water rights was unduly low. This we shall presently undertake to demonstrate.

As to valuation, appellants do not at all question the Master's finding concerning water rights. Their sole contention in this regard is (appellants' brief, p. 30) that certain water rights valued by the Master at $1,998,117 should not have been included. This contention is hereinafter discussed.

As to Classes C to S, inclusive, covering the structures, the Master's valuation thereof ($8,216,237) appears in Column 4 of Table 1 of his report (Rec., p. 122). The value claimed by the plaintiff for these structures ($9,202,389, Exhibit C, p. 64, Col. 9) greatly exceeded the Master's finding. The principle upon which the Master's determination of the value of the structures was made is thus stated in his report (Finding 11, p. 121):

> "Estimates of the cost of reproduction of the structures are made, and from such estimated reproduction cost deductions for accrued depreciation are made, so as to determine the estimated reasonable value of the structures in their present condition. In making such estimates it is assumed that a company attempting to reproduce the structures would not do the work itself, but would cause it to be done under contract after fair competitive bidding. It is further assumed

> by the witnesses that the company reproducing the property would incur costs for engineering and superintendence, as well as other costs in addition to the fair contract cost of the structures."

The Master finds, as is the fact, that this method was "adopted by substantially all the parties on the hearing of this case." Appellants did not except, nor have they assigned any error directed to the method adopted by the Master in determining present fair value of the structures. It was the same method adopted and used by themselves in the court below.

The Master's detailed findings concerning the structures are set forth in his report in Findings 33 to 39, inclusive (Rec., pp. 132 to 135). From these it is evident that he has excluded important and costly structures, as well as large items of cost pertaining to included structures. These structures and items of cost had been included by Metcalf & Anderson, and also by the former board of appraisers.

The Master included in the gross reproduction cost the Company's overhead costs, in the nature of engineering and contingencies, in the amount of 12½ per cent. (Finding 44, Rec., p. 136.) This finding is not excepted to nor made the subject of any assignment of error by appellants, except to the extent of claiming that such an allowance of overhead costs overlaps with and constitutes a duplication of the allowance for going value. Appellants' contentions in this regard are hereinafter more fully considered.

In determining the amount of the overhead costs, the Master (Finding 42, Rec., p. 136) excluded an item of $120,000 claimed by plaintiff on account of "preliminary expenses and organization."

As an element in reproduction cost (Finding 41, Rec., p. 135) the Master determined the necessary Interest During Construction upon the sums invested, which would accrue during the period of construction and be necessarily lost to the owner of the plant, thereby unavoidably constituting a portion of the total cost. The Master determined the gross amount of Interest During Construction to be $805,000, deducted therefrom accrued depreciation, and found the net amount to be $699,545, which he included in his net reproduction cost. The net amount claimed by plaintiff on this account was $837,971 (Exhibit C, p. 64). Appellants do not by any exception or assignment of error question the propriety of this allowance, except to say in respect to this, as in respect to Engineering and Contingencies, that this allowance overlapped with the Master's allowance of Going Value, and therefore constituted a duplication of values. The contentions made in their brief are, however, somewhat broader than this, and will be fully considered later on.

After having determined the gross reproduction cost of structures by the method recited above, the Master (Finding 45, Rec., p. 136) determined the accrued depreciation therein. This determination was expressly founded upon the testimony of witnesses, for defendants as well as plaintiff, who had based their conclusions upon a careful personal examination of the property. The total amount of accrued depreciation deducted by the Master was $1,320,970, and the total amount deducted by him from structures only was $1,200,201 (Rec., p. 122, Table 1, Column 3). Appellants filed no exception or assignment of error directed to the Master's deduction for accrued depre-

ciation; nevertheless, they seemingly criticize it. This criticism will be noticed later.

As to Class T, Personal Property, consisting of "such a stock of supplies as the owner must have on hand to properly operate the water works plant," the Master assigned to this a net value (Record, p. 122, Table 1, column 4) of $174,686.00, although plaintiffs' claim on that account (Exhibit C, p. 64, column 9) had been $227,916.00. The method by which the Master's determination was reached is set forth in Finding 40 (Record, p. 135). The Master determined what he called the "going market value" thereof, which was in reality the wholesale price of these articles f. o. b. Denver, and refused to make any addition for overhead cost, although cost had undoubtedly been incurred in transporting these articles to convenient points of storage along the plant, in arranging them in warehouses and other such places, and in there maintaining them. From the gross figure thus arrived at by the Master ($190,000.00) he deducted accrued depreciation ($15,314.00), resulting in his final figure stated above. For obvious reasons this finding is not criticized by appellants.

Having determined the value of lands and water rights according to their present market value, as aforesaid, and having determined the present value of the structures by ascertaining the present reproduction cost thereof, and deducting therefrom accrued depreciation, and having determined the present value of Class T in the manner aforesaid, the Master found that he had thereby valued merely the "bare bones" of the plant. He had thereby ascertained the value of a "dead" plant, rather than a "live" one; a plant which had not yet begun to go, rather than one which

was going. He had valued it not as a plant in "successful operation," but as one which had not begun to operate at all.

Accordingly (Finding 46, Rec., pp. 136 to 138), having found the foregoing facts, he also found and determined that the value of the status of being a going concern which existed and was inherent in the plant of The Denver Union Water Company, but which he had not yet included in any portion of the valuation which he had already made, was $800,000. Plaintiff's claim for this item (Exhibit C, p. 64) was $1,200,000.

Appellants' exceptions and assignments of error relating to the Master's allowance for going value do not question its amount nor the propriety of the allowance, except to the extent of saying that it was already covered by the Master's allowances for Engineering and Contingencies and Interest During Construction (although the Master expressly found otherwise), and that it should not have been allowed because the Water Company possessed no definite franchise. Appellants' contentions in their brief are broader than this, and will be later dealt with.

The Master's total figure, determined as aforesaid, related to the plant as it stood on November 1, 1913. He brought it down to May 1, 1914 (Finding 47, Rec., p. 138), by deducting the actual depreciation accruing during the interval less the additions to the plant made during the same period.

The total figure thus arrived at ($13,415,899) the Master tested (Finding 47, Rec., p. 138) by comparing the same with the conclusions of all witnesses who had testified concerning reasonable value of the entire plant; by comparing the same with the cost to the

City of providing a duplicate plant, which cost he found to be in any event greater than the valuation determined by him; by a consideration of the adequacy and present condition of the plant and the character of service which it rendered, all of which (Finding 52, Rec., p. 139) he found to be excellent; and by a consideration of the question (Finding 53, Rec., p. 140) whether fair rates measured by the valuation thus determined by him would exceed the value of the service to the consumer, finding expressly that they would not.

By a consideration of all of these matters he found and determined (Finding 48, Rec., p. 138) "that $13,415,899 is the fair and reasonable value of the property used by the Water Company for the convenience of the public," and a proper rating base by which to measure the adequacy of the return afforded by the rates in question. To this determination of fair value appellants filed no exception and no assignment of error. Nevertheless, they assume in their brief to criticize it, because, as they assert, the Master did not give due consideration to the fact that the Company was without a definite franchise (although no franchise value was claimed or allowed), or to the fact that the Company was exposed to the possibility of municipal competition. This criticism will be dealt with later.

Upon the foregoing review, we submit it to be clear that the Master's determination of value was based upon correct principles, and certainly did no injustice to appellants. Every possible doubt was resolved against appellee.

Appellants' criticisms thereof, even as made in their brief, are few in number and limited in scope.

Appellants' exceptions and assignments of error are still more limited, and are of such character as to foreclose consideration of many contentions made in their brief.

So far as structures are concerned, except for their contentions mentioned above, relating to allowances for Engineering and Contingencies and for Interest During Construction, there is no exception or assignments of error upon which any contention can be based. The contentions made by appellants in this regard, other than those specifically mentioned above, are to the effect that cost of reproduction less depreciation was not the proper method of determining present value; that there was a marked variation in the estimates of different witnesses concerning reproduction cost; that the proof respecting the structures was not sufficiently full, complete and specific, and that the original cost of the structures was not sufficiently shown. Upon this record none of these contentions are open to appellants. The record brought to this court was not prepared with any such contentions in view, because none such had been made, either by exception to the Master's report or by assignment of error. Therefore the court must reject them. But it can do so with a good conscience because, as we shall now demonstrate, they are totally without merit.

3. *The Guiding Rules Adopted by the Master Were Correct and Properly Applied. As to Present Value of Structures the Master Rightly Considered Cost of Reproduction Less Depreciation the Most Significant Figure.*

In Smyth vs. Ames, 169 U. S., 466, 546, the court, after holding that present fair value was the deter-

mining factor, prescribed the method by which that value was to be ascertained as follows: "And in order to ascertain that value (1) the original cost of construction, (2) the amount expended in permanent improvements, (3) the amount and market value of its bonds and stock, (4) the present as compared with the original cost of construction, (5) the probable earning capacity of the property under particular rates prescribed by statute, and (6) the sum required to meet operating expenses, are all matters for consideration and are to be given such weight as may be just and right in each case. We do not say that there may not be other matters to be regarded in estimating the value of the property." (Numerals ours.)

In the Minnesota Rate Cases, 230 U. S., 352, 434, the court reiterated the foregoing language, and also held (pp. 449 to 456) that the value of real estate (here including lands and water rights) was to be determined according to the normal market value of similar real estate in the same locality.

These principles of valuation were duly considered and carefully applied by the Master. That the rule prescribed in the Minnesota Rate Cases was applied to the valuation of the lands and water rights has already been demonstrated. As to the rules prescribed in Smythe vs. Ames, none of them were overlooked.

Concerning "the original cost of construction," the Master found (Finding 10, Rec., p. 121) that "the original cost of many items of property cannot be ascertained because the books of predecessor companies are not available or do not disclose with accuracy what the original costs were." Nevertheless, all information available concerning original costs was

gathered and submitted to the Master and duly considered by him, as is evident from his findings. (For instance, see Finding 34, Rec., p. 132, fol. 203.)

Concerning "the amount expended in permanent improvements," the proof was full and complete. Exhibit A-55 (not produced here) was an elaborate detailed and itemized statement of these costs, by years, for each of the twenty years of the Company's life. Exhibit Z (Rec., p. 926) gave like information for the years which had elapsed since the joint appraisement of 1908. These exhibits were reinforced by the testimony of witnesses going into minute detail.

Concerning "the amount and market value of its bonds and stock," the Master found, as was the fact (Finding 10, Rec., p. 121), that "the parties agree that neither the par value nor the market value of the outstanding stocks and bonds of the Water Company aid in determining the present value of the Company's property. Therefore, the market value of these stocks and bonds was not proved on the hearing." This finding was not excepted to, nor was it made the subject of any assignment of error.

Concerning "the present as compared with the original cost of construction," this plainly calls for the ascertainment of present-day reproduction cost. Appellants say (their brief, p. 118) that in Smyth vs. Ames, *supra*, "reproduction cost is not even mentioned" as among the things which "may be considered as guides in determining the value of the public utilities plant." In this appellants are clearly mistaken. The matter of reproduction cost was in this case the subject of most comprehensive proof, by the

testimony of many witnesses and by elaborate exhibits. Very few of these exhibits have been brought to this court. The testimony of the witnesses is represented only by an abstract thereof, in which each page represents fully ten pages of the original transcript. It is, therefore, totally unreliable as a guide, if the question be as to the weight of the testimony.

Concerning "the probable earning capacity of the property under particular rates prescribed by statute and the sum required to meet operating expenses," these subjects also were fully dealt with by most elaborate and comprehensive proof, as has already been shown (*supra*, pp. 115 *et seq.*).

Accrued depreciation was determined in accordance with correct principles, and an ample allowance therefor deducted, as this court has said it should be (Knoxville vs. Knoxville Water Co., 212 U. S., 1, 10).

In short, every rule heretofore laid down by this court was carefully observed, and the result is undoubtedly beyond just criticism, at least so far as appellants are concerned.

As to appellants' suggestion (their brief, pages 83, 85 and 118) that some impropriety was involved in determining present value of structures by the reproduction-cost-less-depreciation method, it is sufficient to say that that method has repeatedly received the approval of this court. As to present value of structures, it is rightly held to be the most influential factor, and except in very rare instances, of which this case is not one, furnishes a minimum figure below which we may not go in determining fair value, either for rating or for condemnation and public purchase, and to which (after deducting depreciation actually

accrued) substantial additions must be made in arriving at the final conclusion as to fair value.

In recent appraisals of property, practically without exception, engineers, commissions and courts, particularly the Federal courts, have laid stress upon the importance of the figure arrived at by estimates of present reproduction cost less accrued depreciation. That was the method employed by the former board of appraisers and by all of the engineer witnesses for the plaintiff in this case (appellee here), and furnished a figure which had a most important influence in guiding their final judgment as to actual fair value. It was also the method employed by all of the engineer and contractor witnesses for the defendants (appellants here), and resulted in the only figure of importance which the defendants presented for the consideration of the Master or the court below, for the defendants did not, as the plaintiff did, present a final figure representing a fair value of the plant, including all of its elements, and arrived at after consideration of all relevant facts.

In Whitten on Valuation of Public Service Corporations, page 69, Sec. 72, it is said, with the citation of many authorities: "The general trend of recent decisions has been to make reproduction cost the sole or controlling basis of value for rate purposes. Some courts plainly state that in their opinion actual cost, capitalization and other factors are to be considered only to the extent that they may throw light on the cost of reproduction or existing depreciation." The many cases cited and quoted from in preceding portions of this argument illustrate this, for almost without exception present-day reproduction cost less actual accrued depreciation has as to structures been

the basic figure adopted, and this has manifestly been with the entire approval of this court. See particularly:

The Consolidated Gas Co. vs. City of New York, 157 Fed., 849, 854, *et seq.*

Wilcox vs. Consolidated Gas Co., 212 U. S., 19, 41, 52.

Knoxville vs. Knoxville Water Co., 212 U. S., 1, 9.

Lincoln Gas & Elec. Light Co. vs. Lincoln, 223 U. S., 349, 358.

Shepard vs. Northern Pacific, 184 Fed., 765, 803.

Minnesota Rate Cases, 230 U. S., 352, 436, 452.

Louisville & Nashville Co. vs. Railroad Commission, 196 Fed., 800, 820.

Moreover, the cost of reproduction must relate to the reproduction of the identical plant involved and under present-day conditions. To undertake to estimate the reproduction cost of some plant other than the identical one under consideration, or under conditions other than those which prevail at the time the reproduction is assumed to occur, to-wit, at the time of the valuation, confuses present fair value with exchange value, and leads into the realm of pure speculation, with no result but perplexity and confusion. As was said by this court in the Minnesota Rate Cases (230 U. S., 454), "the property is held in private ownership, and it is *that property*, and not the original cost of it" (nor, we may logically add, the original or present-day cost of some other or different

property constructed under conditions differing from those which actually prevail) "of which the owner may not be deprived without due process of law." The question is fully discussed in the following authorities:

The Consolidated Gas Co. vs. City of New York, 157 Fed., 849, 854.

Kennebec Water District vs. City of Waterville, 97 Maine, 185; 54 Atl., 6, 19.

Hayes on "Public Utilities, Their Cost New and Depreciation," pp. 18, 217.

Floy on "The Valuation of Public Utility Properties," p. 18.

On the subject of accrued depreciation appellants (their brief, pp. 116, 117) compare the Master's deduction for accrued depreciation with his annual depreciation allowance, and assert as the result that the accrued depreciation ought to have been doubled or the depreciation allowance halved—this though the criticism is supported neither by an exception to the Master's report nor by any assignment of error. In any event, appellants' contention is without merit. The matter has already been fully dealt with in connection with our discussion of the depreciation allowance (*supra*, pp. 147 *et seq.*). It is there demonstrated that appellants' mistake consists in an utter failure to appreciate the total amount of accrued depreciation which has actually occurred. This consists not only of the amount of accrued depreciation in existing elements deducted by the Master ($1,320,970), but also the complete depreciation upon ele-

ments which, for that reason, have heretofore disappeared from the plant, amounting to at least $1,261,000. The total depreciation which has accrued is, therefore, the sum of these, or $2,581,970.

4. *The Alleged Variation in the Estimates and Conclusions of Different Witnesses Does Not Exist.*

Appellants at pp. 83 and 84 of their brief compare the conclusions of the witnesses Freeman, Holman, Hazen and Metcalf & Anderson as to present fair value of the plant (these being the only witnesses who presented their conclusions upon that subject), and state that there is "a difference between the highest and lowest of more than $1,300,000." No such difference actually existed. Metcalf & Anderson's valuation was in round figures $16,000,000. The valuation of the former board of appraisers, as of January 1, 1908, was $14,400,000. Freeman, Holman and Hazen, members of that board, brought their former valuation to date by adding the actual cost of additions, betterments and extensions and deducting the actual depreciation which had occurred in the interval. Holman also took into consideration the increase in value of the water rights which beyond question had occurred, and which in this case was testified to by the witnesses both for plaintiffs and defendants; which increase, as also shown by the evidence, was beyond doubt at least 25 per cent. Freeman and Hazen, although stating that such increase had doubtless occurred, did not take it into consideration, because they had no personal knowledge as to its extent. All this we have hereinbefore fully demonstrated with appropriate references to the record (*supra,* pp. 25 and 26). The value of the water rights as found by

the appraisers in 1908 was $2,845,925. Twenty-five per cent of this exceeds $700,000. If this amount be added to the figure given by Mr. Freeman, or that given by Mr. Hazen, the result will be $16,000,000 or more. Metcalf & Anderson, as did Holman, gave consideration to this increase in value of water rights, their valuation of water rights as of October 31, 1913 (Exhibit C, p. 64), being $3,530,000, or substantially $700,000 in excess of that found by the former board of appraisers as of January 1, 1908. It follows that, for purposes of comparison, and giving due consideration to the facts stated above, Freeman's valuation should be taken to be $16,070,000, and Hazen's valuation $16,000,000, with which are to be compared Holman's valuation of $16,614,719, and Metcalf & Anderson's valuation of $16,000,000.

But appellants also refer (their brief, p. 84) to the figure $10,109,789, furnished by one of their witnesses, John Gaffy; also to the figure $9,915,388 furnished by a Mr. Bickel, who was likewise one of their witnesses. And on page 115 of their brief appellants positively assert that "there was a variation in the various estimates of the total value of the property of $4,000,000 or $5,000,000." The assertion is without foundation in fact and in conflict with the record. As we have already shown, there was a very close correspondence between the conclusions of the five witnesses mentioned above, who alone undertook to testify as to "the total value of the property." The figures given by Gaffy and Bickel, referred to on page 84 of appellants' brief, did not represent, nor did they purport to represent, "the total value of the property." They referred only to the gross reproduction cost of the structures, as is clearly demon-

strated by the testimony of these witnesses and the exhibits which they produced, none of which have been brought to this court.

See the testimony of Gaffy, direct examination, record, pages 687-689; cross-examination, pages 690-710; re-direct examination, pages 710-713; and Exhibits 57, 58, and 66.

See testimony of Bickel, direct examination, record, page 754; cross-examination, 755-777; re-direct examination, 778, and Exhibit 65.

The direct testimony of each of these witnesses really consisted of the very long written exhibits which each produced and filed, none of which have been brought to this court. From these exhibits and also from their oral testimony, an abstract of which is contained in this record, it clearly appears that the gross figures which they presented and which are stated in appellants' brief covered nothing but the reproduction cost of structures. They did not include, nor purport to include, Class A, Lands; Class B, Water Rights; Class T, Personal Property, or Going Value (Rec., pp. 690, 694, fol. 872; p. 760; Exhibit 57, p. 143; Exhibit 65, p. 1, and p. 67-A). Their estimates gave scant consideration to the costs in the way of Engineering and Contingencies and Interest During Construction to which the Company would necessarily be subjected, and their allowances on that account were certainly unduly low. That was a matter concerning which neither of them had ever had any experience and about which they knew nothing, as one of them frankly admitted (Rec., p. 707, fol. 888), and as is evident from the other's testimony (Rec., pp. 755 *et seq.*). These men were contractors whose experience had been limited to small

jobs, and who had never been connected with a work approaching the magnitude of that involved in the reproduction of the Water Company's plant. Their testimony and their exhibits were chiefly directed to fair contract cost—that is to say, what would be a fair contract price to be paid for the reproduction of these structures upon the assumption that the Company had done all the preliminary work of investigation and organization, and had prepared the necessary plans and specifications upon which the work would be submitted to competitive bidding; and upon the further assumption that while the contractor's work was going on the Company's organization would be maintained for purposes of administration, supervision, etc., and that the contract price would be paid in installments from time to time as the work progressed. Upon these assumptions Gaffy stated (Rec., p. 713, Exhibit 66) that a fair price to be paid by the Company to the contractor for the reproduction of the structures would be $8,361,406, and Bickel stated (Rec., p. 778) that it would be $8,662,440. The fair contract cost as found by the Master (Rec., p. 122, Table 1, Column 2, less 12½% for Company's overhead) was $8,370,078. This figure of the Master's did not, nor do those of Gaffy and Bickel mentioned above, include anything for the Company's engineering and contingencies or interest during construction. They are, therefore, strictly comparable. It is significant that the fair contract cost testified to by Gaffy and Bickel equalled or exceeded that found by the Master.

To reach the total figures mentioned on page 84 of appellants' brief, Gaffy and Bickel added to the fair contract cost of the structures as determined by

them certain arbitrary amounts, which they assumed would be costs for overhead and interest during construction to which the Company would be subjected. It is obvious, for the reasons above mentioned, that these were totally inadequate to cover the Company's costs of engineering and contingencies and interest during construction on the structures alone. To ascertain what they were, we must deduct the fair contract cost as finally determined by Gaffy and Bickel from the total figures given by each. The total figure given by Gaffy (Rec., p. 688, Exhibit 57) was $10,109,789. The fair contract cost finally determined by him (Rec., p. 713, Exhibit 66) was $8,361,406. The difference is $1,748,383, which must cover all of the Company's overhead costs upon the structures, including preliminary investigation, preparation of plans and specifications, administration, engineering and contingencies and interest during construction. The total figure submitted by Bickel (Rec., p. 755, Exhibit 65) was $9,915,388. The fair contract cost finally determined by him (Rec., p. 778) was $8,662,440. The difference is $1,252,948, which, as in the case of Gaffy, must cover all of the Company's overhead expense, including engineering and contingencies, and interest during construction. The Master's allowance for Company's engineering and contingencies (Rec., p. 122, Table 1, Column 2) was $1,046,360, and his allowance for interest during construction (Rec., p. 122, Table 1, Column 1) was $805,000. The sum of these, representing the amount included by the Master in gross reproduction cost to cover the Company's overhead expense and interest during construction, is $1,851,360. This is $102,977 more than the total allowance for these items made

by Gaffy, as aforesaid, and $598,412 more than the total allowance made therefor by Bickel, as aforesaid.

But, as we have already observed, the figures given by Gaffy and Bickel and referred to on page 84 of appellants' brief, included nothing whatever for Class A, Lands; Class B, Water Rights; Class T, Personal Property, or for Going Value. In order to obtain a figure relating to total valuation which will be comparable with that found by the Master, we must add the value of the omitted property as determined by the Master and deduct depreciation, as the Master did. The following tabulation shows the result of this. In this tabulation the total figures as given by Gaffy and Bickel are treated as the gross reproduction cost of the structures. They were offered by the witnesses in that guise.

	Gaffy	Bickel
Gross reproduction cost of structures, Classes C to S.	$10,109,789	$ 9,915,388
Class A (as found by Master, Record, p. 122).....	637,814	637,814
Class B (as found by Master, Record, p. 122).....	2,947,617	2,947,617
Class T (as found by Master, Record, p. 122).....	190,000	190,000
Going value (as found by Master, Record, p. 122)..	800,000	800,000
Total	$14,685,220	$14,490,819
Deduct accrued depreciation as found by Master.....	1,320,970	1,320,970
Present fair value.....	$13,364,250	$13,169,849

The Master's determination of present fair value was $13,415,899.

But, as already noted, the allowances made by Gaffy and Bickel for Company's overhead costs and interest during construction were obviously unduly low. Neither Gaffy nor Bickel had any experience or knowledge respecting such matters. This is either admitted by them or plainly appears from their testimony (Record, p. 707, fol. 888; pp. 755 *et seq.*). Beyond question, the allowances made by the Master for Company's overhead costs and interest during construction and found and determined by him to be correct, are, to say the least, more likely to be right than those assumed by Gaffy and Bickel. Giving due consideration to these determinations of the Master, there is, as has been shown above, in the case of Gaffy, a deficiency of $102,977, and in the case of Bickel a deficiency of $598,412. Recurring now to the tabulation set forth above, and starting with the total stated in each, before the deduction of accrued depreciation, the following tabulation is important:

	Gaffy	Bickel
Total gross valuation	$14,685,220	$14,490,819
Deficiency on overhead costs and interest during construction	102,977	598,412
Total gross value corrected	$14,788,197	$15,089,231
Deduct depreciation as found by Master	1,320,970	1,320,970
Present fair value corrected to accord with Master's determination of overhead costs and interest during construction	$13,467,227	$13,768,261

The present fair value as determined by the Master was $13,415,899. The estimates of Gaffy and Bickel, properly considered, each result in a figure representing present fair value greater than that found by the Master.

In order to compare the figures of Gaffy and Bickel with those of Metcalf & Anderson, the comparison must be made on the basis of fair contract cost as determined by each. Gaffy's fair contract cost (Record, p. 713, Exhibit 66) was $8,361,406; that of Bickel (Record, p. 778) was $8,662,440, and that of Metcalf & Anderson (Record, p. 882, Exhibit A-98. Record, p. 1033) was $9,416,861. The difference here, as will be observed, is, as between Gaffy and Metcalf & Anderson, about $1,000,000, and as between Bickel and Metcalf & Anderson less than $800,000. These

differences are fully accounted for by the fact that both Gaffy and Bickel omitted necessary items of construction and elements of cost, as was clearly evident from the detailed exhibits which they presented, none of which is produced here. Many of these omissions were admitted by them upon cross-examination. The exhibits and the testimony of Gaffy and Bickel were carefully analyzed by Mr. Metcalf, and the result of such analysis set forth in his testimony in rebuttal (Record, pp. 881 to 898) and the carefully-prepared series of exhibits which he presented in illustration of his testimony (Exhibit A-98, Record, p. 1033; A-99, Record, p. 1034; A-100, Record, p. 1049; A-101, Record, p. 1054; A-102, Record, p. 1062; A-103, Record, p. 1067). Without going into detail, we assert, without fear of successful contradiction, that, as demonstrated beyond question, the estimates of Gaffy and Bickel concerning fair contract cost failed to include or to take into consideration structures, and items of structures, and elements of costs of construction necessary to be included, and which must be included to put their determinations upon a basis which would make them comparable with that of Metcalf & Anderson. When due consideration is given to these items, the fair contract cost as determined by Gaffy and Bickel will, as the evidence demonstrated, equal, if it does not exceed, that determined by Metcalf & Anderson. It follows that if the other items included in the valuation of Metcalf & Anderson, and purposely and admittedly excluded from the figures of Gaffy and Bickel, be added to such fair contract cost, and the gross valuation thus determined be reduced by deducting accrued depreciation as found and deducted by Metcalf & Anderson, the result will be a present

fair value of $16,000,000, as also found by Metcalf & Anderson.

Beyond question, the assertion made on page 115 of appellants' brief that "there was a variation in the various estimates of the total value of the property of $4,000,000 or $5,000,000," is totally without justification or excuse and in conflict with the record. The obvious mistakes and omissions of Gaffy and Bickel, the erroneous assumptions upon which they proceeded, and the fact that they excluded certain items of structures and elements of construction cost which Metcalf and Anderson and the former board of appraisers had included, are made the subject of express findings by the Master (Finding 34, Record, p. 132; Finding 35, Record, p. 133; Finding 39, Record, p. 133; also page 134, fols. 205½ and 206). Instead of there being any material variation in the estimates of the various witnesses as to reproduction cost of the structures, there was a remarkably close agreement in their estimates; rightly considered, they were practically identical. And instead of there being a variation of four or five million dollars in the determination of present fair value as finally reached by the witness who testified in respect thereto, the conclusions of all, including defendants' witnesses, when due regard is given to items which some included and others omitted, were in substantial agreement and plainly demonstrated a present fair value of not less than $16,000,000. The present fair value as determined by the Master was $13,415,899, substantially less than that which would result from the testimony of any witness either for plaintiff or defendants. But this was largely due to the fact that

the Master excluded items which the others had included.

5. *Appellants' Contention that the Proof Concerning Reproduction Cost of Structures Was Not Sufficiently Full, Complete and Specific, and Their Further Contention that the Actual Original Cost of Structures Was Not Sufficiently Shown, Are Untenable and in Conflict with the Record.*

As we have already indicated, the contentions outlined above are not open to appellants, because of the lack of any exception to the Master's report and any assignment of error relating thereto; but, beyond this, they are in conflict with the facts, as is demonstrated even by the incomplete record which they have brought to this court. If the whole of the voluminous record which was before the Master were here, or if appellants' present counsel were familiar therewith, such contentions could not be conscientiously made; nevertheless, they are made and reiterated in appellants' brief (pp. 22 to 25, 83, 85, 91).

In so far as these contentions relate generally to an alleged lack of particularity in the proof, our answer thereto is the same as that which was made to a like contention relating to the evidence concerning gross income, operating expenses, depreciation allowance, and net income (*supra*, pp. 115 *et seq.*). The witnesses for plaintiff who testified concerning the reproduction cost of structures (Classes C to S, inclusive) were Freeman (Record, p. 195), Holman (Record, p. 210), Hazen (Record, p. 226), and Metcalf (Record, pp. 258, 881, 900). The high qualifications of these witnesses and their extended expe-

rience in construction work of great magnitude, are beyond question and are conclusively shown by this record. Messrs. Freeman, Holman and Hazen were members of the former board of appraisers which, as a board, had determined the reproduction cost of the structures, and whose detailed report is in this record (Record, pp. 27 to 65). The witnesses last named fully explained the report of said board of appraisers, the manner in which its conclusions had been reached, and the reasons therefor, producing in explanation of their testimony further exhibits. As already explained, they likewise brought the determinations of the board of appraisers down to date.

Messrs. Metcalf and Anderson prepared the Company's inventory, Exhibit C, which in its original form is before this court. As to particularity and minuteness of detail, it speaks for itself. As to structures, Mr. Metcalf was to a large extent their spokesman, Mr. Anderson expressly concurring in Mr. Metcalf's testimony upon that subject and devoting the detail of his own testimony largely to the matter of water rights. Mr. Metcalf's testimony upon the subject of structures was extraordinarily comprehensive, detailed and specific, and demonstrated beyond question the extreme care with which the subject had been considered. In addition, Mr. Metcalf prepared and produced many elaborate exhibits in illustration and amplification of his oral testimony. Very few of these have been brought to this court. Moreover, in considering the abstract, which in this record represents the oral testimony, it must never be forgotten that each page thereof is intended to be a condensed statement of what appears on at least ten pages of

the original transcript, and each sentence thereof frequently stands for what in the original was an extended discussion.

On the part of the defendants, those witnesses who testified concerning the reproduction cost of the structures (Classes C to S) were Van Diest (Record, p. 408), Gaffy (Record, p. 687) and Bickel (Record, p. 754). Messrs. Gordon (Record, p. 720) and Hill (Record, p. 739) also gave some testimony, but it was confined solely to the reproduction cost of the distribution system (Class S) and did not relate at all to any of the other structures (Classes C to R). Without attempting here to make invidious comparisons, it is fair to say that the qualifications of defendants' witnesses to testify upon the questions involved were vastly inferior to those of the witnesses for plaintiff. None of them had ever had any experience in construction work upon a large scale, and certainly none had ever been connected with a work approaching the magnitude of the reproduction of the Water Company's plant.

Mr. Van Diest was the spokesman for the Public Utilities' engineers, whose report was before the Master. The testimony of Messrs. Gaffy and Bickel has hereinbefore been considered. The testimony of Messrs. Gordon and Hill, which related solely to the distribution system (Class S), is not referred to in appellants' brief, and is properly characterized in the Master's finding (Finding 39, Record, pp. 133-134) as follows: "The estimates of Gordon and of Hill are, in my judgment, entitled to less weight than those of the other witnesses, because of the limited experience of these witnesses concerning construction work involved in the estimates, and also because

these witnesses made less careful study and investigation of this distribution system." Said finding was not excepted to, nor is it made the subject of any assignment of error.

Each of the witnesses for the defendants produced at least one exhibit and some produced several, all of which were introduced in evidence and duly considered by the Master. In the case of Gaffy, Bickel, Gordon and Hill, these exhibits really took the place of the direct examination. To some extent, at least, this was also true in the case of Mr. Van Diest. With these exhibits left out, the direct testimony of these witnesses is in reality omitted from the record and their cross-examination is largely incomprehensible; and yet none of the exhibits produced by any of these witnesses is brought to this court, except one (Exhibit 54, Record, p. 1083) of the several produced by Mr. Van Diest. Under these circumstances, we submit that the contentions of appellants respecting the structures cannot be considered. Much less can they be upheld. In so far as those contentions rest upon the claim that the evidence was lacking in scope or particularity, a mere inspection of the record is sufficient to conclusively dispose of them.

But appellants are especially insistent (their brief, pp. 22 to 25) that proof in regard to original costs was lacking, and that appellee, although evidently in possession of the facts in that regard, withheld them from the Master. There is no justification for this assertion. The Master found (Finding 10, Record, p. 121) that "The original cost of many of the items of property going to make up the Water Company's plant cannot be ascertained. The books of its predecessor companies are not available or do not dis-

close with accuracy what the original costs were." Moreover, it is clearly evident from other findings of the Master that evidence concerning original costs was before him and received due consideration (Finding 15, Record, p. 125; Finding 18, Record, p. 127; Finding 19, Record, p. 127; Finding 20, Record, p. 127; Finding 34, Record, p. 132, fol. 203). The undisputed evidence demonstrates beyond question the correctness of the Master's finding quoted above. From that evidence it clearly appeared that many of the important structures of the Water Company had either been completed or their construction begun prior to the acquisition of the plant by the present company. It also clearly appeared that the records of the predecessor companies had either not been turned over to the present company and had long since disappeared, or had been kept in such a way as to give no information concerning original costs. It also clearly appeared that, while the present company had since 1894, when it acquired the property, kept a record of construction costs, this record covered the entire construction activities in each year of the Company's life, and the accounts were not segregated, nor was it possible to segregate them, so that the costs applicable to particular structures could be separately ascertained therefrom. This was fully explained by the witnesses. As Mr. Hazen said (Record, p. 228), "It was impossible to determine from these the actual costs of particular structures, except in a few cases. That condition is not peculiar to the Denver works, but is very common in water-works operations." See, also, the testimony of Cheyne (Record, pp. 347, 348, 354), and that of Metcalf (Record, pp. 279, 285).

Nevertheless, all that could be ascertained from the Company's records concerning original costs was freely produced before the Master. Exhibit Z (Record, p. 926) gives with great particularity, by years, the actual cost, exclusive of the Company's overhead costs and interest during construction, of additions, extensions and betterments made between January 1, 1908, to which the former appraisal related, and March 31, 1914. Exhibit A-55 (not produced here) gives like information for each year of the Company's life from 1894 to March 31, 1914. These exhibits were prepared and presented by Mr. Cheyne, who fully explained them (Record, pp. 346 to 352). As already stated, the Company's records did not segregate costs so as to show the actual cost of any particular structure. This it was impossible to ascertain except in a few cases of relatively recent work; nevertheless, the plaintiff presented to the Master all the information available upon this subject. Mr. Metcalf prepared and presented an exhibit (Exhibit A-99, Record, p. 1034) setting forth fully all of the information upon this subject which could possibly be gathered, and explained it at length (Record, pp. 883, *et seq.*, 893). Moreover, Messrs. Freeman and Hazen gave the information which they had gathered concerning original costs while acting upon the former board of appraisal (Record, pp. 201, 202, 204, 207, 227, 233).

We submit that the criticisms in this regard which appear upon pages 22 to 25 of appellants' brief are wholly without justification and should not have been made.

VI.

WATER RIGHTS. THOSE INCLUDED IN THE MASTER'S VALUATION ARE THE PROPERTY OF APPELLEE AND USED BY IT FOR THE ACCOMMODATION OF THE PUBLIC. THEIR PRESENT FAIR VALUE CANNOT BE EXCLUDED FROM THE RATING BASE. THE MASTER'S VALUATION THEREOF WAS EXTREMELY MODERATE AND IS NOT OPEN TO QUESTION BY APPELLANTS.

The Master found the value of appellee's water rights to be $2,947,617 (Rec., p. 122, Table 1, Column 4; Rec., p. 130, Finding 27). The specific findings of fact and conclusions of law upon which the Master arrived at this determination of value are set forth in Findings 22 to 32, inclusive (Rec., pp. 127 to 132). These same water rights had been by the former board of appraisers valued, as of January 1, 1908, at $2,845,925 (Rec., p. 28). Between January 1, 1908, and May 1, 1914, the date to which the Master's valuation related, there had unquestionably been a marked increase in the value of water rights, amounting to at least twenty-five per cent. Defendants' testimony, as well as that of plaintiff, demonstrates this (Rec., pp. 213, 510).

Metcalf and Anderson valued them as of October 31st, 1913, at $3,530,000 (Ex. C, p. 64).

In the figures of the Public Utilities engineers (witnesses for the defendants) nothing was included on account of water rights. This is true although the engineers themselves were plainly of the opinion that

such valuation ought to be included, and Mr. Van Diest, their spokesman, admitted that it should be added. This is clearly indicated in their written report to the Public Utilities Commission (Rec., pp. 71, *et seq.*). Notwithstanding the statements contained in their report, the committee of engineers utterly failed to include in their estimate presented to the Master, any value whatever on account of water rights. Nevertheless, Mr. Van Diest, spokesman for the committee of engineers, in the course of his testimony, said, in substance (Rec., p. 414), that valuation of the water rights was entirely omitted because of lack of time; that (Rec., 416, Fol. 543) he would not undertake to say what their value was, but that they were a very valuable asset and "I think whatever value the water rights have should be included. Whatever the water rights are, I think they should be added to our estimate, but would not undertake to say what that value is."

It will be useful at the outset to determine the scope and the exact limits of appellants' contention.

1. *Scope and Limits of Appellants' Contention. It Has Been Conclusively Determined against Them by Prior Decisions of This Court and of the Colorado Supreme Court.*

Appellants' discussion of water rights will be found in their brief at pages 28 to 63. They do not at all question the Master's determination of value either in whole or in part. They do not at all question the propriety of the inclusion, at the value found by the Master ($949,500), of water rights which the Company or its predecessors had acquired by pur-

chase; on the contrary (their brief, p. 29) they expressly concede the propriety of their inclusion at the value found by the Master. Their contention is limited to the water rights which the Company or its predecessors had, under the laws of Colorado, acquired by appropriation, which they say were valued by the Master at $1,998,117. It will thus be seen that their contention is limited in scope, applies only to a portion of the water rights included by the Master, relates solely to the propriety of the principle upon which they were included, and does not involve any assertion that either class of water rights was overvalued. Plainly, so far as value is concerned, appellants are content.

In support of said contention, the substance of appellants' argument is this: that at the time of the acquisition of said water rights by appropriation the Water Company, or its predecessor, was engaged in the business of supplying Denver and its inhabitants with water; that the water rights so acquired were intended to be used in connection with said business; that therefore the Water Company and its predecessors in making said acquisitions acted merely as agents and trustees for Denver and its inhabitants, and that therefore said water rights are, and from the date of their acquisition have been, the property of Denver and its inhabitants, and not the property of the Water Company, although nominally standing in its name. The determination of this issue depends upon questions of fact as well as of law. All of the questions of fact involved were determined by the Master in favor of appellee's contentions and against those of appellants, as indeed they must have been,

because the evidence was undisputed. These findings of fact are in no manner questioned by appellants. Upon the facts so found and conclusively determined the Master held that appellants' contention upon the question of law was unsound and so rejected it. The court below confirmed this conclusion. We respectfully submit that this determination of the Master and of the court below is right, and should be affirmed. The question has been forever set at rest by the following decisions of this court and of the Colorado Supreme Court, which deal with the precise question here involved, and determine it adversely to appellants' contention:

San Joaquin, etc. Irrigation Co. vs. Stanislaus County, 233 U. S., 454;

City of Denver vs. Walker, 45 Colo., 387;

City of Denver vs. Brown, 56 Colo., 216;

People Ex Rel. City and County of Denver vs. The District Court of the Second Judicial District, decided by the Supreme Court of Colorado on July 2, 1917.

The case last cited has not yet been reported either in the Official Colorado Reports or in the Pacific Reporter, but a reproduction, in print, of a certified copy thereof is attached to this brief as Appendix B, *infra*, pp. 436 *et seq.*

2. *Nature and Ownership of the Property-Right Valued by the Master.*

In Colorado water is a commodity, and the right to divert water from the natural streams, to store

it in reservoirs, to convey it through pipes, ditches or other conduits, and to deliver it upon lands for irrigation purposes, or in communities for domestic and manufacturing purposes, a vested property right protected by the Constitution. This right is, of course, as essential to a waterworks system as the iron pipes which convey the water. In constructing and assembling a waterworks system it must be obtained, and under the conditions which prevail in Colorado at the present time must, like the iron pipes, be bought and paid for. The situation in Colorado is not like that in eastern communities, where nothing more need be done than to insert a pipe into a great freshwater lake, or into a running stream of constant and sufficient flow, and so divert the water without cost, other than that required for the structure itself. In this region necessities exceed supply. The streams are over-appropriated, and population as well as agricultural and other industries are dependent upon and limited by the available quantity of that which is essential to their existence, welfare and growth, and which in other—and in that respect more favored—regions is abundant and free.

This situation was foreseen and provided for early in the history of this state. The doctrine was early adopted, and has since been steadily adhered to, being now crystallized in constitutional and statutory provisions, that by prior appropriation, diversion and application to a beneficial use a vested property right is acquired, of which, or of the use whereof, the owner can not be deprived except by due process of law and upon just compensation.

This doctrine does not at all require that the appropriator shall himself actually make application of

the water to a beneficial use. It is entirely sufficient if this be done by others, provided only that it actually be done. And so an appropriation and diversion of water made by an individual or a corporation is just as complete and just as much a vested right of property if the appropriator and diverter of the water delivers it to others who apply it to a beneficial use, as though such original appropriator and diverter had himself made such application. This court has so decided (Gutierres vs. Albuquerque Land & Water Co., 188 U. S., 545).

In 2 Kinney on Irrigation and Water Rights (2nd Ed.), p. 1208, sec. 703, the author says:

> "Water may be appropriated by an individual or company, where the primary purpose of the appropriators is the sale of the water to others. However, the ultimate object of the appropriation must be the use of the water, by some one, for some beneficial use or purpose, and that, too, within a reasonable time after the appropriation is made. * * *
>
> Not only is the sale of water permitted but under certain conditions appropriations of water are encouraged for that express purpose. The time has come when the water in this Western country which is still unappropriated is each year becoming more and more scarce. There are very few places left where a farmer, with perhaps the aid of his neighbors, can run a plow furrow to a natural stream and there construct a brush dam and

by that means divert a supply of water sufficient to irrigate his farm. The irrigable lands left, which may be reclaimed by the use of the water, also lie further from the natural streams. The water must be taken out from the larger rivers or large reservoir and canal systems must be constructed; and all this must be at a large outlay of money. This, the consumers, as a general thing, have not got; and unless the progress of the country along these lines is to cease the money for these projects must be obtained from some source. Hence, it has been the policy of the legislation in all of the Western States and Territories in this regard to encourage large companies with great financial backing to appropriate the waters of the natural streams or other bodies, construct the works, and then sell or rent the water, or at least the use thereof, to the farmers or other consumers."

And again, the same author says (p. 1324, sec. 767):

"Not only is it unnecessary for the owner of a water right, (for irrigation), under the doctrine of appropriation, to own or possess land adjoining the stream from which the water is taken, as stated in our last section, but a perfect title to a water right may be had and maintained without the owner thereof having the title to, or in the possession of any land anywhere, with the bare exception of the easement or other right

of way for the ditch or canal to conduct the water to the place of use. * * * In fact, it has been held by the Supreme Court of the United States that corporations may be organized for the express purposes of appropriating the waters of some stream, and selling the water to consumers; that the corporations need not own or possess any land except the bare right of way for their ditch, nor need the stockholders of the corporation be a combination of land owners. (Citing Gutierres v. Albuquerque Land & Irr. Co., supra.) However, because the owner of a water right is not required to own land in connection therewith, does not dispense with the rule that all of the water appropriated must be used by someone for some beneficial purpose in order to hold the water right."

The Constitution of Colorado, Art. XVI, provides:

"Sec. 5. Water, public property.—The water of every natural stream, not heretofore appropriated, within the state of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the use of the people of the state, subject to appropriation as hereinafter provided.

Sec. 6. Diverting unappropriated water—Priority.—The right to divert the unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the bet-

ter right as between those using the water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have the preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over those using the same for manufacturing purposes.

Sec. 7. Right of way for ditches, flumes.—All persons and corporations shall have the right of way across public, private and corporate lands for the construction of ditches, canals and flumes for the purpose of conveying water for domestic purposes, for the irrigation of agricultural lands, and for mining and manufacturing purposes, and for drainage, upon payment of just compensation.

Sec. 8. County commissioners fix rates for water.—The general assembly shall provide by law that the board of county commissioners in their respective counties, shall have power, when application is made to them by either party interested, to establish reasonable maximum rates to be charged for the use of water, whether furnished by individuals or corporations."

To carry these constitutional provisions into effect, the legislature has enacted an elaborate code of statutory law. (Revised Stats. 1908, Chap. LXXII,

pp. 860 *et seq.;* Secs. 3165, *et seq.*) These statutes contain specific provisions (Secs. 3181-3187) concerning the filings to be made and the steps to be taken for the purpose of initiating and perfecting such a water right by "every person, association or corporation hereafter constructing or enlarging any reservoir or reservoirs, constructing, changing the location of, or enlarging any ditch, canal or feeder for any ditch or reservoir, for the purpose of furnishing a supply of water for domestic, irrigation, power or storage, or for any other beneficial use, taking water from any natural stream;" and the adjudication of priorities to so divert, both for irrigation purposes and for purposes other than irrigation (which are dealt with separately) is expressly authorized (Revised Stats. 1908, Secs. 3276, 3280).

These constitutional and statutory provisions plainly ordain that one who has complied therewith thereby acquires a vested property right, dating from the commencement of his work, to divert water from the natural stream, store it in reservoirs, convey it to the place of use, and there either himself apply it to a beneficial use or permanently, by sale and deed, or temporarily by lease or license, bestow upon others the right to so use it.

If the original appropriator has, by sale or deed or other permanent arrangement, bestowed upon another the right to receive a certain quantity of water from the ditch or other means of conveyance, and apply it to a beneficial use, the original appropriator has to that extent parted with a portion of his entire appropriation; but he, nevertheless, retains the rest and continues to be vested with

the right to divert the water from the stream, store it when necessary, convey it to the point of use, and there deliver it to the ultimate consumer, which, in and of itself, is a property right protected by the Constitution.

But, where as here, the original appropriator has never, by sale and deed or other like arrangement, or otherwise, or at all, bestowed upon another any permanent right to take water from the ditches, conduits or pipes, but has merely leased or licensed the right to so take for definite periods and upon specific considerations in the nature of rentals, it is clear that the original appropriator has never parted with any portion of his entire appropriation, and still retains unimpaired not only the right to divert water from the natural streams, store the same when necessary, and convey it to the place of use, but also the right either himself to apply it to a beneficial use by using it for domestic purposes in his own home, or for irrigation purposes upon his own land, or to sell to and thereby confer upon others permanent rights so to do, or, if he chooses, to continue to lease such rights to others, himself retaining the title.

These distinctions are lost sight of by appellants, and therein lies the fallacy of their argument.

It does not admit of doubt that the Colorado Constitution and Statutes authorize appropriations of water not only for the direct use of the appropriator himself, but also for *sale* or *lease* to others. Section 988 of the Statutes (R. S. 1908, p. 397) provides for the formation of ditch companies, and section 992 (p. 398) provides that any such company shall furnish water to the class of persons and for the purposes

mentioned in the certificate of incorporation "whenever they shall have water in their ditch *unsold*." In sections 3175 (p. 862) and 3264 (p. 878) the distinction between persons who have, by deed, stockholding, or otherwise, acquired a permanent right to take water from such a ditch, and those who seek or hold a temporary license, in the nature of a lease, upon such a right is clearly made.

Section 8, Art. XVI of the Constitution exists and Sections 3262 (p. 877), 3271 (p. 880) and 3272 (p. 881) of the statutes clearly were enacted for the protection of those who are licensees or lessees, as distinguished from those who, by deed from the original appropriator, or otherwise, have acquired a permanent right to take water from the ditch. And the obvious design of the sections last mentioned is to prevent the imposition of exorbitant rentals upon the lessees or licensees of such rights.

It is a fact, which appellants will not dispute, that almost without exception the large irrigation companies of Colorado have from the beginning pursued the course of selling and conveying permanent rights to take water from their ditches, rather than leasing or licensing such rights for limited periods. Plainly, under the Constitution and Statutes, either course was open to them, but they have almost invariably chosen the first. For this reason the cases which came before the Colorado courts prior to the recent ones hereinbefore cited have involved situations where the original appropriator had, by sale and deed or other permanent arrangement, bestowed upon another or others the perpetual right to take water from its ditch, and so had parted with a por-

tion of its original appropriation. In such cases the Colorado courts have definitely held that the original appropriator actually had something to sell, which it did sell when it parted with the right to apply the water diverted through its ditch to a beneficial use. Thus in Combs v. Agricultural Ditch Co., 17 Colo., 146, 150, it is said:

> "Undoubtedly those who by labor or by the payment of money actually construct an irrigating ditch may thereby acquire a prior right to the water which may be diverted therein, provided they apply the same to beneficial use within a reasonable time after such diversion. * * * Those who construct ditches and divert water for general purposes of irrigation must within a reasonable time apply the water to beneficial use; *or else, upon proper application and for proper consideration, they must dispose of the same to those who are ready to make beneficial use of it.* If ditch companies are unwilling to be charged with such duties and responsibilities they must leave the water in the natural stream." (Italics ours.)

In New Mercer Ditch Co. vs. Armstrong, 21 Colo., 357, 363, the court said:

> "The appellant argues that a corporation under our laws is allowed to divert from a natural stream water for a *speculative purpose*—that is, *to divert it for the purpose of selling to anticipated purchasers, although the corporation itself has never made any*

> *beneficial use of any part thereof.* By analogy, therefore, he contends that the same power should be given to a natural person. *We have no hesitation in accepting this conclusion* and holding that a natural person in this respect would have the same rights as a corporation, and that either might, in accordance with the doctrine announced in Strickler v. Colorado Springs, 16 Colo., 61, *sell the right to use water.*" (Italics ours.)

See also Travelers Ins. Co. vs. Childs, 25 Colo., 360, 362.

In Blakely vs. Fort Lyon Canal Co., 31 Colo., 224, there was involved a ditch company which had constructed the ditch, diverted the water, and thereafter, by instruments in the nature of deeds, sold and conveyed to others the right to take water from the ditch, and apply it to beneficial uses. Each of these deeds contained a covenant on the part of the ditch company that when water rights equal to the capacity of the ditch had been thus sold and conveyed, the company would turn over the structure itself to the purchasers of these water rights and permit them to own, operate and manage the ditch for themselves. The court there held that, having purchased water rights to the capacity of the ditch, the purchasers were under such covenant entitled to a conveyance of the physical structure, and at page 234 said, "There was nothing more vested in either of the vendor companies to sell, and purchasers of excess rights took nothing by their purchase," thereby plainly indicating that before the full capacity of the ditch had been so sold the companies did have something to sell, to-

wit, the right to take water from said ditch up to its full capacity.

See also:

Canal Co. vs. Kreybill, 17 Colo. App., 26.

In Butterfield vs. O'Neil, 19 Colo. App., 7, the court speaking of consumers of water from a ditch who had, by the purchase of ditch stock (a method sometimes adopted, 25 Colo., 144), acquired a permanent right to take and apply to beneficial use a portion of the water diverted by such ditch under its appropriation, said (p. 10):

> "And a claim of prior appropriation is equally baseless. The water was appropriated by the Cushman Ditch Company, and it was from that company and from no other source that the plaintiff derived his title. The Origin of defendant's title was the same. The rights of the parties plaintiff and defendant in the water are evidenced by the stock of the company held by them respectively,"

from which it is clear that the Cushman Ditch Company had something to sell, towit, the right to apply to a beneficial use the water diverted by it and carried in its ditch to the place of use. This it did sell and convey, the evidence of such transaction being the so-called "ditch stock," which, under the practice prevailing in Colorado, is but another name for "water deed."

Finally, in Dickson vs. Dick, 59 Colo., 583, it appeared that corporations had been organized for

the purpose of constructing irrigation works and appropriating and diverting water for irrigation uses. This they had done, but they had not themselves applied the water to such beneficial use. On the contrary, they sold to Dickson and others "full-paid water rights," for which they received full consideration, and which purported to confer upon said Dickson and the other purchasers thereof perpetual rights to take water from the ditches and apply it to beneficial uses. The companies having fallen into financial difficulties, a receiver was appointed, who refused to recognize the rights of the purchasers under their respective conveyances of such "full-paid water rights." At page 587 the court said:

> "The corporations severally sold and received full compensation for perpetual water rights and delivered the same to the respective purchasers, *thus investing the latter with dominion over the things with which the former parted* (citing cases). *Each contract in question constituted a bargain and sale which passed the property in the water rights sold.* The transaction went further than to only create rights *in personam*, to fulfillment of the terms of the contract. It created rights *in rem*, to an enjoyment of such property, and was therefore an executed contract." (Italics ours.)

The contracts provided for the execution of deeds, but the court held that the contracts in and of themselves operated as present conveyances, and then said (p. 588):

"The holders thereof severally paid for and received that which they had purchased, and have since used and enjoyed the same. * * * The contracts were not executory simply because they provided that the respective grantees therein should receive the water during the irrigation season in each year thereafter. *The grantees had severally acquired a right of property, the subject of ownership, like any other property, and to deprive them of that right would be repugnant to the Constitution."* (Italics ours.)

The case last cited plainly demonstrates that the company had something to sell and convey, and that what it did sell and convey was a valuable property right, which, in the hands of the purchaser, was entitled to the protection of the constitution, and which, in the hands of the company (if it, instead of selling, had retained it), would likewise and for the same reason be entitled to such constitutional protection.

Larimer, etc., Co. vs. Wyatt, 23 Colo. 480.

La Junta, etc., Co. vs. Hess, 31 Colo. 1.

Patterson vs. Ft. Lyon Canal Co., 36 Colo. 175.

Consolidated, etc., Res. Co. vs. Old (Colo. Sup.), 163 Pac. 78.

North Poudre Co. vs. Liggett (Colo. Sup.), 164 Pac. 1158.

It is plain from the authorities cited above that ditch companies and water companies may perfect and maintain the appropriation accomplished through their diversions by disposing of the water yielded thereby, either permanently or temporarily, to those who are ready to make beneficial use thereof.

Moreover, those to whom is made such permanent or temporary disposal of the right to take water from the conduit and apply it to a beneficial use, do not thereby themselves become appropriators from the stream, nor the proprietors of any independent appropriation whatsoever. They thereby obtain merely a right to share in the appropriation belonging to the ditch company or water company, and inseparably appurtenant to its diverting works. And the nature of the right which they thus obtain, its scope and limits and its duration, are conclusively fixed by the terms of the instrument which conveys it.

Not only this, but even after the ditch company or water company, which was the original appropriator, and through whose works the diversion from the natural stream was made, has permanently conveyed to others perpetual rights to take water from its conduits, it still retains a distinct and valuable property right in the appropriation itself, in addition to its ownership of the diverting works.

In Wheeler vs. Northern Colorado Irrigation Co., 10 Colo., 582 (the case principally relied upon by appellants), Judge Helm said (p. 588):

> "The Colorado doctrines of ownership and appropriation (as declared in the Constitution, statutes and decisions) necessarily give the carrier of water *an exceptional*

status; a status differing, in some particulars, from that of the ordinary common carrier. Certain peculiar rights are acquired in connection with the water diverted. It is unnecessary now, however, to enumerate these rights in detail." (Italics ours.)

In Farmers High Line Canal & Reservoir Co. v. Southworth, 13 Colo., 111, the same judge held (p. 119) that the consumer of water from the irrigation ditch was not an appropriator from the stream and had no independent priority and no right, except as he diverted water from the ditch under the priority appurtenant to that particular ditch, saying (p. 120):

> "But the consumer himself makes no diversion from the natural stream. * * * * The carrier makes a diversion both in fact and in law."

The learned judge further held that the consumer had no right, after having taken water from the irrigation ditch, to divert it directly from the stream on the priority adjudicated to the ditch, saying (p. 122):

> "But when he elects to take from the carrier's canal, and thus to employ this lawful agency, he cannot reject the accompanying lawful obligations. * * * p. 123) By virtue of its (the statute's) provisions a priority was to be awarded the carrier's canal according to the date of diversion of water thereby from the natural stream, and the quantity diverted and used; but no distinct and independent priority in the consumer was in any way recognized."

And speaking of the contention, which he expressly negatived, that each consumer of water from the canal had an appropriation and a priority of his own, the learned judge further said (p. 125):

> "*Besides, certain consumers will abandon the use of water from the carrier, and other consumers will secure the right to the use thus abandoned.* In each case of this kind the old priority must be dropped and the new priority recognized,"

if the theory mentioned above, which the learned judge expressly rejected, were correct. (Italics ours.)

In Wright vs. Platte Valley Irrigation Co., 27 Colo., 322, the court, in reply to the argument that the consumer of water from the ditch was the owner of the appropriation, said (p. 329):

> "It is true, as has been frequently announced by this court, that a ditch company is not the owner of the water it diverts through its ditch; *neither is its status in the strict legal sense of the term that of a 'common carrier.' * * * Its status is more like that of a private carrier, whose duties are measured by the obligations it assumes towards its consumers and such as the law imposes by reason of the nature of the business in which it is engaged.*" (Italics ours.)

In Combs vs. Farmers High Line, etc., Co., 38 Colo., 420, it is distinctly held that the individual consumer is not an appropriator from the stream; that the appropriation is appurtenant to the ditch or other

diverting works; that the owner of such ditch or diverting works, being the diverter of the water from the natural stream, is entitled to a decree therefor, even though he may, by deed or otherwise, have permanently disposed of the right to apply the water to a beneficial use, and that the individual consumers who have thus acquired perpetual rights to take water from the ditch or other conduit are confined to the use of the water yielded under the priorities decreed to the ditch itself. In the course of the opinion the court says (p. 431):

> "The decree embodies the rights not only of the carrier, *whatever they may be,* but also the rights of its consumers." (Italics ours.)

In O'Neil vs. Fort Lyon Canal Co., 39 Colo., 487, the same situation was presented and the same ruling was made. In the course of the opinion the court said (p. 493):

> "Such appropriation consists of two acts: the diversion of water from a natural stream and the successful application thereof within a reasonable time thereafter to some beneficial use. Where the consumer of water makes the diversion himself, a completed appropriation is made by the same person; but where the diversion is made by a carrier and the successful application is made by another, who is a consumer, a completed *appropriation is the result of their combined acts.*" (Italics ours.)

In the cases hereinabove quoted from the application to a beneficial use had almost invariably been

made by those to whom the diverter and carrier of the water had, by deed or like arrangement, conveyed a permanent and perpetual right to take and so apply the water. This is so because, as we have already said, it has from the beginning been the almost universal practice of ditch companies to convey such permanent and perpetual rights by deeds or their equivalent, instead of conferring merely temporary rights, of short duration, by instruments in the nature of leases or licenses. Nevertheless, it has always been recognized, as was said in Wright vs. Platte Valley Irrigation Co., *supra*, that the status, the rights and the duties of the ditch company or water company "are measured *by the obligations it assumes toward its consumers.*"

But in three very recent cases, in which the City and County of Denver (appellant here) was itself party litigant, occupying the same position here occupied and making the same contentions here made by the appellee Water Company, and in the last of which at least the City and County of Denver was represented by the same learned counsel who appears for it here, the Supreme Court of Colorado definitely defined the status of the diverter and carrier of the water and the status of the recipient thereof who applied it to a beneficial use, and their relation one to the other, in those instances where the completed appropriation had been originally perfected and thereafter maintained by the concurrent acts of two parties or two sets of parties,—namely (1) the diverter and carrier and (2) the applicant or applicants to a beneficial use,— as distinguished from the situation where one party or one set of parties had performed all of the acts requisite to the perfection and maintenance of an

appropriation, including the diversion, the carriage and the application to a beneficial use; and upon the situation before it, which was of the character first above mentioned but involved the further condition that those who had applied the water to beneficial use had done so, not under permanent and perpetual rights so to take and apply it, but under rights merely temporary in character, limited to definite periods, and in the nature of licenses, the Supreme Court of Colorado in the recent cases mentioned definitely and conclusively held that the entire appropriation, including not only the right to divert and carry, but also the right to apply to a beneficial use, or to sell or otherwise dispose of the latter right to others, remained vested, unimpaired and undiminished, in the ditch company or water company which made the diversion.

In the recent cases mentioned above the distinction is clearly pointed out and defined between the situation where the diverter and user is the same and the situation where the diverter and carrier is one and the user another. And in respect to the latter situation, the further distinction is clearly pointed out and defined between the case where the appropriation has been perfected and thereafter maintained, through application of water to beneficial uses, by those to whom the diverter and carrier has, by deed or other permanent arrangement, conveyed a perpetual right to take water from the ditch or other conduit under the appropriation, and the case where the right to take from the ditch or other conduit and apply to a beneficial use, and so at first perfect and thereafter maintain the appropriation, has been temporary and

occasional only, and conferred by way of license from time to time and for definite and limited periods upon a succession of users. And in the recent cases above mentioned the Supreme Court of Colorado has also definitely and conclusively determined that in the situation last described, the appropriation is, in the first instance, perfected, and thereafter fully maintained and protected, through application of the water to beneficial uses by such temporary licensees; but that the entire appropriation so perfected, maintained and protected, including not only the right to divert and carry, but also the right to apply to a beneficial use, or to sell or lease the right last mentioned to others, remains wholly vested in the diverter and carrier of the water.

The recent decisions to which we refer are those cited at the beginning of this portion of our argument, and are reported as follows:

City of Denver vs. Walter, 45 Colo. 387;

City of Denver vs. Brown, 56 Colo. 216;

People ex rel. City and County of Denver vs. The District Court of the Second Judicial District, decided by the Supreme Court of Colorado on July 2, 1917. (*Infra*, Appendix B, p. 436.)

These cases are controlling upon the question here under discussion, and are deemed of sufficient importance to justify extended quotations from the opinions therein.

In these cases was involved what is commonly known as the City Ditch, being the ditch of The Platte

Water Company, in Water District No. 8, to which many references were made in the testimony in the case at bar relative to water rights. To a clear understanding of these decisions, the history of this ditch and of the City's connection therewith is essential; it is thus given by the Supreme Court (56 Colo. 220):

> "In 1860 The Capitol Hydraulic Company was organized under a special act of the territorial legislature of Kansas. This act did not contain any limitation as to the period of the existence of the corporation it authorized to be created, and empowered it to divert the water from the bed of the South Platte River, at any point selected between the Platte Canon and the mouth of Cherry Creek and *conduct the water so diverted to the cities of Denver, Auraria and Highlands for mechanical, agricultural, mining and city purposes.* The purpose of the company was to construct a ditch to carry water to irrigate trees within the municipalities named, and also to furnish water to farmers cultivating land under the ditch. The construction of the ditch was commenced in 1865. In 1867 the name of the corporation was changed to **The Platte Water Company.** In 1875 or 1876, this company entered into a contract with the City of Denver, whereby it leased the ditch, as then existing, with all its rights, privileges and franchises, to the city, and also agreed to sell to the city the ditch and rights leased for the sum of sixty thousand dollars, with interest, in six annual install-

ments. These payments were made and the city then became the beneficial owner of the ditch, and such rights connected therewith as the vendor could convey. Prior to the commencement of the construction of the ditch, other ditches on the river were purchased by the original company. In 1883, under a statutory adjudication of water rights for the purpose of irrigation, the ditch was awarded priority No. 1 of date November 28, 1860." (Italics ours.)

From the foregoing statement it is clear that the original appropriation was expressly authorized and made for the purpose of conducting "the water so diverted to the cities of Denver, Auraria and Highlands (all now embraced in the City and County of Denver) for mechanical, agricultural, mining and city purposes." This is a much more express dedication to a particular use, and to the use of certain communities and their inhabitants, than is true in the case of the water rights of The Denver Union Water Company. The city having in 1875 purchased the ditch, stepped into the shoes of the original ditch company, and occupies a position toward the consumers of water from that ditch analogous to that of The Denver Union Water Company toward the city and private consumers from its system. Both before and after the city acquired the ditch, various farmers and other water users had obtained rights in respect to the use of the water conveyed thereby.

In Denver vs. Walker, 45 Colo., 387, 388:

> "Plaintiffs, who are owners of two adjoining five-acre tracts of land situate in the city of Denver, designated in the record as lots 5 and 6, and who also claim to be owners, through their grantors, of an independent appropriation of the right to the use of water for irrigating these tracts, and to utilize the same through a ditch belonging to the defendant city, brought this action against defendants, the city council of Denver and its board of park commissioners, who have immediate supervision and control of the City Ditch, to restrain defendants from doing certain acts which it is alleged they are about to do, or by a mandatory writ compel them to make such changes in their plans already carried out, which, unless the appropriate relief is given, will result in depriving plaintiffs of their alleged water right."

But the court denied the plaintiffs' claim. The court held (p. 389) that the mere fact that the plaintiffs and their predecessors in title had for many years diverted water from the City Ditch and used it upon these lands did not constitute an original or independent appropriation nor initiate any right; and that if plaintiffs had any right in respect thereto, it must have been by virtue of a contract with the owner of the ditch. And (p. 392):

> "The rights of an independent appropriator of water, and of one whose only right

> to have water carried and delivered to him is the result of contract, are not the same, but in many respects essentially different."

And the court held that the ditch owner (in this case the City of Denver) was under no obligation to continue to deliver such water to the plaintiffs, and could, "in the exercise of its undoubted legal right," so change the line of the ditch as to deprive plaintiffs of the possibility of obtaining water therefrom.

But in City of Denver vs. Brown, *supra*, the question is settled beyond further debate. In that case (p. 218):

> "Appellee Brown, on behalf of himself and others similarly situated, commenced an action against the city and county of Denver, and others, the purpose of which was to adjudicate rights to the use of water from a ditch designated in his complaint 'The Platte Water Ditch,' but more generally known as the 'City Ditch.' Various consumers appeared and were made parties."

At page 220, the court recites the history of the ditch, as above quoted. The court then continues (p. 221):

> "At an early date individuals began to take water from the ditch for the purpose of irrigating lands. The water thus obtained was secured under contracts entered into from time to time, between this class of consumers and the then owners of the ditch. These con-

tracts were only for the irrigating season during the year they were executed; that is, they only covered the irrigating season for the year they were made. The testimony discloses that in many instances, at least, the use of water by these consumers was intermittent; that is, they would contract for and use it a year or so, and then cease to contract for or use it for a period, when they would again resume the use of water in the same intermittent way. On this testimony the court held that these consumers were in no wise affected by the contracts made with either the city or its predecessors, for the reason that they were appropriators, to all intents and purposes, from the river, with the right in the city to exact a reasonable compensation for carriage, and that the rights thus acquired vested and continued from the date the consumers or their predecessors first utilized water from the ditch unless lost by abandonment. Error is assigned on this ruling."

The court thereupon reviewed the authorities, citing and construing the entire series of Colorado decisions which had preceded, including Wheeler vs. Northern Colorado Irrigation Co., *supra;* pointed out the difference between the status of those who by outright purchase or other permanent arrangement had acquired a perpetual right to water diverted by and flowing in the ditch, and the status of those who were licensees only, under temporary contracts for limited periods, such as one irrigation season. Rela-

tive to the latter class of users, the court says (p. 223):

> "When, however, his contract expires by limitation, and is not renewed, and he does not take the necessary steps to preserve the status growing out of his contractual relation with the carrier, his rights to a future use of water from the ditch cannot be based upon past use. In other words, his contract with the carrier is for carriage, and his rights are limited by its terms, so far as valid, to the volume of water for the period mentioned in his contract. On the expiration of his contract he may be entitled to have it renewed, unless inhibited by a valid provision therein; but if a legal demand for that purpose is not made, he is in the same position as though he had never taken water from the ditch.
>
> A consideration of the duties and obligations of carrier ditch companies conveying water for irrigation purposes for hire and the rights of contract users and others who can beneficially apply water from the canals of such companies to the irrigation of lands, *will demonstrate that the rights of contract users of water from companies of that character are measured and limited as indicated.* When such a company has water subject to its control, bona fide applicants are entitled to its use for irrigation purposes upon tender of the lawful rate for carriage and compliance with the reasonable rules of the carrier.

Combs v. Agricultural D. Co., 17 Colo. 146, 28 Pac. 966, 31 Am. St. Rep. 275; Golden Canal Co. v. Bright, 8 Colo. 144, 6 Pac. 142; Wheeler v. Northern Colo. I. Co., *supra*.

As previously noted, the object of a carrier company is two-fold, namely: To aid consumers in obtaining water, and for its private gain. When a mere contract consumer severs his relation with the carrier, the latter is not required, for that reason alone, to permit the volume which it had theretofore diverted from the stream for the benefit of the consumer to remain in the source of supply. If the rule were otherwise, and a contract consumer became an appropriator from the river, in the full meaning of that term, as held by the trial court, then the carrier would be compelled to await the pleasure of the contract consumer with respect to the use of water after once contracting with him, and its revenues would be dependent upon his whim, while others in the interim would be deprived of the use of the volume which the prior contract consumer had once utilized, but had ceased to use. The law does not permit such unjust and anomalous results to grow out of the relation of carrier and simple contract users. The priorities awarded a carrier ditch are for the benefit of those entitled to use the water which they represent. This means those who are entitled to be supplied with water from the ditch, to which the priorities are awarded. When these rights are evidenced by a contract between the con-

sumer and carrier, for a specified volume for a specified period, the obligation assumed by the carrier is to deliver that volume for the period and purpose named in the contract. That is all the consumer contracted for. Such a contract is in no sense illegal or against public policy, and the consumer will not be heard to say that this contract conferred greater or different rights than those specified, save and except that having once become a contract user, he will be entitled to continue that relation from year to year thereafter, without intermission, however, unless limited in the exercise of this right by a valid provision in his contract, upon tender annually of a lawful rate of carriage, and compliance with the reasonable regulations of the carrier. The rights of the contract consumer as thus defined, afford full protection to all. *When the consumer's contractual relations with the carrier are severed, the obligations of the carrier are ended, and the consumer cannot complain because the rights of others have intervened by contract with the carrier for the use of water.* That is their right, when the carrier has water undisposed of; and if it refuses the request of bona fide applicants, it can be compelled to comply with their needs to the extent it has water which it can lawfully control. If a mere contract user becomes an unqualified appropriator of water from the river supplying a carrier ditch, then certainly he ought to be required to compensate

the carrier for the carriage of water, whether he is using it or not; and yet, we apprehend that when his contract expired, if the carrier should undertake to exact such compensation, his complete defense would be that his contract did not impose any such an obligation. *The unjust results which would follow in ruling that a mere contract user is an unqualified appropriator make it apparent that his right is limited by the terms of his contract, so far as valid, and that when he voluntarily ceases, at the expiration of his contract, to exercise his right to continue his contractual relations with the carrier, or preserve the status growing out of that relation, that his future rights only date from the time he again contracts with the carrier for water,* or makes a demand to be supplied with water in circumstances with which the carrier is legally bound to comply." (Italics ours.)

In response to the argument that the city's right in the appropriations of the ditch and the product thereof had been lost, or in some degree lessened, by the practice of making such contracts, the court says (p. 233):

> *"We are also of the opinion that the use of water under these contracts by consumers, bound by the limitations imposed, preserved the status of the city the same as though it had utilized the water covered by these contracts for its own needs. In other words, by these contracts it leased its rights to the*

water which it had acquired as a consumer above that necessary for its present needs, and hence preserved them to all intents and purposes exactly as though it had continued the use of such water. The Cache La Poudre Ir. Co. v. Larimer and Weld Co., 25 Colo. 144, 53 Pac. 318, 71 Am. St. 123." (Italics ours.)

The court concludes the opinion as follows (p. 235):

> "In fixing the rights of individual contract consumers the decree must provide, in an appropriate way, for the payment of lawful carriage rates, and that while the decree will put in permanent form the relative rights of contract consumers, it must be borne in mind that these rights are based upon contracts, and that they may be lost, if the parties only intermittently avail themselves of the right to exercise and enjoy them. The decree should make appropriate provision in this respect, so that the city, as well as the bona fide applicants for water from the ditch in the future, may be fully protected."

Clear as are the determinations of the Supreme Court in the Brown case, *supra*, they are rendered still clearer and more definite by the court's own analysis thereof given in the last decision cited above.

It appears that after the Brown case was decided and, upon reversal, remanded to the lower court, the

latter court was proceeding to enter a decree in conflict with the mandate of the Supreme Court as evidenced by its prior opinion. Thereupon the City and County of Denver, acting through its present city attorney, instituted in the Supreme Court an original proceeding in mandamus seeking a mandate directing the court below to enter a decree in conformity with the Supreme Court's decision. The City's petition was granted and the writ of mandamus issued; the decision was announced and the court's opinion thereon filed on July 2, 1917. Said opinion is hereinafter set forth at length (Appendix B, hereto, *infra*, p. 436). The Supreme Court held that the determinations made in its former opinion had been so clear and positive as to render the duty of the court below merely ministerial and therefore properly the subject of mandamus. In defining what had been held in the former opinion and the consequent duty of the lower court under the mandate, the Supreme Court said (Appendix B, *infra*, p. 437):

> "The City and County of Denver as the proprietor and owner of the ditch *and in possession of its decreed appropriations,* brought the case here for review. The trial court in that case decreed and held that the consumers from the ditch were the appropriators from the stream with vested perpetual water rights in the ditch for the amount used, which accrued and continued from the date water was first utilized from the ditch on the lands of the consumers, regardless of the amount contracted for, and, being the appropriators from stream owning the ditch

appropriations, they were in no way affected by their contractual relations with the ditch owner, or by cessation in the use of water short of abandonment. In November, 1913, we reversed the case and handed down a written opinion in which we held this ruling and decision of the district court, under the circumstances of this case, fundamentally wrong in every particular; *that the original company constructing and owning the ditch as well as its successors in interest were in possession of and controlled the appropriations* and must be treated as a ditch owner carrying water for hire, that is, a carrier ditch as distinguished from water users who own the ditch and its appropriation, and also as distinguished from mutual ditch companies in which stock issued to the members represents the consumer's interest in the company, ditch and water; that the water was obtained each year from this carrier ditch by contracts between the respective consumers and the ditch owner entered into annually; *that the consumers were all contract users and that the consumers' rights depended upon and were limited and controlled by these contracts; that the contract user was not an appropriator from the stream, nor the proprietor of an appropriation, nor the owner of a water right in the ditch in the full sense of these terms; that while the ditch company was not the owner of the water, it nevertheless owned*

the right to divert the decreed appropriations awarded the ditch and to charge a rental annually for its carriage, which in effect constituted it the proprietor of the appropriations; that the ditch owner owned, controlled and possessed the right to divert the ditch's decreed appropriations, and, the consumer having contracted for and used a specific volume for a certain year, had the option and was entitled to contract for the same amount each succeeding year upon tender annually, without intermission, of the lawful rate; *that when the contract expired, if he ceased further use from the ditch, he would then be in the same position in the future as one executing a new contract; that his right each year to water from the ditch is not a perpetual right, but is limited by the terms of an annual contract; that when the consumer severs this contractual relation by not renewing the contract, the contractual obligation of the carrier with the consumer is ended, except of course, that the consumer has an option to renew the contract within a definite time from year to year, and if he fails to do so the owner may contract the use and carriage to another* who would possess the right of renewal each year until he ceases in the use; that the contracts measure and limit the consumer's right, and in addition contain a privilege or option to purchase the use of so much water annually, if exercised within a certain time each year, without intermis-

sion; that a contract user has a right to continue by contract in the future use as against subsequent purchasers, *but when he ceases to contract and use the water, he loses the right as against intervening purchasers and his future right to water, if any is obtainable, will begin from the time he again contracts.* As to the reservation in the right of way deeds, we held the right reserved, constituted an option which the consumer must exercise each year and if he neglected to do so, he stood on the same plane as other contract users. As to the excess water, which term will be comprehended by those familiar with the litigation, *we held the limitations imposed by the city upon the users of this water were in effect a lease of the amount not necessary for the city's present needs and preserve the water privilege in the city the same as though it had continued in the use.* As to the parties who, from their pleadings and proof, had not established under the rule announced in our opinion, that the city was under obligation to furnish them water, we held they were without rights that could be adjudicated or recognized in that suit." (Italics ours.)

The opinion above quoted is the last expression of the Supreme Court of Colorado upon the question here involved. It is there plainly declared:

> "That, while the ditch company was not the owner of the water, it nevertheless

> owned the right to divert the decreed appropriations awarded the ditch, and to charge *rental* annually for its carriage, *which in effect constituted it the proprietor of the appropriation.*"

And that if the consumer fails to renew his contract:

"The owner (the ditch company) may contract *the use* and carriage to another." Clearly, such a contract might be either (a) in the nature of a lease or license for a definite period, in which event the rental would cover, as the court expressly says, not only the "carriage," but also "the use," and the rental would be measured by the value of that demised, including not only the right to have carried but also the right to take and use; or (b) a contract, in the nature of a deed, conveying a permanent and perpetual right to "the use and carriage," in which event the purchase price would be measured by the value of that permanently conveyed, to-wit, not only the right to have carried, but also the right to take and use.

As to the observation embraced in the foregoing quotation that "the ditch company was not the owner of the water," it is sufficient to say that, under the constitution and laws of Colorado relating to water rights, title to the water itself is never acquired; it remains constantly and at all times, as declared in sec. 5, article XVI, of the Constitution, "the property of the public." That which appropriators, under the laws of Colorado, obtain is not title to the water diverted, but merely the right to divert from the natural stream and apply to a beneficial use such

volume of water as the appropriation, considering its date and its relation to other appropriations, will afford.

Wheeler vs. Northern Colo. Irr. Co., 10 Colo., 582, 587, 588.

Crippen vs. White, 28 Colo., 298, 302, 303.

Monte Vista Canal Co. vs. Centennial Co., 22 Colo. App., 364, 368.

It was the *water right* as thus defined, and not the water itself, which was the subject of valuation in the case at bar.

The foregoing authorities conclusively establish the following propositions:

(1) A valid appropriation may be made of the right to divert, store and convey water either for the use of the original diverter or for sale, lease or license to others.

(2) A valid appropriation is made by diverting, conveying to the place of use, and within a reasonable time applying, or causing to be applied, and thereafter continuing to apply, or cause to be applied to a beneficial use.

(3) So far as concerns the application to beneficial use, which in the first instance perfects and thereafter protects and maintains the appropriation, this may be made either by the diverter and carrier of the water, or by those upon whom he has conferred the right to take the diverted water from the conduit and apply it to such use; in either event the appropriation is as well perfected, protected and maintained.

(4) When the appropriator has constructed the diverting and carrying works, has diverted the water

and arranged to carry it to the place of use, he has a reasonable time thereafter within which to apply it, or cause it to be applied, to a beneficial use; if at this point he elects, instead of himself applying it to such beneficial use, to cause it to be so applied by others, he has his choice between two methods; these are (a) to confer upon others, by deeds or their equivalents, permanent and perpetual rights to take water from his conduits and apply it to beneficial use; or (b) to confer upon others, by leases, licenses or their equivalents, temporary rights of that character strictly limited as to time.

(5) If the diverter and carrier confers upon others permanent and perpetual rights to take and use for beneficial purposes, and if within a reasonable time they begin and thereafter continue to do so, the entire appropriation is perfected, protected, and continuously maintained; but the ownership thereof is divided between (a) the diverter and carrier, who owns and continues to own the diverting works and conduits, with the right to possess, maintain and operate them, and also owns and continues to own the right to divert, store when necessary, and carry to the place of use, and (b) the user who owns and continues to own a permanent and perpetual right to take water from the conduit at the place of use and there apply it to a beneficial purpose.

(6) If, however, the diverter and carrier confers upon others not permanent and perpetual rights so to take and use, but merely temporary rights of that character evidenced by a continuous series of leases or licenses, and if, pursuant thereto, the lessees or licensees apply and continue to apply the water to beneficial uses, the entire appropriation is, neverthe-

less, and as fully as in the former case, perfected, protected and continuously maintained; but in such event the title to the entire appropriation, including not only the right to divert, store and carry, but also the right either to use or to sell or lease to others the right to take and use for beneficial purposes, remains unimpaired and undiminished in the ownership of the original appropriator.

(7) Whenever, in the case last stated, the temporary right to take and use, conferred by such a lease or license, terminates, the diverter and carrier has, for sale, lease or license to others, the right to take and use, which, as part of the entire appropriation owned by him, has been in the manner stated fully protected and continuously maintained.

(8) If the diverter and carrier, as owner of such right, should elect to sell it, he would expect to receive therefor its reasonable market value; if it should be taken from him by condemnation, he would have an absolute constitutional right to its full value for the highest use to which it was adapted or available.

(9) If the diverter and carrier, as owner of such right, should elect to lease it, he would expect to receive as rental therefor at least a reasonable net return upon its present market value; and if said right should be devoted to a public use, such as supplying a community with water for domestic and other purposes, and the rates charged for such service should be subjected to public regulation, he would have an absolute constitutional right to such rates as would provide a reasonable net return not only upon the present fair value of the lands and structures constituting the diverting works, the storage reservoirs and the conduits, but also upon the present fair value of

the additional property right owned by him, consisting of the right to take water from the natural streams, store it when necessary, convey it to the place of use, and there either use it himself or permit its use by others.

(10) The proposition last stated is an inevitable corollary of the others, because if one has property which he may sell and does sell, he thereby obtains a return of capital; but if, instead of selling it, he permits its use by others for a fair compensation, he has at least a right to a reasonable return upon the amount of capital which he might have withdrawn, but which, for the accommodation of others, he has permitted to remain invested.

This vested property right to divert, store, convey, deliver and apply, or cause to be applied, to a beneficial use, is not perpetually attached to any certain tract of land, or any definite geographical area, or any particular consumer or community of consumers, or even to any specific beneficial use. The point of diversion, the place of application, and the character of use may all be changed without affecting the vested property right acquired by the original appropriation and diversion.

Kinney on Irrigation and Water Rights (2d Ed.), Vol. 2, p. 1501, sec. 857; p. 1522, sec. 867; p. 1527, sec. 869;

Strickler vs. City of Colorado Springs, 16 Colo., 61;

Ironstone Ditch Co. vs. Ashenfelter, 57 Colo., 31, 39 to 40.

The right to use water for irrigation, though deemed real estate, may be acquired and transferred separate and apart from any land.

Davis vs. Randall, 44 Colo., 488, 492;
Hotter vs. Kimsey (Colo. Sup.) 163 Pac., 75.

Of such a water right it is said in Kinney on Irrigation and Water Rights (2d Ed.), Vol. 2, p. 1326, sec. 768:

> "The distinct, exclusive, usufructuary estate acquired by an appropriator to the use of water, by its lawful appropriation, is property of the highest order and oftentimes of the highest value. The water right is protected by the law as such, and is subject to all of the usual incidents of property. This property right in water is as important, as valuable, and as extensive as the use to which it is applied, and especially so where that use is the irrigation of lands. The land is comparatively valueless without the water to irrigate it. Without the water it can be purchased for from $1 to $2 per acre, but with the water its value at once jumps from the above prices to $100 to $200 per acre, and sometimes to a very much higher price. The property in a water right consists not alone in the amount of water claimed under an appropriation, but also in the priority of the appropriation. And it very often happens that the chief value of an appropriation con-

sists in its priority over other appropriations from the same stream. Hence, to deprive one of his priority to appropriate would be to deprive him of a most valuable property right. A perfected water right is a vested property right and its value capable of estimation in money, and one which the law protects. A water right is such a property right that it comes clearly within the Constitutional provisions that property shall not be taken or damaged for public or private use, except upon due process of law and upon just compensation. A water right is such property that it is capable of being estimated in money. And one who has acquired a legal water right can only be deprived of it by his own voluntary act in conveying it to others, by abandonment, forfeiture under some statute, or by operation of law. And, as long as one is the owner of a valid water right it is such a property right that he has the right to exercise complete dominion, control, and management thereof. The owner may change the use of the water to any other beneficial use, so long as the change does not interfere with the vested rights of others."

Pursuant to the constitutional and statutory provisions hereinbefore referred to, and in reliance upon the well settled doctrine hereinbefore stated, each of the various Water Companies which appear in appellee's chain of title and appellee itself have been organized under the laws of Colorado, and in compliance therewith. Their various articles of incorpo-

ration authorized them to acquire by lawful appropriation, purchase or otherwise, the right to divert the waters of the natural streams, to store them, to convey them through ditches, canals, pipes and other conduits, and to apply them to beneficial uses, either directly or through others upon whom, by license or otherwise, the companies might from time to time confer such right. By lawful appropriations, duly made in full compliance with the Constitution and Statutes of the State, appellee and its predecessors received by direct grant from the State, under clear constitutional and statutory authority, vested property rights to take certain quantities of water from natural streams and apply it or cause it to be applied to *any* beneficial use, which rights they immediately perfected and thereafter fully protected and constantly maintained by actually making the contemplated appropriations and diversions, and continuously causing the waters diverted thereunder to be applied to various beneficial uses, either by the companies themselves or by others upon whom, as they were lawfully empowered, they, from time to time, conferred that privilege.

Cache La Poudre Co. vs. Larimer and Weld Co., 25 Colo., 144, 159-151.

These companies have not at any time sold or otherwise permanently parted with the right to apply to *any* beneficial use the waters diverted under their appropriations, or any part thereof. From the beginning, both in respect to the municipal corporation of Denver itself and in respect to the individual consumers, the relation has been that of licensor and

licensee. This relation has been constantly maintained and studiously safeguarded.

So far as the municipal corporation itself is concerned, a series of contracts has existed, beginning with the year 1870, by each of which the City has, for a definite consideration and for a specified period of time, been permitted to take from the conduits and mains of the Water Company water for certain beneficial uses, municipal in character. These contracts with the City did not constitute a sale or other conveyance of a perpetual right to take this water and apply it to a beneficial use; on the contrary, they were licenses only, for definite periods, relatively short, and at stated prices, and the right conferred thereby entirely ceased at the expiration of the period specified in each of said contracts.

As to private consumers, a like relation has always existed, and from the beginning has been rendered definite and unmistakable by explicit writings. No consumer has ever been permitted to take water from the mains of the Water Company, or any of its predecessors, except upon entering into a definite written contract, expressly defining the relation as that of licensor and licensee, for a limited period and upon a stated consideration to be paid.

All this is the subject of a definite and specific finding by the Master (Finding 24, Rec. p. 128). That finding was not excepted to, no assignment of error is directed thereat, and it is not in any manner questioned. It is, of course, conclusive. Moreover, it was based upon abundant proof, which was wholly undisputed. (Ex. ZZ, A1, A2, A3, A34, A35, A36, A61; Rec., pp. 927-941; also Rec., pp. 318, 322.)

It admits of no doubt that the relation between the Water Company and its predecessors on the one hand and the City and private consumers on the other, has always been that of licensor and licensee. Neither the City nor any private consumer has been, nor under such circumstances could be, the original appropriator of the water, nor the owner of the vested right to divert, store, convey and deliver. They have never had the right even to apply the water to a beneficial use, except as they have received that right under license from the Company for fixed short periods of time. Whenever a private consumer has allowed his license to lapse by failure to renew, or has abandoned or forfeited the same, the company has had the right, which it has exercised, to apply the water to other beneficial uses, or, if it chose, to license some other private consumer to make such application. Whenever the City has in the past decreased, or shall in the future decrease, the quantity of water taken by it under license from the Water Company and applied to beneficial municipal purposes, it certainly has been and will be the right of the Water Company to devote and apply that quantity to some other beneficial use.

The conclusion is inevitable that if all of the private consumers in Denver, acting simultaneously, should refuse to take out new licenses, and if the City itself should refuse longer to take under license any water from the Company's mains for application to beneficial uses, it would in such event be the Company's absolute constitutional right to devote that water to other beneficial uses to which the Company itself might apply it, or to which it might be applied by others under license, sale or other arrangement with the Company.

The Company possesses a vested property right, granted by the State and not by the City, of which it may not be deprived, either in whole or in part, simply because a certain corporation, even a municipal corporation, refuses longer to be served. Certainly the water yielded by these water rights cannot, nor can the water rights themselves be taken or used either by the City or by any of its inhabitants ,except by consent of the Water Company or upon the payment of just compensation, and after due process of law.

The conclusion is also inevitable that, under the laws of Colorado, the Water Company has something to sell or license which is wholly distinct from and in addition to the lands and structures which compose its plant. The value of this element of property is dependent upon the nature and worth of the priority of appropriation appurtenant to and inseparable from the diverting, storage and distribution plant. These are the property rights valued by the Master under the designation "Water Rights."

As is well known, the large irrigation companies make a practice of selling outright by permanent water contracts or deeds, which amount to conveyances in perpetuity, the right to receive a certain share of the water diverted under their respective appropriations and conveyed through their ditches or other works. The market value of these rights is determined not by the reproduction cost of the structures, but by the priority and consequent value of the appropriation.

As was said in Nichols vs. McIntosh, 19 Colo., 22, at 27:

> "Property rights in water consist not alone in the amount of the appropriation, but also in the *priority* of the appropriation. It often happens that the chief value of an appropriation consists in its *priority* over other appropriations from the same natural stream. Hence, to deprive a person of his priority is to deprive him of a most valuable property right."

If a company having an early appropriation had from the beginning consistently pursued the policy of merely issuing temporary licenses to consumers, and was now undertaking to sell permanent rights to those who wished to buy, would the value of such water rights be limited or in any way measured by the reproduction cost less depreciation of the structures, or the market value of the lands constituting the physical plant? Clearly not. That would be to assign to the earliest and best appropriation no greater value than that possessed by those which were later in time and subordinate in right, and perhaps not so great if the physical structures connected with the latter were more extensive and costly.

And is not this conclusive evidence of the fact that the company has something to sell or license wholly independent of its structures, and having a value dependent upon the priority of the appropriation originally perfected and since maintained by its own diversion and conveyance of the water, but by the continuous application thereof to a beneficial use, through the acts of others, under its temporary licenses? And if this be so, how could a company

which, as appellee has done, has preserved this right to itself and never permanently parted with it, be deprived thereof, except by due process of law and upon just compensation? To so hold would be, as this court has stated (233 U. S., 461), to say that while the law declared that water could be appropriated for sale, yet "it meant that there should be nothing to sell."

The water rights valued by the Master were vested property rights of the precise nature hereinabove defined. The value assigned to them was determined and measured by the current market price at which irrigation companies sold and purchasers from them dealt in rights of exactly the same kind and of similar efficiency, which conferred upon the purchaser and owner thereof the permanent right to take similar quantities of water from the irrigation ditch or reservoir and apply the same to the beneficial purpose of irrigation.

It is manifest that the present fair value of such property rights cannot be excluded from the rating base. This has been conclusively determined in a recent decision by this court, which will presently be fully considered.

San Joaquin, etc., Irr. Co. vs. Stanislaus County, 233 U. S., 454.

3. *Colorado Cases Cited by Appellants Do Not Sustain Their Contention Concerning Nature and Ownership of These Water Rights.*

In the pages which immediately precede we have reviewed in a historical way the Colorado decisions dealing with the question here involved, culminating

with the latest, which was announced in July of the present year. These, as it seems to us, conclusively demonstrate that appellants' contention is without foundation.

That contention is that, by some mysterious process, the nature of which appellants do not fully explain, and concerning which apparently they have themselves no clear conception, the property right, which by express grant the State of Colorado vested in The Denver Union Water Company and its predecessors, to divert, store, convey, deliver and apply, or cause to be applied, to beneficial uses, the waters of certain natural streams of this state, has in whole, or at least in part, passed either to the City of Denver, as a municipal corporation, or to the consumers of water therein, or to some of them, although neither the Water Company nor any of its predecessors has ever conveyed it away; but, on the contrary, has always scrupulously, and by specific written instruments, unmistakable in their terms, retained it unimpaired and undiminished.

The argument in support of this contention is fallacious, rests upon no tangible foundation, is in conflict with the long line of Colorado decisions to which we have already referred, and is violative of fundamental principles enunciated by the Constitutions of the State and the nation.

It all arises from an unfortunate expression used by Judge Helm in the early case of Wheeler vs. Northern Colorado Irrigation Co., 10 Colo., 582. That case was heard and decided by two judges only, the third, Judge Elbert, not sitting. Each of these two judges filed a separate opinion, and by a different process of reasoning arrived at the same result. The remarks

relied upon by appellants were, therefore, those of Mr. Justice Helm alone, and not of the court. They had no necessary or other apparent relation to the question at issue, and were obviously *obiter*, besides being the expressions of a single judge, and not of the court. Therefore, the famous and oft-quoted words of Chief Justice Marshall, in Cohens vs. Virginia, 6 Wheaton, 264, 399, are distinctly applicable and receive added force.

In the Wheeler case the sole question was whether The Northern Colorado Irrigation Company was engaged in a business of such a public nature that, having surplus water in its canal diverted under its appropriation in excess of that required to supply those who had, by conveyance or lease from the company, acquired the right to take water from its ditch, which surplus water was therefore available for the purpose desired, it was required to furnish the same to plaintiff for one season's use to irrigate acres lying under the canal, but upon the payment of *just compensation*. The Irrigation Company had refused to furnish the water except upon payment of $1.50 per acre for the season's use, and an additional sum of $10 per acre. The question presented was by Judge Helm deemed, for purposes of argument, analogous to that arising when an intending shipper offers goods for transportation by a common carrier and tenders therewith just compensation for the service. No one at this day questions the principle that an irrigation company organized for the purpose of supplying the public is a public service corporation, and subject to its obligations, as to that portion of its water supply yielded by its water rights and carried in its ditch which exceeds the amount necessary to supply those

who, by deed or contract with the company, are entitled thereto.

In the Wheeler case the aggregate amount per acre demanded by the company for one season's use was, as stated, $11.50. It was alleged in the petition for mandamus that this amount per acre was for one season's use unreasonable and exorbitant, as it plainly was. In the lower court the case was dismissed upon demurrer to the petition; therefore, the unreasonable and exorbitant character of the demanded charge was admitted. The company asserted that it was not a public service corporation, and therefore under no obligation to furnish water to petitioner, and consequently at liberty to impose any terms it chose. Whether this contention of the company was well founded was the only question presented to or considered by the Supreme Court. As stated above, Judge Helm alone, in the argumentative portion of his opinion, likened the business of the Irrigation Company to that of the common carrier, and in that connection used the words which are the foundation of appellants' argument. But the learned judge said (10 Colo., 588):

> "The Colorado doctrines of ownership and appropriation (as declared in the constitution, statutes and decisions) necessarily give the carrier of water an exceptional status; a status differing, in some particulars, from that of the ordinary common carrier. Certain peculiar rights are acquired in connection with the water diverted. It is unnecessary now, however, to enumerate these rights in detail."

And after remarking that the business of the irrigation company was a practical monopoly and its profits fairly guaranteed, the learned Judge further said (p. 590):

> "And an attempt to use its monopoly for the purpose of coercing compliance with unreasonable and exorbitant demands would lay the foundation for judicial interference."

Clearly the Wheeler case has no application to this controversy, nor does it decide, nor was it intended to decide, the question here presented. Clearly Judge Helm, even in his separate opinion, relied upon by appellants, recognized the fact that a vested property right (which he did not undertake to define) rested in the Irrigation Company. Clearly, he did not intend to, nor did he, hold or intimate that the Irrigation Company could be deprived of this vested property right except by due process of law and upon just compensation, or that it in any sense belonged to the ultimate consumer.

Yet, upon certain language, evidently somewhat carelessly used, in the argumentative portion of the opinion of a single judge, and not of the court, and in a case involving no such question as that here presented, appellants reach conclusions which would beyond doubt astonish the learned writer of that opinion if now presented for his consideration. Moreover, any erroneous impression which might be conveyed by these thoughtless words has been entirely removed by a long series of subsequent decisions, culminating in one announced within the last three months, all of which have been hereinbefore cited, and which set the

matter entirely at rest. Upon so slight a foundation does appellants' argument rest.

The other Colorado cases cited by appellants are readily distinguishable and utterly fail to support appellants' contention.

Thomas vs. Guiraud, 6 Colo., 530 (appellants' brief, pp. 33, 44), was a suit between two individual ditch owners, each of whom not only owned his own ditch, but also owned the entire appropriation appurtenant thereto, including the right to divert, convey and apply to a beneficial use, and each was applying the water diverted to the irrigation of his own land. Plainly the case did not and could not involve the rights of third persons, other than the owner of the ditch, to take water therefrom. No such question was considered or decided.

Farmers High Line Canal & Reservoir Co. vs. Southworth, 13 Colo., 111 (appellants' brief, p. 39), involved the rights of users of water from the same ditch as between themselves. Whether such users had, by deed or their equivalent, acquired the permanent or perpetual right to take water from said ditch, or whether they had by leases or licenses, or their equivalent, acquired merely a temporary right so to do, does not clearly appear; but from a statement in Judge Helm's opinion (p. 118) it seems evident that the High Line Company had conveyed to them perpetual rights of that character.

The company had, in a season of scarcity, when it was impossible for the company to divert from the river the full amount of its appropriation, undertaken to apportion the water pro rata among its consumers. One of these consumers brought suit to enjoin the proposed apportionment, alleging that he himself had

a priority of a certain date, and that the result of such apportionment would be to diminish the amount of water to which he was entitled under his priority for the benefit of other consumers from the ditch having priorities of a later date. The company demurred to his complaint. The trial court overruled this demurrer and granted the relief sought by the consumer. On appeal, the sole question considered was whether or not the complaint stated a cause of action, and whether or not the court below rightly overruled the demurrer. The court held that the complaint did not state a cause of action, and that the demurrer should have been sustained. The judgment was, therefore, reversed. But in this case, as in Wheeler vs. Northern Colorado Irrigation Company, *supra*, each judge filed a separate opinion and based his conclusion upon different grounds. The quotation relied upon by appellants here is from the separate opinion of Mr. Justice Helm, the same judge who wrote the separate opinion, likewise relied upon by appellants, in the Wheeler case, *supra*.

In Farmers High Line Company vs. White, 32 Colo., 114, 117, the Supreme Court, commenting on the Southworth case, said that:

> "Each of the three members of the court as then constituted wrote a separate opinion from which it would appear that no one of the learned judges was in entire accord with either of the others as to the main question discussed. That case really went off upon a question of pleading."

In the Southworth case Mr. Justice Hayt (13 Colo., 113-117) held that the demurrer should have

been sustained because the allegations of the complaint were mere legal conclusions. In the course of the opinion, however (p. 114), he stated, by way of *obiter*,

> "It seems clear that at least under some circumstances different users of water obtaining their supply through the same ditch may have different priorities of right to the water; that the appropriations do not necessarily relate to the same time."

Mr. Justice Elliott (pp. 130-139) concurred in the opinion of Mr. Justice Hayt that the demurrer should have been sustained because the allegations of the complaint were merely conclusions of law, and because the pleading was otherwise defective. In addition, but confessedly by way of *obiter*, the learned justice indicated at some length his belief that even consumers from the same ditch might have priorities of different dates. Mr. Chief Justice Helm, however (pp. 117-130), while agreeing with the other two that the demurrer ought to have been sustained, did not base his conclusion upon any technical defect in the pleading, but squarely upon the proposition that different consumers taking water from the same canal have no individual priorities; that there is but one priority, namely, that appurtenant to the diverting canal itself; and that in times of scarcity the water must be apportioned among the consumers who have the right to take it from the canal upon that basis and not otherwise. Upon this question the learned judge was clearly right and his associates clearly

wrong, as has been conclusively determined in later decisions.

> Combs vs. Farmers High Line Co., 38 Colo., 420.
>
> O'Neil vs. Fort Lyon Canal Co., 39 Colo., 487.

But the language employed *arguendo* by Mr. Justice Helm, and quoted at pages 39 and 40 of appellants' brief, was not necessary to the decision, and was a mere reiteration of what he had said in the separate opinion which he filed in the Southworth case, *supra*. Moreover, it must be borne in mind that that language was employed in a case wherein the consumers had obtained from the company, by deeds or their equivalents, permanent rights to take and use the water. It was under these conditions, and none other, that the language relied upon by appellants was used. Moreover, in the course of the opinion, the learned judge said (p. 120):

> "But the consumer himself makes no diversion from the natural stream. * * * The carrier makes a diversion both in fact and in law."

The learned judge further held that the consumer had no right, after having taken water from the irrigation ditch, to divert it directly from the stream on the priority adjudicated to the ditch, saying (p. 122):

> "But when he elects to take from the carrier's canal and thus to employ this lawful agency, he cannot reject the accompany-

> ing lawful obligations. * * * (p. 123) By virtue of its (the statute's) provisions a priority was to be awarded the carrier's canal according to the date of diversion of water thereby from the natural stream and the quantity diverted and used, but no distinct and independent priority in the consumer was in any way recognized."

And speaking of the contention, which he expressly negatived, that each consumer of water from the canal had an appropriation and a priority of his own, the learned judge further said (p. 125):

> "Besides, certain consumers will abandon the use of water from the carrier and other consumers will secure the right to the use thus abandoned."

Thus clearly indicating that when the right of any particular consumer to take water from the canal terminates, the canal company may then bestow that right upon another.

It is clearly evident, both from the nature of the question presented and determined and the character of the argument employed, even in the separate opinion relied upon by appellants, that the case last mentioned affords no support for the contention which appellants here advance. On the contrary, when rightly understood, it is distinctly an authority against them.

Combs vs. Agricultural Ditch Co., 17 Colo., 146 (appellants' brief, pp. 36, 37, 38) involved a petition for the writ of mandamus to compel the ditch com-

pany to furnish water for the irrigation of petitioner's lands. It appeared (p. 149) that the petitioner's lands were so located as to be conveniently supplied from the defendant's ditch; that he requested the defendant to supply him with water necessary for the season's irrigation; that he tendered therefor the price which had been fixed by the Board of County Commissioners (pursuant to sec. 8, Art. XVI, of the Constitution), and that the defendant refused to deliver the water. The sole defense interposed by the ditch company was that it was not a public service corporation, and therefore was not under any circumstances compellable to furnish water to petitioner unless and upon such terms as it chose. The lower court sustained this defense and dismissed the petition. It appeared that the defendant ditch company had conveyed away permanent rights to take water from its ditch, said conveyances being evidenced (as is sometimes the case, 25 Colo., 144) by so-called ditch stock, which possessed not only the usual attributes of corporate stock, but in addition expressly conferred upon the holder thereof a permanent right to take water from the ditch. However (p. 153), it did not appear that the volume of water to which said stockholders were, under their perpetual contracts, entitled, would exhaust the supply yielded by defendant's appropriation. The judgment dismissing the petition was, therefore, reversed, the Supreme Court holding that the defendant company's form of organization was such as to render it in fact a public service corporation, upon which rested the duty, as to its surplus water which it had not conveyed away, to furnish water upon proper application and for just compensation. But the court expressly says (p. 329)

that the status of such a ditch is not "in the strict legal sense of the term that of a common carrier. * * * Its status is more like that of a private carrier, whose duties are measured by the obligations it assumes towards its consumers and such as the law imposes by reason of the nature of the business in which it is engaged."

Again, we submit that the case last referred to furnishes no support for appellants' contention. On the contrary, the reasoning there employed clearly foreshadows the later decisions of the same court, which, as we have demonstrated, completely destroy appellants' contention.

Wyatt vs. Larimer & Weld Irrigation Co., 1 Colo. App., 480 (appellants' brief, p. 40) is referred to and criticized by appellants because it was later reversed by the Supreme Court; but the decision of the Court of Appeals in that case is interesting, because much that was said therein by way of argument plainly foreshadows the settled doctrine afterwards conclusively announced by the Supreme Court in later decisions. The Wyatt case was a suit brought by certain consumers upon whom, by contracts in the nature of deeds, the Irrigation Company had conferred a permanent and perpetual right to take water from its ditch. The sole question involved was as to the correct construction of the instruments of conveyance. It was claimed by plaintiffs that the terms of the conveyances under which they held were such as to entitle them absolutely to a certain volume of water, if that much was available under the ditch appropriation, and that the amount to which they were entitled could not be diminished by the necessity of pro-rating with others to whom the ditch com-

pany had made later conveyances of similar rights. It was contended by the ditch company that under the terms of said conveyances the ditch company reserved the right to make further and additional sales and conveyances up to the physical capacity of its ditch to convey, without regard to the quantity of water available under its appropriation, and that the total quantity available under its appropriation was to be distributed pro rata among all of its consumers who were holders of such conveyances, including the plaintiffs. The trial court and the Court of Appeals upheld the contention of the ditch company, the first sustaining the company's demurrer to the complaint, and the second affirming that decision (1 Colo. App., 488). The Court of Appeals, however (1 Colo. App., 489, 502), departed somewhat from the only question actually presented upon that record, and entered upon an extended discussion of the status of the ditch. This discussion is extremely interesting, especially so as the reasoning employed and the conclusions reached are almost identical with those upon which the recent decisions of the Supreme Court, cited in the preceding portion of this argument, are based.

The Court of Appeals, however (1 Colo. App., 502, 507), really based its judgment of affirmance upon the construction which it gives to the contracts between the ditch company and the consumers.

Wyatt vs. Larimer & Weld Irrigation Co., 18 Colo., 298 (appellants' brief, p. 41), is the opinion of the Supreme Court on appeal from the decision of the Court of Appeals in the case last mentioned, whereby the decision of the trial court sustaining the demurrer to the complaint and the decision of the

Court of Appeals affirming that ruling were both reversed. The opinion of the Supreme Court is, however, based expressly and exclusively upon the construction of the terms of the instruments by which the Irrigation Company had conveyed to the plaintiffs the permanent and perpetual right to take water from its ditch. The fact that any discussion of the status of the Irrigation Company would be *obiter* is expressly determined (18 Colo., pp. 307, 308). The court's observations upon that subject, quoted and relied upon by appellants, are therefore by its own express admission unnecessary to the decision, and in that sense improper. Moreover, these observations were made in respect of a situation where the original owner of the appropriation had, by deeds or their equivalents, bestowed upon others permanent and perpetual rights to take water from its canal. Certainly it does not require extended discussion to demonstrate that nothing contained in the Wyatt case affords any foundation for appellants' contention.

Wright vs. Platte Valley Irrigation Co., 27 Colo., 322 (appellants' brief, pp. 44, 51) plainly involved a situation where the Irrigation Company had, by deeds or their equivalents, conveyed to consumers permanent and perpetual rights to take water from its ditch. By the terms of these conveyances (p. 323) the right of each grantee was confined to the taking of sufficient water to irrigate certain specified lands. One of these grantees (p. 324) was attempting to take water not only to irrigate the specified lands, but also other lands owned by him. The Irrigation Company thereupon brought suit to enjoin such taking. By way of defense (p. 325) the holder of the Water Company's conveyance of such permanent and

perpetual right alleged that the additional lands which he sought to irrigate were adjacent to those described in his deed and under the Irrigation Company's ditch; that in previous seasons he had used water taken from the company's ditch for the purpose of irrigating them; that surplus water existed in the ditch available for that purpose; and that therefore he had a right as ultimate consumer to continue such use. He also alleged (p. 326) that the provisions contained in the company's conveyance of the water right limiting its use to certain specified lands was harsh, unreasonable, contrary to public policy, and therefore invalid. A demurrer to these defenses was interposed (p. 327) and by the trial court sustained. On appeal this decision was affirmed by the Supreme Court.

As is obvious, the situation there presented was one wherein the original diverter of the appropriation had, by deeds or their equivalents, conveyed to others permanent and perpetual rights to take water from its canal. For this reason the case is clearly distinguishable from that now under consideration. For this reason also it is equally clear that it cannot serve as an authority to sustain any of appellants' contentions here. As was said by the court (p. 328):

> "The only important question presented by the pleadings is whether the third provision of the contract, in so far as it limits the use of the water right in question to the necessities of the particular forty acres therein described, is valid and enforceable against appellant. In other words, whether, notwithstanding this limitation, the appel-

lant can use the water for all necessary purposes upon the land specified, and at the same time apply it to the irrigation of other and adjacent land. Counsel for appellant insist that this provision is harsh, unreasonable, against public policy and void, because it is said that the ditch company being simply a 'common carrier', is clothed merely with the right to carry water and receive compensation therefor; and the consumer under the ditch who applies the water to a beneficial use, being really the appropriator of the water, and hence the owner of the water right, is entitled to apply the water thus appropriated to any land he may desire; and any attempt on the part of the ditch company to limit or control his exercise of this right is beyond its power. We cannot agree fully with counsel upon either of these propositions. * * * Its (the company's) status is more like that of a private carrier whose duties are measured by the obligations it assumes towards its consumers and such as the law imposes by reason of the nature of the business in which it is engaged. * * * The consumer, by reason of his application of the water to a beneficial use, is said to be an appropriator, yet we do not think he occupies the exact status of one who appropriates the water directly from the public stream."

It must be remembered that these words were used in relation to a situation where the company

had conferred permanent and perpetual rights upon its consumers to take water from its canal. It must also be remembered that in the later decisions of the Colorado court cited in the preceding portion hereof, it is expressly adjudged that consumers of water from a canal or other conduit owned and operated by another are not in any sense appropriators of water from the public stream, or otherwise. And it must also be remembered that, as conclusively determined in the latest of the Colorado cases, which are hereinbefore cited, where the original diverter and appropriator has never permanently parted with the right to take and apply to a beneficial use, but has merely leased or licensed such right, the lessees or licensees obtain no right, title or interest whatsoever in the water, the water right or the appropriation thereof, save as expressly defined in the instruments under which they hold, and that upon the termination of such limited and temporary rights the entire ownership and control of the complete water right, and the whole appropriation, remain in the original diverter and appropriator, subject to sale, further lease, or other disposition by him. The late decisions just referred to are clearly foreshadowed by what was said in the Wright case, *supra.*

Appellants, at page 47, *et seq.*, of their brief set forth a somewhat lengthy excerpt from the opinion in City of Denver vs. Brown, 56 Colo., 216. This is one of the late cases cited and relied upon by us in the preceding portion of this argument. Certainly, nothing can be found in the Brown case which in any manner tends to support appellants' contention. Appellants merely quote from that opinion, and wisely do not attempt to draw any conclusion therefrom.

At page 51 of their brief they say, in reference thereto:

> "But it cannot be (and certainly is not stated in the Brown case, nor is it a fair inference to be drawn from the opinion) that in such a case" (forfeiture of consumer's right) "the Water Company acquires the right to the water; for unless the water is again applied to a beneficial use by some consumer, it must be left in the natural stream."

But appellants ignore the fact that in People, ex rel. City and County of Denver vs. District Court, decided July 2, 1917, the Supreme Court of Colorado, re-stating what it had held in the Brown case, said, among other things:

> "That while the ditch company was not the owner of the water, it nevertheless owned the right to divert the decreed appropriations awarded the ditch, and to charge a *rental* annually for its carriage, *which in effect constituted it the proprietor of the appropriations; that the ditch owner owned, controlled and possessed the right to divert the ditch's decreed appropriations;* * * * that when the consumer severs this contractual relation by not renewing the contract, the contractual obligation of the carrier with the consumer is ended, except, of course, that the consumer has an option" (by express provision of the contract) "to renew the contract within a definite time

> from year to year, and *if he fails to do so, the owner may contract the use and carriage to another.*" (Appendix B, hereto, *infra*, pp. 438, 439.)

It is significant that counsel for appellants do not in any manner refer to the case last cited, although the decision was announced before their brief was filed herein, and although the City Attorney, chief counsel for appellants here, was likewise chief counsel for the City and County of Denver in the case cited, and on its behalf contended for and obtained the conclusive judicial determinations to which we have referred.

At pages 33 and 34 of their brief appellants quote from Wiel on "Water Rights in the Western States" and from Kinney on "Irrigation and Water Rights." But these text books were written prior to the time when the Colorado doctrine upon this subject was clarified by the recent decisions, and their authors do not distinguish between the case where the consumer has by deed acquired a permanent right, and that where his right has been only temporary and conferred by lease or license (as the later Colorado cases plainly do), and therefore the statements in their text books are clearly inaccurate.

We have thus at tedious length reviewed every one of the authorities relied upon by appellants in support of their contention. We submit respectfully, but with perfect confidence, that none of them support that contention. The law in Colorado, as clearly and conclusively determined by the latest decisions of its Supreme Court is, beyond question, to the contrary.

The contention of appellants is thus stated in a nutshell at page 53 of their brief:

> "The owner of water and water rights in Colorado, then, is the *user* of the water, or, rather, the actual user of the water is the owner of the water and water rights."

Not only is this contention in direct conflict with the settled doctrine in Colorado, as conclusively determined by repeated decisions of its highest court, but its absurdity is manifest when we carry it to its logical conclusion.

If the contention be well founded, then the consumers of water under an irrigation ditch owned by some one else who had made the original appropriation might, for some reason satisfactory to themselves, —or for no reason at all,—unanimously resolve that they would divert the water yielded by the water right of which they were the beneficial owners through a new and parallel ditch which they would construct by the side of that already in existence. By carrying this resolve into effect, they would utterly destroy the investment already made in the original ditch, and, yet, if appellants' theory is correct, would be well within their rights. If this were the law, it would be cheerful news to the many who have enormous sums invested in irrigation enterprises in this State. The proposal of such a doctrine would, to say the least, not encourage further investments of that character.

Or let us apply the doctrine to the Denver situation. If it be true that the ultimate consumer is the actual beneficial owner of the water right, then who

is such owner here? Not the City, because it has been the ultimate consumer only to a limited extent and of a relatively small portion of the water yielded by these rights, and which the company has diverted, conveyed and delivered within the City to its licensees. Not the private consumers, because they have not received and applied to a beneficial use all such water, but only such portion thereof as remained after the City had taken what it desired to apply to beneficial uses, municipal in character. Can it possibly be true that the beneficial ownership is to be ratably apportioned between the City as a municipality and the many thousands of private consumers? If so, what consumers own it? This Company and its predecessors have been supplying the inhabitants of Denver for nearly half a century. The ultimate consumer may not be the same today as he of yesterday, or last month, or a year or ten years ago. Except in rare instances, he is not. What has become of the beneficial ownership, the proprietary interest, of the man who lived in a certain house in Denver fifteen or twenty years ago and took water from the Water Company's mains, but has since moved away? Did he take his proprietary interest away with him when he moved? If not, where has it rested since? And where is it now?

If this theory be correct, then, any one user of water from the Company's mains may conclude that he is tired of city residence, that he desires to move to the country, and that he will there divert, through a ditch, pipe or other conduit, the water which under his water right he has heretofore received at his city residence. Assuming appellants' theory to be correct,

no one could deny him this privilege. His right so to do would be absolute.

Or suppose that a considerable number of the present inhabitants of Denver should resolve that they preferred to live in a smaller town which they would themselves establish, and should thereupon in a body move to a new location, establish there a new town, and announce that they would at that point divert from the Platte River, through new works of their own, the water to which they were entitled under the water rights with which they were severally vested. If appellants' theory be sound, who could say them nay?

Or suppose that the City of Denver should carry out the resolve evidenced by Section 264-a of the charter, and construct a new, independent and complete system of works for the diversion and distribution of water, paralleling and duplicating those now in existence, and should then announce that it would take possession of the water rights and appropriations theretofore used and owned by the Water Company, and, by virtue thereof, divert water from the natural streams and convey and deliver it to consumers under the new municipal system, leaving the Water Company in possession of a complete waterworks system but without any water to flow through its pipes. If appellants' theory be sound, nothing could prevent the City from proceeding in exactly that way.

Incredible though it may seem, precisely that assertion concerning the City's right has been seriously made, and precisely that purpose on the part of the City has been seriously entertained and clearly

announced on numerous occasions in the course of the many attacks to which the Water Company and its property have been subjected. The fact that such a theory is now solemnly advanced and advocated by the City's legal representative is some evidence at least that the City is still animated by such a purpose.

A more effective method of confiscation could hardly be conceived. Even the engineers for the Public Utilities Commission expressly assert that no such thing could be done (see their report, Rec. p. 72) without the payment to the Company of substantial damages, including (Rec. p. 71, Fol. 90) compensation for the exclusive right of diversion, storage and carriage, which these engineers concede the Company owns.

It admits of no doubt that a theory which leads to such absurd and manifestly unjust results must be unfounded. No case has been found and, we submit, none exists, in Colorado or elsewhere, which would justify or permit it.

4. *The decision of this court in San Joaquin, etc., Irrigation Co. vs. County of Stanislaus, 233 U. S. 454, conclusively determines that water rights of the nature here involved are property rights held in private ownership, and that the valuation thereof must be included in the rating base. The fact that the case so determined arose in California affords no ground of distinction.*

In the case cited in the foregoing headline the question was whether rates of charge fixed by public authority for the service of the Irrigation Company were confiscatory and therefore unconstitutional. In order to fully understand the controversy, the opinion of the lower court must be examined with care.

In the lower court (191 Fed., 875), all of the physical property of the company was valued according to the cost of reproduction less depreciation method. But when it came to the company's water rights the lower court concluded (191 Fed., 889 *et seq.*) that their value could not be included in the rating base. In the discussion of this subject the lower court refers to and quotes the constitution and statutes of California and the decisions of its courts thereunder. It also refers (p. 894) to the early decision in Colorado to which we have already adverted, and upon which appellants rely, and quotes the unfortunate *obiter* in that opinion in support of its own conclusion. As we have already pointed out, the Colorado Supreme Court, in recent cases decided since the California case to which we now refer, clarified the situation and put the matter beyond question so far as Colorado is concerned. At this time, therefore, Colorado decisions would afford the California court no comfort or support. But upon this subject the lower court in the California case (191 Fed., 895) arrived at a conclusion which is stated as follows:

> "In these cases the theory that the irrigation company is an intermediate agency in the execution of a public trust is necessarily based upon the doctrine that the right to appropriate water is attached to the land. The company cannot at the same time be principal and agent. It cannot own the water or the right to appropriate and sell it, and at the same time be the agent of the public in appropriating it for a public use. The logical relationship of such a company to its

> appropriated water is that of agent of the owner of the land in diverting and bringing the water to the land for which it has been appropriated. But it is immaterial whether the company is deemed to be the agent of the public in diverting and carrying the water owned by the public to the consumer who owns the right to its beneficial use, or the agent of the consumer in diverting and carrying the water to his principal for a beneficial use. In either case, while the carrier is entitled to be paid for his services as a carrier a reasonable compensation under such regulations as the law may prescribe, he is not the owner of the water carried or the water right created by its diversion, and he cannot compel the consumer to purchase it, and to pay for its use, either in the way of an annual or other rate upon its supposed value as a property right."

At this point it should be noted that the California constitution and decisions lend much more support to such a conclusion than do those of Colorado. In fact, since the recent decisions in the City Ditch cases, hereinbefore cited, Colorado law furnishes no support therefor whatever. Section 1 of Article XIV of the Constitution of California provides:

> "The use of all water now appropriated, or that may hereafter be appropriated, for sale, rental or distribution, is hereby declared to be a public use, and subject to the regula-

tion and control of the state in the manner to be prescribed by law."

As we have already shown, the Colorado Constitution contains no declaration that the appropriation is for public use; but, on the contrary, both the Constitution and the statutes of Colorado contemplate and provide for the appropriation of water for sale, lease, license or other disposition, for domestic, irrigation and other purposes, without any declaration that such appropriation when made is for a public use.

When the San Joaquin case reached this court (233 U. S., 454), the determination of the trial court was reversed, and this court, speaking through Mr. Justice Holmes, announced in emphatic and unmistakable language, the doctrine which must control the case at bar, saying:

> "The bill concerns rates fixed in 1907, and the question before the court has been narrowed to a single issue. If the plaintiff is entitled to six per cent. upon its tangible property alone it is agreed that the orders must stand. But if the plaintiff has water rights that are to be taken into account, the rates fixed will fall short of giving it what it is entitled to and must be set aside. The Circuit Court dismissed the bill, 191 Fed. Rep. 875, and on this appeal figures are immaterial, the only question being whether the principle adopted is right. * * *
>
> (459) It is not disputed that the plaintiff has a right as against riparian proprietors to withdraw the water that it distributes

through its canals. *Whether the right was paid for, as the plaintiff says, or not, it has been confirmed by prescription and is now beyond attack.* It is not disputed either that if the plaintiff were the owner of riparian lands to which its water was distributed it would have a property in the water that could not be taken without compensation. But it is said that as the plaintiff appropriates this water to distribution and sale it thereby dedicates to the public use under California law and so loses its private right in the same. It appears to us that when the cases cited for this proposition are pressed to the conclusion reached in the present case they are misapplied. No doubt it is true that such an appropriation and use of the water entitles those within reach of it to demand the use of a reasonable share on payment. It well may be true that if the waters were taken for a superior use by eminent domain those whose lands were irrigated would be compensated for the loss. But even if the rate paid is not to be determined as upon a purchase of water from the plaintiff, still, at the lowest, the plaintiff has the sole right to furnish this water, the owner of the irrigated lands cannot get it except through the plaintiff's help, and it would be unjust not to take that fact into account in fixing the rates. We are not called upon to decide what the rate shall be, or even the principle by which it shall be measured. But it is proper to add a few words.

The declaration in the Constitution of 1879 that water appropriated for sale is appropriated to a public use must be taken according to its subject matter. *The use is not by the public at large, like that of the ocean for sailing, but by certain individuals for their private benefit respectively.* Thayer vs. California Development Co., 164 California, 117, 128. Fallbrook Irrigation District vs. Bradley, 164 U. S., 112, 161. The declaration therefore does not necessarily mean more than that the few within reach of the supply may demand it for a reasonable price. *The roadbed of a railroad is devoted to a public use in a stricter sense, yet the title of the railroad remains, and the use though it may be demanded, must be paid for.* In this case it is said that a part of the water was appropriated before the Constitution went into effect, and that a suit now is pending to condemn more as against a riparian proprietor, for which of course the plaintiff must pay. *It seems unreasonable to suppose that the Constitution meant that if a party instead of using the water on his own land, as he may, sees fit to distribute it to others he loses the rights that he has bought or lawfully acquired.* Recurring to the fact that in every instance only a few specified individuals get the right to a supply, and that it clearly appears from the latest statement of the Supreme Court of California, Palmer vs. Railroad Commission, January 20, 1914, 47 Cal.

> Dec., 201, that the water when appropriated is private property, *it is unreasonable to suppose that the constitutional declaration meant to compel a gift from the former owner to the users and that in dealing with water 'appropriated for sale' it meant that there should be nothing to sell."* (Italics ours.)

We respectfully submit that the decision of this court quoted above leaves nothing further to be said upon the question here presented. The water rights involved in the San Joaquin case were of exactly the same nature as those here involved, and had been acquired and were held in precisely the same manner. The constitution and statutes of California are, upon this question, of exactly the same import as those of Colorado. Indeed, as already noted, the language of the California Constitution lends more support to such a contention as appellants' than does that of the Colorado Constitution. The contention made and expressly negatived in the San Joaquin case was precisely that advanced by appellants in the case at bar.

But appellants claim (their brief, pp. 58 *et seq.*) that there is some difference between the laws of California and those of Colorado which justifies a distinction. In this appellants are clearly wrong.

They assert in this connection (their brief, pp. 58, 59) that California has never adopted the rule, which they claim prevails in Colorado, that the owner of the ditch or other diverting works does not own the water right, but that this is owned exclusively by the consumer. As we have already demonstrated, the Colorado doctrine in this respect is not that which

appellants claim it to be. Its exact nature and scope has been conclusively determined by the recent Colorado decisions hereinbefore cited and quoted from. But it does not admit of doubt that the Colorado doctrine, or one precisely like it, prevails in California.

In support of their assertion appellants again refer (their brief, p. 58) to Kinney on "Irrigation and Water Rights." But, as we have already pointed out, this valuable work was written prior to the time when the Colorado court, by its recent decisions, crystallized and clearly and conclusively enunciated the Colorado doctrine upon this subject. Consequently the Colorado doctrine, with its proper limitations, is not accurately or fully stated in the text book mentioned.

Appellants, at page 59 of their brief, mention California as one of the states in which a rule has been adopted, concerning the relation between an irrigating ditch and the consumers therefrom, differing from that in Colorado. In this appellants are clearly wrong. The rule in that respect prevailing in California is exactly the same as that which prevails in Colorado. This is evident from the fact that in the San Joaquin case, *supra*, the exclusion by the master and the lower court of the value of water rights (which decision this court reversed) was expressly based upon the proposition that the ditch company was merely a carrier, and that the title to the water rights was vested in the ultimate consumers (see 191 Fed., pp. 889, *et seq.*). His honor, Judge Morrow, in delivering the opinion of the lower court in that case, discussed this proposition at length, citing numerous authorities, including many California cases, by which, as he thought, it had been conclusively deter-

mined. He also (191 Fed., 894) cites and quotes from the Colorado cases (Wheeler vs. Northern Irr. Co., 10 Colo., 582; Wyatt vs. Larimer, 18 Colo., 298), upon which appellants here rely; and clearly holds that the California and Colorado doctrines are identical in determining that the owner of the ditch is not the owner of the water rights, but a mere carrier of the water, as agent for the consumer thereof. After reviewing these cases, including those in California, he says (p. 895):

> "In these cases the theory that the Irrigation Company is an intermediate agency in the execution of a public trust is necessarily based upon the doctrine that the right to appropriate water is attached to the land. The company cannot at the same time be principal and agent. It cannot own the water or the right to appropriate and sell it, and at the same time be the agent of the public in appropriating it for a public use. The logical relationship of such a company to its appropriated water is that of agent of the owner of the land in diverting and bringing the water to the land for which it has been appropriated."

This, beyond question, is the Colorado doctrine as contended for by appellants.

When the San Joaquin case reached this court, the same contention was advanced and the same authorities cited in its support, as is evident from the brief of appellee filed in that case (58 U. S. Sup. Ct. Repts., Law. Ed., p. 1045). Among the California

cases so cited both in the lower court and in this court were the following:

Leavitt vs. Lassen Irrig. Co., 157 Calif., 82.

Lassen Irrig. Co. vs. Long, 157 Calif., 94.

In Leavitt vs. Lassen Irrigation Co., *supra*, the Supreme Court of California said (p. 85):

> "Treating Leavitt's appropriation as being wholly and entirely for public use, he, the owner of the system, *was but an instrumentality for the distribution of the waters* which he gathered to such members of the public as might apply for them and pay to him the legal charge for the service that he rendered. As the agent of such public use, he had no power whatsoever to reserve to himself for his private purposes any part of this water. If he could reserve a part he could reserve all, and thus by his *ipsi dixit* convert a public use *into private ownership;* or if he could reserve a part for himself, he could with equal authority give away parts of the supply to others, and by this method destroy what the Constitution itself has declared shall forever remain a public use." (Italics ours.)

This, so far as the question here involved is concerned, is the exact equivalent of the Colorado doctrine as contended for by appellants.

But appellants (p. 59 of their brief) assert that in Palmer vs. Railroad Commission, 167 Calif., 163;

138 Pac., 997, cited by this court in the San Joaquin case (233 U. S., 460), something will be found which distinguishes California law from that of Colorado, and to that end insert in their brief a long quotation from the case mentioned.

The entire opinion must be read to ascertain what was determined. And such reading clearly demonstrates that the law of California, as declared in that case, is precisely the same as that of Colorado.

It is held in the Palmer case that by diversion and application to beneficial use a property right is acquired to continue to so divert and apply to such use, as against all except those having prior rights. This is the law in Colorado.

It is held in the Palmer case that if the appropriator and diverter applies the water to a beneficial use, private in its nature, such as the irrigation of his own lands, the right acquired is in all its aspects exclusively private, and neither the public nor any member thereof has any interest therein whatsoever. This also is the law in Colorado.

In the Palmer case it is held that if the appropriator and diverter, instead of applying the water diverted to a private use, devotes it to a public use, such as supplying it to a city for municipal and domestic purposes, or to the owners of lands lying under the ditch for irrigation purposes, then the right to use is owned by the public in the sense that any member of the public within reach of the service is entitled to demand and receive such use upon payment of just compensation therefor, provided there be surplus waters not needed for the supply of those

already taking such service. This also is the law in Colorado, as has been clearly demonstrated.

But it was held in the Palmer case that where members of the public within reach of the service have already availed themselves thereof to such an extent that the water rights will not yield and the conduits will not carry any more water than is needed for their supply, then other members of the public, although within reach of the service, are not entitled to demand or receive any of such water. And this also is, beyond any doubt, the law in Colorado.

These things, and these only, are determined in the Palmer case. In that case the Supreme Court of California did not attempt, except as above, to define the relationship existing between the Water Company and its consumers in cases where the water rights had been devoted to a public use, or appropriation thereof made for purposes of sale to others, nor did it in any manner undertake to decide whether in such a case the ultimate ownership of the water rights or the water afforded thereby was vested in the Water Company, or in the public, or in the consumers thereof. The language quoted by appellants (their brief, pp. 59, 60, 61) refers to the proprietary interest of a riparian owner in the waters of a stream flowing past his land. Some of the rights involved in the Palmer case were apparently of that nature; others, however, were rights acquired by appropriation, and strictly analogous to similar rights acquired in the same way under the laws of Colorado (138 Pac., 997, 998 (3)). The gist of the opinion is found in the concluding lines (138 Pac., 1001):

> "The company has not supplied or agreed to supply the plaintiffs with water for

> irrigation. The water it has, according to the findings of the commission, is necessary to supply the inhabitants of the City of San Diego,"

to which public use it was being devoted.

The Supreme Court of Colorado would have held the same thing under similar circumstances relative to appropriations made under the constitution and laws of this state, and the water yielded thereby; for in Colorado, as in California, the obligation to supply those within reach of the service exists only when the appropriator under his appropriation is able to divert water in greater quantities than may be required by those already making beneficial use of the yield of the rights; and in Colorado, as in California, whenever such surplus water exists, either because sufficient consumers have not yet been found to take the entire yield of the rights, or because former consumers have ceased to take, the company which diverts under the appropriations and carries the water so diverted to the place of use is entitled to sell, lease or otherwise dispose of the right to use such surplus water. In Colorado, as in California, this is a vested and valuable property right, includes the right to divert under the appropriations, to convey and to deliver, pursuant to sale or license, as the case may be, and is a right of which the owner may not be deprived except by due process of law and upon just compensation, and the confiscation of which is prohibited by the Federal Constitution.

This right, and this only, is the one which was valued in the case at bar.

In Colorado, as in California, it is a manifest absurdity to say (as the decisions of both states do) that the company possesses this valuable right and yet, in the face of that holding, to argue in effect (as appellants do) that the company has it not, by contending that such property right actually belongs to the ultimate user, potential or actual.

This is the thought expressed by Mr. Justice Holmes in the San Joaquin case, when, in concluding the opinion, he said (233 U. S., 460):

> "It is unreasonable to suppose that the constitutional declaration meant to compel a gift from the former owner to the users, and that in dealing with water 'appropriated for sale' it meant that there should be nothing to sell."

And when, as here, and in the City Ditch cases and in the San Joaquin case, the company has never permanently parted with any portion of these rights, but has always studiously retained them, undiminished and unimpaired, is it not obvious that it still has them for purposes of lease, sale or valuation?

The doctrine of appropriation by diversion and application to a beneficial use originated and has had its fullest development in California. True, that state still recognizes, in a modified form, the doctrine of riparian rights. Therefore, in California, there are two kinds of water rights, different in their nature, to-wit, rights by appropriation and riparian rights. Rights by appropriation as recognized and enforced in California are exactly the same in nature

and characteristics as are similar rights in Colorado. The water rights involved in the San Joaquin case were rights by appropriation. Riparian rights were in no way involved. The San Joaquin case, therefore, is on all fours with the present case so far as the question of water rights is concerned.

In Fuller vs. Swan River Placer Mining Co., 12 Colo., 12, the Supreme Court of Colorado recognized the similarity of the doctrine of appropriation as it exists in California and in Colorado, on page 16 cited numerous California cases in explanation and support of its decision relative to a Colorado water right gained by appropriation; and among others cited and quoted from Davis vs. Gale, 32 Cal., 27, wherein:

> " * * * The court, in speaking of the rights of an appropriator of water, say: 'Appropriation, use and non-use are the tests of his right; and place of use, and character of use, are not. When he has made his appropriation, he becomes entitled to the use of the quantity which he has appropriated at any place where he may choose to convey it, and for any useful and beneficial purpose to which he may choose to apply it. Any other rule would lead to endless complications and most materially impair the value of water rights and privileges."

The riparian right as recognized in California belongs solely to the owner of the land on the bank of the stream, and pertains strictly to the beneficial use of water in the stream directly upon and for the

benefit of the riparian lands so owned. It is not permissible by virtue of such right to divert water from the stream for a beneficial use elsewhere. But in California riparian rights may and frequently do exist side by side with rights by appropriation to divert for a beneficial use elsewhere, and may exist in respect to the same stream, and even in the same person, though the two rights are wholly distinct.

Vol. 1, Kinney on Irrigation & Water Rights, 2nd Ed., Secs. 508, 510, 516, 517, 519, 594, 810, et seq.

Wiel on Water Rights in Western States, 3rd Ed., p. 761.

But the doctrine of appropriation, which, as stated, exists in California side by side with the modified riparian right doctrine differs in no respect from the doctrine of appropriation as it exists in Colorado. It is dependent upon diversion and continuous application to a beneficial use, and is not confined, as is the riparian right, to a beneficial use upon or for riparian lands in the ownership of him who claims the right. In California it is assumed that the United States, as original proprietor of the public domain, was the owner of all riparian rights, and that when it permitted the diversion of waters of the natural streams and the application thereof to beneficial uses at points distant from the stream banks, it thereby waived its right as a riparian owner. In Colorado, on the other hand, the doctrine of riparian rights has never prevailed. It is assumed that the natural streams are within the jurisdiction of the state and not the national government, and there-

fore the state is deemed to be the origin of the title which supports the perfected right by appropriation. These differing theories do not affect the question here presented. The right which results is essentially the same both in California and in Colorado.

In Wiel on Water Rights in the Western States, 3d Ed., p. 227, Sec. 187, the author, after a complete discussion of the subject, concludes as follows:

> "Aside from this difference in the present derivation of the rights of the appropriator, and in the consequent attitude toward riparian rights, the substantive law of appropriation itself is much the same in those jurisdictions which confine it to the public lands as in those that do not. Its characteristics, extent of right, loss of right, and similar matters, are founded upon the early California decisions made for waters on the public domain; California being the spring from which this peculiar feature of Western law has come. The decisions of that court in the earlier days seldom failed to be quoted in the other Western States in this connection, and its early cases had everywhere a persuasive force that closely approached authority. The substantive law of appropriation is largely the same under both systems."

In California if the appropriation by diversion and application to a beneficial use be made at a time when the riparian lands are still public domain, the appropriator need concern himself only with prior

appropriations, if any, of like character to his own, for priority in time gives priority in right, both as against other appropriators and against riparian owners.

2 Kinney on Irrigation & Water Rights, 2d Ed., Secs. 631, 812, 813, 814.

If, however, at the time of the appropriation the riparian lands, or some of them, are held in private ownership, the appropriator must take into consideration an additional class of priorities, to-wit, the riparian rights appurtenant to the privately owned riparian lands.

2 Kinney on Irrigation & Water Rights, 2d Ed., Secs. 812, 815.

The rights of the appropriator by diversion and application to a beneficial use upon non-riparian lands cannot be interfered with by a riparian owner who acquired his title subsequent to the appropriation; here, as stated above, priority of time gives priority of right; and, notwithstanding prior private ownership of the riparian lands, the right of the junior appropriator by diversion and application to beneficial use cannot be interfered with, lessened or prejudiced by the senior owner of such riparian lands, unless such riparian owner can show actual damage to his senior riparian rights.

Kinney on Irrigation & Water Rights, 2d Ed., Vol. 1, Sec. 592, p. 1024; Vol. 2, Sec. 820; Vol. 3, Sec. 1611.

And even where the junior appropriator, by diverting to the full extent of his claim, inflicts a dam-

age upon the senior riparian owner in respect of his riparian right, nevertheless the right of the appropriator to divert and apply to a beneficial use upon non-riparian land may be perfected by prescription.

2 Kinney on Irrigation & Water Rights, 2d Ed., Sec. 1039.

Or, by private contract, and upon sufficient consideration, the senior riparian owner may waive his right to interfere with the junior appropriator. This was the case in San Joaquin Co. vs. Stanislaus County, 233 U. S., 454, for Mr. Justice Holmes says (p. 459):

> "It is not disputed that the plaintiff has a right, as against riparian proprietors, to withdraw the water that it distributes through its canals. Whether the right was paid for, as the plaintiff says, or not, it has been confirmed by prescription, and is now beyond attack."

This is exactly what was done in the case at bar, when the plaintiff Water Company purchased senior power rights, such as that of the Rough and Ready Mill Ditch and that of the Mullen Ditch, so that they might not interfere with its diversion under its junior appropriations.

As to the San Joaquin case, we have carefully examined not only the decisions of the Circuit Court and of the Supreme Court, but also the printed record and the briefs of counsel. It is certain that the water rights there involved were rights acquired by appropriation, diversion and application to a bene-

ficial use upon non-riparian lands far distant from the stream, and that they were not riparian rights nor derived from such rights. Moreover, the appropriations were made for purposes of sale or other like disposition of the water product, and therefore appropriated for public use by the express declaration of the California Constitution, Article XIV, Sec. 1, which reads as follows:

> "The use of all water now appropriated or that may hereafter be appropriated for sale, rental or distribution is hereby declared to be a public use."

5. *The Method of Appropriation Affords No Ground Upon Which Appellants' Contention May Be Based.*

But appellants assert (their brief, pp. 55, *et seq.*) that, at least in respect to the great reservoir known as Lake Cheesman, and the water rights appurtenant thereto, there is something in the notice of appropriation or statement of claim relating to these water rights, or in the decree by which they were finally adjudicated, which demonstrates that they are not the property of the Company, but of the City and the citizens of Denver. In this connection it must be remembered that Lake Cheesman was constructed, and is owned, and title to its water rights held, by The South Platte Canal and Reservoir Company, a separate corporation, whose articles of incorporation declare (Exhibit E, Rec., p. 904) that its objects are, among other things:

> "To construct, maintain, operate and enlarge, purchase, receive, hold, sell, grant

and convey, reservoirs, canals, tunnels, pipe lines, water pipes and water mains, for the purpose of conveying water to be used for irrigating, domestic, sanitary, fire, mining, manufacturing and mechanical purposes, and all rights, privileges and franchises belonging to, or to be acquired by, the same; to appropriate water, water rights, franchises and privileges; to sell and otherwise dispose of water and the right to the use of water for the purposes aforesaid; * * * to furnish and sell water to water-works companies, and to irrigating companies; to sell and supply the City of Denver and additions thereto, and towns and cities in the vicinity thereof, and the inhabitants thereof, and others in the vicinity, and all municipalities, and the inhabitants thereof, and all corporations and individuals along the line of its canals, ditches, pipe lines, water mains and water pipes, with water for the purposes aforesaid."

This company has never had any direct relationship with the City or the citizens of Denver, nor has it ever assumed any obligation or duty to them, contractual or otherwise. It is true that the Water Company owns all of the stock of The South Platte Canal & Reservoir Company, but it did not acquire that stock until 1899 (Rec. p. 162). The Lake Cheesman water right was initiated long before. (Rec. p. 922.) It is also true that the Water Company holds and operates all of the property of the South Platte Com-

pany, including its water rights, under lease, but that lease was not made until 1903 (Rec. p. 163, Exhibit F, not produced here). Its statement of claim and notice of appropriation relating to the water rights of Lake Cheesman referred to and quoted from by appellants (their brief, p. 56) contains other language which is pertinent, besides that quoted by appellants. It is there stated (Rec. p. 926, Exhibit S) that the Company "appropriates and claims the right to store in said reservoir all of the unappropriated and flood waters and waters flowing in the non-irrigation season; * * * and also claims the right to use such stored water for domestic purposes in the City of Denver, and along the lines of its mains and the mains of The Denver Union Water Company, *and for irrigating, sanitary, mining, manufacturing, mechanical, fire, power and storage purposes, and for all other beneficial purposes, and the right to supply and sell such waters for the purposes aforesaid.*" (Italics ours.)

A portion of the priority thus claimed related back to December 28, 1889, and the remainder to October 23, 1893; these being the dates when work upon the project and its enlargement was begun. It is perfectly evident that there is nothing in these facts, or in the language of the statement of claim, which indicates that The South Platte Canal & Reservoir Company, in making said appropriation, did so, or intended to do so, as the agent or representative of the City of Denver or its inhabitants. On the contrary, as was expressly stated, the appropriation was made for the purposes, among other things, of sale or lease of the right to use the water afforded thereby,

and obviously the appropriator did not intend that it should have nothing to sell or lease.

Appellants also refer to the decree by which the priority and extent of the appropriations of Lake Cheesman were judicially determined. Said decree was entered in 1913.

In Colorado such a decree is not essential to the validity of a water right. A water right is perfected, protected and maintained by diversion and continued application to a beneficial use. The decree provided for by the Colorado statute is merely convenient record evidence of the existence of such a right. In that respect it is analogous to a United States patent covering a mining claim. Such patent is not essential to the property right created and maintained by the location and continued assessment work thereon. Under the laws of Colorado, separate proceedings are to be had and separate decrees entered relating to uses for irrigation only, and uses for purposes other than irrigation (Rev. Stats., 1908, Secs. 3276, 3280). The decree to which appellants refer indicates merely that Lake Cheesman's right to divert and store for purposes other than irrigation has already been decreed, but that the entry of a decree covering its equivalent right to divert and store for irrigation purposes has not yet occurred.

Moreover, the decree referred to (Rec. pp. 925, 926) expressly adjudges:

> "That this decree shall not be taken, held or deemed as in any wise limiting or restricting the uses or purposes to which the waters now or hereafter diverted, stored, and

> impounded in said Lake Cheesman may be beneficially applied, or as in any wise having the effect of a waiver of or foreclosing or determining the right of said claimant, and its said lessee and their successors and assigns, and the lawful owners of said Lake Cheesman, to make beneficial application of said waters to any or all of the purposes and uses specified and enumerated in said maps and statements of claim, duly filed, as aforesaid, in the office of the Colorado State Engineer, or as in any wise barring or estopping them from asserting and maintaining such right in any other proceeding or proceedings."

And it further appears from said decree (Rec. p. 922, Fol. 1151) that as early as *January 19, 189½*, (five years before the Water Company acquired any interest therein), The South Platte Canal Reservoir Company filed in the office of the State Engineer of Colorado its map and statement of claim, relating to the Lake Cheesman right claiming the right to divert and appropriate said waters "for irrigating, domestic, sanitary, mining, manufacturing and mechanical purposes, and to supply and sell to irrigating companies and water-works companies for the purposes aforesaid;" and further claiming "the right to use said reservoir for any other purposes for which it may be utilized not inconsistent with the main purposes."

As we have already demonstrated (*supra*, p. 269), the point of diversion, the place of application, *and the character of use*, may all be changed without af-

fecting the vested property right acquired by the original appropriation and diversion.

Strickler vs. Colorado Springs, 16 Colo., 61;

Ironstone Ditch Company vs. Ashenfelter, 57 Colo., 31, 39-40.

In any event, the fact that the supplying of Denver and its inhabitants is mentioned as one of the uses for which the water is to be sold or leased, is of no significance.

In the case of the City Ditch, the act of the legislature of Kansas by which the water right was granted expressly limited the same to the right "to conduct the water so diverted to the cities of Denver, Auraria and Highlands for mechanical, agricultural, mining and city purposes" (56 Colo., 220). But it was expressly held that neither of said communities, nor any of the inhabitants thereof, acquired any proprietary interest in the appropriation by reason thereof.

The grant of this right now vested in the company was not made by the city, but by the state. The offer which the state, by its constitutional and statutory provisions, made to all who chose to accept the same, was availed of by the water company and its predecessors, who, by the necessary due diligence, and the expenditure of time, money and energy, and the accomplishment at the proper time and in the proper manner of all of the things prescribed, acquired by the state's grant this vested property right, which it has always since scrupulously maintained unimpaired. Presumably the city of Denver might have taken advantage of the state's offer and acquired the right for

itself. But it did not do so, either as a municipality or a community of residents. How can it now take away that which it did not give? How can it justly claim that that which the state granted another, and which that other has acquired at tremendous expense of money, time and energy, now belongs to it?

It cannot be doubted that these water rights possess enormous value to the company. They are an indispensable and inseparable portion of its plant. With them it is able to conduct its business, furnish water to consumers and collect reasonable tolls and charges therefor. Without them, its other property would be useless and practically have no value. If the city should condemn and take over this plant, undoubtedly, if its present theory be correct, it would continue to divert water upon, and by reason of, these same vested rights, and exact and receive reasonable tolls and charges from consumers. How can it possibly be true that this vested right is of enormous value immediately before and immediately after the taking, but at the moment of the taking possesses no value for which compensation should be paid?

A question identical in principle was considered by the Supreme Court of the United States in *Monongahela Navigation Co. vs. United States*, 148 U. S., 312, from which we have already hereinbefore made copious quotation. That was a condemnation suit brought by the United States against the Navigation Company to acquire a certain lock and dam which the navigation company had constructed in the Monongahela River. In addition to the ownership of the tangible property, the navigation company had a franchise, granted by the state of Pennsylvania, which

entitled it to take tolls for the use of this lock and dam. The lower court awarded compensation for the taking of the tangible property, but refused to allow compensation for the vested right to take tolls which the state had granted. In the Supreme Court it was argued by the United States that this grant by the state was revocable and of no force and effect as against the United States, because the river was a navigable stream and as such within the jurisdiction of the federal government, and that any grant or other action by the state could be effective only until such time as Congress and the federal government exercised their plenary power. These claims the Supreme Court sternly rejected. The opinion, by Mr. Justice Brewer, at pages 325 and 326 sets forth the governing fundamental principles, in language which we have already quoted. In respect to the claim that no compensation need be paid by the United States for the right which the state had granted, the court says (p. 337):

> "Because Congress has power to take the property, it does not follow that it may destroy the franchise without compensation. Whatever be the true value of that which it takes from the individual owner must be paid to him, before it can be said that just compensation for the property has been made. * * * So, coming to the case before us, while the power of Congress to take this property is unquestionable, yet the power to take is subject to the constitutional limitation of just compensation. * * *

And here it may be noticed that, after taking this property, the government will have the right to exact the same tolls the Navigation Company has been receiving. It would seem strange that if by asserting its right to take the property, the government could strip it largely of its value, destroying all that value which comes from the receipt of tolls, and, having taken the property at this reduced valuation, immediately possess and enjoy all the profits from the collection of the same tolls. In other words, by the contention this element of value exists before and after the taking, and disappears only during the very moment and process of taking. Surely, reasoning which leads to such a result must have some vice, at least the vice of injustice. * * *

(341) The theory of the government seems to be, that the right of the Navigation Company to have its property in the river, and the franchises given by the State to take tolls for the use thereof, are conditional only, and that whenever the government, in the exercise of its supreme power, assumes control of the river, it destroys both the right of the company to have its property there, and the franchise to take tolls. But this is a misconception. The franchise is a vested right. The State has power to grant it. It may retake it, as it may take other private property, for public uses, upon the payment of just compensation. A like, though a supe-

> rior, power exists in the national government. It may take it for public purposes, and take it even against the will of the State; but it can no more take the franchise which the State has given than it can any private property belonging to an individual."

And the court concludes its opinion (p. 344) as follows:

> "Our conclusions are, that the Navigation Company rightfully placed this lock and dam in the Monongahela River; that, with the ownership of the tangible property, legally held in that place, it has a franchise to receive tolls for its use; that *such franchise was as much a vested right of property as the ownership of the tangible property;* that the right of the national government, under its grant of power to regulate commerce, to condemn and appropriate this lock and dam belonging to the Navigation Company, is subject to the limitations imposed by the Fifth Amendment, that private property shall not be taken for public uses without just compensation; that just compensation requires payment for the franchise to take tolls, as well as for the value of the tangible property; and that the assertion by Congress of its purpose to take the property does not destroy the state franchise."

Mutatis mutandis, that case and the one at bar stand upon the same bottom. They are governed by the same principles.

In *Gardner Water Co. vs. Inhabitants of Gardner*, 185 Mass., 190, is found a case wherein the same principle is applied by the Supreme Court of Massachusetts to facts which cannot be distinguished from those in the case at bar. By a proceeding analogous to condemnation the town of Gardner had undertaken to acquire the water works system of the company. Pursuant to the statute of Massachusetts, commissioners were appointed who valued the property. One of the commissioners was Mr. Nathan Mathews, Jr., a distinguished lawyer of Boston. We have had access to the report of the commissioners, from which it appears that the total value allowed was $274,000, made up as follows: Total for physical plant, $183,000, included in which was an allowance for "Additional value of plant as a connected going concern, $18,000;" to the total of the physical value of the plant was added, for water rights, $90,000, and for street franchises $1,000. We direct attention particularly to the amount of this allowance for water rights and its relation to the total value of the plant, in view of the manifest difference which exists in respect to the quantity of available water between conditions prevailing in the Commonwealth of Massachusetts and those prevailing in Colorado. The water right so valued consisted in a right, conferred by special act of the legislature of Massachusetts upon the Gardner Water Company, to insert an intake pipe into a great pond, known as Crystal Lake, and to divert and convey the water therefrom into the town of Gardner "for the purpose of furnishing the inhabitants of Gardner with water for the extinguishment of fires and for domestic and other purposes." By the instrument of appro-

priation the company expressly declared that the appropriation was made "for the purpose of supplying the inhabitants of Gardner with pure water" (185 Mass., 191).

Against the inclusion in the award of the value assigned by the commissioners to water rights the town protested vigorously. Its contentions have a familiar ring. They are thus set forth in the reported case (185 Mass., 193):

> "That the sole source from which the company obtained water to supply the town of Gardner was a source that was *publici juris;* that the title which the State had in this lake and its waters was held in trust by the State for the public; that the public owned or was entitled to the entire beneficial use of the waters of the lake; that the power of the State was limited to regulating the public uses to which the lake might be put and in deciding between two inconsistent uses; that the provisions of St. 1882, c. 145, so far as these provisions have reference to Crystal Lake, did not operate to confer upon the company, (a) any proprietary rights whatsoever, (b) any rights in or to the lake or the waters thereof for which it was entitled to receive any sum of money whatever; that a grant by the State of rights in or to the lake or the waters thereof which entitled the company to a valuation on the basis set forth in the report would deprive the public of that beneficial use to which it is entitled; that the grant or authority contained

in St. 1882, c. 145, was conferred with an implied reservation of the public right, and that such implied reservation is inconsistent with any right on the part of the company to have the lake or its waters or any rights therein valued as a part of the corporate property or as one of its rights and privileges; that said ch. 145 was in effect a regulation and determination as to different and inconsistent rights and uses to which the company was entitled; that the provisions of said ch. 145 conferred upon the company (a) merely a loan of the waters, (b) a permission to perform the service of delivering the water to a part of the public entitled to it which the Legislature did not intend should be included in the valuation in case the town voted to purchase as authorized by sect. 9 of said ch. 145; that the rights, if any, in and to the waters of Crystal Lake, of whatsoever nature, passed to the town under the vote taken April 26, 1902, as provided in said sect. 9; that the said rights were and are public rights for which nothing can be recovered in money by the company from the town,' etc."

But the court, in no uncertain terms, rejected all of these contentions, saying (p. 194):

"The respondent in its argument relies chiefly upon the fact that the water rights granted are to use the waters of a great pond. It is true that such ponds are held by the Commonwealth for the benefit of the public,

and it is not to be presumed that the Legislature would attempt to make any disposition of their waters inconsistent with the interests of the public. In this case we have no nice question as to the power of the Legislature to grant such property to an individual solely for a private use, for the grant to the petitioner was for an important public use. Of the power of the Legislature to give to a private corporation, as well as to a city or town, water rights in a great pond, to be used in supplying inhabitants with water, there can be no doubt. This power has been exercised many times in Massachusetts. The rights and privileges of this corporation in the water, under the charter, are similar to the rights of a railroad company in the land taken for its roadbed. Such land can be taken and held only for a public use; but the corporation has a valuable right of property in it. *While the primary object in taking and holding it is the public benefit, which alone justifies a taking without the consent of the owner, an incidental object is the hope of profit to be derived by the corporation from the use of it. In this respect the title of the present petitioner in the use of the water does not differ materially from the title to the roadbed of a railroad acquired under the right of eminent domain.* The act of the Legislature in granting these water rights is simply a regulation of the public rights in a great pond. It makes subordinate all other public rights which

are inconsistent with the exercise of this one. West Roxbury v. Stoddard, 7 Allen, 158. Rockport v. Webster, 174 Mass. 385. Watuppa Reservoir Co. v. Fall River, 147 Mass. 548. Fay v. Salem & Danvers Aqueduct Co., 111 Mass. 27. Attorney General v. Revere Copper Co., 152 Mass. 444. It allows the corporation to hold and exercise these rights as a trustee for the public, and at the same time permits it to obtain income in its private capacity from the sale of the water. It makes no difference that there was no private ownership in the waters of the pond before the enactment of the statute. Land which is taken for a railroad under the right of eminent domain is not acquired and held by virtue of a transfer of the title of the former owner as private property, but by virtue of the public interest which it is taken to subserve. The valuable private interest which the railroad company afterwards has in it is incidental to the public use, but it is none the less a right of property, secured by the franchise." (Italics ours.)

It is worthy of note that in *Newburyport Water Co. vs. City of Newburyport*, 168 Mass., 541, and in *Gloucester Water Supply Co. vs. Gloucester*, 179 Mass., 365, both of which were participated in by Mr. Justice Holmes, then a member of the Supreme Court of Massachusetts, substantial awards for water rights of like character had been made. Doubtless Mr. Justice Holmes had these cases in mind when later, as a Justice of the Supreme Court of the

United States, he was called upon to decide a similar question which had arisen in a rating case.

These water rights were no more acquired in the interest or for the benefit of the community or the public, to whose use they have been devoted, than was the right of way of the Pacific railroads. This right of way, as is well known, was granted, without cost, by Act of Congress for the express and declared purpose that it be used for the benefit and accommodation of those served by the railroads. Nevertheless, it has been conclusively determined that such right of way is the property of the railroads to which it was granted, and must be included in the valuation of its entire property when rate regulation is in question.

Ames vs. Union Pacific, 64 Fed., 165, 176.
Smyth vs. Ames, 169 U. S., 466, 546.

The same thing has been held not only of the right of way granted by special Act of Congress to the Pacific railroads, but also of the right of way granted under the General Act of 1875, wherein the definition of the purpose of the grant is equally specific.

Shepard vs. Northern Pacific, 184 Fed., 803.
Minnesota Rate Cases, 230 U. S., 454.

In the Consolidated Gas case there was involved the right to lay, maintain and operate in the streets of the City of New York the necessary pipes for the distribution of gas. These had been granted by the city or the state, without cost, expressly for the bene-

fit of the consumers of gas in said city, and for no other purpose. Notwithstanding this, it was held both by the lower court (157 Fed., 875) and by this court that they must be valued and their value included in the rating base.

Wilcox vs. Consolidated Gas Co., 212 U. S., 43, 44, 52.

We submit that appellants' contentions based upon the language of the statement of claim or notice of appropriation, or the provisions of the decree, or upon the fact that the appropriator intended when he made the appropriation to utilize the same, in whole or in part, for the purpose of supplying Denver and its inhabitants with water, are totally without merit.

6. *The Evidence Before the Master Justified, If It Did Not Require, a Much Higher Valuation for the Water Rights Than That Which He Allowed.*

As we have already pointed out, the former board of appraisers valued these water rights, as of January 1, 1908, at $2,845,925 (Rec., p. 28). Between that date and the date to which the Master's valuation related, there had unquestionably been an increase in the market value of water rights, amounting to at least twenty-five per cent, and the water rights in question had been improved and enlarged (Rec., pp. 199, fol. 287; 213, fol. 303; 510, fol. 653). Taking these facts into consideration, Metcalf and Anderson, as of October 31, 1913, valued these rights at $3,530,000 (Exhibit C, p. 64). The Master, as of May 1, 1914, valued them at $2,947,617 (Rec., p. 122, Table 1, Column 4; Rec., p. 130, Finding 27).

We submit that in so reducing the value of the water rights, the Master was more than just to appellants; indeed, his conclusion in this regard, beyond question, did an injustice to appellee.

As the Master expressly states (Rec., p. 129, Findings 25 and 26), the value which he found was measured and limited by the market value of similar rights for *irrigation purposes;* but these rights were not being used for irrigation purposes, though available and valuable for that purpose. They had through a period of more than forty years been assembled, perfected and maintained as a source of supply for the water works system serving Denver and its inhabitants. They were of such character and so located as to be peculiarly available and especially well adapted for that purpose. That they possessed a higher value for the purpose for which they were being used than for irrigation purposes does not admit of doubt. All of the witnesses so testified, those for defendants as well as those for plaintiff (Rec., pp. 304, fol. 10; 307 and 308, fol. 414; 328 and 329, fol. 439; p. 362; p. 513, fol. 658; pp. 656, 657, fol. 827).

These water rights are real estate.

Davis vs. Randall, 44 Colo., 488, 492.

Therefore the determination of their value for purposes of condemnation or rating is governed by the same rules applicable to land. Those rules require that where the property in question has peculiar and special adaptability and availability for any particular use, and for that reason possesses greater value than the current market price for similar property of like kind, but not possessing such special at-

tributes, the additional value must be added and included in the valuation, or the constitution is violated.

Minnesota Rate Cases, 230 U. S., 352, 451.

Boom Co. vs. Patterson, 98 U. S., 403, 405, 407, 409.

Shoemaker vs. United States, 147 U. S., 282.

Monongahela Navigation Co. vs. United States, 148 U. S., 312, 344.

United States vs. Chandler-Dunbar Co., 229 U. S., 53, 76.

Nevertheless the Master ignored this added value, which admittedly existed, and valued upon the basis of current market price of similar rights for irrigation purposes only. But the Master's valuation, even upon the basis adopted, was unduly low.

Lake Cheesman is the enormous storage reservoir operated by the Company and located in the mountains about fifty miles from Denver. It was formed by the construction of a masonry dam across the stream-bed of the south fork of the South Platte river. This masonry dam is 221 feet in height, and at the time of its construction was, if it is not now, the largest structure of its type in this country. Photographs thereof are shown in Exhibit C following page 124. The reservoir thereby created has a surface area of 874.08 acres, and a capacity of 25,761,407,322 gallons of water (Exhibit C, p. 17). The water right appurtenant thereto is extremely valuable. It was valued by the Master for irrigation purposes at $1,611,117. It undoubtedly possesses a

much higher value as a source of city supply, the purpose for which it is now being used, and to which it is especially well adapted and available

In order to determine the value of the Lake Cheesman water right for irrigation purposes, its "safe yield" for such a purpose was reduced to "acre-feet." By "safe yield" is meant the quantity of water for irrigation purposes which could each year be with reasonable safety relied upon from this source of supply. By "acre-feet" is meant the quantity of water necessary to cover one acre of land to the depth of one foot. The determinations by plaintiff's witnesses of "safe yield," or, as it was otherwise called, "average available storage," were, as the Master found (p. 131, Finding 29), based on records of stream-flow through available data and actual observation covering a period of fourteen years. The Master states that Mr. Anderson, a witness for the plaintiff, found such average available storage to be "about 55,339 acre-feet." As a matter of fact he found it to be 57,016 acre-feet, as is shown by Exhibit A-31, Rec., p. 970. The Master also stated that Mr. Bull, a witness for defendants, found the average available storage to be 51,700 acre-feet. It appears that the Master took the average of these, for he found 54,000 acre-feet to be a reasonable estimate of the water storable in and available for delivery annually by the Cheesman reservoir. An acre-foot is equivalent to 43,560 cubic feet, or 325,855 gallons of water. The Master's finding is, therefore, equivalent to the determination that Lake Cheesman will yield each year 17,596,170,000 gallons of water. Mr. Anderson's determination was fully sustained by the

testimony of other experienced and well-qualified witnesses, who made most thorough investigations. If Mr. Anderson's determination had been accepted by the Master, instead of the mean between his and that of Mr. Bull, obviously the value allowed for the Lake Cheesman water right would have been much greater.

The Master applied (Rec., p. 130, Fol. 199) a unit price of $55 per acre-foot in determining the value of these rights. The evidence was exceedingly strong that the value of these rights, per acre-foot, measured by the current market value for irrigation purposes of similar rights, was not less than $60 per acre-foot; the testimony of many witnesses went as high as $75 (Rec., pp. 309, 245, 328, 339, 342, 344, 356, 361). These were the statements of experienced and well-informed men, who based their conclusions upon the current market prices paid for similar rights for irrigation purposes. No witness for plaintiff testified to a lower market price than $60 per acre-foot. Obviously, if the Master had applied the unit value of $60 per acre-foot, instead of $55, to the yield of Lake Cheesman, as determined by him, it would have meant an additional value for that water right of $270,000. If he had applied a larger unit price, as the evidence fully justified, and, as we think, required him to do, the resultant value would, of course, have been proportionately greater; or if he had applied the unit price determined by himself ($55 per acre-foot) to the yield as determined by Mr. Anderson, the resultant increase in the valuation would have been approximately $165,000; or if he had applied the unit price of $60 to the yield as determined by Mr. Anderson, the resultant increase would have

been such as to make the net value of the Lake Cheesman water right $2,000,000, as claimed by plaintiff (Exhibit C, p. 117).

Without going into details, the same thing is true as to Group 1 of the water rights valued by the Master at $949,500, and for which plaintiff claimed $1,150,000. The Master reduced the yield, as determined by plaintiff's witnesses and established by convincing evidence, and to the reduced quantity thus found applied the unit price of $55 per acre-foot, in spite of the strong evidence referred to above which, as we think, conclusively demonstrated a minimum current market price of $60 per acre-foot.

We submit that even the value for irrigation purposes as determined by the Master was unduly low.

But, in reality, that is not the value which these rights possess for the use to which they are now devoted. It is very much less than their present actual value for the present higher use. It is analogous to the junk or wreckage value of the company's structures. No one could properly claim that the value which ought to be assigned in this case to the Water Company's pipes and other apparatus should be the wreckage or junk value which the company could obtain therefor after it had retired from or been forced out of the water-works business.

But the Master did not take into his determination of present fair value even the entire value of the water rights for irrigation purposes as thus ascertained. After determining the market value of the water rights for irrigation purposes only, the Master deducted therefrom the reproduction cost of the

water-works structures by which these rights are developed and made useful (Rec., p. 131). The evidence shows without dispute that these water-works structures are much more elaborate and expensive than those which would be employed in the development of like water rights to a similar efficiency for irrigation purposes; even the defendants' witnesses so testified (Rec., pp. 513, 514). It follows that if any such deduction should be made at all, too large a deduction has been made here.

But we submit that in all fairness no such deductions should be made. As a matter of fact, the market price for water rights for irrigation purposes represents simply the cost of an important and indispensable part of the raw material which anyone reproducing this plant must purchase and pay for. It is analogous in every sense to the price which would have to be paid for the pipe to be put into the distribution system. When the pipe is bought, the necessary expenditures have only begun. Much more labor and much additional cost is involved in making it a part of the water-works system.

The same thing is true of irrigation water rights after they are purchased at irrigation prices. To make them available and useful for water-works purposes, much additional expenditure is necessary.

One who undertakes to reproduce this plant could not acquire the necessary water rights by original appropriation. He would be obliged to go into the market and purchase at the current market price rights already devoted to irrigation purposes. This is so, for, as all admit, the waters of the streams are overappropriated for the numerous beneficial uses to which they are applied, and it is impossible at

this date to acquire any such rights as are here needed by original appropriation. If he purchases the entire or a substantial part of the yield of an irrigation system, he must necessarily pay not only for the water rights, but also for the structures by which they are developed and made useful. Moreover, since the rights prior to his purchase are used for the irrigation of lands lying under the ditches, he must pay the damages which those lands would suffer by being deprived of their supply. This would be equivalent to practically their entire worth as irrigated lands, for without the supply of water the land would be of little value.

Not only this, but, having made his initial investment, he must incur the additional expense, suffer the long delay and risk the hazard incident to the legal proceeding for changing the point of diversion and character of use. Not only this, but rights adequate and available for city uses must be those furnishing a constant and sufficient supply at all seasons of the year. He must therefore purchase rights of this character, which are the most costly of all, or else he must undertake to convert irrigation rights, applicable only to the irrigation season, into such as would entitle him to make a continuous, uninterrupted diversion throughout the year. This would require enormous additional expenditure. But after the reproducer of this plant had done all of these things, and had, by the expenditure of the necessary time, money and effort, rendered his water rights so acquired available for use for supplying the City and County of Denver and its inhabitants, and therefore equivalent in character, adaptability and availability to those now owned by the Water Works Company,

he would have to build the necessary water-works structures. All of these things are clearly demonstrated by the testimony of plaintiff's witnesses (Rec., pp. 304, 328) and frankly conceded by defendants' witnesses (Rec., pp. 611, 612).

If, as the courts have repeatedly held, reproduction cost is a fair measure of present value; if the value of a thing which is worth having is at all indicated by what it would cost to get it, then we respectfully submit that the procedure outlined above will serve to give the court a fair idea of the present value of the water rights of the appellee company, for the uses and purposes to which they are now devoted, and for which they have peculiar availability, adaptability and fitness. We therefore respectfully submit that, instead of deducting the reproduction cost of the water-works structures from the value of the water rights arrived at, on the basis of the ruling market prices for irrigation purposes, there should in fact be added to the irrigation value so ascertained not only the cost of the water-works structures, but also all of the additional costs mentioned above, including the interest upon the necessary investment during the period of time necessary to assemble such rights and make them available for water-works purposes.

It is true that Metcalf and Anderson, in arriving at the valuation of water rights ($3,530,000) stated in Exhibit C at page 64, deducted from gross irrigation value, as determined by them, the reproduction cost of the water works structures; but the fact that they did so, merely indicates the extreme conservatism and care which pervaded their entire valuation. The Master followed the same course, but

he did so after determining a much less gross irrigation value than had been ascertained by Metcalf and Anderson. From what has been said, it must be evident that the value of water rights, as found by the Master and included in his determination of present fair value, might be greatly increased—it is not too much to say that it might be doubled—without exceeding the actual present value of the water rights here involved.

We respectfully submit that the propriety of the allowance therefor claimed by plaintiff, and stated in Exhibit C at page 64, was conclusively demonstrated by the evidence, that it was the least value which should have been assigned thereto, and that the Master in deducting therefrom approximately $600,000 committed an error.

The matters hereinbefore discussed are covered by appellee's exceptions to the Master's report (Rec., pp. 1126 to 1128; Exceptions XIX to XXVII), and by its assignment of errors (Rec., pp. 1172, 1173; Assignments 19 to 27). They are made the basis of the cross-appeal, the purposes of which have been hereinbefore explained. (*Supra*, pp. 34, *et seq.*)

VII.

GOING VALUE. THE STATUS OF BEING A GOING CONCERN IS INHERENT IN THIS PLANT AND IS, LIKE THE REST OF THE PLANT, THE PROPERTY OF APPELLEE, AND DEVOTED TO THE PUBLIC USE. ITS PRESENT FAIR VALUE CANNOT BE EXCLUDED FROM THE RATING BASE. THE MASTER'S VALUATION THEREOF WAS EXTREMELY MODERATE AND IS NOT OPEN TO QUESTION BY APPELLANTS.

The Master found (Finding 46, Rec., p. 136, *et seq.*) that there was inherent in this plant the status of being a going concern, that this was a property right of great value, and that it, like the physical elements, was owned by the proprietor of the plant. He also expressly found that, after having valued lands, water rights and personal property according to the present normal market value of similar lands, water rights and personalty, and after having added to such values the actual present-day cost of reproducing the physical structures only, less the actual accrued depreciation therein, he had failed to appraise or to include in the figure arrived at, as aforesaid, anything whatsoever on account of the value of this important item of property.

Accordingly, he valued it at $800,000 and included that sum in his total present fair value of the plant. This property right had been valued by the joint board of appraisers as of January 1, 1908, at $1,100,000 (Rec. p. 28 (c), 196, 211, 229). It was valued by Metcalf and Anderson, as of October 31,

1913, at $1,200,000 (Exhibit C, p. 64). The amount last mentioned measured the plaintiff's claim on this account.

The Master's finding mentioned above is the subject of three exceptions and three assignments of error on the part of the appellants. Exception 17th Rec. p. 1136) and Assignment XVIII (Rec. p. 1154) assert that the allowance should not have been made because the Master had "previously fully allowed the item of Interest During Construction and Engineering and Contingencies," and therefore had valued the property "as an established and assembled plant doing business and earning money." This latter assertion was made notwithstanding the fact that the Master expressly found and declared that he had done nothing of the sort.

Exception 18th (Rec. p. 1136) and Assignment XIX (p. 1154) again assert that the allowances for Engineering and Contingencies and Interest During Construction included and covered going value, although the Master had expressly found and declared that, as figured and allowed by him, they did not at all cover, include or relate to that item of property or element of value.

Exception 19th (p. 1136) and Assignment XX (p. 1154) assert that no allowance for going value should have been made because, as alleged, the Company was without a definite franchise.

It will thus be seen that no contention is open to appellants relative to the *amount* of this value as found by the Master. Appellants' contentions are confined to the *principle* which should govern its inclusion, and are coupled with the tacit admission that,

if it should be included at all, the value assigned thereto and included by the Master was not excessive.

As to the *principle* which should govern its inclusion, appellants do not question the proposition that it was rightfully included at the value found by the Master, unless (a) it had already been included in the allowances for Engineering and Contingencies and Interest During Construction (although the Master expressly found and declared that it had not), or unless (b) the fact, if it be a fact, that the Company is without a definite franchise forbids its inclusion at any value.

That the status of being a going concern exists and is inherent in such a water-works plant as this, that it possesses great value, and that it is the property of the owner of the plant, of which he may not be deprived except by due process of law and upon the payment of just compensation, has been conclusively determined.

> Omaha vs. Omaha Water Co., 218 U. S., 180, 191, 202;
>
> National Water-Works Co. vs. Kansas City (C. C. A. 8th Cir.), 62 Fed., 853, 864.

In the case last cited the opinion was by Mr. Justice Brewer, and his reasoning and conclusions were expressly approved and adopted by this court in the case first above cited.

That the status of being a going concern must be valued and the full value thereof included and given due consideration where the question concerns the

validity of rate regulation, has also been conclusively determined.

> Des Moines Gas Co. vs. City of Des Moines, 238 U. S., 153, 165.

1. *Appellants' Contention That, on Principle, This Element of Value Should Not Be Included Is Without Merit.*

The nature of this property right has never been better defined, its great value more clearly stated, nor the necessity of the inclusion of such value more strongly emphasized, than in Omaha vs. Omaha Water Co., 218 U. S., 180, cited, *supra*. That was a case of municipal purchase, analogous to a proceeding in condemnation.

The purchase was to be effected under the provisions of the ordinance pursuant to which the waterworks had been constructed and were operated, and which provided (p. 191) that "nothing shall be paid for the unexpired franchise of said company." The total valuation allowed was $6,263,295.49. Of this (p. 202) $562,712.45, or about ten per cent. of the value of the other elements, was allowed for the going value. The city objected to the allowance of this item. This court affirmed the propriety of its inclusion, saying:

> "The option to purchase excluded any value on account of unexpired franchise; but it did not limit the value to the bare bones of the plant, its physical properties, such as its lands, its machinery, its water pipes or settling reservoirs, nor to what it would take to

reproduce each of its physical features. *The value in equity and justice must include whatever is contributed by the fact of the connection of the items making a complete and operating plant. The difference between a dead plant and a live one is a real value, and is independent of any franchise to go on, or any mere good will as between such a plant and its customers.* That kind of good will, as suggested in Willcox v. Consolidated Gas Co., 212 U. S., 19, is of little or no commercial value when the business is, as here, a natural monopoly, with which the customer must deal, whether he will or not. *That there is a difference between even the cost of duplication, less depreciation, of the elements making up the water company plant, and the commercial value of the business as a going concern, is evident.* Such an allowance was upheld in National Water-works v. Kansas City, 62 Fed. Rep., 853, where the opinion was by Mr. Justice Brewer. We can add nothing to the reasoning of the learned Justice, and shall not try to. That case has been approved and followed in Gloucester Water Co. v. Gloucester, 179 Massachusetts, 365, and Norwich Gas Co. v. City of Norwich, 76 Connecticut, 565. No such question was considered in either Knoxville v. Knoxville Water Co., 212 U. S., 1, or in Willcox v. Consolidated Gas Co., 212 U. S., 19. Both cases were rate cases, and did not concern the ascertainment of value under contracts of sale." (Italics ours.)

National Waterworks Co. vs. Kansas City, 62 Fed., 853, was referred to by the Supreme Court in the foregoing case, and the reasoning of Mr. Justice Brewer expressly adopted. It has, therefore, the force and effect of an opinion of the Supreme Court itself.

The works had been built and operated under an ordinance and contract limiting the right to continue their operation to a period of twenty years, (which had expired), and expressly providing that at the expiration of said period the city should purchase the works at their then "fair and equitable value." It is important to observe that the words quoted from this ordinance and contract are exactly the same as those repeatedly used by the Supreme Court of the United States to describe the value upon which a utility is entitled to earn a fair return. The city asserted (p. 863) that at the expiration of the twenty-year period some important elements of the property had automatically passed to the city, or at least had ceased to exist. But this contention Mr. Justice Brewer negatived and sternly rebuked. Upon the subject of valuation the learned Justice said (p. 864):

> "The difficult question, however, still remains; and that is, what is 'the fair and equitable value' which, by the statute and the ordinance, the city is to pay for the waterworks? This amount was found by the circuit court to be $2,714,000. The company insists that the test is to take the income or earnings, and capitalize them. The earnings pay 6 per cent. on four millions and a half. In other words, the company has produced a property which earns 6 per cent. on four mil-

lions and a half; and that, it is claimed, is the fair valuation of the property, 6 per cent. being ordinary interest. On the other hand, the city insists that the franchise has ceased, and that basing the value upon earnings is in effect valuing a franchise which no longer exists, and which the city is not to pay for; that the true way is to take the value of the pipe, the machinery, and real estate, put together into a water-works system, as a complete structure, irrespective of any franchise, —irrespective of anything which the property earns, or may earn in the future. We are not satisfied that either method, by itself, will show that which, under all the circumstances, can be adjudged 'the fair and equitable value.' Capitalization of the earnings will not, because that implies a continuance of earnings, and a continuance of earnings rests upon a franchise to operate the water-works. The original cost of the construction cannot control, for 'original cost' and 'present value' are not equivalent terms. *Nor would the mere cost of reproducing the water-works plant be a fair test, because that does not take into account the value which flows from the established connections between the pipes and the buildings of the city.* It is obvious that the mere cost of purchasing the land, constructing the buildings, putting in the machinery, and laying the pipes in the streets —in other words, the cost of reproduction— does not give the value of the property as it

is today. A completed system of water-works, such as the Company has, without a single connection between the pipes in the streets and the buildings of the city, would be a property of much less value than that system connected, as it is, with so many buildings, and earning, in consequence thereof, the money which it does earn. *The fact that it is a system in operation, not only with a capacity to supply the city, but actually supplying many buildings in the city,—not only with a capacity to earn, but actually earning, —makes it true that 'the fair and equitable value' is something in excess of the cost of reproduction.* The fact that the company does not own the connections between the pipes in the streets and the buildings—such connections being the property of the individual property owners—does not militate against the proposition last stated, for who would care to buy, or at least give a large price for, a water-works system without a single connection between the pipes in the streets and the buildings adjacent. Such a system would be a dead structure, rather than a living and going business. The additional value created by the fact of many connections with buildings, with actual supply and actual earnings, is not represented by the mere cost of making such connections. Such connections are not compulsory, but depend upon the will of the property owners, and are secured only by efforts on the part of the

owners of the water-works, and inducements held out therefor. *The city, by this purchase, steps into possession of a water-works plant, —not merely a completed system for bringing water to the city and distributing it through pipes placed in the streets, but a system already earning a large income by virtue of having secured connections between the pipes in the streets and a multitude of private buildings. It steps into possession of a property which not only has the ability to earn, but is in fact earning. It should pay therefor not merely the value of a system which might be made to earn, but that of a system which does earn.*" (Italics ours.)

Gloucester Water Co. vs. Gloucester, 179 Mass., 365 (cited by this court in the Omaha case) was a purchase case under a statute of Massachusetts, and equivalent to condemnation. This statute provided (p. 381) that upon such purchase the city should pay the company the "fair value" of the plant, and "such value shall be estimated without enhancement on account of future earning capacity or future good will, or on account of the franchise of said Company." The commissioners (p. 372)—one of whom was Mr. John R. Freeman, a witness for plaintiff in the case at bar—allowed for the entire property the sum of $600,000, of which $75,000 was allowed on account of going value. This was objected to by the city. On this subject the court says (p. 382):

"The only doubt as to the propriety of the allowance of a sum in addition to the cost

of duplication, less depreciation, of the water company's plant is whether the principles on which the commissioners proceeded were sufficiently favorable to the water company.

It is plain that the real, commercial, market value of the property of the water company is, or may be, in fact, greater than 'the cost of duplication, less depreciation, of the different features of the physical plant.' Take, for example, a manufacturing plant: Suppose a manufacturing plant has been established for some ten years and is doing a good business and is sold as a going concern; it will sell for more on the market than a similar plant reproduced physically would sell for immediately on its completion, before it had acquired any business. National Water Works Co. v. Kansas City, 62 Fed. Rep., 853.

We think it is plain that there is nothing in the provisions of sec. 16 of the act in question, St. 1895, c. 451, forbidding the commissioners considering this element of value which, as we have seen, in fact exists. The provisions of the act are that the 'fair value * * * shall be estimated without enhancement on account of future earning capacity, or future good will, or on account of the franchise of said company.' Whether that would allow present earning capacity and present good will, apart from the franchise, to be taken into account, as distinguished from future earning capacity and

future good will, need not be considered. It is plain that the element of value, which comes from the fact that the property is sold as a going concern, in which case it has, or may have, in fact, a greater market value than the same property reproduced in its physical features, is not excluded from consideration by that provision of the statute.

It is also plain that the commissioners, in allowing the $75,000 allowed by them in addition to the cost of duplication, less depreciation, of the plant in its physical features, did not go beyond this. They state that in their opinion 'the cost of duplication, less depreciation, of the different features of the physical plant, * * * does not represent a fair valuation of this plant, welded together, not only fit and prepared to do business, but having brought that business into such a condition that there is an enhanced value created thereby, so that the city in purchasing it, without considering its income or right to do business, but having the power to carry it on on its own account, should pay more for the property as such than as if this consideration did not obtain. This is a value that we have found to be seventy-five thousand dollars ($75,000) that has been imported into the plant, which seems to us as much a part of the property valuation as any other part of it.' "

The allowance for going value was about fourteen per cent. of the total value of the other elements

of the plant. It is interesting to note that at the time of this decision, Mr. Justice Holmes was a member of the court and apparently concurred therein.

Newburyport Water Co. vs. City of Newburyport, 168 Mass., 541, was a purchase case under a statute of Massachusetts similar to that involved in the Gloucester case, and therefore in the nature of a condemnation proceeding. In this case also one of the commissioners appointed by the court was Mr. John R. Freeman, a witness in the case at bar. The statute under which the proceeding was had provided that the City should purchase the property at its "fair value," and that "such value shall be estimated without enhancement on account of future earning capacity or good will, or on account of the franchise of said company." The total fair value found by the commissioners was $275,000. Of this $40,000, or about 17% of the valuation placed upon the other elements of the plant, was allowed for going value. The matter is thus stated in the commissioners' report (p. 545):

> "We further find that the plant was a going concern and in full operation at the time of the transfer,—one that had been tested by experience and with which the city could begin the immediate prosecution of the business of supplying water to the established connections for domestic and municipal purposes (including in the latter hydrant service),—and upon examination of these facts are of opinion that the property had a greater value for the purposes of its use by the city by reason thereof, than if the

> plant had not been in full operation, and that this should be considered in passing upon the value of the entire plant. This enhancement we have fixed upon as adding to the value of the property the sum of $40,000. In passing upon the same, we have not made the income derived from the business its element or basis, or any other factor than that above stated."

This valuation was objected to by the city, but upheld by the court, the opinion being by Mr. Justice Holmes, then a member of the Massachusetts Supreme Court. The court said (p. 555):

> "The commissioners state the elements of valuation which they have taken into account. In addition to the value of the tangible property and easements, they have allowed forty thousand dollars for the fact that the plant was a going concern and in full operation. They have allowed for everything for which the petitioner was entitled to be paid. They have approached the question in a manner in which it was within their discretion to approach it. National Water Works Co. v. Kansas City, 62 Fed., 853."

In the following, among other purchase cases, going value was included, the percentage thereof to the value of the remaining elements being in each instance given where ascertainable:

> Norwich Gas & Electric Co. vs. City of Norwich, 76 Conn., 565; 57 Atl., 746, 750, 751, (11½%).

Galena Water Co. vs. City of Galena, 74 Kas., 644; 87 Pac., 735, 736 (25%).

Kennebec Water District vs. City of Waterville, 97 Maine, 185; 54 Atl., 6.

Brunswick Water District vs. Maine Water Co., 99 Maine, 371; 59 Atl., 537.

Long Branch vs. Tintern Manor Water Co., 70 N. J. Eq., 71; 62 Atl., 474, 478.

Appleton Waterworks Co. vs. Railroad Com. of Wisconsin, 154 Wis., 121; 142 N. W., 476.

It admits of no doubt that this property right and element of value exists. It cannot be better defined than was done by this court in the Omaha case and by Mr. Justice Brewer in the Kansas City case. The Master found that it existed and was inherent in this plant, and valued it at $800,000.

But appellants say (their brief, p. 64) that "the holdings have been almost uniform that 'going concern' is an element that should not be considered in determining the value of property for rate making purposes." This is a contention not open to appellants, because not raised by any of their exceptions or assignments of error. But in any event the contention is without merit.

In Des Moines Gas Co. vs. City of Des Moines, 238 U. S., 153, at 165, the court said:

> "'Going value' or 'going concern value' i. e., the value which inheres in a plant where its business is established, as distinguished from one which has yet to establish its busi-

> ness, has been the subject of much discussion in rate making cases before the courts and commissions. * * * That there is an element of value in an assembled and established plant doing business and earning money, over one not thus advanced, is self-evident. This element of value is a property right and should be considered in determining the value of the property upon which the owner has a right to make a fair return when the same is privately owned, although dedicated to public use."

The foregoing declaration is, of course, conclusive; but it is interesting to note that the principle thus declared had previously been consistently adhered to in an unruffled current of judicial authority. Below are listed some of these cases, all relating to the regulation of rates. In connection with each citation is given, where ascertainable, the amount allowed for going value measured by its relation, in percentage, to the value allowed for other elements of the plant:

> Pioneer Telephone Co. vs. Westenhaver, 29 Okla., 429; 118 Pac., 354, 359, 360. (20 per cent.)
>
> Public Service Gas Co. vs. The Board of Public Utility Commissioners, 84 N. J. Law, 463; 87 Atl., 651, 657. (30 per cent.)
>
> Public Service Gas Co. vs. Board of Public Utility Commissioners, 87 N. J. Law, 581; 92 Atl., 606 (affirming the decision last cited).

People vs. Willcox, 141 N. Y. Supp., 677, 681. (30 per cent.)

People vs. Willcox, 210 N. Y., 479; 104 N. E., 911 (affirming the decision last cited).

M. K. & T. vs. Love, 177 Fed., 493, 496.

Love vs. A. T. & S. F. Ry. Co. (C. C. A., 8th Cir.), 185 Fed., 321 (affirming the decision last cited).

Metropolitan Trust Co. vs. Houston etc. R. R. Co., 90 Fed., 683, 687.

Venner vs. Urbana Water Works Co., 174 Fed., 348, 352. (16 per cent.)

Des Moines Water Co. vs. City of Des Moines, 192 Fed., 193, 197, 198. (10 per cent.)

Bonbright v. Geary, 210 Fed., 44, 51, 54. (30 per cent.)

In the Minnesota Rate Cases the Master had deducted nothing for accrued depreciation, but, on the contrary, had added to the gross reproduction cost of the railroads large sums "for the solidification and adaptation of their respective railroads." The additional allowance in the case of the Northern Pacific was over $1,600,000, and in the case of the Great Northern over $3,200,000. These additional allowances were made by the Master on the theory that the added value attributable to "solidification and adaptation of their respective railroads" had exceeded accrued depreciation by the respective amounts men-

tioned above. In the lower court said findings of the Master were in all respects approved and confirmed.

Shepard vs. Northern Pacific, 184 Fed., 765, 810.

When the cases reached this court (Minnesota Rate Cases, 230 U. S., 352, 456) the lower court's decision upon this point was criticized only because it involved a mere assumption that the increased value due to the elements mentioned above had more than offset the actual depreciation which had accrued. This court mentioned the fact (p. 457) that the Master had found that a portion of the value offset by him against accrued depreciation had been "adaptation to the needs of the country and of the public served," "knowledge derived from experience," and "readiness to serve." This court did not at all criticize, but, on the contrary, seemingly approved the principle which justified the inclusion of these values in the rating base. It merely held that the amount of depreciation actually accrued should have been specifically determined so that it might be seen, as a matter of fact, whether such depreciation was actually more than offset by said added elements of value.

Some idea of the total amount which had been allowed for these items by the Master is gained by considering that in the case of the Northern Pacific the addition to the gross reproduction cost on account of "adaptation and solidification" was more than $1,600,000, and the depreciation in the physical property which, as the Master held, had been offset by the remaining part of these added values, had been (230 U. S., 458) estimated by the engineer of the State Commission as between $8,000,000 and

$9,000,000, making a total allowance by the Master and the lower court for these items of intangible value of from $9,600,000 to $10,000,000 out of an entire value (230 U. S., 443) of $90,000,000. This is an allowance for going value of more than 10 per cent.

From the foregoing decisions it is apparent that the allowances for going value both in rate and condemnation cases have never been less than 10 per cent. of the value of the remaining elements of the plant,—ranging from that to as much as 30 per cent. of such remaining values. It is important to observe that in the case at bar the Master's allowance for going value ($800,000) is about 6.3 per cent. of the net value ($12,615,899) of the remaining elements of the plant, and only slightly over 8 per cent. of the net value ($9,668,282) of the remaining elements of the plant, exclusive of water rights. (Rec., p. 122, Table I.)

But appellants say (their brief, pp. 64 and 65) that going value should not have been allowed to the extent that it was, because appellee (so they assert) has a monopoly of supplying a prime necessity of life, the need of which by all is emphasized in an arid region such as that where Denver is located. It is interesting to note that in this connection appellants claim that the value of appellee's property should be lessened because "it has a monopoly," whereas, in another part of their brief (p. 120), they assert that the value of appellee's plant should be lessened because it has not a monopoly but is constantly exposed to the possibility of municipal competition. Evidently appellants do not regard con-

sistency as a jewel of much worth. Of this we shall speak later.

But appellants' contention relating to going value, mentioned above, is based upon the thought that, because of the facts assumed, little cost and not much time would be required to build up the business to the level of that enjoyed by the present plant. Plainly this contention goes to the *amount* of going value allowed, as distinguished from the *principle* governing its allowance. It is therefore not open to appellants. Moreover, the contention proceeds upon the false assumption that going value as here allowed is measured exclusively by the cost of building up the business. Such is not the case. The status of being a going concern as defined in the cases hereinbefore cited, as defined by the witnesses in this case, and as defined by the Master himself in his report, includes many elements other than the mere expense and time required to get customers. Appellants say (their brief, p. 78) that the Master defined going value as "the cost of establishing the business after the plant is fully completed." This is a mistake. The Master defined it as the difference in *value*, not *cost*, between an established and going plant and one not so established and going. As to that particular element (of cost), the witnesses and Master clearly took into consideration the fact that customers might be more easily acquired in Denver than in communities where wells and other sources of supply were more numerous. The Master expressly so declared (Rec., p. 138). The witnesses so testified (Rec., p. 267, Fol. 367, pp. 290, 291). Moreover, as was said in Public Service Gas Co. vs. Board of Public

Utilities Commissioners, 84 N. J. Law, 463; 87 Atl., 651, 657:

> "The cost of a gas plant includes not merely the loss of interest while the plant is in course of construction and is building up a paying business, but *even in the case of an old established plant for the manufacture and distribution of a commodity, to the use of which the public has become so accustomed that it seems a necessity, there must be loss while pipe lines are extended to await the coming of consumers as the city extends.*" (Italics ours.)

This is conspicuously true in Denver, where the population is widespread and sparse and where, to serve them, long pipe lines must be extended which, at the beginning and for many years thereafter, obviously do not pay their way.

As was said by one of the witnesses in this case (Rec., p. 290):

> "Assuming continuity of operations, I do not believe that there ever is a time in the operations of the plant when additions to going value cease."

It seems clear that if in Omaha the going value inherent in the water plant was equal to 10 per cent. of the value of the other elements, the going value inherent in the Denver plant is at least equivalent to 6.3 per cent. of the value of the remaining elements, after making due allowance for all of the matters to which appellants refer. That percentage, as has been

demonstrated, was what was allowed by the Master in the present case.

The authorities cited by appellants (their brief, pp. 67-75) do not support their contention that going value should be entirely excluded. Those cases, so far as they have any bearing, clearly hold that such value should be included, and go merely to the extent of holding that in those particular instances it was difficult to determine that value as a separate item.

But appellants say (their brief, p. 72) that what was here valued was "good will," as defined in the Consolidated Gas Co. (157 Fed., 849, 872; 212 U. S., 19). That this is not so is clearly demonstrated by the Master's definition of what he valued, by the testimony of the witnesses to which the Master's finding related, and particularly by the decision of this court in Omaha vs. Omaha Water Co., 218 U. S., 180, 202, where the distinction is very clearly drawn, and by the other decisions hereinabove cited.

But finally appellants say (their brief, p. 73) that no going value should be allowed, because, as they assert, the company has no definite franchise. This is the only contention relating to the principle governing the inclusion of this value which is open to appellants under their exceptions and assignments of error; but this contention is plainly without merit. This is clearly demonstrated by the decision of this court in the Omaha case and the decisions of the Supreme Court of Massachusetts in the Newburyport and Gloucester cases, all of which are hereinbefore cited, wherein the governing statute or ordinance expressly required that all elements of value dependent upon franchise be excluded and wherein, neverthe-

less, going value in large amounts was included with the express approval of the courts. It is also demonstrated by the decision of Mr. Justice Brewer in the Kansas City case (cited, *supra*), expressly approved and adopted by this court in the Omaha case, wherein the franchise of the company had actually expired and it had no right to go on at all, which fact the court noticed, and wherein, nevertheless, it was held that a large allowance for going value must be made and included in the total fair value.

In this case appellee makes no claim for franchise value, notwithstanding the fact that its rights in the streets continue, although the duration thereof may be indefinite. If it had made such a claim and had demonstrated its ownership of a franchise, the value thereof must have been allowed.

> Willcox vs. Consolidated Gas Co., 212 U. S., 19, 43, 44.

The Master allowed no franchise value, and expressly so stated in his report (Rec., p. 136, Finding 42).

All of the witnesses who testified upon this subject plainly stated that the status of being a going concern existed and was inherent in this plant, notwithstanding the absence of franchise, that the valuations which they respectively placed thereon included nothing whatever for franchise value, and that said status and its value were and would be wholly unaffected by the presence or absence of a franchise (Rec., pp. 196, 205, 211, 222, 229, 234, 283).

It must be manifest that the absence of a definite franchise can have no different or other effect upon

going value than it has upon the value of any other element of the plant. Indeed, appellants expressly contend in a later portion of their brief that the present fair value of the plant ought as an entirety to be greatly reduced because of the alleged absence of a definite franchise, and also because of the possibility of municipal competition. This matter will be further noticed when we reply to that contention (*infra*, pp. 409 *et seq.*).

We have now discussed every contention of appellants relating to the propriety of the principle of inclusion of going value, although, upon this record, appellants are foreclosed as to most of them. We respectfully submit that all of such contentions are without merit.

2. *Appellants' Contention that the Allowances for Engineering, Contingencies and Interest During Construction Included also an Allowance for Going Value, is Contrary to the Master's Express Finding, in Conflict with the Record, and Wholly Untenable.*

Appellants assert (their brief, pp. 72, *et seq.*) that any valuation of the other elements of appellee's plant in excess of their "scrap value" necessarily includes going value, and that where, as here, present value of the structures has been determined by the reproduction-cost-less-depreciation method, and allowances have been made for Engineering and Contingencies and Interest During Construction, as part of such reproduction cost, such allowances necessarily include going value, and the plant has necessarily been valued as "an assembled and established plant doing business and earning money," as distinguished

from one "not thus advanced." "Scrap value," sometimes otherwise referred to as "junk value," or "wreckage value," means the amount of money which the owner of a plant can realize therefrom when, after retiring from the business for which the plant was constructed and in which it has been engaged, he sells the materials composing the plant to junk dealers and others, to be removed and applied to other uses. To say that such a value measures the present fair value of the plant, even exclusive of going value, is monstrously absurd. It is equivalent to the assertion that the value of a house is measured by what the owner would receive if he tore it down and sold the bricks, stones and lumber as second-hand material.

No case concerning either rates or condemnation can be found in which either fair value or just compensation is measured in any such way as that suggested. All are to the contrary. The assertion that any allowance in excess of scrap value includes going value, flies in the face of the many authorities hereinbefore cited where, in rate and condemnation cases alike, the value of lands has been determined according to their current market value, the value of structures has been determined by the reproduction-cost-less-depreciation method, and in addition thereto large allowances have been made for the element of going value.

Moreover, appellants' assertion that, because the Master, in determining gross reproduction cost of structures, included in such cost allowances for Engineering and Contingencies and Interesting During Construction, therefore and thereby he necessarily included and covered the value of the status of being a going concern, is in direct conflict with the Master's

express finding and declaration; for the Master expressly found and declared (Rec., p. 135, Finding 41) that his allowance for Interest During Construction covered only "interest on the money necessarily expended *in the construction of the plant from the time the work is commenced until the plant begins to earn an income;*" and expressly found and declared (Rec., p. 136, Finding 44) that his allowance for Engineering and Contingencies was "twelve and one-half per cent. *of the estimated fair cost of reproducing the structures;*" and in Table 1, Column 2 (Rec., p. 122) included it in, and stated it as being part of, the gross reproduction cost of the structures only. And when he came to the question of going value (Finding 46, p. 137) his finding and declaration upon this subject are so positive and distinct as to place the matter beyond the possibility of doubt; the language is: "Has this element of value (going value) been considered and appraised in the valuation found for the physical property (including water rights) of the Company in the preceding pages of this report? Such valuation of the physical property represents and is intended to represent the present market value of the company's lands (Class A), water rights (Class B) and personal property (Class T), *with no addition whatsoever because such property constitutes part of a long-established plant doing a business which yields an income.* The valuation of the other classes of the property is intended to represent its present value determined by its estimated reproduction cost (new), less its actual accrued depreciation, *with nothing added because the property is a part of 'an assembled and established plant doing business and earning money.'* Such valuation of the entire

property has been made precisely as if the plant were about to commence serving the public with its business yet to be established. *The plant is one 'where its business is established' and is 'an assembled and established plant doing business and earning money.' It follows that the 'element of value'—the 'property right'—going concern value remains to be appraised.*" (Italics ours.)

These findings and declarations of the Master are not excepted to nor made the subject of any assignment of error. They are unquestioned and unquestionable. They are based upon the Master's personal knowledge of the processes by which he had arrived at the various figures thereinbefore set forth in his report. There can be no better evidence than this. How, then, can appellants with good conscience assert, as they do (their brief, p. 78) that "in the present case the Master, as we view it, has made an allowance for overhead charges which is more than enough to take care of any so-called 'going concern' " ? Moreover, all of the witnesses who testified in this case concerning allowances for Engineering and Contingencies and Interest During Construction scrupulously confined them to the period of construction which elapsed prior to the time when that element of the plant to which they related went into service (Rec. pp. 203, 208, 228, 265, 267, 277, 285, 298, 890-892, 893; Ex. A19, sheet 7, Rec. p. 958 (1192); Ex. A103, Rec. p. 1067 *et seq.*), and those who testified concerning going value, in so far as it had any relation to the cost of establishing the business, scrupulously confined such cost to the period which would elapse after construction work was fully completed, and upon the assumption that each element of the plant would go into serv-

ice as soon as finished. (Rec. pp. 266, 267, 277, 290, 291, 893 (f. 1108); Ex. A19, Rec. p. 958 (f. 1191, 1192.)) It does not admit of any doubt that there was no possibility of overlap between the allowances testified to by the witnesses and made by the Master for Engineering and Contingencies and Interest During Construction, and the allowance, so testified to and so made, for going value.

Appellants in this connection rely upon the decision in Des Moines Gas Co. vs. the City of Des Moines, 238 U. S., 153, but this decision, instead of supporting their contention, destroys it. In the case cited this court, after (p. 165) distinctly holding that going value must be included, said:

> "Each case must be controlled by its own circumstances, and the actual question here is: In view of the facts found and the method of valuation used by him, did the Master sufficiently include this element in determining the value of the property of this company for rate-making purposes?"

This question was considered and answered in view (p. 163) of the guiding rule concerning burden of proof laid down in Knoxville vs. Knoxville Water Co., 212 U. S., 1, and applicable to cases where the rates have been prescribed by a valid ordinance. As we have already demonstrated, this is not such a case *(supra*, p. 56 *et seq.*).

In the Des Moines case the Master and the court below both had held that the ordinance rates were not confiscatory. As the case was presented to this court, it was therefore necessary for the company

to overcome not only the strong presumption of validity attendant upon rates established by an ordinance otherwise valid, but also the strong presumption of correctness attendant upon findings and conclusions of a Master and a trial court, the reversal of which is sought. Exactly the opposite situation is here presented.

In the Des Moines case it appeared (p. 166) that the Master had added for overhead costs, including Engineering, Contingencies, Interest During Construction, Organization Expenses and other items which he did not very clearly specify, the sum of $303,177, where the gross reproduction cost of the entire property, without overhead costs and exclusive of lands, was (p. 162) $1,975,026. There was no finding that these allowances for overhead costs covered only the period of construction. On the contrary, the Master's finding indicated that they covered the whole elapsed period between the beginning of construction and the date when the plant became fully established, in successful operation, with its business attached. Quite the contrary is true here, as has already been shown.

In the Des Moines case (p. 170) the Master expressly found and declared that he had valued the plant as one "in successful operation." Here, as we have shown, the Master expressly found and declared that until he included his allowance for going value he had not so valued the plant.

In the Des Moines case (p. 170) the Master expressly found and declared that the total value which he had assigned included an allowance, which he deemed sufficient, for the status of the plant as a

going concern. In the case at bar, as we have shown, the Master expressly found and declared to the contrary.

Under the circumstances which we have recited, and in view of the strong presumptions to which we have referred, which support the validity of rates prescribed by an ordinance otherwise valid, and which also support the propriety and correctness of the findings and conclusions of a Master and of the court below, this court, in the Des Moines case, affirmed the decree. In concluding upon this subject, the court said (p. 171):

> "While there is a difference between court and counsel as to what the Master meant by this, we think it is apparent that he meant to say that, applying the rule of the Cedar Rapids case, he had already valued the property in the estimate of what he called its physical value upon the basis of a plant in actual and successful operation; for he said that otherwise its value would be much less. * * * When, as here, a long-established and successful plant of this character is valued for rate making purposes, and the value of the property fixed, as the Master certifies, upon the basis of a plant in successful operation, and overhead charges have been allowed for the items and in the sums already stated, it cannot be said, in view of the facts in this case, that the element of going value has not been given the consideration it deserves, and the appellants' contention in this behalf is not sustained."

In short, this court in the Des Moines case did not hold, nor did it intend to hold, that going value should not be included in a rate case. On the contrary, its holding was directly otherwise.

And this court in the Des Moines case did not hold, or intend to hold, that going value should be excluded merely because Engineering, Contingencies, Interest During Construction and other overhead costs had been allowed. Its ruling in that regard was that no *separate* allowance for going value need be made when it appeared that, without such separate allowance, the plant had actually been valued as one in successful operation, and when it also appeared that, in addition to the market value of the lands and the actual cost of the structures, large allowances had been made for indefinite items, apparently not confined to costs incurred merely during the period of construction.

And this court in the Des Moines case affirmed the decree because appellant had not sustained the burden of showing that the Master and the court below did not give due consideration to the element of going value, just as in the case at bar the court must affirm this decree because the appellants have not sustained, and cannot sustain, the burden of showing that, if the specific allowance made by the master for going value be excluded, the valuation which remains includes the fair present value of the status of being a going concern.

3. *The Evidence Not Only Justified But Required a Larger Allowance for Going Value Than That Made by the Master.*

The master's allowance for going value was, as stated, $800,000. The joint board of appraisers valued this property right, as of January 1, 1908, at $1,100,000 (Rec. pp. 196, 211, 229), and defined it as (Rec. p. 28) "the added value of the plant because of its connections and business, and because the parts are united into one system and are tested and in successful use." This allowance represents the united judgment of five distinguished engineers, whose qualifications are beyond dispute. So far as appellants are concerned, it amounts, we submit, to an agreed valuation below which they cannot be permitted to go. This will be further noticed later on.

Mr. Freeman states (Rec. p. 196, Fol. 284) that this value was "entirely independent of any business and franchise value," and that it was not based upon "the expense of developing the business," and that (Rec. p. 205, Fol. 294) he based his recent determination of the amount of going value, which was the same as his former one, upon the same elements as in 1908, "regardless of the fact that the City is about to begin construction of its own plant. I believe that the value is there if the City chose to avail itself of it."

Mr. Holman said (Rec. pp. 211, 213) that going value "is the value found in a live plant, over and above the value of a non-operating plant of similar physical characteristics," and assigned a value to it as of May 1, 1914, of not less than $1,154,788. At page 222, folio 314, he defined it further and in much the same way, adding "a concern may have a large going

value, though its gross earnings are such that it is losing money."

Mr. Hazen (Rec. p. 229, Fol. 322) in his testimony assigned to it the same value ($1,100,000) as that which the joint board of appraisers had given it, and defined the property right as follows: "It represents the difference in value between this plant as it is and a plant identical with it as to physical structures, but without the business or connections and not in operation. Going value is the same, with or without a franchise. It has been called 'cost of developing business' and that definition has a good deal of merit. I should not consider it altogether cost, although it is largely a cost item;" and (Rec. p. 234, Fol. 328) "going value is an element of real value. It is also to a large extent an element of cost, and as an item of cost it seems to me that it is a part of the capital that must fairly be taken into account in discussing fair rates. It is an element that grows out of the real conditions of the business and adds both to the value of the property and to the rates that are fair. Going value is an element of value that stays with the plant all the time."

Metcalf and Anderson determined the going value to be, as of October 31, 1913, $1,200,000 (Exhibit C, p. 64). Mr. Metcalf explained this allowance fully and conclusively justified its amount not only by oral testimony but also by a number of elaborate and convincing exhibits (Rec. 265 to 267, 283, 290, 291, 894-896; Exhibits A-19, Rec. p. 958; A-104, Rec. p. 1075). Mr. Metcalf demonstrated very clearly the necessity and propriety of an allowance in the amount stated in Exhibit C, showed plainly that it was not and could

not be affected by the presence or absence of a franchise, proved conclusively that there was no possible overlap between such an allowance and the allowances for Engineering and Contingencies and Interest During Construction, and, among other things, said (Rec. p. 267, Fol. 367):

> "As a result of these studies in this region, where I believe the rate of acquisition of the business would be more rapid than normally found in this country, I have assumed the going value of this property to be $1,200,000. I believe that the actual development expense in this plant has been substantially more than that." * * * (Rec., p. 283, fol. 386) "I took into consideration in arriving at both the going value and the general value the fact that the company's franchise had expired."
>
> (Record, p. 290) "Assuming continuity of operations I do not believe that there ever is a time in the operations of the plant when additions to going value cease. * * * The cost of educating the public to the advantage of water under pressure is not the sole element of expense involved in the development expense or going concern. The development expense is made up very largely of the burden of interest charges, the carrying of the plant to a point where the earnings of the plant will carry it."

The witnesses mentioned above were the only ones who testified upon the question of going value, or the amount thereof inherent in this plant. The

Master in his finding refers to their testimony (Rec., p. 137, fol. 211) and also mentions Mr. Van Diest as one who had estimated "development expense at about $375,628."

The truth is, as the record clearly demonstrates, that the Public Utilities' engineers included nothing whatever in their determination of values on account of going value. The value of this item, like that of water rights, was entirely omitted. This is true, although they admitted that going value, in the sense in which it was defined and allowed by plaintiff's witnesses, should be allowed and included in the valuation. Their original report did contain an item called "development expense," in the amount stated by the Master, but this was the result of figuring the deficits in actual net income (compared with what it should have been) accruing from the actual operations of the company during the twenty years of its life, upon what was asserted to be, but was not in fact, the formula of the Wisconsin Railroad Commission, and upon assumptions as to value and other basic facts which were unjust to the company. All this clearly appears from the cross-examination of Mr. Van Diest (Rec., pp. 414, 427-430; Exhibit A-64, not produced here).

In Mr. Metcalf's testimony and exhibits, the injustice of the assumptions and the impropriety of the method adopted by the Public Utilities' engineers in figuring so-called development expense was clearly demonstrated; and it was shown, that even upon those assumptions, if the formula of the Wisconsin Railroad Commission had been actually followed, it would have resulted in a development expense of at

least $1,710,000, and probably much more (Rec., p. 958).

But the actual fact is that the item "development expense" embraced in the report of these engineers did not really cover anything whatever in the nature of going value. It was simply made use of as a "catch-all" for various items of actual construction cost, which these engineers had by inadvertence omitted, as distinguished from going value or development expense, and the sum of these omitted items of actual construction cost greatly exceeded the total of the allowance for so-called development expense. This is clearly demonstrated in the cross-examination of Mr. Van Diest (Rec., p. 427, fol. 556; p. 440, fol. 572; p. 421, fol. 549). It therefore admits of no doubt that there actually was no allowance whatsoever by the Public Utilities' engineers for going value, development expense, or anything analogous thereto, although they frankly admitted that such value existed and should have been included. It follows that the Master's allowance ($800,000) is less by $300,000 or $400,000 than it should have been under any view of the testimony. Upon this point there was no conflict in the evidence; it was all one way.

In the case at bar the Master's allowance for going value ($800,000) is about 6.3 per cent. of the net value ($12,615,899.00) of the remaining elements of the plant; about 5½ per cent of their gross value before deduction of depreciation; only slightly over 8 per cent. of the net value ($9,668,282.00) of the remaining elements of the plant exclusive of water rights, and about 7 per cent. of the gross value of said remaining elements before deduction of deprecia-

tion. (Record, p. 122, Table 1.) The authorities cited in the preceding pages demonstrate that the minimum allowance has been 10 per cent., ranging from that to as much as 30 per cent. The testimony of the witnesses in this case was to the same effect.

To say the least the allowance for going value made by the Master did appellants no injustice. Indeed, it was more than just to them, and so low as to be, under the undisputed evidence in this case, unjust to appellee. We respectfully submit that the value claimed by the plaintiff for this item ($1,200,000.00) was amply sustained by undisputed evidence. This the Master himself observes (Record, pp. 137, 138); nevertheless, he discounts that claim by $400,000.00, although, confessedly, there is no evidence justifying the reduction.

This presents purely a question of law and not one of fact relating to a finding based upon conflicting evidence. The contention is covered by Exception XXXVIII (Record, p. 1131) and by Assignment of Error 38 (Record, p. 1175) upon which the cross-appeal is based. This exception and assignment of error were filed and the cross-appeal taken for the reason, with the purpose, and under the conditions and limitations hereinbefore fully explained. (*Supra*, p. 34, *et seq.*)

VIII.

COMPANY'S OVERHEAD COSTS, INCLUDING ENGINEERING AND CONTINGENCIES AND INTEREST DURING CONSTRUCTION MUST INEVITABLY BE INCURRED IN THE REPRODUCTION OF THE PLANT. THEY CANNOT BE EXCLUDED FROM DETERMINATION OF REPRODUCTION COST, WHICH IS A MEASURE OF PRESENT FAIR VALUE. THE MASTER'S ALLOWANCES THEREFOR WERE EXTREMELY MODERATE AND ARE NOT OPEN TO QUESTION BY APPELLANTS.

The principal and, it is fair to say, the only real contention made by appellants respecting overhead charges and Interest During Construction is that the allowances therefor necessarily included an allowance for going value, and that therefore the separate allowance for going value made by the Master constituted a duplication of values. This contention has already been fully discussed and is, we submit, without merit (*supra*, pp. 366 *et seq.*).

Eliminating said contention, apparently nothing is left concerning these allowances which even appellants consider worthy of discussion.

Their treatment of the subject mentioned in the foregoing headline appears on pages 79 to 82 of their brief, is practically devoid of the citation of authorities, contains no references to the record, and is in every respect so casual and slight as to justify the assertion that all contentions concerning overhead charges and Interest During Construction are aban-

doned except that relating to duplication of values, which is hereinabove specifically mentioned.

Appellants' exceptions and assignments of error relating to these matters are in substance as follows: Exception 2nd (Rec., p. 1132) and Assignment III (Rec., p. 1148) assert that "The Master ought to have used the fair contract cost, new, of the said property and plant, instead of the gross reproduction cost, less accrued depreciation, in determining the present reasonable value."

Exception 18th (Rec., p. 1136) and Assignment XIX (Rec., p. 1154) assert that Engineering and Contingencies and Interest During Construction "are what are commonly known as overhead charges, and go to make up the item of 'going concern value,'" wherefore, the latter should not have been allowed as a separate item.

Exception 16th (Rec., p. 1135) and Assignment XVII (Rec., p. 1153) relate only to the allowance for Interest During Construction, and assert that no such allowance should be made "if there is to be allowed also the item of 'going concern' value, and because the plant of complainant company was not constructed as a new and complete plant, in the construction of which Interest During Construction might be an item for consideration, but was a plant constructed piecemeal and from time to time, and, except for a very inconsiderable portion thereof, has been constructed out of income and with money derived through the payment of water rates in advance."

From a consideration of the foregoing exceptions and assignments, it is manifest that the possible contentions open to appellants are very limited both in number and in scope. Aside from the contention,

which has been already disposed of, relating to the alleged duplication of values, appellants are at the most limited to the following points: (a) That where fair contract cost is the basic figure, the Company's overhead costs and Interest During Construction should not be added *nor* (it seems) *accrued depreciation deducted;* (b) that as to Interest During Construction (but not as to Engineering and Contingencies) it should not be allowed, because the existing plant was actually constructed in a piecemeal manner.

No contention is open to appellants and none is made concerning the *amount* allowed by the Master for any of these items. The *amount* of these allowances is dependent upon findings of fact made by the Master which are unquestioned and unquestionable. If on *principle* such allowances are proper, then, so far as appellants' contentions are concerned, said allowances in the amounts found by the Master should stand. So far as the question of *principle* is concerned, this depends, as we submit, upon the necessity of such costs in the reproduction of this plant, and therefore upon a question of fact which the Master found against appellants. This finding of fact also is unquestioned and unquestionable, and therefore appellants are foreclosed not only as to the amount of the allowances, but also as to the principle which justifies their inclusion.

Appellants (their brief, pp. 79, 81) intimate rather than assert that because reproduction cost was determined upon the assumption that the work of producing the structures would be done under contract, therefore these allowances should not be made. But this was the assumption

made by every witness who testified before the Master, those for defendants as well as those for plaintiff, and every one of them added allowances for the Company's Engineering, Contingencies and Interest During Construction to what was deemed fair contract cost. It is a fact, so obvious and well known that the court will take judicial notice thereof, that work of this character, conducted on a large scale, can be done more cheaply by experienced and well equipped contracting firms than by the owner on his own account. In practice, such work is invariably so done. It is equally obvious that, though the actual construction work be done under contract, the owner must necessarily incur great expense in addition to the mere contract cost of structures.

The Master's allowances for these items covered all of the Company's costs of construction in excess of the contract price, and included preliminary expenses and organization (Rec., p. 136, Finding 42); engineering, including exploration work and detailed surveys in the field necessary before the plant could be located, and plans and specifications for its construction prepared; and including also the preparation of such plans and specifications, the submission thereof to bids and the letting of contracts; the subsequent superintendence by the Company while the work was in progress; the testing of materials and the like; and examination of the work from time to time and at its conclusion to see that it progressed according to the contract and the plans and specifications; all costs of administration and the maintenance of a company organization; all costs involved in the acquisition, assembling and subsequent main-

tenance, during the period of construction, of the lands and water rights—all of which necessarily would require a large organization—and also interest upon all of the sums of money invested during the period of construction and until the plant began to operate. All these things and others of like kind the Company must do at its own cost.

Appellants say that if the plant is constructed under contract, interest during construction would not accrue, because, presumably, the contract price would not be paid until the plant was complete. But, as is obvious, the contract or contracts would relate only to the structures. The heavy investment necessary for the acquisition of the lands would have to be made at the very beginning and before the contractor began to put the structures thereon. But as to the contract itself, appellants are clearly mistaken. The structures which compose this plant are massive in character and great in extent; several years would necessarily be required for their reproduction; this all witnesses admitted, and the average period assumed was about five years. Obviously, no contractor would take a contract which required him to raise and invest the vast sum necessary for construction, and receive no payment on his contract until the construction work was fully complete. Therefore, all witnesses assumed, as was obviously necessary, that the contract price would be paid in installments and from time to time as the work progressed. It is too clear for argument that interest during construction would necessarily be incurred in large amounts because of payments on the contract price required to be made long before the structures went into service.

As to the assumption that the structures of the plant would be reproduced under contract, not only did all of appellants' witnesses proceed upon this assumption, but appellants themselves appeared to be entirely satisfied therewith. Their Exception 2d and Assignment III (Rec., pp. 1132 and 1148) expressly assert that the Master "ought to have used the fair contract cost, *new*, * * * instead of the gross reproduction cost, less accrued depreciation." This language is somewhat cryptic, but if appellants mean what they clearly appear to say, they should be satisfied, because the Master's determination of fair contract cost, new, of the structures, without any addition for engineering and contingencies, was $8,370,078 (Rec., p. 122, Table 1, Col. 2), whereas his determination of the present value thereof, arrived at by adding the overheads and deducting accrued depreciation, was $8,216,237 (Rec., p. 122, Table 1, Col. 4). The latter and lesser figure was the one taken into his total present fair value of the plant.

As to the assertion by appellants that the allowances for Engineering and Contingencies and Interest During Construction should be affected by the consideration that the existing plant was actually constructed by piecemeal, and not as an entirety under one contract, or series of contracts, executed as rapidly as possible, the obvious answer occurs that this relates to the *amount* of the allowances rather than to the *principle* of their inclusion. As we have already pointed out, all questions concerning amount are foreclosed.

Moreover, this contention relating to piecemeal construction of the existing plant has to do with ac-

tual original cost, as distinguished from present value. As we have already demonstrated, present value, measured by present-day reproduction cost and not actual original cost, is the test (*supra*, pp. 189 *et seq.*, 207 *et seq.*).

But it does not admit of doubt, and this record demonstrates, that piecemeal construction is, in any event, more expensive than continuous construction on a large scale; the testimony before the Master showed this without dispute (Abstract, p. 278; original transcript 4 C., pp. 1823, *et seq.*). The original testimony is more extensive, distinct and emphatic than the abstract thereof. Moreover, the fact that piecemeal construction involves greater cost has many times been the subject of express adjudication and is well recognized.

> Whitten on Valuation of Public Service Corporations, Vol. 1, Secs. 360-362.

Appellants assert that upon the assumptions made by the Master and the witnesses, the Company "has to complete its whole plant before it commences to earn money." But in this appellants are mistaken. The assumptions were that, as rapidly as portions of the plant were completed, they went into service and continued to serve while construction work progressed upon the remainder. Thereby Interest During Construction and Engineering and Contingencies were lessened and going value in the sense of development expense was likewise lessened.

In fact, every assumption made was of a character which would reduce the cost and consequent valuation, and therefore favored appellants.

But appellants assert that inasmuch as the plant has actually been produced piecemeal, and while the Company was actually engaged in operating that portion of its plant already completed, therefore the work would be done and supervised by an organization already formed, and the cost thereof would be charged "as operating expenses." In this appellants are clearly mistaken. As we have already demonstrated (*supra*, pp. 143, 152, *et seq.*), the operating expenses, by consideration of which the Master determined net earnings, contained no item attributable to construction. In so far as concerns reproduction cost or present value, it is certainly a matter of no significance where the money actually came from or how it was charged.

Appellants cite Cumberland Tel. & Tel. Co. vs. City of Louisville, 187 Fed. 637, and from it draw the conclusion that overhead charges are too intangible to justify their allowance. No such thing was held in the case cited. There the Master had found a value which was sufficiently large to require a decree adjudging the rate in question confiscatory. Whether such valuation might not properly have been larger was, of course, moot. The court, therefore, gave scant attention to the company's exception which asserted that the Master's allowance for overheads had been inadequate.

Appellants (their brief, p. 82) refer again to Des Moines Gas Co. vs. Des Moines, 238 U. S. 153, and from this court's opinion therein draw the conclusion that because overhead charges were allowed, therefore going value should not be. This contention has already been discussed and its futility demonstrated. (*Supra*, pp. 366 *et seq.*)

Appellants also assert that in the Des Moines case the total allowance for overhead charges amounted to about 15 per cent. If, as a matter of computation, this be correct, it is of no significance. The determination of amount involves a question of fact, and each case presents different facts. Doubtless, in the Des Moines case, the plant was of such a nature that the period of construction was much shorter and the difficulties to overcome much less than in the Denver case.

Appellants assume that in the Des Moines case the allowance for overhead costs included and covered the total allowance for going value. This is a mistake. As we have already shown, the plant was, in the Des Moines case, valued as one "in successful operation." Plainly this element of value was not entirely, although it may have been partially, covered by the allowance for overhead costs.

Without going into details, it is sufficient to say that the evidence in the case at bar more than justified the allowances made by the Master for Engineering and Contingencies and Interest During Construction. The witnesses went into great particularity and detail in describing the assumptions upon which and the methods by which their conclusions had been reached. It was evident that every assumption adopted tended to lessen and not to increase these allowances. The percentages and amounts testified to by the witnesses exceeded those adopted by the Master. (See Rec., pp. 203, 208, 219, 220, 228, 265, 268, 277, 285, 286, 298, 891, 892, 893. Ex. C, p. 64. Ex. A19, Sheet 7, Rec., p. 958, folio 1192. Ex. A103, Rec., pp. 1067, *et seq.*)

For instance, Metcalf and Anderson found, and plaintiff claimed (Ex. C, p. 64), an item of overhead cost, for preliminary expenses and organization, of $120,000. This the Master disallowed (Record, p. 136, Finding 42), although it was well sustained by undisputed evidence (Record, p. 265). Again Metcalf and Anderson found, and plaintiff claimed, that in the acquisition of the lands, overhead costs for legal and engineering expenses and contingencies would be incurred to the aggregate amount of $65,464 (Record, pp. 955, 957). This the Master disallowed (Record, p. 125, Finding 15), although well sustained by undisputed evidence and although it is obvious that such costs must be incurred.

The decisions dealing with these questions plainly demonstrate the necessity and propriety of such allowances, and further demonstrate that the allowances here made by the Master are extremely moderate.

As to the propriety and necessity of the assumption that the structures would be reproduced under contract, and that the Company would, in addition to the contract cost, incur overhead costs and the loss of interest during construction, see:

Floy on Valuation of Public Utility Properties, pp. 64 *et seq.*;

Foster on Engineering Valuation of Public Utilities, p. 34;

Des Moines Water Co. vs. City of Des Moines (see Whitten on Valuation, p. 221, Sec. 246);

Town of Falmouth vs. Falmouth Water Co., 180 Mass. 235; 62 N. E. 255, 258.

As to allowances for overhead costs and Interest During Construction, the necessity therefor and the amount thereof, see

Whitten on Valuation of Public Service Corporations, Vol. 1, Secs. 240-302; Vol. 2, Secs. 1180-1204,

where the authorities are listed and quoted from, and many allowances relatively much greater than those made by the Master in the case at bar shown to have been made both by courts and commissions.

See also:

Floy on Valuation of Public Utility Properties, pp. 91-128;

Hayes on Public Utilities, Their Cost, New, and Depreciation, Secs. 37-49;

Brunswick Water District vs. Maine Water Co., 99 Me. 371; 59 Atl. 537;

Metropolitan Trust Co. vs. Houston, etc., R. R. Co., 90 Fed. 683, 689.

We respectfully submit that the Master's allowances for Engineering and Contingencies and Interest

During Construction are amply sustained by the evidence, are not open to question by appellants, and are extremely moderate. Certainly they resulted in no injustice to appellants.

IX.

FAIR VALUE. THIS WAS DETERMINED BY CONSIDERATION OF EVERY RELEVANT FACT. THE VALUATION FOUND WAS MOST CONSERVATIVE, AND ONE OF WHICH APPELLANTS CANNOT COMPLAIN. IF JUSTLY SUBJECT TO ANY CRITICISM, IT IS THAT THE VALUE FOUND WAS TOO LOW.

In the Minnesota Rate Cases, 230 U. S. 352, speaking of the fair value of the property, which must be the measure of the adequacy of rates, the court said (p. 434):

> "The ascertainment of that value is not controlled by artificial rules. It is not a matter of formulas, but there must be a reasonable judgment having its basis in a proper consideration of all relevant facts."

As we have already pointed out (*supra*, pp. 195 *et seq.*), the Master valued the lands (Class A), the water rights (Class B) and the personal property (Class T) according to what he found to be the present normal market price for similar property. He valued the structures (Classes C to S) according to the re-

production-cost-less-depreciation method; and he valued the status of being a going concern according to the testimony of experienced and informed witnesses, modified by his own judgment, based upon considerations which he mentions; and as a result arrived at a total figure ($13,415,899). In arriving at this figure, as we have also pointed out, the Master resolved every doubt in favor of appellants and against appellee, and erred, if at all, on the side of conservatism.

But before adopting this figure as the present fair value of the property by which to measure the adequacy of rates, the Master tested it by the application of "reasonable judgment having its basis in a proper consideration of all relevant facts;" by comparing it with the conclusions of all witnesses who had testified concerning reasonable value of the entire plant (which conclusions were invariably greater than his own); by comparing it with the cost to the City of providing a duplicate plant, which cost he found to be in any event greater than the valuation determined by him; by a consideration of the adequacy and present condition of the plant and the character of service which it rendered, all of which he found to be excellent; and by a consideration of the question whether fair rates, measured by the valuation thus determined by him, would exceed the value of the service to the consumer, finding expressly that they would not. By a consideration of all of these matters he found and determined (Finding 48, Rec., p. 138) "that $13,415,899 is the fair and reasonable value of the property used by the Water Company for the convenience of the public," and a proper rating base by which to measure the adequacy of the return afforded

by the rates in question. This also we have hereinbefore fully explained, with appropriate references to the record (*supra*, pp. 202 and 203).

We venture the assertion that no rate case has ever come before this court in which the guiding rules applicable were more closely observed, the evidence in the lower court more complete, the consideration by the Master more thorough, intelligent and conscientious, or the valuation found more conservative. The Master was an experienced and accomplished lawyer. The decisions of this court by which the guiding rules have been established were constantly before him. The inquiry involved the entire body of rates, and therefore all of the property, all of the expense, and all of the revenue connected with or relating to the public service in which appellee was engaged. No necessity existed to segregate property or apportion expenses or earnings. Every item of information in any wise relevant to the inquiry was freely produced, fully and clearly set forth, and carefully considered by the Master. The result is one of which, certainly, appellants cannot justly complain. It is also true that the final result necessarily flowing from the Master's prior determinations is one of which appellee may not complain, because that result was a decree in its favor.

It is obvious that the ordinance is invalid and the rates which it prescribes confiscatory, and the decree so adjudged. That adjudication would be no more complete or conclusive even though large additions were made to the valuation found by the Master. Nevertheless, appellee contends, and by its cross-appeal presents the contention, that the Master's valuation was in fact unduly low. This contention is pre-

sented not because appellee complains of the final decree—which it does not, for said decree was in its favor—and not because it seeks reversal of said decree, for such is not appellee's purpose. On the contrary, the cross-appeal was taken, and these contentions are urged, not to reverse but to support the decree of the lower court, and to demonstrate that the total fair value as found by the Master was certainly not more, and, as we contend, was less, than the evidence justified and required. (*Supra*, pp. 35, 36.)

1. *The Master's Valuation Was Less Than Any Previous Valuation of the Same Property, and Less Than That Resulting from the Testimony of Any Witness in the Case at Bar.*

The former board of appraisers found the value, as of January 1, 1908, to be $14,400,000. This valuation was found by disinterested and highly qualified appraisers selected by the parties pursuant to a contract between the City and the Company, which (Rec., p. 19, Sec. 4) required them to ascertain such value. We submit that the valuation thus ascertained is in effect an agreed valuation, and that both parties are conclusively bound by the determination that the property in question was on January 1, 1908, of a fair value of $14,400,000. The determination of this fact was by a special tribunal of the parties' own selection, and the procedure was analogous to that considered by this court in Omaha vs. Omaha Water Co., 218 U. S. 180. Such being the nature of the determination, it was and is as conclusive as the valuation of the

franchises to which this court referred in Willcox vs. Consolidated Gas Co., 212 U. S. 19, 43, 44.

The authorities are a unit in declaring that a determination of such a fact in such a way is conclusive for all purposes.

3 Cyc., 728, 735;

2 A. & E. Enc. of Law, 2d Ed., pp. 794, 805.

Three of these appraisers testified in the present case. As we have already shown (*supra*, pp. 24, *et seq.*), they brought the appraisement down to date by adding the cost of new structures and deducting depreciation. One of them also added the conceded increase in the value of water rights which had occurred in the interval. As a result, his determination of value at the date of the inquiry was $16,259,078; the valuations found by the other two were, respectively, $15,370,000 and $15,300,000, without any addition for increased value of water rights which they conceded but did not include. With such addition their figures also would have equalled or exceeded $16,000,000.

Metcalf and Anderson's valuation, the details of which have been hereinbefore described, was, as of October 31, 1913, $16,038,379 (Exhibit C, p. 64).

The valuation made by the Public Utilities engineers was, as we have already shown, incomplete (*supra*, pp. 27, *et seq.*). Confessedly, it did not include either going value or any value for water rights, although these engineers when testifying admitted that both should be included (*supra*, pp. 227, 228 and 377, 378). The corrected total of the incomplete

valuation as found by these engineers was $10,021,681 (Exhibit 54, Sheet 6A, Rec., p. 1090, Fol. 1380). Adding, as we must, for purposes of comparison, the value of the omitted items, the results are as follows: Using the value of the omitted items as found by the Master (Rec., pp. 121, 123), we add for going value $800,000 and for water rights $2,947,617, bringing the valuation, based upon the estimate of the Public Utilities engineers, to $13,769,298. This exceeds the valuation found by the Master

But the Public Utilities engineers included certain items excluded by the Master. For instance, from Class A, Lands, the Master excluded a number of items the total valuation of which exceeded $110,000 (Rec., p.127, Finding 21; Exhibit C, pp. 111, *et seq.*). Notwithstanding this, their total valuation on lands was $513,601, as compared with his total valuation on the same class of property of $637,814. The difference is $124,213. Considering the property which they included and he excluded, the actual difference on lands alone is $234,213. The details of their land valuations appear in the record at pages 1083, *et seq.;* those of the Master at pages 124 and 125. It does not admit of doubt that their land values were inordinately low; this the Master found and the evidence demonstrates. The Master's land values are not questioned by the appellants. Using the land values found by the Master, instead of those determined by the Public Utilities engineers, the resultant total valuation, based upon the Public Utilities engineers' partial determination, would be $13,893,511. This still further exceeds the Master's total valuation of $13,415,899.

But the determinations of the Public Utilities engineers respecting structures were also in many respects erroneous and unduly low; this the Master finds (p. 134, Fol. 205½). Indeed, as the record demonstrates (Rec., pp. 414-440, 442-448, 881-896; Exs. A98-A104, Rec., pp. 1033-1075), if the things which they omitted were included, and the palpably erroneous assumptions which they made corrected, the fair contract cost as determined by them would have equalled, if it did not exceed, that determined by Metcalf and Anderson; and if to that result we add those things necessary to be added to fair contract cost, in order to complete the valuation, the result would be a figure substantially the same as that found by Metcalf and Anderson, Freeman, Holman and Hazen, and very much greater than that found by the Master.

We have hereinbefore reviewed the testimony of defendants' witnesses Gaffy and Bickel (*supra,* pp. 212 *et seq.*), and demonstrated that, viewed in any aspect, their determinations necessarily result in a total value greatly exceeding that found by the Master. We submit that the Master's valuation is far less than any heretofore determined by any board, commission or tribunal, and far less than that which necessarily results from the testimony of any witness in this case, either for plaintiff or for defendants.

2. *In the Exclusion of Items of Property and Elements of Value, and in the Reduction of Values, the Master Resolved Every Doubt Against Appellee and in Favor of Appellants.*

The extreme conservatism of the Master and his anxiety to avoid any injustice to the City of Denver

or the consumers of water, who were payers of the rates, was manifest throughout. It is particularly evident in his treatment of all questions relating to the valuation. Whenever a question arose as to whether a particular item of property possessed peculiar availability and adaptability, and therefore special value, he resolved the question against appellee, and added nothing to current market price on account of such special availability and adaptability. Whenever a question arose as to whether certain property was or was not to be included in the valuation as a portion of the plant, he invariably excluded it whenever there was the slightest doubt as to whether it was indispensably necessary thereto. Whenever a question arose as to unit prices or as to quantities, he almost invariably adopted the lower. It is our contention that in these particulars the rules applied by the Master operated too strongly against appellee. Some illustrations of this follow:

As to Class A, Lands, the total valuation allowed by the Master was $637,814 (Rec., p. 125); the valuation found by Metcalf and Anderson and claimed by plaintiff was $920,103 (Ex. C, p. 64). As already pointed out, the Master (Rec., p. 127) excluded from the list of lands valued a number of items which Metcalf and Anderson had included, the aggregate value of which was not less than $110,000. These consisted principally of the Platte Valley ranches, which were excluded as not being necessary to the water plant, although the evidence showed without dispute that it is necessary, or at least advisable, for the Company to retain them in order to make full use at all times of its water rights, and thereby preserve them undi-

minished (Rec., pp. 173, 310, 433). The lands excluded also covered the sites of Sullivan reservoir and Harriman Lake, both of which will be presently mentioned when we come to the structures excluded. In the matter of the lands, the Master also refused to consider any added value on account of special availability or adaptability, although the evidence in respect thereto was full and complete and without dispute. Thus he valued Item 1, Lake Cheesman reservoir site, at $160,000, although Metcalf and Anderson and the former board of appraisers had, considering its special availability and adaptability, valued it at $200,000 (Rec., p. 953); and he valued Item 17, Marston Lake reservoir lands, at $125,000, although Metcalf and Anderson and the board of appraisers, considering their special availability and adaptability, had valued them at $168,000 (Rec., p. 954). There were a number of other like instances.

Passing to Class B, the water rights, we have already pointed out (*supra*, pp. 334 *et seq.*) how the Master allowed for these $600,000 less than Metcalf and Anderson found and the Company claimed. The Master's valuation of water rights was substantially the same as that found by the former board of appraisers, although the evidence showed without dispute that, between the date of their valuation and that of the Master, the water rights had been enlarged and improved and had increased in value by at least twenty-five per cent. The Master also adopted as to the water rights lesser quantities and lower unit prices than those which were clearly justified by the evidence.

Coming to the structures, Classes C to S, the Master excluded every item of property and every element of cost or value about which there was the slightest question, although, as we think, in all cases the law and the evidence clearly justified their inclusion, and in many cases required it.

For example (Rec., p. 133, Finding 36), the Master excluded from Class I Item 6, Harriman Lake structures, net reproduction cost $10,541 (Exhibit C, p. 78), as he had already excluded the lands constituting the reservoir site (Rec., p. 127), having a value of $8,450 (Exhibit C, p. 112, Item 15), or a total of $18,991, although the evidence showed without dispute that this reservoir was distinctly useful and was actually used for the purpose of supplementing and protecting the city supply (Rec., pp. 170, 317).

From Class J (Rec., p. 133, Finding 37) he excluded the structures, as he had previously (Rec., p. 127, Finding 21) excluded the lands, constituting the office and superintendent's residence at Littleton. This exclusion amounted in the aggregate to approximately $13,000.

From Class L (Rec., p. 133, Finding 38) he excluded the structures of Sullivan reservoir, as he had previously (Rec., p. 127) excluded the site. The depreciated value of the structures as found by Metcalf and Anderson was $132,000 (Rec., p. 274), and the value of the site was $2,000 (Exhibit C, p. 112), making a total deduction of $134,000 on this account; and this notwithstanding the fact that this reservoir, which is a large artificial basin, although not at the time of the valuation in actual use, was really useful

and had great potential value as a part of the plant, and plans had already been made to utilize it (Rec., pp. 274, 436).

From Class S, the distribution pipe system, the Master made large deductions (Rec., pp. 133, *et seq.*, Finding 39). He deducted the item of Pavement over Mains, having a gross reproduction cost, without overhead or Interest During Construction, of $539,558, and the items of cost attributable to parallel tracks and conduits of other utility companies, having a like gross reproduction cost of $109,992, an aggregate of $649,550 without overhead or Interest During Construction, although the evidence clearly demonstrated that in the reproduction of the plant it would be necessary to incur these costs, to cut and replace the existing pavements and care for the overlying tracks and conduits, and that the estimate of reproduction cost would certainly be incomplete without their inclusion. The Master bases their exclusion upon the decision of this court in the Des Moines Gas case (238 U. S. 153). It is true that in that case the Master had excluded somewhat similar items, and this court refused to reverse the decree based upon the entire report of the Master. We submit, however, that that does not necessarily indicate a conclusive determination by this court that such items should, under all circumstances, be excluded.

It is manifest that if one, about to enter the water-works business, were considering whether he should build a new plant or buy the existing plant, his decision would be influenced and the price which he would pay for the existing plant enlarged by reason of the fact that if he bought the existing plant he

would not have to cut and replace these pavements, and care for and avoid these obstructions, and incur the necessary cost incident thereto, whereas, if he built a new plant, he would. Plainly, viewed in this light, value is added to the existing plant by these considerations. It is of no moment that this value was added by reason of something for which the Water Company did not pay and for which, perhaps, it was not responsible. That is true of all increments of value arising from increased population, a rise in the current market price of real estate and other like matters; but, as has been conclusively determined and as we have hereinbefore shown, the utility is entitled to all such increases (*supra*, pp. 189 *et seq.*). Moreover, reproduction cost necessarily and logically contemplates the reproduction of the identical plant under present-day conditions (*supra*, pp. 209 *et seq.*). For all of these reasons, we submit that the doubt in this case, if any, concerning the large items mentioned above ought to have been resolved in favor of the inclusion and not the exclusion thereof. The depreciated value of the items so excluded was not less than $650,000 (Exhibit C, p. 97).

From Class S the Master also excluded the value of taps for private consumers, having a gross reproduction cost, without overhead or Interest During Construction, of $140,038. These had been included by Metcalf and Anderson and their value claimed by the Company because, while, under the rules of the Company, the cost thereof was required to be advanced by the consumers, yet, under the same rules and by force of circumstances, they became the property of the Company. Notwithstanding this, the Master ex-

cluded them because they had not been paid for by the Company. But, as has been conclusively determined, the question as to what an item of property cost, or whether it cost anything at all, is of no moment. If it be actually owned by the utility, it is entitled to its value (*supra*, pp. 189 *et seq.*). The depreciated value of this item of taps for private consumers was (including Interest During Construction) approximately $130,000 (Exhibit C, p. 97).

As to Class T, Personal Property (Rec., p. 135, Finding 40), the Master valued the articles comprising this class at their wholesale price f. o. b. Denver, and refused to allow anything on account of the cost of conveying them along the plant, arranging them in convenient places for distribution, and there maintaining them, although these acts were necessary, and unquestionably added to the value of the property at least their cost. (*Supra*, p. 201.) This deduction amounted to approximately $30,000.

As to going value, in spite of the fact that the proof abundantly sustained an allowance of at least $1,200,000 and the fact that the undisputed evidence required an allowance of at least $1,100,000, the Master's allowance was only $800,000, a deduction of $300,000 or $400,000, made without any apparent and, we submit, without any sufficient reason. (*Supra*, pp. 374 *et seq.*)

The Master excluded reasonable overhead costs to the amount of $185,464 (*supra*, p. 389), thus effecting a horizontal reduction, by elimination, of that amount. He also further reduced the allowance for overhead costs by applying the percentage (12½%) to a lesser base than that testified to by the witnesses.

Moreover, he rejected the claim (Record, p. 136, Finding 43) for an allowance of $100,000 for working capital, although it was well sustained by undisputed evidence (Record, p. 270, Ex. A-24), and although the necessity, in so large a business, of at least such a relatively small amount of working capital is self-evident.

We will not go further into details, although there were many other instances of like character. What we have said is sufficient to clearly demonstrate that all doubts were resolved against appellee and in favor of appellants and for the reduction of the valuation. The sum of those deductions only which are hereinabove specifically referred to exceeds $2,000,000. The addition of this amount to the present fair value as fixed by the Master would reduce the rate of annual net return under the ordinance from .0364, as found by the Master, to .0317 and (assuming that 8 per cent per annum is the requisite rate of return) would increase the value of the plaintiff's property taken for public use without just or any compensation, from $7,305,649 (*supra*, p. 164) to at least $9,305,649.

The matters hereinabove referred to are the subject of appellee's exceptions to the Master's Report and its assignment of errors upon which its cross-appeal is based (Record, pages 1121 *et seq.*, 1168 *et seq.*, 1176). As hereinbefore explained (*supra*, pp. 34, 35, 36) appellee's exceptions and assignment of errors were filed and its cross-appeal taken not to reverse the decree, but to insure its affirmance. The papers on their face expressly so state.

The ordinance is in any event totally invalid. On the issue of confiscation the value might be increased by many millions and the rate of return decreased to the vanishing point and yet the ordinance be no more invalid. When totality is reached, the ultimate has been achieved. This, of course, appellee and its counsel fully realize. Nevertheless, the matters hereinabove referred to are called to the court's attention because they plainly demonstrate the ultra-conservative character of the Master's valuation and because they make it clear that said valuation may in any event be accepted by the court, without, to say the least, doing any injustice whatsoever to appellants.

3. *The Cost to the City of Providing a Duplicate Plant Would Greatly Exceed the Value of the Present Plant as Found by the Master.*

The Master found (Rec., p. 138, Finding 48) that "a new plant capable of serving the public with like efficiency cannot, according to the evidence, be built for $13,415,899." This finding is not made the subject of any exception or assignment of error. The evidence clearly demonstrates its correctness.

Mr. Freeman, testifying in this case, said (Rec., p. 205, Fol. 294) that it would cost the city approximately $20,000,000 to provide a duplicate plant.

The engineers of the Public Utilities Commission in their report stated (Rec., pp. 73, *et seq.*) that it would take at least five or six years to construct and assemble such a duplicate plant, and that the approximate cost thereof would be $12,750,000 if diversion made from the Eastern slope, or $16,250,000 if diver-

sion made from the Western slope, the latter being the course which they recommended. That this estimate was only an approximation, they frankly admitted, and qualified it with this statement, "All estimates of cost of a new system throughout must be approximations, which experience would probably prove to be erroneous in many particulars. Necessary information, such as surveys and detailed plans would develop, is wanting in every essential element." Moreover, they recommended strongly against any attempt to construct a new plant, and in favor of the purchase of the existing plant. They pointed out that during the period of five or six years required for the constructing and assembling of the new plant the city would be obliged to forego and therefore would lose the net revenue which it might have enjoyed from the existing plant if, instead of constructing, it had purchased. This they regarded as a loss and therefore a cost, in addition to the other costs incident to the construction and assembling of the new plant. This is substantially the equivalent of the development expense to which the city would be put in constructing the duplicate plant and bringing its business to the level of that now enjoyed by the existing plant, and was regarded by the Public Utilities engineers as an important reason why the existing plant should be purchased and no attempt made to construct a duplicate plant (Rec., pp. 74, 1079, 1080, Ex. A-106). The loss to which the City would thus be subjected, they stated, would be $290,365.45 for each of the five years of the assumed construction period, or a total of $1,451,827.25. But an important error in their assumption is to be noted, in that they should not have used

the net income after deducting interest upon the bonds, as they did, but should have used the net income applicable to the payment of interest charges and dividends found by deducting from the gross revenue the operating expenses, taxes and depreciation allowance, which net income, according to their figures, would have amounted to the sum of $824,571 per annum, or for the five-year period a total of $4,122,855. Therefore, if consideration is to be given to this loss (and the Public Utilities engineers say it must be included in the estimate), the total cost of the alternative plant, based upon the theory advanced by them, would be not less than $16,000,000, and would be more likely to exceed $20,000,000.

Moreover, the estimate of the Public Utilities Commission was based upon grossly erroneous assumptions. As an illustration of this, the total amount which they allowed for lands and water rights was $750,000 (Rec., p. 73), although the Master found (Rec., p. 122) that the lands necessarily included in the present plant were, measured by current market prices, worth $637,814 and the water rights $2,947,617. The fact that these items of cost were grossly underestimated by the Public Utilities engineers is plainly demonstrated by the testimony of every witness who appeared in the case at bar, and particularly by the testimony of Mr. Fellows himself (Rec., pp. 611, 612). We therefore submit that the estimate of the Public Utilities engineers is equivalent to a finding that the cost of a duplicate plant would be not less than $16,000,000, and more likely $20,000,000.

In this connection we take the liberty of informing the court of a fact which does not appear from

the present record, because the transaction out of which it arose began after all of the evidence herein was taken, and was not completed until long after the final decree herein was entered. Nevertheless it is a fact of importance, one which appellants cannot, and of course will not, question, one which is a matter of public knowledge because it relates to a public transaction and one which it is only fair that this court should know.

In 1915 the City and County of Denver, through the Public Utilities Commission, evidently realizing that the estimate of the cost of a new plant contained in the report of the Public Utilities Engineers filed in January, 1914, was, as it was plainly stated to be, incomplete and doubtless inaccurate, employed a firm of non-resident, impartial and thoroughly competent engineers to make a complete investigation of and ascertain and report the cost to the City of such a new plant, duplicating that in existence. Pursuant to said employment the engineers in question came to Denver and with a large force of assistants were there engaged upon this work for more than a year, concluding their investigation and making their report on December 14th, 1916. The cost to the City of this investigation and report exceeded $86,000, which is an evidence of the thorough and complete character of the work. As a result of their careful, comprehensive and complete investigation these engineers reported that *the cost to the City of providing an adequate plant capable of serving the community and its inhabitants as efficiently as that of appellee, would be $27,479,498.57*, and these engineers also strongly recommended that the City and County of Denver

should, instead of attempting to provide a new and duplicate system, acquire the property of the Denver Union Water Company under the terms of the option agreement dated February 21st, 1916, to which we have hereinbefore referred (*supra*, pp. 3, 4, 5).

The facts recited above, all of which are indisputable, make it clear beyond question that the valuation found by the Master was, to say the least, not unjust to appellants. Indeed, it was more than just to them, and, in fact, unjust to appellee. It results with the certainty of a mathematical demonstration, that the total valuation as found by the Master may be accepted and acted upon by this court with the positive assurance that the property of appellee devoted to the public use was worth at least that much, and probably much more.

4. *Appellants' Contention That Present Fair Value as Found by the Master Should Be Reduced Because of the Lack of a Definite Franchise, or the Possibility of Municipal Competition, Is Untenable and Unconscionable.*

The contention outlined above is repeatedly urged by appellants (their brief, pp. 73, 119-125). It is not open to them because, except only as to the allowance of $800,000 for going value (Rec. p. 1136; Exc. 19th, p. 1154, Ass. XX), it is not even referred to in any exception or assignment of error.

In this connection it is said (page 120) that the appellee has no monopoly in that the City may at any time build its own plant and so, in effect, exclude the Company from the business of water supply, thereby reducing the value of its

409

plant to its mere junk value; whereas, at another place in the brief (p. 65), it is urged in respect to going value that it should be eliminated or at least greatly reduced because the Company has a monopoly. The lack of consistency in these two statements is manifest.

But appellants' contention outlined above is monstrously absurd, clearly untenable and wholly unconscionable. Evidently, it so appears to appellants, for the words with which it is presented are pregnant with the spirit of apology. Thus, at page 121 of the brief, it is said: "So far as we are aware, municipal corporations are no more prohibited from driving 'good bargains' or 'hard bargains' than are individuals;" and again at page 124, "Denver has not done any act or thing to impair the value of the Company's property or to imperil the investment of its stockholders; it has simply taken advantage of a situation which was as inevitable as death; that is, the depreciation in the value of the property which necessarily arose from the loss of the monopoly which the Company had theretofore enjoyed." These words also convey the plain admission that Denver is undertaking to drive a "good bargain" or a "hard bargain," and to that end is "taking advantage of the situation."

The futility of appellants' contention is best shown by a homely illustration. A dollar is worth one hundred cents, both intrinsically and in the markets of the world. And yet what is it worth to the owner in whose pocket it is at a time when he is being held up by a highwayman at the point of a pistol? And under such conditions how much would anyone

pay to change places with that owner and accept the contents of his pocket?

The gist of appellants' argument is this: Appellee's definite franchise in the streets of the City has expired; therefore the City may at any time expel it therefrom; appellee has no exclusive contract or monopoly; therefore the city may at any time build its own works, take the business away from appellee, and force it to sell its plant for junk.

But it has never yet been held that because of the expiration of the Company's definite franchise the city may expel it from the streets. All that this court held in the former litigation (229 U. S. 142) was that the city was at liberty to build its own plant.

While it is true that since April 10, 1910, the Company has had no definite franchise, in the sense of an express contract, vesting it with the right to occupy the streets for a specified period, nevertheless, it has ever since occupied said streets without any attempt on the part of the City to revoke its right so to do. Indeed, it was and is, and will continue to be, indispensably necessary to the City and its inhabitants that the Company continue so to occupy the streets, because the City and all of its inhabitants are solely dependent upon this Company for their water supply. Even though it be within the power of the City to revoke the right to occupy the streets (which is not conceded), nevertheless, it has not revoked it, and certainly will not attempt to do so until it has provided itself with a duplicate plant and water supply adequate for all the needs of itself and its inhabitants.

As yet, it has not even commenced the building of a new plant. It is conceded by all that from the date of such commencement at least five or six years, and probably much longer, will be required to complete and put into operation such a duplicate municipal plant. The definite rights granted utility companies to occupy the streets of a city are in Colorado limited to twenty years, and the definite period expressly mentioned in Ordinance 44, Series of 1890, expired on April 10, 1910. If this date marked the expiration of the definite right of the Company to occupy the streets, then, from what has been said, it is evident that the Company's present franchise must run for at least thirteen years from that date and the Company is today, so far as street rights are concerned, in no worse position than that which it occupied in 1904, when its definite franchise still existed and had six years to run.

But would appellants contend that if this valuation had been made in 1904 anything should be deducted from present fair value because the definite franchise had only six years to run, or is it appellants' contention that the loss of value, which they claim, occurred suddenly at that hour of the tenth day of April, 1910, when the twenty-year period specified in Ordinance 44, Series of 1890, expired? Is it their contention that property which on the 9th day of April, 1910, was used in supplying Denver and its inhabitants with water, and had on that day a fair value, as the former board of appraisers said of at least $14,400,000, had on the 11th day of April, 1910, a fair value of not to exceed $6,000,000, although it remained the identical property, still supplied Denver

and its inhabitants with water, and would so continue to supply them for an indefinite period? The service which it rendered was the same and worth as much on April 11, 1910, as on April 9, 1910. Why, then, should its rates be any less? And yet, if appellants' theory be correct, such rates could with impunity be, by public authority, reduced more than sixty per cent., and yet escape the charge of confiscation.

If appellants' theory be correct, why should a city ever grant an extension of franchise, or why should it ever purchase the works of a public utility, or even build its own plant? If the law be as appellants say it is, the city is at liberty to sit tight, take the benefit and use of the service afforded by the present plant, leaving the ownership and operation thereof in the hands of its present owners, and neither grant a new franchise, build a new plant, or purchase the existing plant, and at the same time is at liberty to reduce the present rates by about two-thirds, and also is at liberty to continue such a situation indefinitely. A theory which leads to such manifestly absurd and utterly unjust results cannot be sound.

If appellants' answer be that if the Company is not pleased with such a situation it may withdraw from the business, the obvious reply is that it cannot withdraw without inflicting upon Denver and its inhabitants an injury which would almost result in communal extinction, and that it cannot withdraw without the loss of practically its entire investment because its works are massive and permanently installed, and, except for its water rights and lands, the elements of its plant have practically no value for any purpose other than that to which they are devoted. And our

reply would begin and end with the words which Mr. Justice Brewer once used in characterizing a very similar contention: "Apples of Sodom were fruit of joy in comparison" (C. & N. W. vs. Dey, 35 Fed., 866, 880).

As a matter of fact, and as is well known, public utilities are not established by private capital, nor are their rates fixed, with a view to any such conscienceless and reprehensible attitude on the part of the municipality at the expiration of the term of the definite franchise. If they were, then it would be not only the right but the duty of the public utility, privately owned, to charge such rates for its service as not only to afford a fair return upon the capital invested, but also to amortize practically the entire value of the plant at the expiration of the definite franchise; for, as this court has said (Knoxville vs. Knoxville Water Co., 212 U. S., 13) the utility "is entitled to see that from earnings the value of the property invested is kept unimpaired so that at the end of any given term of years the original investment remains as it was at the beginning. It is not only the right of the company to make such a provision, but it is its duty to its bond and stockholders and, in the case of a public service corporation at least, its plain duty to the public."

If it be now the purpose of the City of Denver to build its own municipal plant, and thereby destroy that of appellee, and if it is also the intention of the City, as under the circumstances it must be, to avail itself of the service of the existing plant until its own is completed, it is not only the right but the duty of appellee to impose rates for the service furnished dur-

ing such period sufficiently large to amortize nearly the whole value of its plant by the time the municipal plant is completed. The distinguished engineers and operators and managers of water works plants who were witnesses for appellee in the court below all so testified, explaining their reasons at length (Rec. pp. 200, 205, 207, 231, 234, 235, 236, 283, 284, 295 (folio 400), 299). They also testified that even such rates, though substantially double those which the Company now imposes, would not exceed the value of the service rendered. This is so because the going rates are unduly low and the value of the service exceedingly great. But such rates would certainly be very high and so burdensome to the consumers as obviously to be practically intolerable.

In this case no franchise value was claimed, and, as the Master expressly stated (Rec. p. 136, Finding 42), none was allowed. So far as appellants' contention is based upon the lack of a definite franchise, the true rule is and must be that, except for the exclusion of the value directly assignable to the franchise itself as a distinct item of property, the present fair value of the entire property is, for purposes of rate-making or condemnation, the same, although a definite right to occupy the streets for a specific period be lacking.

So far as appellants' contention is based upon the possibility of municipal competition, it is important to observe that the situation today differs in no respect from that which has at all times since 1871 existed. Neither this Company nor any of its predecessors has since said date had an exclusive franchise, or any contract, or other arrangement with the City which prevented the City from itself at any time building a

competing plant, or authorizing others so to do (Exhibits ZZ, A-1, A-2, A-3, Rec. pp. 927-941). Not only has the City at all times possessed the right to compete, but even before the expiration of the twenty-year period mentioned in Ordinance 44, Series of 1890, it frequently threatened so to do, and in 1900 actually voted and caused to be engraved and executed the bonds with which to build a competing plant (*supra*, p. 10). And in 1889, by authority of the City, the competing plant of the Citizens Water Company was installed and operated—to the complete ruin of the older existing Company. (*Supra*, pp. 7, *et seq.*) It is plain that appellants' contention would in this aspect have been as good if addressed to the situation which existed in 1900 or any other year in the history of the plant as it is when directed to the year 1915.

But is it not most illogical and manifestly absurd to say that for the reason asserted the fair value of the water plant as it existed at any date in its history has always been much less—approximately seventy per cent less—than the actual cost on said date of the installation of its various elements (after deducting all depreciation caused by age, wear, or obsolescence)? And yet, reduced to its essence, such is the exact contention of appellants.

The fallacy of appellants' argument lies in the fact that they ignore the distinction between *exchange value* (meaning the price which some other corporation or group of individuals might be willing to pay for the public utility, privately owned, with a view of continuing its business), and *fair value* (by which is meant that *just compensation*, to which the owner of the property is entitled whenever it or its use is

taken by public authority, and which in case of condemnation measures the award, and in case of rate regulation measures the adequacy of the return).

It is obvious that *exchange value* as defined above may be greatly and seriously affected by the attitude and acts of the community which is being served. It was for this reason, and none other, that, as the Master found (Rec. p. 121, Fol. 184), the parties hereto agreed that the market value of the outstanding stock and bonds of the Water Company would not aid in determining the present value of the Company's property. For it does not admit of doubt that the attitude and acts of the City of Denver set forth in the historical review with which this brief is introduced (*supra*, pp. 5 *et seq.*) have seriously and prejudicially affected the marketability and market value of the Water Company's securities. And the courts have frequently held that for such reasons the market value of securities affords no guide to present fair value of the property.

> Spring Valley Waterworks vs. San Francisco, 192 U. S., 137, 145;
>
> Des Moines Water Co. vs. City of Des Moines, 192 Fed., 193, 197;
>
> Consolidated Gas Co. vs. City of New York, 157 Fed., 849, 861.

But appellants' contention as now made is plainly inconsistent and in conflict with their previous agreement, as found by the master.

To permit the attitude and acts of the community served, which necessarily affect *exchange value*, to likewise and in the same measure affect *fair value*

for rate or condemnation purposes, would, as is obvious, place private capital invested in public utilities in a situation where it would be absolutely at the mercy of the uncontrolled whim, caprice and even malice of the communities and consumers served.

So far as the construction of the municipal plant is concerned, it has not yet been built nor even commenced, although the threat of the construction of such a plant, evidenced by Section 264a of the Charter, remains. It is, as was said by this court (Willcox vs. Consolidated Gas Co., 212 U. S., 49) "a proposition almost unthinkable" that the City of Denver will, for the purpose of making competition and destroying the present plant, proceed at enormous expense with the construction of a duplicate municipal plant. This is especially true here, since, as found by the Master (Rec. p. 139, Finding 52), the existing plant is adequate, complete and in every respect satisfactory, and the service which it renders excellent; and since, as also found by the Master (Rec., p. 138, Finding 48), and as demonstrated in the preceding pages, the cost to the City of providing a duplicate municipal plant will be greater—indeed, enormously greater—than the fair value of the existing plant as fixed by the Master; and since, as has already been shown (*supra*, pp. 3 and 4), the City may, if it chooses, purchase the existing plant at the fair value thereof as fixed by the Master.

Much more might be said, but that which precedes should suffice. Appellants' contention is clearly illogical, monstrously unjust and wholly unconscionable. No court of justice can or will countenance it. It is in conflict with fundamental and elementary

principles of right dealing and common honesty and falls within the prohibition of express constitutional provisions.

In Yick Wo vs. Hopkins, 118 U. S., 356, this court negatived in most emphatic words a similar contention, and in the course of its opinion said (p. 371):

> "Accordingly, in the case of the State of Ohio, ex rel., etc., v. Cincinnati Gas, Light & Coke Co., 18 Ohio St., 262, 300, an ordinance of the City Council purporting to fix the price to be charged for gas, under an authority of law giving discretionary power to do so, was held to be bad if passed in bad faith, fixing an unreasonable price for the fraudulent purpose of compelling the Gas Company to submit to an unfair appraisement of their works."

In Knoxville Water Co. vs. Knoxville, 189 U. S., 434, 438, the court said:

> "It is argued here that the reduction of rates is not reasonable and is or may be taking a first step towards a compulsory purchase of the Company's plant at an unfairly low price by cutting down its value. We may assume, with the Supreme Court of Tennessee, that if rates were reduced unreasonably, a judicial remedy would be found. We may assume, further, that an attempt to affect the price of the Company's plant in that way, if the City should elect to purchase, would not be allowed to succeed."

In San Diego Land and Town Co. vs. Jasper, 189 U. S., 439, 443, the court said:

> "Of course, as we indicated the other day in Knoxville Water Co. v. Knoxville, ante, p. 434, if an attempt had been made to cut down values by the reduction of rates, the courts would know how to meet it."

Se also Dobbins vs. Los Angeles, 195 U. S., 223, 240.

In Lincoln Gas & Elec. Light Co. vs. City of Lincoln, 182 Fed., 926, it was claimed by the City that the Company's franchise had expired and for that reason fair value, exclusive of franchise value, should be reduced; but the court refused to pass upon the claim that the franchise had expired, holding the question immaterial, and determined the present fair value of the plant according to the reproduction-cost-less-depreciation method, without, however, adding anything on account of franchise value, and also without deducting anything because of the lack of a franchise. On this subject the court said (182 Fed., 930):

> "The question as to whether or not complainant's franchise is a perpetual one, or has already terminated, has been argued, but that question is not properly involved in the case. The ordinance prescribing the rates to be charged in effect admits that complainant is properly occupying the streets and alleys, and whether such occupancy is by reason of a perpetual franchise or by sufferance is not involved in the proper determination of this case."

Lincoln Gas & Elec. Light Co. vs. City of Lincoln, 223 U. S., 349, is this court's decision upon the Company's appeal. The lower court had determined that even with fair value ascertained in the manner aforesaid the rates had not been shown to be confiscatory, and had decreed accordingly. In the court below the testimony had been taken before and the initial findings made by the district judge holding the circuit court. The decree was reversed because the findings were not sufficiently complete and specific, with directions to refer to a special master for complete findings. The case was in effect remanded for a new trial, but this court did not criticize, and apparently approved, the decision of the lower court concerning the lack of a definite franchise, because it sent the case back for trial and left that determination to be the guiding rule in the next ascertainment of fair value.

In Henry L. Doherty, et al. vs. Toledo Rys. & Light Co. and City of Toledo (*infra*, Appendix A, p. 429) the United States District Court for the Northern District of Ohio was considering the validity of an ordinance passed by the Toledo City Council reducing the fares of the Street Railway from five cents to three cents per person. The Street Railway Company's franchise had entirely expired, and it had no definite right longer to maintain its tracks or operate its cars in the streets of the City. The City by its ordinance offered to grant it a new franchise if it would accept the three-cent fares, but the Company refused, claiming the three-cent fares to be confiscatory, and brought its suit in the Federal Court to enjoin the enforcement of the ordinance rates. Notwithstanding

the lack of definite franchise mentioned above, the Company continued to operate and to collect fares at the five-cent rate prescribed by it. It claimed the right to collect fares which would afford it a net revenue commensurate with the investment in its property, as measured by its present fair value, notwithstanding that it had no right to remain in the streets or continue in the business, and that the City was threatening to exclude it entirely from the streets unless it accepted the three-cent fares. The Company's contentions were in all respects upheld; the present fair value of the property was ascertained and no diminution thereof permitted because of the lack of a definite franchise. Measured thereby, the rates were found to be confiscatory, and the enforcement of the ordinance was enjoined. Among other things, the court says (*infra*, p. 430):

> "It is unnecessary to cover again in full the discussion then had of the relative rights of the Company on the streets *without franchise* and the City. It is sufficient here to say only that the Company might run its cars from day to day, until forbidden by the City, at such rate as it was able to collect, *and that it had the right to charge a rate that would pay its operating expenses and leave a surplus equal to a fair return upon its real investment.*" (Italics ours.)

In Newburyport Water Co. vs. Newburyport, 168 Mass., 541, 554, Mr. Justice Holmes, then a member of the Supreme Court of Massachusetts, remarked:

> "Of course, an offer by a water company" (to sell to the city) "made under the threat of municipal competition and to avoid ruin, might be voluntary only in name, but we have no reason to assume in this case that the petitioner is the victim of robbery, and must treat it as having acted of its free choice in fact as well as in form."

In Cedar Rapids Water Co. vs. City of Cedar Rapids, 118 Ia., 234; 91 N. W., 1081, 1090, it was held that after the expiration of the Water Company's franchise the Company did not become a trespasser upon the streets of the City, but was entitled to remain therein at least until the City in some proper way terminated the privilege; and that continuing to accept water service and passing an ordinance regulating water rates after the expiration of the period of the franchise, constituted an implied consent by the City to the continued occupation of the streets by the Water Company. It was further held that under such conditions the Water Company was entitled to charge and receive rates which would afford a reasonable return upon the fair value of its property, and that it could not be compelled to take less by virtue of the City's ordinance; the fair value, by which was measured the adequacy of the ordinance rates, was determined according to the method and upon the principles adopted and applied in the case at bar, and without any diminution because of the lack of a definite franchise.

In National Waterworks Co. vs. Kansas City, 62 Fed., 853; 65 Fed., 691, the Circuit Court of Appeals

and the Circuit Court, each speaking through Mr. Justice Brewer, protected by decree in equity the property of the Waterworks Company until the City paid therefor its present fair value as determined by the court, without diminution because of the lack of franchise, although the franchise under which the Company had operated was expressly limited to twenty years, and although the controlling statute forbade the municipality to confer any right to operate the waterworks for any period beyond twenty years from the date of approval of the ordinance. In that case the Waterworks Company, with the approval and under the protection of the courts, continued to operate the waterworks long after the expiration of said twenty years and until its property was purchased by the City at its fair value, determined as aforesaid.

In 2 Abbott's Municipal Corporations, Sec. 457, p. 1155, it is said:

> "The specific grant of the power to establish and maintain a water supply has been held to include the power to purchase from private persons a plant wholly or partially constructed and in operation. When this right is available, municipal authorities often endeavor to drive a bargain and force a sale, by the private company, of its plant, by refusing to pay a fair value, the interests of bona fide investors suffering by the transaction. It has been held that such a proceeding is a taking of property without due process of law. Such a forced sale is generally sought to be effected by either the threat of competition, a refusal to extend a franchise

for no good or sufficient reason but that of compelling the private corporation to come to its terms or by failing to pay water rentals due under legal contracts, making fictitious objections to the quality or quantity of a water supply, with the purpose of creating litigation in order to effect the same purpose."

In Dillon on Municipal Corporations (5th Ed.), Vol. 3, p. 2199, Sec. 1315, the learned author sums up the entire matter as follows:

"On the expiration of a franchise to furnish water or light and to use the streets of the municipality in connection therewith, for a limited term, the rights of the grantee, unless so provided by law or contract, do not immediately and totally terminate, and the grantee does not become a trespasser on the city streets. A public service corporation has been engaged in the performance of a work of public utility. That service was, of necessity, of a nature which required the occupation of the streets with pipes buried in the soil, with connections therefrom of more or less permanence of character to the buildings and premises of consumers. These improvements could not be removed, nor to any extent interfered with, during the term of the franchise, without interrupting the service the corporation was bound to render; and it must be presumed, where the grant or contract is silent on the point, that it was con-

templated by the parties that the corporation should remain in possession such *reasonable length of time after the expiration of the term as might be necessary to negotiate an extension or renewal of the franchise, or, in default thereof, to close out its business without unnecessary sacrifice.* Even when *the franchise has expired* and the city has a reserved right or option to purchase the property of the company, the *title* to the water or lighting plant or system *does not vest in the city*, until the company has been paid or tendered the value thereof. If the city continues to accept a service of water or light from the company and assumes to regulate the rates therefor, this *gives implied consent* to the continued possession of the streets and operation of the works until such time as the city shall, by reasonable notice, see fit to terminate the corporation's tenure of the privilege. And so long as the corporation continues to perform the service and the city continues to accept it, the obligation of the city and other patrons to pay a *reasonable compensation* therefor will continue. If, after the expiration of the franchise, the city exercises its right to prescribe reasonable rates, *it must do so under precisely the same limitations and conditions as to reasonableness which applied before the expiration of the franchise.*" (Italics ours.)

We therefore respectfully submit that appellants' contention herein before discussed is totally without

merit and so unconscionable that it should not have been advanced.

X.

CONCLUSION.

From what is hereinbefore set forth, doubtless at too great length, the following conclusions are inevitable:

1st: The ordinance in question is invalid because merely an arbitrary exercise of power and not a legislative act, and because it was passed without notice, or hearing, or opportunity to be heard, without investigation, consideration or determination as to the propriety or justice of the ordinance, or of the rates which it prescribed, and in total and intentional disregard thereof. Thereby appellee's rates were reduced by more than twenty per cent., and it was deprived of its property without due process of law, regardless of the question whether the rates so fixed were confiscatory or not; consequently, all questions relating to the issue of confiscation are moot (*supra*, pp. 56, *et seq.*).

2nd: Four hundred and eighty-eight thousand eight hundred and twenty dollars ($488,820) is the largest annual net earning which can possibly be realized under the ordinance rates, and eight per cent. is the least rate of annual net return which will escape the charge of confiscation. It follows that the ordinance rates are confiscatory and the ordinance invalid, no matter what view might be taken of any or all of appellants' contentions concerning valuation. In any

event, property owned by appellee, and having a value of from $4,507,532 to $7,305,649, is taken for public use without just or any compensation (*supra*, pp. 164, 165); consequently, all questions relating to valuation are moot (*supra*, pp. 158, *et seq.*).

3rd: The Master's valuation was extremely conservative and has, beyond possible doubt, been fully sustained (*supra*, pp. 185, *et seq.*). It certainly was not too great; it was, if anything, too little. The ordinance is, therefore, unquestionably invalid because thereby property owned by appellee and having a value of not less than the sum of $7,305,649, is taken for public use without just or any compensation (*supra*, p. 164).

4th: Viewed in any aspect, and for all or any of the foregoing reasons, the ordinance is certainly invalid. The court below by its decree so adjudged, and enjoined the enforcement of the ordinance. It inevitably follows that such decree should be affirmed.

Respectfully submitted,

GERALD HUGHES,
CLAYTON C. DORSEY,
Solicitors for The Denver Union Water Company.
WILLIAM V. HODGES,
Of Counsel.

APPENDIX A.

IN THE DISTRICT COURT OF THE UNITED STATES, NORTHERN DISTRICT OF OHIO, WESTERN DIVISION.

Henry L. Doherty, Charles T. Brown and Frank W. Frueauff, Partners Doing Business Under the Firm Name and Style of Henry L. Doherty & Company,

Plaintiffs,

vs.

The Toledo Railways & Light Company and The City of Toledo,

Defendants.

MEMORANDUM OF OPINION ON MOTIONS OF THE PLAINTIFFS AND THE DEFENDANT, THE TOLEDO RAILWAYS & LIGHT COMPANY, FOR TEMPORARY INJUNCTION.

KILLITS, J.:

The first motions in this case for temporary injunctions to restrain the operations of the so-called Schreiber ordinance were denied because then the City was neither attempting to enforce it nor by its terms allowed to enforce it except through an order

of a competent court before which the complainants could charge and prove, if possible, that it was confiscatory and consequently invalid. The consequence of this opportunity to the complainants to resist an order of enforcement left this court powerless to apply the extraordinary remedy of injunction. The court then had jurisdiction of the main case, to which the motions were plainly ancillary.

It is unnecessary to cover again in full the discussion then had of the relative rights of the company on the streets without franchise, and the City. It is sufficient here to say only that the Company might run its cars from day to day until forbidden by the City at such rate as it was able to collect, and that it had the right to charge a rate that would pay its operating expenses and leave a surplus equal to a fair return upon its real investment, and further, at any time the company might discontinue service, take its cars off the streets altogether, and remove its tracks. The City, on the other hand, might either forbid the company absolutely the use of the streets, or, permitting the use, impose therefor reasonable regulations respecting service and rates of fare.

The ordinance in question never having been accepted by the Company, the initiative for enforcing it was upon the City, and that fact was recognized by its author in the provision directing the City Solicitor to go into court for an order on the company to observe it. It is not an ordinance which the City can enforce through its police power.

Conditions have radically changed, however, since last March. During the intervening months, the City's executive, neglecting the direct and only

proper method of enforcement which the ordinance itself provided, but which involved a decision of the contention loudly urged by the Company that it was oppressive and unreasonable, attempted indirectly its enforcement through an encouragement of reliance upon its terms by individuals. The uncontradicted evidence in this hearing shows that, taking the indefensible position that the measure was self-enforcing, the officers of the City assumed an attitude of sustaining private judgment, even to the extent of suggesting that the power of the City would be employed to assist any individual who attempted to enforce his opinion of his rights under it. This was a wholly indefensible position. To have placed at the call of any individual, to enforce his judgment that he should ride at three cents, a policeman, would have been as flagrant an abuse of power as to have given the same individual police aid to enforce any other private right he assumed to have without any other adjudication than his own consideration.

By the ordinance itself, the Company was given the right to question its obligations thereunder in a duly constituted general forum for the adjudication of responsibilities and was not obliged to submit to the view of any person who chose to board its cars. The effect of the City's attitude, however, was practically an enforcement, and the Company was faced with the alternatives of submitting without a test or of suffering innumerable annoyances and suits in the nature of damages, and, in all probability, violence. It is to deal with precisely these situations that courts of equity are open to suitors of any class, and this corporation, as is the case with any individual person,

is under the protection of the guaranties of the federal constitution.

We hold, therefore, that the court may now, as we could not before, inquire into the charge that the ordinance is confiscatory in its effect, and, if we find the facts clearly sustaining the charge, we may apply the extraordinary remedy of injunction.

This ordinance, as in the case of any other legislation, is favored by every presumption. It is presumed that the public agencies concerned in its production acted intelligently, honestly and providently, and that its terms are reasonable and fair. The fact that a piece of legislation enjoys these presumptions does not, however, make it invulnerable. It may still be attacked in any of these particulars, the presumptions having the effect only of testimony of validity, wherefore clear evidence against it may be adduced to overcome them and to set it aside. The court also, while bound to indulge these presumptions, may look to the surroundings for a measure of their strength. The law of Ohio provides rules to secure deliberation in the passage of ordinances of this kind. Three readings on three different dates are required to precede the adoption of such a measure, unless some emergency or other proper reason impels a suspension of the rules by a three-fourths vote of the council.

This measure, not to go into effect for four months and not for three months after the incoming of a new council and a new administration, was passed to adoption through three readings at one sitting by a council and urged by an administration whose friends had just suffered defeat at an election.

These circumstances suffice to start speculation upon the value of the presumptions. When, however, we find, as the testimony here shows without dispute, that, at the time this ordinance was passed and signed, the executive of the city was not only possessed of statistical information in most illuminative detail from its trusted expert, which, properly considered, showed that a three-cent fare was confiscatory, but that also the force of such statistics to this effect was pointed out in advice privately given in writing and orally by this expert to the executive, with reasons why a three-cent ordinance should not be passed, and, further, that the city had, in November, 1913, no evidence or light whereon to base a fixing of rate except that given it by its own chosen expert to the above effect, it does not take a very acute mind to see that these vaunted presumptions descend nearly to the level of mere legal figments.

However, the court on this hearing honored them to the full by requiring the movants to sustain the burden of their charge that the ordinance was unreasonable by clear evidence, and it was not until, through the testimony of the City's own expert, Nau, and a showing of the experience of the Company, a volume of evidence was had which demanded that the City produce support for the failing presumptions upon which it relied, that the court required any action at all by the City. Every possible facility was afforded the City to support the ordinance, the court adjourning the hearing for five weeks for that purpose. The record now shows in evidence comprehensible to every intelligent man, and derived from testimony in which there is absolutely no dispute, that

this ordinance is unfair and that to attempt to enforce it is to attempt confiscation.

The City Solicitor, after struggling against the inevitable as long as possible, finally, and commendably, confessed that it was impossible either to get any other evidence than that before the court or to draw any conclusion from the testimony, which he could not dispute, than that at the rate of three cents the Company's revenue would do more than barely pay running expenses, leaving nothing for a return upon the investment. There are some lines in the City on which a fare under three cents would pay operating expenses; there are lines on which six cents and even seven cents would not even expenses. There is one line whose revenue does not meet one-third of its expenses, and others whose returns are but one-half to two-thirds of their outlays. Averaging all the lines together, if the public insists upon the present routing, any man capable of doing sums in simple arithmetic can see that an average rate of three cents is too low. It is demonstrated from the record that if every person who has ridden on the cars since March 27th, last, whether he had paid or not, had paid three cents, the income of the Company would barely have paid its expenses, and the months since March are the months of a year when traffic is the heaviest and expenses the lightest.

It is beyond dispute from this record that this ordinance is unreasonable and unfair, wherefore it should be declared invalid, and an order to that effect may be entered.

JOHN M. KILLITS,

September 12, 1914. Judge.

The United States of America,
Northern District of Ohio,
Western Division, ss.:

I, B. C. Miller, Clerk of the District Court of the United States within and for said District, do hereby certify that I have compared the within and foregoing transcript with the original Memorandum Opinion filed in the proceedings of said Court in the therein entitled cause, at the term, and on the day therein named; and do further certify that the same is a true, full and complete transcript and copy thereof.

WITNESS, My official signature and the seal of said Court, at Toledo, in said District, this 2nd day of November, A. D. 1914, and in the 139th year of the Independence of the United States of America.

GARRIGUES, J.

STATEMENT OF THE CASE.

This is an application to compel the district court of the City and County of Denver, to enter a decree in accordance with our judgment and opinion in the case of City and County of Denver vs. Brown, et al., 56 Colo., 216.

In the general statutory adjudication settling the relative priority of irrigating ditches in water district No. 8, on the South Platte river, what is now known as the City ditch, was awarded priority No. 1, by original construction, date November 28, 1860; priority No. 75, by first enlargement, date November 1, 1873; and priority No. 131, by second enlargement, date March 7, 1881. The volume of these appropriations, while determined by the decree, is immaterial for the purposes of this case. July 21, 1902, an action was brought in the district court to have adjudicated the respective rights of consumers from this ditch and June 15, 1908, the court entered what is termed the original decree in that behalf. The City and County of Denver as the proprietor and owner of the ditch and in possession of its decreed appropriations, brought the case here for review. The trial court in that case decreed and held that the consumers from the ditch were the appropriators from the stream with vested perpetual water rights in the ditch for the amount used, which accrued and continued from the date water was first utilized from the ditch on the lands of the consumers, regardless of the amount contracted for, and, being the appropriators from stream owning the ditch appropriations, they were in no way affected by their contractual relations

with the ditch owner, or by cessation in the use of water short of abandonment. In November, 1913, we reversed the case and handed down a written opinion in which we held this ruling and decision of the district court, under the circumstances of this case, fundamentally wrong in every particular; that the original company constructing and owning the ditch as well as its successors in interest were in possession of and controlled the appropriations and must be treated as a ditch owner carrying water for hire, that is, a carrier ditch as distinguished from water users who own the ditch and its appropriation, and also as distinguished from mutual ditch companies in which stock issued to the members represents the consumer's interest in the company, ditch and water; that the water was obtained each year from this carrier ditch by contracts between the respective consumers and the ditch owner entered into annually; that the consumers were all contract users and that the consumers' rights depended upon and were limited and controlled by these contracts; that the contract user was not an appropriator from the stream, nor the proprietor of an appropriation, nor the owner of a water right in the ditch in the full sense of these terms; that while the ditch company was not the owner of the water, it nevertheless owned the right to divert the decreed appropriations awarded the ditch and to charge a rental annually for its carriage, which in effect constituted it the proprietor of the appropriations; that the ditch owner owned, controlled and possessed the right to divert the ditch's decreed appropriations, and, the consumer having contracted for and used a specific volume for a certain year, had the option and was entitled

to contract for the same amount each succeeding year upon tender annually, without intermission, of the lawful rate; that when the contract expired, if he ceased further use from the ditch, he would then be in the same position in the future as one executing a new contract; that his right each year to water from the ditch is not a perpetual right, but is limited by the terms of an annual contract; that when the consumer severs this contractual relation by not renewing the contract, the contractual obligation of the carrier with the consumer is ended, except of course, that the consumer has an option to renew the contract within a definite time from year to year, and if he fails to do so the owner may contract the use and carriage to another who would possess the right of renewal each year until he ceases in the use; that the contracts measure and limit the consumer's right, and in addition contain a privilege or option to purchase the use of so much water annually, if exercised within a certain time each year, without intermission; that a contract user has a right to continue by contract in the future use as against subsequent purchasers, but when he ceases to contract and use the water, he loses the right as against intervening purchasers and his future right to water, if any is obtainable, will begin from the time he again contracts. As to the reservation in the right of way deeds, we held the right reserved, constituted an option which the consumer must exercise each year and if he neglected to do so, he stood on the same plane as other contract users. As to the excess water, which term will be comprehended by those familiar with the litigation, we held the limitations imposed by the city upon the users of

this water were in effect a lease of the amount not necessary for the city's present needs and preserve the water privilege in the city the same as though it had continued in the use. As to the parties who, from their pleadings and proof, had not established under the rule announced in our opinion, that the city was under obligation to furnish them water, we held they were without rights that could be adjudicated or recognized in that suit.

March 4, 1914, remittitur was issued to the lower court; March 15, 1915, the Brown heirs filed supplemental claim; March 24, 1915, the court entered what is termed the second decree; November 15, 1916, the city filed a motion in the district court asking that court to vacate and hold for naught the second decree and enter a decree complying with our judgment and remittitur; March 10, 1917, the district court overruled the motion; and March 17, 1917, an original petition was filed in this court which among other things alleged:

> "That the said district court of the second judicial district, and the said judge thereof, have at all times refused and neglected, and still refuse and neglect, to comply with the terms of said opinion, remittitur and mandate of this court, and to enter a decree in said cause in accordance with the views expressed in said opinion and with the terms and commands of this court embodied in said remittitur and mandate; and that no decree has ever been entered in said cause by said district court, or any judge thereof, in accordance with the views so expressed in

> said opinion, and the commands of said remittitur or mandate, or otherwise or at all; and the said court and the said judge thereof intend to and will, unless compelled by this court to enter a decree in said cause in accordance with the views expressed in said opinion and the terms of said remittitur and mandate, continue to refuse and neglect to comply with the same."

and praying:

> "1. That an order or writ of this Honorable Court issue, commanding the respondents to show cause why said judgment or said decree has not been entered according to the opinion and mandate of this court.
>
> "2. That this Court issue an order commanding the said respondents, John W. Sheafor, as presiding judge of said Court, and said Court, to enter said decree immediately in accordance with the opinion and mandate of this Court."

The answer filed May 2, 1917, is merely a reiteration of the original theory of respondents, sustained by the district court in the original decree, condemned by us as erroneous in every particular, and reiterated again by it in the second decree which shows upon its face that it was entered upon exactly the same theory as the decree reversed. April 28, 1917, a demurrer was filed to this answer upon the grounds: That it appears from the face thereof, that it does

not state facts sufficient to constitute an answer, or return, or defense in favor of respondents.

GARRIGUES, J., after stating the facts as above:

1. The district court entered the first decree upon the theory that each consumer was an independent appropriator from the stream, of the volume he took from the ditch and used upon his land, regardless of his contractual relations with the ditch owner. We reversed the case because the district court proceeded upon this erroneous theory, and, in a written opinion, directed it specifically to enter a decree upon the theory that the consumers were not appropriators and were limited, bound, controlled and governed by their contracts; that such contracts imposed no obligation upon them to continue taking the water if they did not wish to, but provided for a continuous series of annual transactions which the consumer might enter into or not, as he chose, and that to protect himself against others applying for the water, he must exercise the option each year; that if he should, at the expiration of his contract, fail to make demand for the water within the proper time, he would be in the position of one who had never received water and his future rights would date from the time when he again contracts and that, generally speaking, all the consumers were to be supplied alike from all the appropriations. We reversed and remanded the case with directions to the district court to enter a decree upon this theory without further pleadings or testimony, except testimony, if offered, to establish the relative rights of the consumers under

their contracts in and to the respective appropriations, if they were made to supply different classes of consumers, the general rule being, that where a ditch is awarded priorities of appropriation by original construction and by first and second enlargements, as this one was, that all the consumers stand upon an equal footing and are to be supplied alike from all the appropriations. And we pointed out that unless the testimony showed that the several appropriations were made to supply distinct classes of consumers, then the water privilege of each consumer extended alike to all the appropriations decreed the ditch. This was because the claim was made that the three appropriations awarded the ditch were to supply three separate and distinct enterprises or classes of consumers, and while all the appropriations were diverted by a common headgate and carried for some distance through a common canal, still they were in fact to supply distinct and separate classes of consumers the same as though each appropriation had a separate ditch and headgate. On account of this claim, the opinion recognized that a ditch might embrace and have within, along and through it, several ditches in one, with a common headgate, each taken out to supply distinct purposes or enterprises. In such a case the different appropriations though awarded one ditch, would be as distinct and independent as though they were carried in separate ditches, each having its own headgate. If such were the facts in the case here, then of course this would have to be recognized by the city and by the court in the adjudication of the rights of the various consumers from the ditch; but each consumer would be en-

titled to be heard before his rights could be affected by such a decree. We therefore instructed the court to enter a decree upon the pleadings and testimony already taken, except testimony, if offered, to establish whether the different appropriations were made to supply different classes of consumers. If they were not, then all should stand alike upon an equal footing as to all the appropriations. Instead of complying with our directions and following the rule we laid down, the court permitted testimony to be introduced in direct opposition to our instructions, for the purpose of showing that the consumers were appropriators from the stream and owned the decreed appropriations, and entered a second decree upon precisely the same theory as the original. It not only failed to enter a decree in accordance with our directions but affirmatively acted in opposition to our mandate by receiving testimony for the purpose for which we said it should not be received. This is not merely error committed in an attempt to carry out our directions, it is disobedience constituting direct conflict between the two courts. The second decree is as much in direct conflict with the principles declared, with the rule laid down, and with the directions given in our former opinion as the first decree. A writ of review in such a case affords no remedy, and would only make the district court a court of last resort. Where the appellate court directs that a designated course be pursued, the inferior tribunal must yield obedience, otherwise our courts would be in hopeless confusion. The district court had no power and was without jurisdiction to do other than we directed. The second

decree is void, and the motion to vacate and set it aside should have been sustained.

Galbreath v. Wallrich, 48 Colo., 127-130;
Wells v. Littlefield, 62 Tex., 28-33-34;
Perry v. Tupper, 71 N. C., 380;
Patten Co. v. Canal Co., 93 Wis., 283-290;
4 C. J., 1221;
Elliott on App. Proc., Sec. 576.

In Galbreath v. Wallrich, *supra*, we said:

"The reason for this rule is obvious. When a particular judgment is directed by the appellate court, the lower court is not acting of its own motion, but in obedience to the order of its superior. What that superior says it shall do, it must do, and that alone. Public interests require that an end shall be put to litigation, and when a given case has received the consideration of this court, its merits determined, and then remanded with specific directions, the court to which such mandate is directed has no power to do anything but to obey the mandate; otherwise, litigation would never be ended, and the supreme tribunal of the state would be shorn of that authority over inferior tribunals with which it is invested by our fundamental law. By permitting the filing of the supplemental answer and cross complaint the trial court is proceeding contrary to what we directed."

"To permit a trial court to disobey in the least respect the mandate of this tri-

bunal, would inevitably mar the harmony of our whole judiciary system, bring its parts into conflict, and produce disorganization, disorder, incalculable mischief and confusion, by allowing judgments which we have directed to be modified, or questions injected into the case, after being remanded, the purpose of which would be to annul or modify the judgment which this court had directed should be rendered."

In Wells v. Littlefield, *supra*, the court said:

"If the ground taken by respondent's counsel, that we cannot issue the writ because the relator has his remedy by appeal, is to prevail, then this court will be without power to enforce its judgments in any cause. If the district court disobeys our mandate and the injured party appeals, and we again decide in his favor, that court may again disobey, and by continuing this course deprive us of all power to right any wrong which may be committed below. The position of the two courts will be changed. The district court will become the tribunal of last resort, and this court rendered subordinate to it in every respect."

The decree to be entered must of course be confined to the rights of the parties as they were at the time of the trial. It is to be expected that the rights of many of the consumers have shifted, that many changes have occurred since the trial and will occur

in the future, but in all changes in the use of water from the ditch, the rule of law we laid down in our opinion will continue as the guide and must of necessity be followed by the ditch owner in dealing with the various consumers in the future use from the ditch.

The trial court is directed to vacate and set aside the second decree entered March 24, 1915, and to proceed in conformity with the prior mandate of this court, and the writ issued herein will be made absolute.

Decision *en banc.*

Mr. Justice Scott and Mr. Justice Allen not participating.

STATE OF COLORADO,

IN THE SUPREME COURT OF THE STATE OF COLORADO.

The People of the State of Colorado, ex rel. City and County of Denver,
Petitioner,

vs.

The District Court of the Second Judicial District of the State of Colorado, and the Hon. John W. Sheafor, Presiding Judge of Division No. 1, of said Court, and J. S. Brown, Robert S. Brown and George William Brown,
Respondents.

I, JAMES R. KILLIAN, Clerk of the Supreme Court of the State of Colorado, do hereby certify that the foregoing is a true copy of an original opinion filed in the above entitled cause, on the 2nd day of July, A. D. 1917, and now remaining of record in my office.

WITNESS my hand and the Seal of said Supreme Court affixed at my office, in the City of Denver, this 12th day of July, A. D. 1917.

APPEAL FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF COLORADO.

REPLY BRIEF OF CITY AND COUNTY OF DENVER, ET AL.

INTRODUCTORY OBSERVATIONS.

The brief of appellee is striking in intensity and formidable in volume. Exceeding zeal has lead to

many assertions of fact and conclusions of law which would ordinarily not eminate from such eminent counsel. Nowhere is there a yielding spirit. According to appellee every position taken by appellant is untenable—wholly untenable. Out of the scores of questions raised and discussed appellant is always wrong—both in premise and in conclusion. Not even by the fortune of chance has appellant a single time taken the right view or made a correct statement concerning a single question. Even the people, living in appellant's city are the "irresponsible members of the general electorate" (Appellee's brief p. 66), are corrupt, with ulterior motives (Appellee's brief p. 29), turbulent and oppressive in their nature, going about like a roaring lion seeking what they may devour, while the appellee, clothed in its robe of righteousness, is always meek, humble and infallible in every transaction. Even counsel for appellant themselves are tainted with these same vicious propensities, and are charged with making statements alleged to be "loose," "false," "fallacious," "untrue" and made with "ill grace," so that this court will be driven to the record in each instance to verify their statements and to satisfy itself as to the veracity of counsel for appellant on all material questions.

When appellee's positions have been sustained the courts have always written learned opinions and expressed themselves through a distinguished member of the court, while if an expression of the court in any case is adverse to the position of appellee it is an "unfortunate remark of a single judge."

The record, though unusually voluminous and its correctness established by solemn stipulation of counsel and certified to by the trial court (Record page

1120), is wholly imperfect, incomplete and insufficient, and calls for numerous and extended statements wholly outside of and beyond its limits, notwithstanding the case is up for consideration before the bar of the highest and most august tribunal of the land.

In instances almost without number plain expressions of learned and consciencious courts have had to yield to what appellee's counsel believe must have been their spirit and intention; and by a subtle process of elimination and substitution courts of less keen vision could easily be misled, and the oracles of the law entirely obscured. All this can serve but to increase the labors of this court and impel it to a greater effort to scrutinize the record of facts and the decisions announcing the law. We are willing—entirely willing—to rest our case upon and within the record as here lodged, and upon the plain, ordinary meaning of the rules of law and court decisions bearing upon it.

Much has been said by appellee that is so foreign to the material issues and so wholly without merit that it would be presuming upon the duties and time of this court to give it even passing consideration. Conspicuous also are questions argued at great length, which are presented for the first time here and which were not raised in the court below, but on the other hand, evidently sometimes purposely omitted in the court below, and without an effort to show or even the termerity to argue that they are covered by the assignment of cross errors. As an illustration, the power of the City and County of Denver to enact such an ordinance as here involved is questioned in a discussion covering thirty-seven pages of the brief not-

withstanding an amendment to the bill of complaint found at page 81 of the Record not only strikes out the portion of the bill referring thereto, but evidences a clear intention to eliminate it from consideration in the case, and notwithstanding further that not a single one of the cross errors of appellee even so much as hints at the objection. Numerous other instances could be pointed out, but as they will be obvious it would serve no useful purpose.

It would ordinarily be supposed that the appellant and its counsel possess some attributes of truth and that sometimes to the undefiled some things would be pure, but a perusal of the voluminous brief leads to a forlorn hope as they march triumphantly on like the mighty Philistine to slay the shepherd boy representative of the children of Israel.

If the ordinance in question is confiscatory, in justice to the appellee it should be overthrown. If it is not and if a rate of return is being asked upon property and values which ought not to be allowed, and if the ordinance in question establishes a rate that will afford a fair return upon the reasonable value of the property of the appellee used and useful, this court will not hesitate to uphold it.

In our original brief we pointed out why the ordinance should be upheld. In making numerous deductions from a very voluminous record that we may have inadvertently fallen into slight inaccuracies goes almost without saying, and as they have been or may be discovered we will freely admit them. Perfection is not one of our attributes. But where errors have been unjustly charged, perhaps through unintentional error of opposing counsel, we shall

content ourselves with pointing out the facts as found in the record to enable this court to satisfy itself from its own deductions.

While there is something to be said on the side of the appellee on many of the questions its counsel have raised, their positions are far—very far—from being incontestable, and in some very important particulars they are wholly without support in law or in fact. Although counsel for appellee allege all the merits to be on their side of the case they spend much time and extensive space in an endeavor to shut out this court from a consideration of the merits of the controversy. If always right, why not be unafraid? With such an abiding conviction and such an intense confidence in the correctness and justice of their cause why tremble at being judged by a just tribunal?

This court has said that its power in such cases is best safeguarded against abuse by preserving to this court complete freedom in dealing with the facts of each case. That in view of the nature of the judicial power involved in such cases it is not tolerable that its exercise should rest securely upon the findings of a master even though they be confirmed by the trial court. In cases of this character the court will not fetter its discretion by artificial rules, however useful and well settled these rules may be in ordinary litigation. (Knoxville v. Water Co., 212 U. S. 1.)

In this case the appellee frequently urges that the findings of the master are conclusive, both as to the law and the facts, and that appellant is not at liberty to call them into question. A reference to the order referring the case to the master to take testimony and make observation as to the facts and the

law will hereafter be made. The master was merely the representative of the trial court. No halo of sanctity is cast about the results he reached or the report he made; his conclusions are no more binding than would be the findings of a jury or a trial court if the evidence had been taken before such jury or such court. It is true the trial court adopted the master's conclusions in their entirety, but they are nevertheless open to question at least to the same extent as the conclusions of fact and law of the trial court would be in any other case.

We do not understand that there is any force in the statement so frequently found in appellee's brief that because in our opening brief we did no dwell at great length by statement and argument, covering many pages, on certain questions presented by the record, that those contentions have been abadoned. Half a page is as sufficient as a volume if the point is sufficiently covered. Brevity is sometimes the soul of wit. If force of argument is to be determined by the number of printed pages, if a proposition once clearly stated is re-enforced by reiteration, if the same long quotations from court reports frequently repeated go for making strength, if bringing in and submitting to the court page after page of matter not in the record and entirely foreign to the question under discussion will help in any way to a correct solution of questions which are serious and important and vexing enough at best, then perhaps appellant must yield to appellee. If entirely unjustified criticism of lawyers engaged on the other side of the controversy may help, then certainly we are at a disadvantage. We will not enter the arena and engage in any such combat. We

doubtless have made mistakes and it may be that our judgment is not always sound, but we certainly would not here or elsewhere attempt to mislead any court, and we would not be so foolish as to consciously make misstatements to be subjected to the keen scrutiny of counsel, who are always willing to seize upon them and capitalize them at many times their face value.

On page 2 of the brief of appellee the first ground of attack is that the ordinance involved in this case is illegal on account of the manner of its passage. As already stated this ground of attack was stricken from the complaint by amendment (Record p. 81) which evidenced a clear intention to abandon the position, and it nowhere appears at any place in the record that this question was at any time even so much as mentioned in the court below. This subject will receive further attention later.

The court's attention on page 3 of brief of appellee has been invited to an option agreement which is nowhere to be found in the record. If it is permissible, if the proprieties of the occasion even so much as permit a reference to that which is wholly outside of the record, we are willing to admit that since the conclusion of this case in the court below the appellee has tendered to the appellant an option to purchase this property at a valuation not to exceed that fixed by the special master, or at any valuation to which the same may be reduced under the ruling of this court on any of the questions involved; but we do not understand that this converts the case into a purchase case. Certainly the City could not have obtained the option had not the appellee been abundantly willing to execute and deliver the same to the appellant, because it is an *option* given by the

appellee and not by the appellant. In the motion filed in this court to advance this case counsel for appellant had no intention whatever of in any way referring to any such subject wholly outside of the record. We said then and we say now that the determination of this case by this court will undoubtedly furnish a basis of further action on the part of the City and County of Denver for the acquisition of a municipal water plant, but what this action is to be is for the people and not for counsel to say.

Appellee says that for more than twenty years the controversy over the Denver water plant has "continuously raged" and has made many references which purport to say that the controversy has always been the fault of the City and its people, forgetting perhaps that a controversy cannot "continuously rage" without there being two parties to such controversy. They refer in their brief on page 7 to "the fierce competition" between the Denver City Water Company and the Citizens Water Company, and on page 8 say that the two companies were in active competition until 1894; that "a fierce rate war resulted," and they make other statements of a similar character. It thus appears that the fire of "controversy," which has so continuously raged, was kindled between two of the companies absorbed by the appellee, and if appellee has continued to burn inwardly with rage ever since it is not surprising. Many other references are made in the opening pages of appellee's brief to controversies which found their way into the courts, but it is sufficient to say that some of them were decided unfavorably to the appellant, and others unfavorably to the appellee, among which may be noted cases decided by this court:

City and County of Denver v. New York Trust Company, 229 U. S. 123; Wheeler & Lusk v. Denver, 229 U. S., page 123.

In the opening statement of appellee much stress has been laid upon former valuations and estimates of the value of the plant of the water company. All of these references are wholly immaterial because the ultimate question in this case depends upon the value to be fixed upon the property of appellee by the court in this very case and all of the conflicting evidence referred to was evidence which was submitted to and considered by the special master and is not now being made the subject of attack. Appellee refers to a higher appraisement alleged to be made by virtue of the terms of Ordinance No. 163 of the Series of 1907, but if this was evidence such discrepancy is explained by the admission of counsel for appellee where they say at page 29 of their brief that this discrepancy "is largely accounted for by the fact that the master excluded certain items of the property and elements of value which the other had included." They also refer to an unofficial report of an engineering committee of the Public Utilities Commission which, although it very properly excluded any value for water rights and going concern, was never adopted by the Public Utilities Commission.

Indeed if matters of this kind are evidence of value we would call attention to the fact that the people of Denver by amendment to their charter in 1910 adopted Sec. 264-A, in which they offered appellee $7,000,000 for all of its property used and useful in supplying the City and County of Denver with water, and on the refusal of the appellee to ac-

cept the tender commenced to spend an authorized issue of $8,000,000 to build a new plant, which appellee has been continuously endeavoring to prevent ever since.

(Wheeler & Lusk vs. Denver, 229 U. S. 342. Wheeler & Lusk v. Denver, now pending in this court on motion to dismiss.) Neither is controlling of value in this case.

In view of the psychological effect which appellee has sought to produce it is not inappropriate to say that it is the desire of appellant to preserve and not destroy, and that the appellant is not now approaching a settlement of this controversy in any spirit of bitter or unwarranted attack (page 24 appellee's brief) or with an "ulterior motive," or for the purpose of establishing fierce competition or of destroying or reducing values, but in a conscientious effort to see that right and justice may be done, both to the people of Denver and to the owners of the Denver Union Water Company, and to obtain the impartial opinion of the highest tribunal to which we may appeal for the purpose of furnishing a basis for the settlement of our honest differences. To destroy or confiscate the property of the appellee would be an injustice which would be reflected to the injury of the people in the community where the appellee is doing business, and would be an economic waste which would injure all.

Moreover our purpose and our only purpose is to see that justice as between the community and the Water Company shall be discovered and established in order that all disagreement may be forever set at rest; and harmony and tranquility permanently established.

As the completed brief of the appellee only came to appellant on September 12, 1917, less than three weeks before the date set for the argument of the case, it is needless to say that it would be a futile mental effort, as well as a physical impossibility, to analyze all of the cases cited by appellee and to reply to every criticism made by appellee in so short a time. We shall simply endeavor in this brief to cover some of the more important points and discuss some of the questions which it is thought may be the most helpful to the court in considering the case.

Counsel for the appellee imply that because we were not engaged in the trial of the case below, as they were, we are in some measure disqualified from a proper consideration of the questions here. While it is true we have not had the same advantage of becoming familiar with the facts as they have had, we have also not been under the disadvantage of laboring under impressions obtained in and out of the court below which are not borne out by the record.

ARGUMENT.

SCOPE OF THE REVIEW.

The first point argued by counsel for appellee is as to the scope of this review (pp. 37 to 55, appellee's brief). They argue, first, that the order of reference to the Master was by consent, and hence his conclusions are not open to question; and second, that inasmuch as the record does not contain all of the evidence taken that appellants are foreclosed from considering the evidence.

The order of reference in this case is as follows:

> "This cause being at issue and it appearing to the Court that the issues and the conditions as herein presented are so exceptional as to require the appointment of a special master and the reference of this suit to him for the purpose of taking testimony and reporting to this Court; all parties hereto consenting;
>
> It is ordered that W. J. Chinn of Colorado Springs be appointed Special Master in this suit with all of the powers conferred upon the Master under the rules of practice for the courts of equity of the United States, and subject to the further orders of this Court, with power, subject to review by the Court, to pass upon the legal admissibility of evidence. This suit is referred to said Special Master for the purpose of taking all testimony in the suit and reporting to the Court said testimony, his findings of fact and such conclusions of law as he may deem essential to the proper advisement of the Court. Each party will deposit within ten days $500 to be applied on Master's allowance" (Record, page 112).

Under the foregoing order of the Court and recitals as to consent therein contained, this is not a submission by consent of the controversy to the Master. It appears that the parties did consent that the reference be made to the Master for the purpose of

taking testimony and reporting to the Court, and the Court ordered that it be referred to the Special Master for the purpose of taking all testimony and reporting such testimony to the Court and his reporting his findings of fact and such conclusions of law *as he may deem essential* to the proper advisement of the Court. As far as the order itself is concerned, the reference in this case was not different from a reference to a referee. But assuming that the rule, as laid down by counsel in the cases cited, viz.: Kimberley vs. Armes, 129 U. S. 512; Davis vs. Schwartz, 105 U. S. 631, and in Adamson vs. Gillilland, 242 U. S. 350, are controlling in this case, it only means that the findings of fact of the Master would be taken as presumptively correct, subject to be reviewed when there has been error in the consideration given to the evidence or in the application of law.

We have not attempted in our original brief to attack the findings of the Master when his findings are the result of conflicting evidence. We have taken all of his findings of fact as presumptively true, but have from time to time questioned the sufficiency of the evidence and the character of the same, upon which the Master based his conclusions, and surely, even if it be conceded that the reference was by consent, or even that the whole matter in controversy was submitted to the Master, still his findings and conclusions could be no more conclusive than the findings of a jury, and surely no more conclusive than the findings of a trial court.

In rate making cases, however, where it is sought by a complainant to set aside in a court of equity the action of a legislative body, this Court has adopt-

ed a different rule as to the conclusiveness of the Master's findings.

In the case of Knoxville vs. Water Company, 212 U. S., page 1, the Court, by Mr. Justice Moody, page 8 of the opinion, says:

> "There can be at this day no doubt, on the one hand, that the courts on constitutional grounds may exercise the power of refusing to enforce legislation, nor, on the other hand, that power ought to be exercised only in the clearest cases. The constitutional invalidity should be manifest, and where that invalidity rests upon disputed questions of fact, the invalidating facts must be proved to the satisfaction of the Court. In view of the character of the judicial power invoked in such cases it is not tolerable that its exercise should rest securely upon the findings of a Master, even though they be confirmed by the trial court. The power is best safeguarded against abuse by preserving to this Court complete freedom in dealing with the facts of each case. Nothing less than this is demanded by the respect due from the judicial to the legislative authority. It must not be understood that the findings of a master, confirmed by the trial court, are without weight, or that they will not, as a practical question, sometimes be regarded as conclusive. All that is intended to be said is, that in cases of this character this Court will not fetter its discretion or judgment by any artificial rules

> as to the weight of the Master's findings, however useful and well settled these rules may be in ordinary litigation. We approach the discussion of the facts in this spirit."

The foregoing quotation from this Court is a complete refutation of all of the contentions of counsel with reference to the conclusiveness of the Master's findings, either of fact, or questions, as they express it, of "mixed law and fact," and whatever view may be taken as to the character of the reference in this case, yet under this rule this Court is not prohibited from and it is its duty to review not only questions of law, but also such questions of fact as may be necessary to be examined in order to determine whether the Master has committed error in any of his conclusions. We have followed strictly, we think, the rule as laid down in the case just cited. We have recognized that the findings of the Master should be given weight, and where questions of fact are involved, have treated his findings as presumptively correct, but as has been said, this Court should not be fettered by any artificial rules as to the weight of the Master's findings.

The court below should have given consideration to the exceptions which had been filed to the Master's report, should have investigated the evidence and weighed it, and from its own personal investigation of the record should have come to an independent judgment as to whether or not the findings, which were reported, were correct. The court below did not do this. It held that the findings of the Master were conclusive, both as to the questions of law and as to fact, and simply affirmed such findings in *toto*.

The ultimate question to be determined in this suit is as to whether or not the ordinance in question is confiscatory of complainant's property. All other questions are incidental, but in order to arrive at this ultimate question it is necessary to consider several independent elements. The first to be considered is the fair value of complainant's property used in furnishing water for Denver and its inhabitants. The next question in logical order is the return that the company is getting from its investment, and lastly, the rate of return after deducting taxes and operating expenses. On page 10 of the opening brief we have subdivided the topics for discussion, and each and every one of them raised by us are legal questions. As said before, we have challenged the sufficiency of the evidence, and have said that it is not of that character required in rate making cases where it is sought to set aside the action of a legislative body. On page 45 of their brief counsel say that the record "does not contain, nor purport to contain, all the evidence on all the issues, nor all the evidence on any issue decided by the Special Master," and cites the case of Sheffield Company vs. Gordon, 151 U. S. 285, in support of the proposition that in the absence of a certificate by the Master that the entire evidence taken by him was sent up with his report, it is impossible to impeach his conclusions upon it. There is no basis for this contention, as in paragraph 1 of the Master's report (Record, p. 118) he certifies as follows:

> "All of the testimony, as well as all exhibits offered on the hearing, are described in Exhibit A, and are returned and filed with this report."

The claim is also made that the evidence, in part, consists of that gained by actual inspection by the Master, and that, therefore, the Master's findings are conclusive. It has been held in some cases that where some particular fact was established before a jury, either by a view of the jury or by certain physical demonstrations, and when such fact was the controlling fact in the case, the Court would not disturb the verdict thus arrived at. The only thing in the record here, with reference to a view, is the statement of the Master in his report at page 141 of the record, wherein he states:

> "September 10th and 11th, at the request of complainant, I used in a journey to Lake Cheesman with counsel representing each party hereto."

Lake Cheesman is only one unit, and there is nothing in the Master's report to indicate that this little diversion in any manner influenced him or changed his opinion from what it would have been if he had not taken the trip. The request was made by the complainant, there was no consent to the trip, nor is it shown that any view was made of anything in which any facts were controverted by the parties. It is hardly necessary to argue so trivial a question as this. Bearing in mind the language of this Court in the Knoxville case, above referred to, that "it is not tolerable that its exercise should rest securely upon the findings of a master, even though they be confirmed by the trial court," it is unnecessary to pay any further attention to this claim.

Furthermore, the record in this case is here by stipulation, and it is agreed by respective counsel

that it contains the statement of the evidence that is to be used for the purposes of defendant's appeal and the cross-appeal of the plaintiff to the Supreme Court of the United States under Equity Rule 75, (Record, page 1120); and the parties having solemnly agreed that this statement, which is the record herein, is all of the evidence, both parties are bound by it. Counsel have made frequent references throughout their brief to our unfamiliarity with the evidence taken before the Master, and have copiously quoted from and stated evidence, which it is claimed was taken before the Master, but not included in this agreed record. We confess we are not familiar with the evidence taken before the Master, except as represented in this agreed record. We have taken the record, as we undoubtedly had the right to do, as a complete statement of all of the evidence in the case, and expect to stand or fall by what it contains.

In view of the stipulation filed herein, appellant had the right to assume that the record as prepared fairly and fully contained the matters necessary for the appellate court to have before it in a review of the case, and it is unbecoming of counsel, to say the least, to now say that the record is not complete. Counsel well know that the record was not prepared by the appellant, but was prepared by counsel themselves, and prior to the time arguments were had before the Master. Counsel not only prepared the record themselves, but agreed that what they had prepared was a full statement of the evidence; but notwithstanding this agreed record, counsel have all the way through the brief contributed matters not contained in the record in an endeavor to sustain their various contentions, and we refer to this, not

for the purpose of entering into an unbecoming controversy with counsel as to their good faith, but merely for the purpose of endeavoring to aid the Court in arriving at a fair conclusion of the matters reviewable in this case.

Exceptions to Master's Report.

On November 5, 1915, both the complainants and the defendants below filed their exceptions to the report of the Master. The exceptions filed in behalf of the City and County of Denver contained twenty-two separate assignments (Record, p. 1131), and after the Court had ruled upon these exceptions the City filed its assignment of errors, containing thirty-one separate assignments (Record, p. 1147); these assignments were full and complete. They pointed out with particularity all of the objections urged in appellant's original brief, and with more particularity than the rules of this Court require. It is not necessary, either in exceptions filed to a Master's report, or in assignments of error, to write a brief. It is only necessary to direct the Court's attention to the matters expected to be urged in support of the appeal.

As has been said before, the ultimate question involved here is as to whether the ordinance in question is confiscatory. The Master reported that after an examination of all the evidence he was of the opinion that it was confiscatory. No other direct issue was involved, yet for the convenience of the Court we have carefully enumerated in thirty-one assignments the various incidental questions, involving this ultimate question, and believe that in a case of this char-

acter, involving as it does, the act of a legislative body, in view of the Court's attitude in such cases, the Court should not circumscribe itself by any technical or artificial rules which would prevent it from a full and fair consideration of the matters necessary to be considered in arriving at the real question at issue in the case. It does not appear that the District Court made any examination of the evidence for the purpose of determining whether or not any questions were raised by the exceptions that could be passed upon by the Court, but nevertheless the Court held that all questions of fact raised by the exceptions were not open for consideration, and also that the exceptions did not raise questions of law for determination by the Court material to the case (Record, page 1138), and the Court thereupon approved and confirmed the Master's report and held the ordinance to be invalid and of no force or effect whatsoever, in that said ordinance attempted and did deprive the complainant of its property without due process of law (Record, page 1141).

The contention of counsel that the exceptions to the Master's report and the assignments of error herein are insufficient is technical in the extreme, and the cases cited by them in support of this proposition do not bear them out. They are cases in which there was either no exceptions made to the report of the Master, or in which the exceptions virtually amounted to a general denial of the whole report of the Master.

On page 52 of their brief counsel, under a separate heading, again raise the question of the sufficiency of the record and state that it was not pre-

pared for the purpose of presenting points now urged. They then follow this statement by referring to Rule 8 and Equity Rules 75 and 76, and state that the purpose of these rules is clear, and that is, to limit the record on appeal to those portions only of the record in the lower court essential to the presentation in the Appellate Court of the questions properly reserved in the court below, and state again that subdivision (b) of Equity Rule 75 requires that all parts of the evidence, not essential to the decision of the questions presented by the appeal, be omitted. Why their argument under this topic should be prefaced in the manner just referred to is not clear, for it is evident that the record in this case was prepared in strict observance of the rules referred to. The record contains almost 1,200 pages, in addition to the various exhibits that are included therein. There were few exceptions taken to the introduction of testimony, hence there was no purpose of setting out the examination of the witnesses by questions and answers, but it is evident that the transcript contains a narrative statement of all of the testimony introduced.

At page 53 of its brief appellee says that appellee refrained from objecting to the record as prepared, and also stated:

> "It is, to say the least, doubtful whether there are any questions open for consideration upon this appeal. If there be any, they are, at most, confined by the exceptions and assignments of error to a few naked questions of law. Obviously the appellant prepared the record with this in view, and in-

> cluded only those parts of the evidence '*deemed by them essential to the decision of the questions presented by the appeal.*' It is equally obvious that for the reason aforesaid appellee refrained from objecting to the record thus prepared."

Counsel not only refrained from objecting to what they themselves had prepared, but stipulated that the statement of the evidence, as prepared, was a statement of all of the evidence to be used on the appeal and cross-appeal. Now what is the evidence contained in the record that counsel say was deemed by the appellant as essential to the decision of the questions presented by the appeal? An examination will show that there is a complete narrative statement of the testimony of witnesses as to the value of the property in controversy as to the value of the so-called "going concern," to the depreciation item, to overhead charges and interest during construction, to operating expenses, to what would be a fair return, to the rate of return, and to various other questions which are incidental to these main questions. In fact, it is not shown that there was any evidence given before the Master not included in this record. When the statement of the evidence was agreed upon a number of the exhibits were by the agreement left out of the record, and probably for the reason that these additional exhibits were either duplicates of exhibits that were included by the stipulation, or were considered immaterial. In any event, the parties stipulated both as to what evidence would be considered on the appeal, and as to what exhibits would be included in the record.

METHOD, MANNER AND MOTIVE OF PASSAGE OF THE RATE ORDINANCE.

Pages 29 to 32 and 56 to 92, inclusive, of appellee's brief are devoted to a discussion of the method, manner and alleged motive of the passage of the rate ordinance.

This extensive disquisition is asserted to be in vindication of certain legal principles, but the discussion does not seem to arrive at any definite conclusion, is only partially concerned with matters in the record and is apparently used by appellee with a view to its moral effect. In other words, the whole object of the discussion is to create an atmosphere hostile to the appellant and favorable to the appellee, and in order to create this atmosphere appellee does not hesitate to indulge in various forecasts of what the City Council would have done and what the people of the City and County of Denver would have done, although, as a matter of fact, there is no proof whatever as to what would have been the course of any of these persons had they adopted a different course from that which they actually pursued. Disentangling, so far as we may, from the somewhat complicated and involved discussion of the appellee the cardinal points which it wishes to enforce, they seem to amount to this:

1. That the City Council passed the ordinance, not for the purpose of regulating rates, but with some ulterior and wicked motive, and particularly with the idea of hampering and damaging the business of the Company.

2. That the City Council passed the ordinance without consideration or examination and without giving the Company a hearing, which, appellee declares, rendered the ordinance void.

3. Lastly, it is asserted, so far as we can fathom the argument of the appellee, that the fact that the ordinance might have been submitted to the people for a vote under certain circumstances, although as a matter of fact, it was not, renders the ordinance void.

On page 76 of the record, at paragraph 16 of the bill of complaint, it is alleged that the ordinance in question was prepared under the direction of the Public Utilities Commission, *was introduced in the Council, and enacted, approved and published in accordance with the Charter of the defendant City and County of Denver.* Then follow the allegations that said ordinance was passed without consultation with the complainant and without notice or opportunity for complainant to be heard, and that neither the Public Utilities Commission nor the City Council attempted prior to its enactment, to investigate its fairness or justness, and that it was adopted for the purpose of crippling and hampering complainant, and to enable the City and County of Denver to purchase the properties of complainant at less than fair, actual, present value. There is no allegation, however, to the effect that the City Council did not have jurisdiction or that it did not have power to pass the ordinance, and the facts, as above briefly related, beginning immediately after the italicized words, were denied by the answer (Record, pages 102, 103, paragraph 16).

But these allegations of lack of notice and of failure to afford the Company an opportunity to be heard, and the failure of the City Council to investigate the fairness of the rate are allegations without avail insofar as raising the question of the legality of the ordinance is concerned; for the legality of its passage had already been admitted in the preceding portion of the section, and we will quote the words again with reference to the passage of the ordinance: "* * * *was introduced in the council and enacted, approved and published in accordance with the charter of the defendant City and County of Denver.*" (Italics ours.) After having made this admission in the allegation, its effect could not be contradicted by what followed, and the subsequent portion of the allegation must be treated as merely matters in aggravation of the complainants' contention that the rate fixed by the council was unjust and confiscatory or, at most, to rebut the presumption that obtains that the rate was reasonable, and it is evident that it was not the intention of the complainant in its bill to raise this question of the illegality of the passage of the ordinance. For if such had been its intention, it would not have stricken from the bill paragraph 24 (Record, pages 81, 90), which was as follows:

> "Twenty-fourth. Neither the Council of the City and County of Denver, or any of the members thereof, who passed or acted upon Exhibit 'A' (the rate ordinance) had any right, power or authority whatsoever to consider, enact or approve said Exhibit 'A' under Article XX of the Constitution of the State

> of Colorado, or of the Charter of defendant, the City and County of Denver, and each and every act and pretended act of said Council, and the members thereof, in reference to said Exhibit 'A,' is and was at all times of no effect whatsoever. *Said Exhibit 'A' is null and void and of no force or effect whatsoever because not legally passed or adopted by the Council of the City and County of Denver*, or any of the members thereof, having the power to act in the premises, and neither the Council of the City and County of Denver or any of the members thereof, had any right, power or authority to fix or attempt to fix the charges for services rendered and to be rendered by the complainant." (Italics ours.)

The allegation above quoted is the only allegation of the bill which raises the question of the power of the City Council of the City and County of Denver to pass the ordinance, and this was in conflict with the admission in Section 16 of the bill and was eliminated from the bill by an amendment (Record, page 90), said part being voluntarily eliminated by the appellee in order that but one question would be presented to the Court for its determination, viz.: the question as to whether the ordinance, fixing the rates was confiscatory. The purpose of the amendment eliminating this section was evident, and is further evidenced by appellees failure again to raise the question in the proceedings below. Furthermore, we have been unable in our examination of the record to find any evidence sustaining the allegations of para-

graph 16 of the bill as to the illegality of the ordinance.

The Master makes the observations on page 120 of the record that the Water Company had no notice from the defendant of the proposal to draft or enact the ordinance other than that given by its publication in a newspaper; that when the ordinance came before the City Council for consideration the members of the council were of the opinion that it was their legal duty to pass it without making any attempt to determine whether the rates prescribed by it were reasonable.

These observations of the Master were not findings and do not purport to be findings, but are simply preliminary observations. The findings and decision of the Master with reference to the validity of this ordinance are as follows: *"It is presumed that ordinance 26 of the series of* 1914 *is valid, and that the rates fixed by it are reasonable and fair, and therefore sufficient to permit the Water Company to earn a fair return for the use of its property by the public"* (Italics ours) (Record, page 120).

The findings of the Master just quoted were not excepted to by appellee, was not made the subject of an assignment of error, and therefore the question of the validity of the passage of the ordinance is not the subject of review by this Court, even were there issues and proof to sustain its invalidity.

It is nowhere alleged in the bill that the ordinance was passed by the Council under the belief that it was compulsory for the Council to pass it and the fact that the then City Attorney was mistaken as to the law with reference to the province and duty

of the City Council or as to the effect of the Council's act in passing the ordinance does not affect the City as to its undoubted legal rights.

Counsel has frequently throughout this brief assumed that the Council passed this ordinance at the behest of the signers to the petition, but the Charter does not so provide. The Charter provides, as is set forth in counsel's brief, page 64, that when a proposed ordinance is submitted to the Council by petition such proposed ordinance shall be passed by the Council without alteration, *or* the Council shall refer such proposed ordinance to the qualified electors. The Council has a perfect right to pass the ordinance if in its judgment and wisdom it should be passed, or it can refuse to pass the ordinance if in its judgment the ordinance should not be passed; but in case of its refusal it then becomes its duty to submit the ordinance to a vote of the people; but if the Council, as said before, in its judgment, sees fit to pass the ordinance, it is a legislative act; not the act of a commission exercising judicial power, but a legislative act, and an act which has the same force and effect as an act of the Legislature of a state.

On page 65 of their brief, counsel have referred to and quoted from Article 20 of the State Constitution, which is the home rule amendment; have referred to the cases in Colorado with reference to the purport of this amendment; have quoted from the Charter itself and have quoted from an amendment to Article 20 of the State Constitution, the same being Section 6 thereof, to the following effect:

> "All provisions of the Charter of the City and County of Denver * * * as heretofore certified and filed with the Secretary of State * * * are hereby ratified, affirmed and validated as of their date."

The following is the initiative provision of the charter referred to by appellee, viz:

> "Any proposed ordinance may be submitted to the council by petition therefor of qualified electors equal in number to at least five per cent of the last preceding vote for mayor, and such proposed ordinance shall be passed without alteration by the council, and if vetoed by the mayor shall be passed over his veto, within thirty days after such petition is filed, *or* the council shall refer such proposed ordinance to the qualified electors at the next municipal election held not less than sixty days after such petition is filed." (Page 142, Sec. 273, Charter, as revised to May 17, 1916.)

The provision in the charter referred to by counsel giving the City Council power to regulate rates is as follows:

> "All power to regulate the charges for service by public utility corporations is hereby reserved to the people, to be exercised by them in the manner herein provided for initiating an ordinance." (Page 146, Sec. 280 of charter, as revised to May 17, 1916.)

The following is the charter provision of Denver relating to the introduction, publication and passage of ordinances:

> "* * * No ordinance shall be passed except by bill, and each bill, when introduced, shall be read at length, and shall not be so altered or amended as to change its original purpose. No ordinance shall take effect until published in some newspaper of general circulation published in the City and County, or in book or pamphlet form, by authority of the council. The manner of publication shall not be changed after the beginning of the fiscal year.
>
> No bill or resolution shall be passed until after the expiration of one week from and after the introduction of the same, nor until one publication thereof shall have been made. Any amendment altering the same shall be published in like manner before final action thereon. * * *" (Page 120, Sec. 216, Charter as revised to May 17, 1916.)

It is admitted by the appellee in the bill of complaint that the ordinance was passed in accordance with the charter. And according to the bill of complaint it is admitted that the ordinances had been prepared by the Public Utilities Commission more than a month before its passage by the council (Record, page 76).

So, therefore, it is conceded that the people of Denver have by Charter the same plenary power, as the State Legislature would have. It follows that

the people of Denver, by its Charter, had the right to provide that ordinances might be submitted to the Council for its passage, or in the alternative be submitted to the people for their vote. But counsel say that the Council passed the ordinance because and solely because it was submitted to the Council by petition, and seem to abhor the idea that 5,593 signers of the petition, not officers of the city, *but irresponsible members of the general electorate,* should be able to demand that an ordinance of this character be passed; but the submission of the petition by this "irresponsible electorate" amounted at least to the introduction of a bill. It did not become a law until either the Council in its judgment saw fit to pass it or until upon its refusal to pass it, it was voted upon by the whole "irresponsible electorate," and the ordinance having been passed in the manner provided by the Charter, and in no manner obnoxious to the Federal or State Constitutions, it became a law, and as to what was in the minds of the members of the Council when they passed the law, or as to what their supposed duties were in respect to the law, the courts are not at liberty to inquire. Their motives and reasons for passing a law, certainly cannot be inquired into by the judiciary; neither is there any evidence in this record, or counsel's contributions to the record, tending to show that the ordinance was passed with any other than honest motives.

It should also be borne in mind that the Assignments of Cross-Error of the appellee are strictly limited and are stated by the appellee to be intended to take effect only in the event that the appellant succeeds in overthrowing the report of the Master. The

appellee indeed throughout this brief has been urging with great show of earnestness that the Master's findings are incontestable and indisputable, and yet the whole discussion of the passage of the rate making ordinance is a direct attack upon the Master's very first conclusion of law. Under the circumstances it cannot be doubted that what appellee has to say on this branch of the case is used purely for its psychological effect.

It is contrary to our form of government for the judiciary to question the motives of the legislative branch of the government, or to inquire into legislative bodies' means of knowledge in passing a law when it has power to act.

In the case of Chesapeake and Potomac Tel. Co. vs. Manning, 186 U. S., 238, Mr. Justice Brewer thus states the rule at page 245 of the opinion:

> "But it is well settled that the courts always presume that the legislature acts advisedly and with full knowledge of the situation. Such knowledge can be acquired in other ways than by the formal investigation of a committee, and courts cannot inquire how the legislature obtained its knowledge. They must accept its action as that of a body having full power to act, and only acting when it has acquired sufficient information to justify its action."

In the case of Soon Hing vs. Crowley, 113 U. S., at page 710, this court held that the motive of legislatures, except as disclosed on the face of the acts, will not be inquired into by the Court. There is an

exception, however, to the rule as laid down by Judge Brewer, and that is in a case where the penalties for disobedience are by fines so enormous and imprisonment so severe as to intimidate the company and its officers from resorting to the courts to test the validity of the legislation.

See Ex-parte Young, 209 U. S. 123, 147.

In the Young case just referred to a statute had been passed by the Legislature of the State of Minnesota reducing the rates of a railroad company. The penalty for violation of the act was a fine not exceeding $5,000 or imprisonment in the state prison not exceeding five years, or both such fine and imprisonment. In the present case the penalty fixed by the ordinance was a fine of not less than one hundred nor more than three hundred dollars (Record, page 90). And in the State of Colorado an action to enforce a penal ordinance is not in the nature of a criminal action, but a suit to recover the penalty imposed thereby, which is in the nature of a civil action, and the penalty is not so enormous as to intimidate the company and its officers from resorting to the courts, as was said in the Young case.

> "The validity of legislation can never be made to depend on the motives which have secured its adoption, whether these be public or personal, honest or corrupt. There is ample reason for this in the fact that the people have set no authority over the legislators with jurisdiction to inquire into their conduct, and to judge what have been their purposes in the pretended discharge of the legislative trust. This is a jurisdiction

which they have reserved to themselves exclusively and they have appointed frequent elections as the occasions and the means for bringing these agents to account. A further reason is, that to make legislation depend upon motives would render all statute law uncertain and the rule which should allow it could not logically stop short of permitting a similar inquiry into the motives of those who passed judgment. Therefore the courts do not permit a question of improper legislative motives to be raised, but they will in every instance assume that the motives were public and befitting the situation."

(Cooley's Principles of Constitutional Law, page 172.)
Citing Ex-Parte McCardle, 7 Wall, 506.
Doyle vs. Insurance Company 94 U. S. 535.

Judge Cooley also in speaking of the power of courts to review legislative action says:

"They (the courts), also assume that the Legislature had before it any evidence necessary to enable it to take the action it did take."

Cooley on Principles of Constitutional Law, page 173.

Dillon in his work on "Municipal Corporations," Fifth Edition, Volume 3, at page 2254, says:

"*Whether the rate fixed deprives or will deprive* the company of its property

> without just compensation is a question to determined by the Court upon an *original independent investigation*, and not by an examination of the proceedings of the body fixing the rate to ascertain what evidence it received and acted upon, and whether that evidence was sufficient to justify the conclusion reached."

In Spring Valley Water Co. vs. San Francisco (C. C.) 124 Fed., 574, Judge Morrow has this to say on this question at page 584:

> "It is not the province of the Court to review the evidence upon which the board of supervisors acted in adopting the ordinance under consideration. Whether the ordinance deprives the complainant of its property without due process of law, denies to it the equal protection of the laws, or abridges the privileges and immunities of the complainant, are questions to be determined by the Court in this action upon an original independent investigation, and not by an examination of the proceedings of the board to ascertain what evidence it received and acted upon, and whether that evidence was sufficient to justify the conclusion reached,"

and in a case between the same parties, reported in 165 Fed. at page 657, Judge Farrington of the District Court, quoted with approval the language of Judge Morrow in the 124th Fed.

Counsel in their brief cite two cases which hold that a city council cannot fix rates without giving the

utility an opportunity to be heard: One case is the Agua Pura Company vs. Mayor, 10 New Mex., 6; the other is the Cleveland Gas, Light & Coke Co. vs. City of Cleveland, 71 Fed., 614. In the two cases just referred to the respective courts held that city councils could not fix rates for the municipalities that they represented for the reason that in effect it would be fixing rates by one of the parties interested in them, but these opinions have no support.

The case of Knoxville vs. Knoxville Water Company, 107 Tennessee, 647, was a case involving the right of the City Council to fix water rates, and the Court, after referring to the opinion of Mr. Justice Jackson in the Cleveland case, supra, on page 688 says:

> "But the fallacy, as we think, in this argument lies in the fact that the question of the reasonableness or unreasonableness of the rates is always open to judicial investigation, and while it may safely be said that the Legislature cannot constitutionally delegate the power to fix prices at which water shall be sold in a city by the authorities of the city, which is itself a consumer, either in its municipal capacity or through its inhabitants, without liability to a judicial investigation of the reasonableness of the rates fixed by such authorities. Still, if no such provision is made in an ordinance, the law will imply one and preserve to the Company its right to litigate the question upon that ground. We do not think it necessary that the provision be incorporated in

> the contract or in the ordinance, but it will be implied when not expressly provided for."

The last case referred to was taken to the Supreme Court of the United States, and is reported in 189 U. S. page 434, and the decision of the lower court was upheld. When the case reached this Court all of the questions raised in the Court below were not discussed by Mr. Justice Holmes, who rendered the opinion, but the ordinance was held to be valid, and the decision of the State Court was thereby confirmed.

After the decision of this case by this Court, another case was tried between the same parties, in the Federal Court. An injunction having been sustained by the Court below, an appeal was taken to this Court and reported in 212 U. S., page 1, this Court, on page 6 of the opinion saying:

> "The bill contained many allegations, which have become immaterial by the decision of this Court in *Knoxville Water Co. vs. Knoxville,* 189 U. S., 434, in which the validity of the ordinance was sustained, except so far as it might confiscate the property of the company by fixing rates so low as to have that effect. The latter contention alone was left open to the company, and to it the remainder of the bill is mainly directed"

and on page 7 this Court held that the function of rate making is purely legislative, whether exercised by the Legislature or a subordinate body, in the following language:

"At the threshold of the consideration of the case the attitude of this court to the facts found below should be defined. Here are findings of fact by a Master confirmed by the Court. The company contends that under these circumstances the findings are conclusive in this court, unless they are without support in the evidence or were made under the influence of erroneous views of law. We need not stop to consider what the effect of such findings would be in an ordinary suit in equity. The purpose of this suit is to arrest the operation of a law on the ground that it is void and of no effect. It happens that in this particular case it is not an act of the legislature that is attacked, but an ordinance of a municipality. Nevertheless the function of rate-making is purely legislative in its character, and this is true, whether it is exercised directly by the legislature itself or by some subordinate or administrative body, to whom the power of fixing rates in detail has been delegated. The completed act derives its authority from the legislature and must be regarded as an exercise of the legislative power." (See also Prentiss vs. Southern Ry. Co., 211 U. S. 210, 226, 227).

McQuillin on "Municipal Corporations," Vol. 4, Section 1743, says:

"The fact that the municipality which fixes the rates is not an impartial tribunal

> because it is interested in the rates, either in its municipal capacity or through its inhabitants, does not preclude the power of the legislature to delegate to a municipality the authority to regulate the rates of public service companies doing business within its limits."

There is little reasoning to support the theory that a City Council cannot fix rates for the reason that it is passing on its own case. The same reasoning would apply to the courts when rates of a public utility are fixed within their jurisdiction. It is not presumed that a public official, for the reason that he might have a private interest in the subject matter of a question by him to be determined, would not lay aside any partisanship or selfish interest that he might have and determine the question according to his sworn duty; and to say that before a City Council can pass an ordinance, fixing rates, it must give to the parties concerned a right to a full hearing, would be in effect to deprive such council of the right to fix rates at all. Take this case as an example. Counsel state that it took nine months to try the case before the Master, and if the Council had to provide such hearings in order to exercise its rate-making functions, it would be impossible to fix rates.

Counsel have cited a large number of authorities under this subject which we have examined critically, but none of them, except the New Mexico case and the Cleveland case, supra, bears out their contentions. It therefore follows that a city council, if given the power through the Charter of the municipality, has the power to fix rates of public utility

companies, and when they have fixed such rates, the courts will conclusively presume that the legislative body was actuated by proper motives and that its investigations was sufficient to entitle it to act.

There are two kinds of presumptions to be considered, which counsel seem to confuse. The first presumption is that the legislative body acts advisedly and with full knowledge of the situation. This presumption is conclusive on the courts, and not to recognize it would be an invasion by one co-ordinate branch of the government of the functions of another. The other presumption is that when a legislative body has acted with reference to fixing rates, the rates by it fixed are fair and reasonable, and are not confiscatory of property. This last presumption may be rebutted, and if the evidence is sufficient to satisfy the conscience of the court and the requirements of law, the court may set aside or hold void the act of the legislature, notwithstanding this presumption.

The third proposition for which appellee contends seems to be this: That the fact that the ordinance might have been submitted to the people for a vote, although as a matter of fact it was not, renders the ordinance void. The argument of appellee, so far as we can analyze it, seems to amount to this: That the City Council, although having the power of reasoning, failed to exercise that power, and without thought and without consideration and without a hearing, being a corrupt and wicked body, passed the ordinance. It is next contended that had the City Council in the exercise of its wisdom refused to pass the ordinance and submitted it to the people, the people being not only wicked and corrupt, but without

the power of reasoning, would without thought, without consideration and without a hearing have passed the ordinance in question, which would have made it just twice as void as though the City Council had passed it.

In the first place the whole question as to the validity of an initiated measure is a moot question, for, as a matter of fact, the City Council passed the ordinance and the same never was submitted to the people and no one could know what the people would have done with it had it been submitted to them. As we have pointed out, the court will not inquire into the motives of a legislative body in passing an act, nor into the qualifications of that body to judge of the propriety of the act; these questions are foreclosed and it must accordingly be assumed that the council passed the act because the members thereof thought it ought to be passed; indeed, reasoning in the fashion that ordinary human beings reason who are not tangled and tied up in the meshes of rules of artificial logic, it would not be at all surprising had the council considered that this Water Company, deprived of its franchise as it was and with no place where it could "market its product" at anything like the price that it had previously been able to obtain, would secure all it was entitled to if they gave it more than anybody else would give for its services.

We do not care to discuss at length this moot question of the validity of the initiative which appellee raises. Certainly the argument of appellee takes an extraordinary turn and evidences great peculiarity of mental process. Since the foundation of the Republic, it has been one of the principles of our organic law that certain rights are reserved to the

people, and that there are certain matters of fundamental importance on which the people of the sovereign State alone ought to pass. Thus a change in the organic law is considered to be of such high importance that the people of the State should have an opportunity of expressing themselves directly and not through representatives upon the question involved. Appellee informs us that there is another class of legislative duties of such character that they cannot be performed by the people, but must be performed by a legislative body whom the people shall select, and unless such duties are performed by that legislative body any action which may be taken will be void and unconstitutional. Can it be possible that the affairs of this Water Company are of more importance than an amendment to the Constitution of the United States? We should say not, and yet it is contended that a rate making ordinance passed in the fashion that an amendment to the Constitution would be passed would be *ipso facto* unconstitutional and void.

In support of the unique contention which it advances, appellee cites at pages 72 and 74 of its brief two Texas cases. These cases rest upon certain provisions of the Charter of the City of Dallas, which provided a particular form of procedure for rate making, and the Court held that this form of procedure must be followed and that any attempt to pass a rate making ordinance by initiation was void, because it did not conform with the Charter provision. The two cases are accompanied by a third case decided at the same time—Ex parte Farnsworth, 135 S. W. 535, which appellee does not cite. This case holds that the initiative and referendum are uncon-

stitutional because they are inconsistent with the constitutional guaranty of a Republican form of government; and the reasoning of this case permeates the other two. All three of these cases precede the decision of this Court, holding that such matters are not justiciable. In view of this fact we submit that the cases are not authorities at all, and that the Texas court would have never rendered the decisions had this Court passed upon the initiative and referendum previous to the time the Texas decisions were rendered. But, as we have already said, this entire discussion is the discussion of a moot question. The people of the City and County of Denver did not pass the rate making ordinance. The City Council did pass the rate making ordinance. Questions as to the motive of the City Council and as to the evidence upon which it based its judgment in passing the ordinance are foreclosed. The whole argument of appellee in this regard, aside from the mere psychological and moral effect which undoubtedly appellee hopes it may have, is a skillful endeavor to shift the burden of proof from its own shoulders to the shoulders of appellant. The appellee repeatedly and continuously asserts that the Master's findings are final; and it should not now be permitted to escape assuming the burden of proof required, and presenting to the Court evidence clear and convincing that its fundamental rights are being invaded and that the rates provided in the ordinance are confiscatory.

WHAT MUST THE RATES YIELD UNDER AN ORDINANCE TO ESCAPE THE CHARGE OF CONFISCATION?

Commencing on page 108 of appellee's brief, severel pages are devoted to a discussion of principles which it is claimed are well settled, and which we admit are well settled. Counsel say that appellant's contentions are that any net return, no matter how small, in excess of the actual cost of conducting the business, is sufficient to escape the charge of confiscation. We have nowhere made such a statement. We have recognized the rule and again assert it that a public service company is entitled to a fair return on the fair value of its property, provided the rate of return does not exceed the value of the service to the public. True we have cited cases, for the purpose of showing the development of the law on this subject, which have been less liberal with utility companies than the rule which is recognized by other courts. It must be remembered, however, that the courts do not make the rates; that they do not substitute their judgment for that of the rate-making body, and it is only in cases where it is manifest the rate fixed by the rate-making body will yield a return less than a fair return that courts will exercise their prerogative of disturbing the rate.

As to the authorities cited on the pages following page 108 of appellee's brief upon the question of the fair rate of return to be allowed to a public service corporation, we have no contention with counsel. We recognize the right of the Court to pass upon the act of a legislative body and if the result of the act

of the legislative body has been that the property of a utility company has been taken or that a just return has not been provided for the property employed by the company for a public service, then the courts have the undoubted right to set aside the act of the legislative body; and the fact that the court does have the right to pass upon the question, and the fact that there is no law in Colorado or in the Charter of the City and County of Denver or in the ordinance which made this reduction to the effect that the rate thus made is final and conclusive affords the complainant a remedy and affords it due process of law.

Fair Value of Service to Consumer.

It was held in the case of Smith vs. Ames, 169 U. S. 466, that what the company is entitled to ask is a fair return upon the value of the property it employs for the public convenience, but that on the other hand what the *public* is entitled to demand is that no more be exacted from it for the use of a public highway than the services rendered by it are reasonably worth.

Mr. Dillon in his work on Municipal Corporations, 5th Edition, pages 2266-2267, says:

> "The corporation is not compelled at the outset to enter into the undertaking. It must enter, if at all, subject to the contingencies of the business and subject to the rule that its rates must not exceed the value of the services rendered to its consumers. It has accepted valuable franchies granted by the State,—franchises

which are ordinarily exclusive for the time being—franchises which ordinarily debar the public from serving themselves satisfactorily in any other way, and in return, it must perform the duties to the public which it has voluntarily assumed at rates not exceeding the value of the services to the public taken as individuals, and irrespective of the remuneration which it may itself receive. On the other hand, it is argued that a rate which is founded upon the intrinsic value of the services in themselves may result in an excessive profit or return to the corporation, and in the payment of dividends which exceed the reasonable expectations of the incorporators. Under such circumstances, again, the rights of the public must be regarded as superior to those of the corporation. A reasonable rate to the public cannot be higher than the services in themselves are worth to the public; but this does not necessarily mean that a public service corporation is entitled to charge as a reasonable rate the full worth of the services to the public. If the attendant results of such a charge are to confer upon the corporation more than a fair return upon the value of the property used for the public at the time it is being used, that fact is sufficient to make the cost of the services to the public more than a reasonable rate and the corporation can only charge such lesser rate as yields a fair return to it for the use of its property;'' Citing:

Brunswick & T. Water Dist. vs. Main Water Co. 99 Me. 371.
Smyth vs. Ames, 169 U. S. 466.
Covington & L. Turnpike R. Co. vs. Sanford, 164 U. S. 578.
Chicago, M. & St. P. R. Co. vs. Minnesota, 134 U. S. 418.
Cotting vs. Kansas City Stock Yards Co. 183 U. S. 79.

Testing the fair rate of return by the value of the services to Denver and its inhabitants, let us for a moment examine this case:

The Water Company has no franchise. It obtained a franchise in 1890 which expired in 1910, and during that period of twenty years it adopted the system in use at the commencement of the period and added to said system in order to comply with the terms of its contract. The terms of this contract, both on the part of the city and the company, have been fulfilled, and the company is left with certain reservoirs, conduits and a distributing system, which it is now employing to furnish the city with water until such time as the city shall acquire or construct a new plant, and while the contractional rights of both parties have ceased to exist, there are certain obligations which the law enjoins; in other words, it is the duty of the Water Company to continue to furnish to the city water for a reasonable time. This obligation exists by reason of the necessities of the case; but what is the value of the service to the city and its inhabitants? The city has full power to condemn, at its reasonable value of course, the Water Com-

pany's plant. It has power to issue bonds for the purpose of paying for it, and the cost to the city in the event of taking such property would be the interest it would have to pay on its bonds which would not exceed 4½ per cent. Four and one-half per cent on $13,415,000.00 would be $603,000.00 per year, but if you subtract from $13,415,000.00 the item of going concern and the item of water rights, which the Master undoubtedly erred in adding to the value of the company's property, you have $10,610,000.00, the total value of the company's property; and at 4½ percent annually the amount that it would cost the city to pay interest on this total value would be an annual expense of $477,000.00, or $11,000.00 less than the Master found as the net revenue of the present company, under this ordinance.

Tested by this rule the service to the city and its inhabitants is only worth the amount it would cost the city to procure the service by exercising its right of condemning the property. Furthermore, it is not reasonable to suppose that the city if it purchased the plant or condemned it, would have to pay as much for operating expenses as is allowed by the Master. It would not have to pay $60,000.00 a year for executive officers, nor $30,000.00 a year in addition to what it does pay for legal expenses. It could get along without an expenditure of $32,000.00 for automobile and stable hire. It would have no taxes to pay because if it belonged to the city the system would be exempt from taxation, and thereby the cost of water to the city and its inhabitants would be materially reduced under the return provided by the ordinance.

Then considered from another angle, what does the Water Company consider its plant worth, and what does it consider is a fair return upon the money that it has invested? Counsel in their brief have contended that inasmuch as the legal rate of interest in Colorado is 8 percent, that, therefore 8 percent is a fair return upon its investment. Counsel evidently overlooked a statute in Colorado which provides that pawnbrokers shall not charge to exceed three percent per month, or 36 percent per year on money loaned by them; but to show absolutely what the complainant is willing to accept for its money we will follow a reference made by appellee to a matter outside of the record. This is to the option referred to by them through which they are seeking to sell their system to the city. Counsel justified themselves in referring to this contract by alleging that in our motion to advance the case, we made reference to this contract, but they carried their argument beyond their attempted justification and endeavored to show that the officers of Denver by entering into this contract on behalf of the city considered the valuation as found by the Master a fair value of the property. The option contract referred to is not an agreement on the part of the City and County of Denver to purchase the property for the price and upon the terms mentioned therein, but is merely an offer to the city, giving it the right, upon determination of the case in this court, to purchase the property at the price fixed by the Master, from which may be deducted such sums, or items of value as this Court may find or determine should be so deducted from the foregoing valuation fixed by the Master. Had the officers of the city considered the amount

as found by the Master a reasonable price for the property involved, they would not have taken the case to the Supreme Court of the United States, but would have immediately submitted to the voters in Denver the question of issuing bonds for its purchase. It is further provided in this ~~opinion~~ Petition which appellee has referred to that it will take its pay in bonds of the City and County of Denver at par, bearing interest at the rate of 4½ percent per annum, and that such bonds may run for a period of not less than ten years, nor more than fifty years. In other words, it is willing to accept a return of 4½ percent on ($13,415,000.00) or the amount to which this sum may be reduced, notwithstanding its claim that its money is worth 8 percent. The appellee offered in 1907 to sell its plant to the city for cash or bonds bearing 4% interest (Record, p. 21). The people rejected the offer and the appellee tried to enforce it. Denver vs. N. Y. Trust Co., 229 U. S. 123). Thereby indicating that its money was worth 4%.

Were the Gross and Net Earnings Sufficiently Proven?

In appellant's former brief it is contended that the evidence with reference to the gross earnings and operating expenses and the resultant net earnings is not sufficiently shown to afford the Court a basis for determining what the net earnings are, or rather what they should be.

Counsel on page 116 of their brief say that they submit with confidence that every detail pertaining to gross earnings and the net return under the ordiance rate was shown by proof which was specific to

the most minute particular, and conclusive in every respect. Appellants' former brief controverted this and it is again controverted by this reply brief. While the record does go into particulars as to the amount of the gross earnings and as to the amount of the operating charges, it is not explained what the money was expended for. The witness Cheyne (page 346 of the record) was the witness relied upon by the complainant below to prove the operating expenses. He was a witness employed by the complainant; he obtained his information, upon which his opinion was based, from vouchers and other information furnished him by the company. He tabulated the conclusions thus arrived at and introduced them as exhibits, the same being Exhibit "A-56," Record, page 990; Exhibit "A-107," Record, page 1080; and Exhibit "A-108," Record, page 1080. Exhibit "A-56" is the exhibit we referred to in our former brief, and is a tabulation covering the years from 1895 to 1913, inclusive. This exhibit purports to give the operating expenses of the company for the years included, but the objection is that it doesn't state what the money was expended for. Exhibit "A-107" is a statement of the earnings for the year 1914, which was not included in the tabulation above referred to, but this is no more specific than the other tabulation. Exhibit "A-108" purports to give the cost of repairs charged to and included in the operating expenses for the five years, ending October 31, 1914. To illustrate: Exhibit "A-107" gives the cost of operating expenses for pumping works for the year 1914, $68,702.67, and Exhibit "A-108" gives the cost of repairs included in operating expenses as $16,226.21, leaving an amount of

$52,000.00 charged to pumping works, which is not attempted to be explained at all; nor is it explained what the repairs were; furthermore, the evidence is that of a witness who has obtained his knowledge solely from information furnished him by the complainant company.

Counsel say that the witness, Cheyne, while on the stand offered to produce certain vouchers, showing some of the charges for operating expenses, and also say that the defendants took advantage of this offer and made many such requests, all of which were promptly complied with, and to substantiate this statement refer to the record at pages 351, 352 and 801, but a reference to the record at the pages indicated by counsel fails to show that said vouchers were ever introduced, or that the witness, Cheyne, or any one else ever offered to introduce or furnish them. At page 801 of the record it is shown that by an agreement of counsel the Master was authorized to appoint an accountant to check the items set forth in the exhibits of the witness, Cheyne, and pursuant to this consent an accountant was appointed, who purports to have checked over the exhibits of witness, Cheyne. His evidence is found on page 1101 of the record, and the figures he checked over are for the years 1913 and 1914. He also made tabulations which were referred to as Exhibit "C" and Exhibit "D" (Record 1108-1109), the exhibits referred to in our former brief, being his tabulations for the years 1913 and 1914. The witness, Mitchell, had the same means of information as to the witness, Cheyne, it is therefore evident that the result of their tabulations would be the same, but it is not evident why they should

have made the same mistakes in adding up the items of the operating expenses for the two years in question. Both the witness, Cheyne and the witness, Mitchell, in adding up the items of operating expenses for 1913 found them to be $352,242.42, which was a mistake on the part of both of them of $30,892.76. The same remarkable coincidence is true with reference to the two witnesses' concurrence in the items of operating expenses for 1914. Here both witnesses agreed that the total operating expenses were $473,276.99 and in adding up the items making up this amount it is found that they were both mistaken in the same amount, viz: $31,834.40. There is another remarkable coincidence: The bill of complaint on page 69 of the Record alleges the financial operations of the complainant for the years 1908 to 1913. This complaint was sworn to on the 29th of April, 1914, months before either of the witnesses referred to had testified. The operating expenses for 1913 were alleged as $352,242.42, the same amount found by the two accountants, notwithstanding that they had both concurred in a mistake in addition of $30,892.76, and for the years 1908, 1909, 1910 and 1911, the allegations of the bill agreed with the totals of operating expenses of witness Cheyne, although the witness' additions for those years were in error more than $30,000 for each year. (Record p. 390, Exhibit "A-56," columns 3, 4, 5 and 6.)

Counsel say at page 121 of their brief that the result of Mr. Mitchell's examination of the vouchers was to verify in every respect the testimony and exhibits proffered by Mr. Cheyne. Yes they verified his figures so clearly that their mistakes agree, as

well as their computations, and both of them agreed with the allegations of the bill of complaint.

But counsel say that we didn't make reference to all of the testimony introduced with reference to operating expenses, but that many exhibits were introduced before the Master that are not contained in this record, this evidence being referred to at pages 117-120 of their brief, but we are not arguing here from counsel's contention as to matters *dehors* the record, but from the record as it is presented here. Whether or not their contentions are true with reference to these matters that they themselves did not see fit to incorporate in the record, we are unable to say, but in view of their uniformly cautious and comprehensive manner in exhausting every subject as indicated by their brief, we seriously doubt whether the exhibits referred to would have added anything further than is contained in the record before the Court.

But counsel also say that Mr. Metcalf, another of their experts, whose qualifications they modestly admit to be of the highest, made a forecast respecting like items for ensuing years, a horoscope as it were, which must have greatly aided the Master in determining what the operating expenses of the company would be in the future; and that the engineers appointed by the Public Utilities Commission, who had had free access to the company's records (but had never availed themselves of the opportunity), were of the opinion that the present rates and the rates in the past had been grossly inadequate, but we are not appealing from these voluntary opinions of this unofficial board of engineers whose report was rejected by the commission appointing it, but from

the judgment of the court below. There is nothing to show what investigation these engineers made, how they arrived at their conclusion, or what opportunities were afforded them for knowledge except that it appears by counsel's statement that the company offered them access to their records, but it is not shown that they ever availed themselves of this offer.

Counsel conclude this topic of their brief by saying that the case of Chicago, etc., Co. vs. Wellman, 143 U. S., 339, quoted on page 21 of appellant's original brief, is not in point as to the necessity of the company advising the Court as to what was done with the receipts and earnings of the company, for the reason that this was a friendly suit, the expenses were stipulated to, and both parties were anxious to reach the same result; but the fact that it was a friendly suit and that the operating expenses were agreed to, does not change the principle involved. In fact, the witness, Cheyne, and the witness, Mitchell, appointed by the Master, agreed as to expenses here. Before a court will set aside the act of a legislative body fixing rates, it must have before it *facts* which will authorize it to set aside the action, and whether those facts are insufficient on account of an agreement, or whether there is a failure to furnish them, it makes no difference in principle.

As stated by the Court in case of Knoxville vs. Water Company, 212 U. S., page 8:

> "The power is best safeguarded against abuse by preserving to this Court complete freedom in dealing with the facts of each case."

It was not intimated in the Wellman case that there was any fraud or collusion on the part of the parties, but the Court said on page 345:

> "We do not mean to insinuate aught against the actual management of the affairs of the company. The silence of the record gives us no information, and we have no knowledge outside thereof, and no suspicion of wrong."

Therefore, as to the principle involved, the Wellman case is clearly in point in this case. Justice demands that the fullest disclosure be made of all material facts in order that the Court may know whether or not the company by judicious management could make a reasonable profit upon its gross returns, and so far as any definite information to the Court is concerned, the evidence in the Wellman case was as full as it is in the present case. In the Wellman case it was agreed by counsel that a certain amount was the operating expenses of the company. In the present case it is contended on the one side that certain totals are the operating costs for pumping works, reservoirs, office expenses, stable expenses, etc., and the other side does not agree to this. The evidence on behalf of the complainant was wholly lacking, and this Court is not able to determine from it whether or not the money paid out for operating expenses was judiciously expended.

Should the Rates Have Been Submitted to a Practical Test?

Under this topic counsel in a labored effort endeavor to show that the appellant's contention that

the ordinance rates should be submitted to a practical test before holding them confiscatory is untenable.

Counsel refer to paragraph 18 of the bill and say that it is there alleged that the gross revenue will be no greater and the operating expenses no less in the future than in the past, and say that these allegations were not denied in the answer, and therefore stand confessed. A reference to the answer, page 104 of the Record, paragraph 18, will show that this allegation was denied and put in issue by the answer.

Counsel also state that in such an ordinance, where flat schedules of rates to the consumer are provided on the payment of a certain sum, it is obvious that increased consumption does not result in increased revenue; but it is not obvious. There were nearly 45,000 water users in Denver. Many of them, and probably the greater portion of them are those to whom payment of their water rents becomes a burden. More is charged by the company when baths are used than when they are not and when toilets are used. Many of the uses that are charged for in the schedules of the company are uses which become luxuries for people in moderate or straitened circumstances, and it is not obvious that a reduction of rate will not increase the use of water by people in Denver, and there will be a great increase in use and resultant increase in revenue without a proportionate increase in the volume of water necessary, and even if more water were drawn through the pipes than at present, how would that increase to any considerable amount the cost of operating expenses?

They wouldn't have to employ any more executive officers or pay out any more for automobile and stable hire; in other words, the overhead expenses would be the same, and most of the water being furnished by gravity, there would be practically nothing to add to the expense. It is therefore one of those cases that before it can be determined whether the rate, as reduced, is confiscatory, it is absolutely necessary to resort to a test. But counsel say that they did have an opportunity to determine, and that evidence was given of what net revenue the company received for six months after the ordinance went into effect. It is hard to see how the passage of the ordinance would afford a test as to what the result would be unless the ordinance were being obeyed. The test referred to by the courts is a test of the application of the law operating under the reduction that has been made; and where there is any doubt as to whether or not the rate is confiscatory the courts have invariably held that this test is necessary before resorting to the courts. It is very true, as stated by counsel, and borne out by the cases they have cited on page 128, et seq., of their brief, that where there is no doubt as to the reduction being confiscatory, then the courts will not wait to put the matter to a test when it is certain that the result of the test will not change the confiscatory character.

In the case of Knoxville vs. Water Company, 212 U. S., page 1, the Court at page 15, says:

> "In this case there could be no absolute certainty, because the ordinance had never been put in operation;"

and again at page 17:

> "Where the case rests, as it does here, not upon observation of the actual operation under the ordinance, but upon speculations as to its effect, based upon the operations of a prior fiscal year, we will not guess whether the substantial return certain to be earned would lack something of the return which would save the effect of the ordinance from confiscation. It is enough that the whole case leaves us in grave doubt. The valuation of the property was an estimate and is greatly disputed. The expense account was not agreed upon. The ordinance *had not actually been put into operation;*"

and concluding the opinion by saying, page 18:

> "If hereafter it shall appear, under the actual operation of the ordinance, that the returns allowed by it operate as a confiscation of property, nothing in this judgment will prevent another application to the courts of the United States or to the courts of the State of Tenessee."

The ordinance in the foregoing case was passed on March 30, 1901, and suit was filed December 7, 1901. The decision in the court below was based upon the operations of the fiscal year, ending March 31, 1901, and the Court says at page 15:

> "We think it was error to confine the investigation to, and base the judgment upon that year alone. The precise subject of inquiry was, what would be the effect

> of the ordinance in the future. The operations of the preceding fiscal year, or of any other past fiscal year, were valueless if the year was abnormal, and were only of significance so far as they foretold the future''

and, as shown by the record in this case, the year, 1914, was an abnormal year; the expenses of operation were higher, and the gross returns were lower than for any of the three years that preceded it, and this without taking into consideration the unsatisfactory character of the testimony.

Counsel quote from the case of Boyle vs. St. L. & S. F. R. Co., 244 U. S., 106, the following language:

> ''We agree with the District Judge that the two months of investigation afforded a basis of argument as to constant conditions''

and there is no doubt here that the evidence of the operating expenses for 1914 afforded a basis of argument and counsel have fully availed themselves of the opportunity afforded, but when it is taken into consideration that the year is the most unfavorable year that could have been selected, and that if the year 1913 or 1912 or 1911 had been taken instead and to this had been added the gradual average increase of the company's earnings in the past, amounting to at least 5 percent annually, the gross returns would have been very substantially higher than the basis the master took.

In the case of Wilcox vs. Consolidated Gas Company, 212 U. S., 19, the Court at page 42, after discussing the unsatisfactory nature of the *expert tes-*

timony, stated that where the rate complained of shows in any event a very narrow line of division between possible confiscation and proper regulation, "and the decision depends upon opinions as to value, which differ considerably among the witnesses, and also upon the results in the future of operating under the rate objected to so that the material fact of value is left in much doubt, a court of equity ought not to interfere by injunction *before a fair trial has been made of continuing the business under that rate,* and thus eliminating, as far as is possible, the doubt arising from opinions as opposed to facts" (Italics ours). and again on page 51 of the opinion says:

> "The question of how much an increased consumption under a less rate will increase the earnings of complainant, if at all, at a cost not proportioned to the former cost, can be answered only by a practical test. In such a case as this, where the other data upon which the computation of the rate of return must be based, are from the evidence so uncertain, and where the margin between possible confiscation and valid regulation is so narrow we cannot say there is no fair or just doubt about the truth of the allegation that the rates are insufficient."

Exhibit C page 39 gives a summary of the population of Denver during the period that the Company has operated, the number of taps and the per capita consumption. It is apparent from this table that the population of Denver has steadily increased. In 1876 this population was 17,000; in 1880, 35,662; in 1885, 76,000; in 1895, 116,000; in 1900, 140,000; in

1905, 175,000; in 1910, 220,000 and in 1913, the last year given in the table, 242,000. Thus it is apparent that on the average of the entire period, the population of Denver has increased in excess of 6,000 per year, and the last three years has show an increase in 1913 over 1912 of 7,000; an increase in 1912 over 1911 of 5,000; an increase in 1911 over 1910 of 10,000. The number of taps has increased at about the same ratio. It is asserted by appellee that, inasmuch as consumers take water under a flat rate and are entitled if they pay these rates to take all the water needed during the period for which payment is made, an increase in the consumption does not make an increase in revenue. So far as the individual consumer is concerned this matter has already been discussed, but an increase in the number of consumers certainly results in an increased revenue to the Company.

On the other hand, if the consumer cuts down his consumption of water, unquestionably the Company is able to furnish service cheaper, and it is apparent that from the period beginning with 1895 down to the present time, the per capita consumption of water has gradually, but steadily decreased. This is best shown by taking the average of the periods. From 1895 to 1899, both inclusive, the average consumption of water per capita was 224 gallons per day; from 1905 to 1909, it was 212 gallons per capita per day. For the four years from 1910 to 1913, it was 202 gallons per capita per day. This decrease is explained, of course, by the situation common to every city in the country; the increased density of population resulting from an increased number of inhabitants and from the rise in popularity of apartment houses and

hotels as dwelling places, as such institutions require much less water for irrigation than do private residences.

This Ordinance complained of was not enacted for the year 1914 alone; it was made for the future, and while in the first two or three years of its operation the revenue rate might not be so large as the Company desires and might even be held to be less than was proper, still, it would undoubtedly increase and increase substantially as time went on by virtue of the increase in the number of consumers, and the fact that each consumer is, on the average, using less water every year. It should be borne in mind that the testimony throughout the record tends to show that the present plant is adequate for many years to come, without the addition of further units.

Gross Revenue.

The Master in his report, basing his estimate on the fiscal year, ending October 1, 1914, found that the gross earnings, if the reduction were made as provided by the ordinance, would be $1,093,615.45.

At page 93 of the opening brief appellants claimed that the gross earnings of the company for the year 1914, as shown by the testimony of complainant, was $47,067.30 less than for the year 1913, and $48,341.66 less than for the year 1912. Counsel say that this statement is absolutely untrue.

The total gross earnings given by the witness, Mitchell for the year ended October 31, 1913, were $1,382,703.96, (Record, page 1108), and the total gross earnings given by the same witness for the year ended, October 31, 1914, were $1,335,636.09. For 1912

the gross earnings, referring to Exhibit "A-56," column 2, are given by the witness, Cheyne as $1,383,-977.75; thus verifying appellant's former statement. Counsel admit after numerous calculations that the gross earnings for 1914 were $30,879.68 less than for 1913, and $45,182.25 less than for 1912, thereby contradicting their witness Cheyne; but they say that they equalled those for 1911, and exceeded those for any previous year in the company's history. In 1911, while appellee's statement is no doubt true as to the total gross earnings, the operating expenses were only, according to their own statement, $325,053.53, (Exhibit "A-56" Record, page 990), or $33,472.31 less than for 1914, (Record, page 1111).

The foregoing reference to the gross earnings included the ranch income, but it includes it for all of the years mentioned, 1914, as well as 1913, 1912 and 1911, and in view of the fact that a part of the operating expenses went to the maintenance of the ranch and no attempt was made to segregate the expenses of the ranch from the general operating expenses given, there is no way in the record to separate this ranch income, and our reference was only a comparative reference.

Counsel endeavor to explain the difference of the income for 1912 and 1913 by saying that in 1914 there were delinquent license payments, amounting to $37,619.70 as compared with $6,152.55 at the end of the year 1913, and that the latter amount was about the normal of such delinquencies, and state that therefore in order to make a just comparison that the difference in these two delinquencies, viz: $31,467.15, must be added to the gross earnings for

1914. But the Master didn't do this. Had the Master taken as a basis the gross earnings of 1913, together with the natural increase, which is no less than five percent per year, there would be no complaint, but out of the last four years he took the year where the earnings were the least and the expenses were the greatest.

After counsel's fruitless endeavor to show that the record has been misrepresented with reference to the operating expenses for the years 1914, 1913 and 1912, they resort to their usual haven of refuge and refer to exhibits not contained in this record, and again conclude this topic by saying that Mr. Mitchell by his testimony and his report sustain in every particular the facts shown by complainant's exhibits.

Counsel on page 136 of their brief refer to the allegations of the complaint wherein it is alleged that the operating expenses would be $333,045.06, whereas, the Master found the expenses to be $347,-845.00, and explain the difference by saying that the bill was filed at the time when of course the actual facts could not be known; but if the company were willing to positively allege the amount referred to being familiar as it must have been with the operation of its affairs, not only as of the time of the filing of the bill, but for years preceding such time, isn't it fair to say that this illustrates the unreliability of taking the year 1914 alone as the basis for determining what the expenses for the future would be and also illustrates the necessity of a test. In addition to the finding by the Master of the amount of the operating expenses, counsel state that the witnesses all agreed that a much larger allowance than that made

by the Master would be reasonable, (page 137, appellee's brief), and refer to the evidence of Mr. Freeman, the engineer that has had such a vast amount of experience (in testifying on behalf of public corporations), wherein he states that he *believes* that the sum of $350,000.00 a year would be a fair allowance for operating expenses. Mr. Holman, another witness, also testified that from his experience in operating water works, he would *want to spend* at least $400,000.00 a year, and Mr. Hazen's judgment was that $350,000.00 a year with an additional contingent amount of from $20,000.00 to $100,000.00 a year should be allowed for operating expenses. Fortunately for the city, however, these witnesses were not the Court or Master below, but were simply witnesses; but they should have testified to the facts from which the Master could have drawn the conclusion, rather than to have drawn the conclusions themselves and stated them to the Master.

On page 139 of appellee's brief they state that the Exhibits "C" and "D" referred to at pages 97 to 100 of appellant's brief, are not the exhibits of appellee, but of appellants, and that they were prepared by defendant's expert accountant witness, Mr. Mitchell. Counsel have previously stated that this witness, Mitchell, was appointed by the Court for the purpose of checking up the report of the witness, Cheyne, and this former statement of theirs is borne out by the record, (Record, page 1101), and it has heretofore been pointed out that the evidence of the witness, Cheyne and the witness, Mitchell, have coincided so closely, even to the extent of the two witnesses having made the same mistakes in addition, that there is a grave suspicion as to the re-

liability of either witness's testimony, and there is no other evidence in the record except of these two witnesses as to the operating expenses.

Counsel in replying to appellant's criticism at page 139 of their brief say that the statement with reference to pumping works that no explanation is given as to why this cost is greater in 1914 than in preceding years "is untrue," and we find that we overlooked the reference in the record referred to, but counsel do not yet, and neither does the record, show what the $68,000.00, which is charged for pumping works, was used for in 1914, nor how the equivalent charge was used for any of the other years. As to the item of reservoirs, there is nothing in the record as to what these repairs consisted of, and as to whether they consisted of repairs which were equivalent to renewals; and the Exhibit referred to, "A-107," (Record, page 1080) gives no information whatever on the subject, but simply under the head of "operating expenses and taxes," the item of "reservoirs" is put down as $42,700.46. The same criticism applies to the showing of expenses for the other items contained in Exhibit "A-56" and Exhibit "A-107."

Counsel take the astounding position that they have a right to charge to "operating expenses" attorney's fees and other expenses of litigation incurred in the endeavor to set aside this rate. In other words, that if a city feels that rates being charged it by public utility companies are too high and therefore seeks to reduce them, the companies can by employing enough lawyers and enough high priced expert witnesses make their operating expenses so

high that the ordinance will become confiscatory even though it wasn't before the attorneys and witnesses were employed. Such a rule would be a dangerous one; it would be too much of an invitation to public utility companies, naturally desirous of receiving as high rates as possible, to contest any reduction if the result of the contest would have to be paid by the public.

Counsel state on page 143 of their brief that it is proper that operating expenses, should include cost of repairs and ordinary maintenance. This is not questioned. They state that on the other hand, replacements are properly chargeable to depreciation, which is also true, and state that the evidence before the Master clearly demonstrated that the operating expenses contained no charges for replacements, betterments or extensions, and refer to Exhibit "A-107" and Exhibit "A-108," Record page 1080, in support thereof. As stated before, Exhibit "A-107" does not show what one penny of the amount set opposite the items was expended for, except that they have divided up the operating expenses into pumping works, reservoirs, conduits, etc., Exhibit "A-108" shows what part of the amounts set opposite the various items under the head of "operating expenses" were charged to cost of repairs, but the proportion of the entire amount charged is very small in each instance, and this does not show the character of the repairs, or as to whether the repairs were so permanent in character that they should have been charged to "depreciation," or whether they were properly charged to "operating expenses."

DEPRECIATION.

Let us here correct an error in printing on page 86 of our original brief. We intended to say one and three-fourths percent of the present value (not revenue) of the plant.

In stating his conclusions on this important item of depreciation, the Master expresses himself as follows:

> "The allowance of one hundred forty thousand dollars for annual depreciation is based largely on the testimony of Mr. Hazen, who estimated such depreciation at one hundred fifty thousand dollars. His estimate was based on a higher appraisement of the plant then mine" (Record, page 139).

It therefore becomes interesting to examine the testimony of the witness, Hazen, on this point. This testimony is found at page 230 of the Record, where he says:

> "I estimate that a fair allowance for depreciation on the property today is one hundred fifty thousand dollars per annum. In 1907-8-9, the Board of Appraisers estimated the depreciation at one hundred thirty-five thousand dollars per annum. The estimate of one hundred fifty thousand dollars is for straight depreciation with no allowance for contingencies. It is the sum set aside to make good the loss from wear and tear from all causes other than those that are taken care of by ordinary maintenance, repairs, etc."

Of course this item allowed for depreciation and charged as a part of the annual operating expenses of the Company must be based on an estimate of the life of the plant, and must be placed at such an amount that this annual allowance (the estimate being made either on the sinking fund theory or a straight line depreciation), will provide at the end of the estimated life of the plant a fund equal to the plant's value, less the value of those units which by their very nature cannot depreciate in value and less the junk value of what may be left.

In our former brief at page 86, we stated that it seemed reasonable to say that the estimated life of the units, taking the average, will be fifty years from May 1, 1914. The appellee at page 147 of its brief criticises this statement of ours and alleges that the testimony shows "quite the contrary." It is not pointed out wherein our estimate is wrong, nor is any attempt made by the appellee to place an estimate what this future life may be. Such a matter cannot be determined accurately in advance; it is all a matter of judgment and we based our statement in this regard largely on the fact that the future life of the expensive elements of the Company's plant was shown in Exhibit "C," at page 65, et seq., to be at least eighty-four years from 1914, and the further statement of the witness, Metcalf (Record, page 295), that in many cases his estimates of the useful life of certain elements of the plant had already been shown to be too low. In the absence of any aid or suggestion from the appellee on this point, we renew our assertions that it is fair to estimate that the average life of the plant would be at least fifty years from 1914.

This being so, we submit with fullest confidence in the correctness of our position that the estimated yearly future depreciation allowed by the Master is grossly excessive and that on this account the Master's determination of net earnings is far too low.

The appellee attempts to explain the great disparity between the past depreciation fixed by the Master and that found to be the depreciation for the year 1914 (our original brief, page 87), by stating that that disparity is explained by the fact that the determined depreciation for the past does not include property which amounts in value to $1,261,000.00 abandoned as obsolescent or otherwise useless in serving Denver, while for the future a depreciation allowance ought to be made for property of this character which will soon be abandoned or become obsolescent.

Of what does this property abandoned in the past consist? Exhibit "C," page 98 to 100 gives a resume of this abandoned property and an examination of this exhibit shows clearly that such property consists of large units given up principally for the reason that they were found not to be practical installations, or because they had been superseded by the larger units of the plant at present used. For example, the first group consists of various pumping stations:—the old Fifteenth Street Station; the Beaver Brook Station, both of which were entirely abandoned and their places taken by the more modern gravity system. The Ashland Avenue plant was built on leased land, later it was dismantled, and a new plant built. Why that plant was abandoned is not shown clearly, but we assume that it was because it was impracticable to renew

the lease. Among the tanks and stand pipes, it appears that out of the four mentioned, all, save one, have been abandoned and that this one has been removed to University Park, a distant suburb of the city. Among the reservoirs, the Strong Reservoir was abandoned because the Cheesman site was considered more advantageous; the Skelton Reservoir was abandoned, because it was submerged by the construction of the Marston Lake Reservoir; the Highland Reservoir was abandoned and no explanation is given, but we assume that it was because the water was furnished in some more satisfactory way by new works installed by the Company.

There are two artesian wells which were abandoned, a variety of buildings were abandoned, including a hotel; various filter plants were abandoned; a submerged dam in Cherry Creek at Sullivan was abandoned; various privately owned telephone lines were abandoned (presumably because better telephone service could be procured from the public telephone lines).

In addition to these, certain conduits were abandoned and certain distributing pipes, but the total value of these conduits and pipes does not much exceed the sum of $200,000.00 and from this list it seems clear that very little was given up because it was worn out, but that the things which have been abandoned were engineering mistakes and that small units used in the early history of the Company were given up when larger or more efficient units were provided to take their places.

Sullivan Reservoir is a good illustration of the situation and shows to some extent why some of

the larger units such as above described have been abandoned. Even the omniscient Mr. Metcalf is puzzled regarding this structure and declares (Record, page 274), that he does not know what service this reservoir was originally designed to perform although he makes various guesses as to how it might be used. This reservoir, according to Mr. Metcalf's testimony, has already cost $190,000.00. The Master did not classify it as abandoned property, but did characterize it as property neither "used nor useful," so that, we repeat, the property which has been abandoned in the past has consisted almost entirely of small units displaced by more extensive and effective units or of the Company's engineering mistakes.

If it is true that the present plant is so ill conceived, so ill devised and such a patch-work that other extensive units thereof must shortly be abandoned, then the rate which the Master charged for future depreciation may be explained. Certainly it cannot be justified. On the other hand if such property is shortly to become useless, if it is to be abandoned, then it is outrageous to value such property at its reproduction cost, less only physical depreciation.

However, there is nothing in the record to show that large units of the Company's plant will need to be abandoned in the immediate or near future; the Master says in his report "Lake Cheesman delivers water to the city with small loss in transit; is sufficient as a source of domestic supply and is available for use and used in periods when the supply of water in the natural streams is limited and the demand for water great" (Record, page 130). He

further declares: "The evidence shows clearly that the Company's plant as a whole is in excellent condition. The quantity of water is abundantly in excess of the needs of the community; the pressure under which the water is furnished is good, comparing very favorably with the records in the larger of our American cities. In general, I believe that the service furnished by the Denver Union Water Company compares favorably with that furnished by other water works systems in the country" (Record, page 139).

This does not indicate that any considerable portion of the Company's plant will have to be abandoned in the near future; indeed it indicates quite a contrary condition, and certainly there is an immense volume of testimony in the record, testimony produced by the appellee, to the effect that the plant is not only in nearly perfect condition, but is ample for the needs of the community for many, many years to come.

As we have already suggested, all allowances for annual depreciation must certainly be based on some estimate regarding the number of years in which the amount shall be contributed, in order to make up the value of the plant. If the witness, Hazen, whose testimony was the Master's guide, had this principle in mind, he must have fixed the amount that was to be so replaced at $15,300,000.00, which was his estimate of the value of the Company's property (Record, page 230), and in order to provide for this large amount of money, he placed the annual depreciation allowance at $150,000.00. The Master, having estimated the total value of the property at a less amount than Mr. Hazen, reduced, rather

more than proportionately, the Hazen estimate for annual depreciation and made it $140,000 annually. But why should the Master, or Mr. Hazen, or any one else take the value of the Company's *entire* property as a basis for computing annual depreciation. The only property that should have been taken into consideration in determining this question is property that depreciates.

Referring to the Master's table 1 (Record, page 122), we find some items that cannot possibly be the subject of depreciation. The first is lands valued at $637,814.00. The next are water rights valued at $2,947,617.00; the next is going concern, valued at $800,000.00. Now *past* depreciation was not allowed by the Master on any one of these items. We are entirely unable to see why any of them could possibly depreciate in the future. The Master took the value of $13,415,899.00 as the basis for computing future depreciation, but in computing past depreciation he eliminated these three items of lands, water rights and going concern.

Assuming that all of the other items of the property were subject to depreciation, and deducting these three items of lands, water rights and going concern from the total valuation found by the Master, we have $9,030,468.00 as the total value of all the property which can possibly be subject to depreciation, and if the Master's estimate of $140,000.00 annual depreciation on his valuation of $13,400,000.00 is a fair estimate, then calculating the annual depreciation allowance in the same way, this item should be $90,000.00; $50,000.00 less than found by the Master, and the net returns as found by the Mas-

ter should be increased by this amount of $50,000.00 at least.

One hundred and forty thousand dollars found by the Master as properly allowable annual depreciation is an annual rate of 1.55 per cent on $9,030,468.00, the very highest valuation that could be placed on property subject to depreciation.

At page 145 of its brief, appellee refers to the evidence at pages 347, 348, 799 and 801 of the Record to support the Master's allowance for annual depreciation. The evidence referred to is that of the accountant Cheyne, but this witness did not purport even to make an estimate of annual depreciation, and on his cross-examination (Record, page 899), he says: "In using the figures $170,000.00 for depreciation and contingent reserve, I simply adopted the estimates of the Company's engineers."

The evidence of the witness, Metcalf, referred to in this connection, is to be found in the Record at page 896.

With all deference to the distinguished ability claimed for this witness by counsel for appellee, we declare that his testimony is more a partisan argument than a statement of evidentiary facts. He says that Mr. Fellows' annual depreciation allowance should be materially increased and that the depreciation allowance set forth in table C, is based on the sinking fund method as 95/100 of 1 per cent and the appellee in its brief at page 146, tells us that the engineers of the Public Utilities Commission applied the rate of 1 per cent to the gross reproduction cost or gross value. This is true only to the extent that $140,000.00 is practically 1 per cent of $13,415,000.00,

but to call this a depreciation allowance under the sinking fund method of 1 percent per annum is an entirely mistaken statement, for if the life of the plant is fifty years, the real situation is as shown in our opening brief (page 88). As we pointed out in our former brief at page 88, $140,000.00 paid in annually with interest at 4 per cent compounded annually will amount to $13,500,000.00 in about thirty-nine years and seven months, while $85,028.00 so paid in annually with interest at 4 per cent thereon compounded annually would amount to $13,500,000 in the fifty years which we have fairly estimated as the future life of the plant, but the allowance that ought to be made is an amount sufficient to yield $9,030,488 less the scrap value of the plant, rather than $13,-415,899.00; now $56,685.00 paid annually with interest at 4 per cent compounded annually will amount to $9,000,000 in fifty years.

The finding of the Master as to depreciation for the year 1914, and following years, is not reinforced by showing, as appellee has attempted to do, that the courts have in cases of gas companies, or that State Comissions have in cases of electrical companies made larger allowances for depreciation than was made by the Master here. It is absurd to contend that a water supply system, the principal elements of which consist of massive structures of masonry and durable iron pipe, both of which, even on the testimony of appellee's own witnesses, have a theoretical life of ninety-four years, and will probably last much longer, depreciates at the same rate as an electrical plant filled with delicate machinery which is constantly running. How skillfully Mr. Metcalf, appellee's expert witness, on whose testi-

mony the witness, Cheyne, relies in making his figures, has handled the situation for the Water Company can be seen from an examination of his testimony. When he values the plant of the Water Company for the purposes of obtaining its present valuation, he deducts accrued depreciation, basing his deduction, as he says, upon judgment and his observation of the property (Record, page 901). He declares that the property of the Company, upon actual examination, has depreciated far less than might have been expected, and when confronted by tables of theoretical depreciation which he had published, he makes the following statement (Record, page 294):

> "You imply that regardless of the condition or character of the machine a man must adopt a list of estimated ages which was made years ago with perhaps a certain set of conditions in mind, and that simply because that list has been so printed, therefore, regardless of the condition of the property, a man should always stick to the list.
>
> At West Denver Station, page 88, Exhibit "C," I gave the life of one set of boilers 23 years, another set 20. At Capitol Hill 24 years, at University Park Station 15 years, Montclair Booster Station 21 years. Ashland Avenue Station 21 years. The life tables give the average life of boilers at 12 to 16 years, many of these boilers are already older than that, still doing good service and still approved by the boiler insurance companies. I might say

that those tables were made when I was considerably younger and had had less experience than today. As I have stated, many of the structures in this plant are actually older than the useful life which I have given in the tables and yet are in excellent condition and destined to be in the service for many years to come. I conceive it to be the duty of the engineer to pass judgment in the light of conditions as he finds them, not in the light of any arbitrary tables, least of all to be bound by anything which he has written before, simply on account of a desire to be consistent with what he has written."

When, however, he comes to testify concerning future depreciation, he bases his judgment purely on the theoretical estimates which he says earlier in his testimony should not be controlling, and this is true, not only of Mr. Metcalf, but of all the engineers employed by the Company.

The witness ultimately states exactly what he has done in the following words (Record, page 894):

> "The extent of depreciation that has accrued, must be determined first and foremost by an actual inspection of the plant. In our depreciation allowance for the future, we based our estimate on the sinking fund method with a 4 *percent interest rate.*" (Italics ours.)

By this ingenious method of computation, Mr. Metcalf is able to testify that the various elements of the plant have depreciated up to the present time

a small fraction of 1 percent per year, based on their values as found, and that for the future they will depreciate at the rate of about one per cent per year, based on their reproduction cost. The discrepancy is not explained by the appellee and is evidently incapable of explanation.

IS EIGHT PER CENT PER ANNUM THE LEAST RATE OF NET RETURN, WHICH IN THIS CASE CAN ESCAPE THE CHARGE OF CONFISCATION?

In appellee's brief at page 158, et seq., it is contended that 8 percent is the least rate of net return that in this case would escape the charge of confiscation. It is also claimed that even taking as a rating base the lowest valuation which by any possibility could result from appellant's contentions, and applying thereto the net earnings under the ordinance, the resultant rate of return would be far below that which is repeatedly held necessary to escape the charge of confiscation. In arriving at this conclusion appellee assumes that the net return of $488,820 found by the Master is fixed and established.

At page 162 of appellee's brief the rating base, deducting from the Master's report the items of water rights, going value, engineering and contingencies and interest during construction is calculated at $9,005,321. This calculation as made by appellee is correct; in our previous computation of interest during construction and enginering and contingencies, we neglected to deduct the Master's finding of accrued depreciation. Appellee says that measured by this rating base, the net annual return

would be .054. As said before, however, this is on the assumption that the finding by the Master of the net return is $488,820.00.

As heretofore pointed out, the year taken by the Master, namely, 1914, was an abnormally low year. The gross revenues for that year were from $45,000 to $47,000 less than for 1912 and 1913, and the operating expenses were considerably higher than they had been during the whole life of the company. Furthermore, the Master allowed $140,000 for depreciation and the only evidence in the case upon which to base a conclusion as to depreciation was the arbitrary allowance of 1 per cent and less, but the Master not only included property which is the subject of depreciation, but also over $4,000,000 of property that he had expressly held was not subject to depreciation (Record, page 122), thus his allowance for depreciation was at least $50,000 too high. Add this sum to the $50,000 difference between 1914 and a normal year and we have $100,000 that should be added to the Master's estimate of annual net return, or $588,820, and this is not taking into consideration the gradual increased revenue of the company which would reasonably be expected, an increase of 5 per cent annually over 1912 and 1913. Take then the rating base of $9,005,321 and the corrected net return of $588,820 would provide a rate of return of 6½ per cent, or instead of taking the rating base of $9,005,321 simply deduct the water rights, $1,998,117 and going value, $800,000, from the Master's total valuation, and the resultant rating base is $10,617,-782. Then also taking the corrected net return of $588,820 makes the rate of return .0555.

The foregoing computations and resultant rates of return are based on the Master's findings as to value except those items to which there are strictly legal objections, and upon the assumption that the operating expenses found by him are justified by the evidence, and we again insist that neither the valuation found by the Master nor the annual operating expenses estimated by him are shown with that clearness and certainty that is demanded in such cases.

On pages 164-166 of appellee's brief it is sought to arrive at the fair return by capitalizing the net earnings found by the Master. This, of course, establishes nothing. If the assumptions are correct no doubt their mathematical figures are correct, and the computation serves to prove only that their mathematical deductions are correct.

On pages 168, 169 of appellee's brief it is said that appellant neglected to deduct from the items of engineering and contingencies and interest during construction the percentage found by the Master for past depreciation. This criticism is well taken, as we have heretofore said and we frankly acknowledge the mistakes.

On page 169 of appellee's brief it is stated that the business done and the consequent gross earnings and resultant net earnings for the year 1914 were greater than for 1913, and substantially the same as for 1912. We simply refer the Court to our previous argument on this question and to the record at pages 990, 1080, 1108 and 1109.

On page 172 of its brief appellee states that the going rate of interest for loans on residence prop-

erty in Denver is 6 per cent, and that the interest rate provided by the Colorado statute is 8 per cent, and that the current bank rate on good risks is about 6½ per cent. The interest statute in Colorado was adopted 28 years ago, Section 3161, Rev. Statutes, 1908. Since that time other interest statutes have been adopted by the Legislature. In 1899, ten years later, an interest statute was passed fixing the rate of interest on County, City and School Warrants at 6 per cent. Revised Statutes, 1908, Sec. 3164. In 1891, Rev. Statutes, 1908, Sec. 305, a statute was passed, prohibiting trust companies from allowing or paying interest in excess of 6 per cent. The interest provided by statute on state warrants and certificates of indebtedness is 4 per cent (Sec. 6225, Rev. Statutes, 1908).

The fact that the company's long term bonds have been sold at a reduction so that the effect is that the company is paying over 6 per cent per annum, is not persuasive. It will be remembered that the present company was organized by the consolidation of a number of other companies. Eight million dollars in bonds were issued, $7,000,000 of them being divided among the previous owners of the consolidated system, the other $1,000,000 being used for construction. The original investment, therefore, was represented by the issuance of promises to pay, and as to what the value of the property consolidated was considered to be worth we have no knowledge. The bonds then have no significance whatever.

On page 174 of appellee's brief the rate of return found by the Master is compared with the rate of return on Liberty Bonds. Counsel say the bonds being tax free, really net an actual return of 3.9 per

cent, but the same is true of the rate of return established by the Master for he had already made an allowance to be deducted from the gross earnings for taxes. Of course the fact that a $2,000,000,000 bond issue was readily purchased by patriotic Americans would furnish little, if any basis for determining what investors considered their money worth. A very large number of the persons who purchased the Liberty Bonds would have purchased them if the government had provided no interest, for it was not considered a loan as an investment, but as a patriotic duty owed to our country. The purchase by investors of United States securities during the years 1914, and 1915, the years this case was tried, would be a better criterion for determining what money was worth during those years, bearing in mind of course, that United States securities are considered the best. In 1915, from January 1 to September,—the range of prices on United States securities was as follows:

U. S. 2s Consols, Reg., maturing April, 1930, lowest, 96¾; highest, 99¼.

U. S. 3s Reg. 10-20s, lowest, 109; highest, 111½.

Panama Canal 3s, maturing 1916, lowest, 100¾; highest, 102.

Risks and Hazards of Business.

At page 177 of their brief, counsel discuss the risks and hazards of their undertaking, and state that a rate of return should be permitted sufficiently large to take care of this risk or hazard. Counsel have failed, however, to point out a single hazard or risk

that is undertaken by them that is not amply and fully covered and insured against in the operating expenses and depreciation allowance allowed by the Master.

Counsel say, on page 177: "The Water Company's investment is not only subject to the usual risks ordinarily incident to the public utility business in a western city, but in addition it has always been and is now subject to the risk of municipal competition, *which is a real and most serious menace.* As is obvious, and is clearly demonstrated by the evidence in this case, *municipal competition would result in the practical destruction of the Water Company's entire investment*" (Italics ours). But why is the risk greater in a western city than in an eastern city? Denver is no longer a frontier town; it is as well governed as any eastern city. The city is what is known as a "dry town." The "cup" that was heretofore employed as a cup to cheer is no longer employed for that purpose, but is devoted to the single use of consuming the product of this company. Nor does the fact that the company is threatened with municipal competition, or being supplanted by the city in the water business add anything to the risk that the company would be entitled to charge for. It is a fact that the company is likely at any time to find itself out of business by reason of the city exercising its right of becoming the owner of a municipal water system, and this would amount to a "Practical destruction of the Water Company's entire investment." But this does not authorize the company acting by sufferance as it now is to charge for this risk. This is only an admission of what we have repeatedly said, that by reason

of this contingency the value of the company's property is greatly reduced, and that therefore the reproduction theory does not afford a fair basis for arriving at the value of the company's property.

A recent case analogous to the situation here is the case of Goldfield, etc., Water Company vs. Public Service Commission, 236 Federal, 973. This was a case involving the regulation of rates for water in the City of Goldfield, Nevada. The water plant had been constructed during the time that Goldfield was a prosperous, booming mining camp. The plant was large enough to supply thirteen million gallons of water per month, but at the time this suit was instituted its monthly sales were no more than five million gallons per month. The physical depreciation of the plant had been negligible, it only having been installed for a short time. But in arriving at the depreciation the Court in that case, at page 984 of the opinion said:

> "For eight years, while its mines have been yielding $65,000,000, Goldfield has been wonderfully prosperous. During that time the company apparently has had a free hand in the matter of fixing rates, but it has collected nothing for depreciation. The commercial value of its property has diminished more than 50 per cent. It seems unfair that this burden of accrued depreciation should be added to current depreciation and cast upon the present retail consumers of the company. Save in exceptional cases—and this is not an exceptional case—depreciation properly chargeable to one period

should not be collected from the customers of another period. Puget Sound Electric Ry. Co. vs. Railroad Com., 65 Wash. 75, 117 Pac. 739, 748, Ann. Cas. 1913B, 763; Harris vs. South Side Gas & Electric Co., P. U. R. 1915F, 747, 759; Whitten on Valuation of Pub. Service Corp., Sec. 483 et seq."

The argument used by the Court in the foregoing case is applicable here. Here the plant of the company is depreciated by age and use, but it is depreciated to a far greater extent by the fact that it may soon be valueless.

Counsel's cases cited on pages 179-180, with reference to rates that railroad companies should be entitled to receive, hardly furnish a fair comparison. A railroad company is subjected to many risks and hazards. It might have disastrous wrecks, there may be failures in crops that it depends upon to obtain its tonnage from, the constant risk of personal injuries to its employes, and many other things that might be cited make the business of operating a railroad hazardous. But what are the hazards here? What are the risks of the business? The demand for water will not decrease; it is an absolute necessity; there are no dangers of fires which could cause any great loss to the company; and furthermore, let us again turn to Exhibit "A-56," which is appellee's tabulation of the company's financial affairs during a period of twenty years. The only items included in this tabulation which could be considered as hazards or risks are the "operating expenses" referred to as loss and damage and personal injuries, and for these items for the twenty years included in the tabulation,

the average amount paid out for personal injuries annually was $68.50, and the average annual amount paid out for all other loss and damage was $692.60, or $761.10 annually for all of the hazards and risks suffered by the company for a period of twenty years.

Complainants below offered no other testimony sustaining their claims on this question of hazard or risk than the general tabulations showing their operating expenses. And taking them as a guide, it shows that the hazard that the company undertakes in carrying on its business is about as great as the hazard of operating a town well.

On page 178 appellee refers to the risks of its business on account of threatened municipal competition and says that municipal competition would result in the practical destruction of the Water Company's entire investment, and also speaks of the attempt of the city to force the company out of business. This company or its predecessors voluntarily entered into a contract in 1890 to furnish the city and its inhabitants with water for a period of twenty years; its contract is terminated; it is now a tenant by sufferance. It is not being forced out of business, and will not be forced out of business when the city erects its own plant. It should have prepared against the time when its services would no longer be required, and should have "written off" its investment during its franchise period, and now having reached the end of this franchise, and the city not being ready to supply itself, it is using its structures, which would otherwise be practically worthless, for temporarily furnishing Denver with water.

Appellee in concluding its argument on the question of rate of return refers to a few of the recent

decisions digested in Whitten on Valuation of Public Service Corporations (Vol. 1, Sections 731-785, Vol. 2, Sections 1433-1445). The cases selected are cases which show the highest rate of return of any referred to by Mr. Whitten, and with the exception of two, are all telephone and telegraph companies and railroads. We will select some other cases referred to by Mr. Whitten in the sections indicated by appellee:

1897, Steenerson vs. Great Northern R. R. Co., 69 Minn. 363, 2½ per cent on cost of reproducing terminals, 5 per cent on the rest of the road.

1902, Cedar Rapids Water Co. vs. Cedar Rapids, 118 Ia. 234, 4.4 to 5½ per cent.

1903, Spring Valley Water Works vs. San Francisco, 124 Fed. 574, 5 per cent.

1905, Long Branch vs. Tintern Manor Water Co., 70 N. J. Eq. 71, 5 per cent.

1908, Spring Valley Water Co. vs. San Francisco, 165 Fed. 657, 5 per cent.

1909, Cedar Rapids Gas Co. vs. Cedar Rapids, 144 Ia. 456, 5 to 6 per cent.

1911, Contra Costa Water Co. vs. Oakland, 159 Calif. 323, .0468.

The case of Louisville vs. Cumberland Tel. & Tel. Company, 225 U. S., 430, was an injunction proceeding to prevent the enforcement of an ordinance

fixing telephone rates. The Master, to whom the case was referred, found that the revenue under the reduction would be sufficient. The Court was of a different opinion and the injunction was granted. The case was reviewed by this Court and the values as found by the Court below were not disturbed, namely, $1,788,000. This Court, however, did not agree with the lower court as to the gross earnings or as to the operating expenses allowed, but found that the net return should be $89,455.62, which, as said by the Court, is just above 5 per cent on the judge's valuation. It had evidently been contended by the appellee in that case that any net rate of return under 6 per cent would be confiscatory, but Mr. Justice Holmes at page 436 of the opinion says:

> "We express no opinion whether to cut this telephone company down to 6 per cent by legislation would or would not be confiscatory. But when it is remembered what clear evidence the Court requires before it declares legislation otherwise valid void on this ground, and when it is considered how speculative every figure is that we have set down with delusive exactness, we are of opinion that the result is too near the dividing line not to make actual experiment necessary. The judge on assumptions to which we have stated our disagreement makes the present earnings 5 10/17 per cent with a reduction by the ordinance to 3 6/17 per cent. The whole question is too much in the air for us to feel authorized to let the injunction stand."

WATER RIGHTS.

Questions Involved.

A question of supassing importance is as to the ownership of "water rights" that is, those water rights acquired through the joint acts of the company and the City and its inhabitants in diverting water from the natural streams by the carrier company and applying it to a beneficial use by the City and its inhabitants, as distinguished from water rights purchased by the company from farmers, who had previously acquired title thereto by diverting it from the streams and applying it to a beneficial use on their farms. The question is not only important as materially decreasing the value of the property found by the master as being used and useful in furnishing Denver with water, but of far greater importance is it in involving principles long since settled and determined by the constitution, statutes and the decisions of the Supreme Court of Colorado.

One of the fundamental principles of the irrigation law of this state is that the user is the proprietor and owner of the water right that he uses. It must be borne in mind that in Colorado the water of its natural streams is declared by the constitution to be the property of the public (Colorado Constitution, Article 16, Section 5), and it is only the *use* of the water that the constitution permits the people of the state to become owners of. Our constitution differs from the constitutions of some of the other western states, notably California, in which there have been dedications of the water of the states. In California, for instance, water is dedicated to the public

use. The state, however, does not retain the ownership or proprietorship of the water, but merely declares that it shall be used for public or quasi public purposes, and therefore, subject to the control of the state. Furthermore, under the constitution of California, which differs radically from the constitution of Colorado, appropriators of water are permitted not only to acquire the right, for their own beneficial use, but to acquire a right in it for the purpose of sale, rental and distribution. California Constitution of 1879, Article 14.

On the other hand, in Colorado, where it is permissible to acquire by appropriation the right to the use of water, it is not permissible to acquire either the water or the right to the water for the purpose of sale or rental. In other words, we have in this state, by our fundamental law, said that appropriators of water from the natural streams may acquire the right by priority to the use of the water, but that the state will not permit an ownership, either in the water, or in a right to its use, except by those actually applying it to a beneficial use, but after this right of use has been acquired in Colorado in the manner provided by its laws, the party acquiring such right has a property right which he can sell, rent or otherwise dispose of, but before he can sell or rent the water he must have reduced it to an ownership, and this is accomplished, not by the diversion of the water from the natural stream, but by the application of it to one of the beneficial uses recognized by the constitution.

Through the constitutional and statutory provisions of the state and through the decisions of its courts, the respective rights of car-

rier ditch companies and users from their ditches have been fully determined. A person in Colorado has the right to divert the unappropriated water of a natural stream and to make application of it on land, and when these two acts have been completed the person has a completed appropriation and a resultant right to the use of the water of the stream, but, on the other hand, if a person, instead of constructing a ditch, should, through the agency of a carrier ditch company, procure water that the carrier ditch company had diverted from the stream, the person is none the less the owner of the water right, provided he complies with his obligations to the company that the law imposes and continues to pay the company for the services rendered, namely, for the carriage of water through the company's ditch; and the fact that the statutes of the state and the decisions of its courts have safeguarded the carrier company with respect to its rights as a carrier, in no manner militates against the principle herein enunciated, and to declare a different principle would be shocking, not only to a lawyer, but to any layman who has grown up with the development of the irrigation jurisprudence of the state.

Assuming that the foregoing statements as to the law in Colorado are correct, it can readily be seen what a disastrous effect a contrary opinion of the Supreme Court of the United States would have upon vested interests in Colorado. Thousands of acres of land that were theretofore practically worthless have been reclaimed by the industry of those who have cultivated the lands and applied the waters of the natural streams of the state under the guaranties of the state constitution; and it is the universal

understanding in Colorado that the law is that where a person procures water through the agency of a carrier and applies it to his land, thus completing the constitutional appropriation of the water right, the person thus applying the water to his land is the owner of such water right, subject to the obligation which the law imposes upon him to pay a reasonable charge for the carriage of the water, and to comply with other reasonable rules, either imposed by law or by the carrier company, and the same universal understanding as to lands applies equally to cities. Here in Denver millions have been expended in building permanent improvements with the confiding belief that water would always be available in the city, and that its procurement was not subject to the whim or caprice of any company, but that the company was acting as a carrier simply, and that its rates could be regulated by the proper authorities; that the water rights, so indispensable to the value and enjoyment of their property belong to the users thereof, and not to the carrier, who is simply a public servant furnishing to the users water dedicated to them by the constitution, under a contract of carriage; and it matters not whether this contract of carriage is made by the water company with the City as the representative of the inhabitants, or whether it is made with the inhabitants themselves, for the reciprocal rights of the users and the carrier would be the same, whether made with the city for the benefit of its inhabitants, or made with the inhabitants by the carrier.

Counsel have stated that the value of water rights as found by the Master, is too low.

Conceding, for the sake of argument, that the Master had the right to include the water rights other than the purchased water rights as a part of the property owned by the company, we do not admit that such rights were fixed too low, but contend that even in such case the rights were fixed too high. The evidence upon which the Master based the value of these water rights was evidence as to the value in Colorado of water on the basis of acre-feet. He placed this value at $55.00 per acre-foot. But the evidence given in this behalf by the complainant below was not as to the value of a water right independent of structures, but as to the values of water rights, including structures. But it is unnecessary to enter into a discussion as to what the value of these water rights other than purchased water rights is, for the question here involved is not a question of value, but of ownership.

Counsel, on page 228 of their brief, say that the appellants do not question the inclusion of the water rights which the company had purchased and which amounted to $949,500, but that they expressly conceded the propriety of their inclusion. Counsels' statement is not entirely correct. We do concede that the company, having purchased these water rights and purchased them for the purpose of employing them for furnishing water to the City of Denver and its inhabitants, is entitled in equity to have an allowance made, and whether this allowance is to be considered as added to the company's property or not, in justice, it would make no difference. With reference to these purchased water rights, however, there is a serious question as to whether the company, having purchased them for the sole and only purpose of

devoting them to supplying the City and its inhabitants with water, and since said purchase the City and its inhabitants, having kept alive the appropriations by use, as to whether the company did not obtain said rights in trust for Denver, and that its allowance in a rate making case should not be for the value of these water rights, but for the amount of money laid out and expended by the company for them in trust for Denver and its inhabitants. But the Master took as the basis of such valuation the amount that he considered represented the sale value of said water rights, which was at least ten times the amount that the company had paid for such water rights. These purchased rights will be discussed further under the subject of "Valuation." It must be further borne in mind that the company acquired these water rights not for the purpose of sale, not for the purpose of using said water rights for its own use, but for the purpose of carrying out the contract it had entered into with the City to furnish it a sufficient supply of water.

The Colorado Cases.

Counsel in their brief have frequently criticised the language of Mr. Justice Helm in the case of Wheeler vs. Northern Colorado Irrigation Company, 10 Colorado, 582, wherein the principle was first laid down by the Supreme Court of the State that the user, and not the carrier, was the *proprietor* of the water diverted from the stream. Counsel say that this is the unfortunate expression of a single judge, is not to be seriously regarded, and is not in keeping with other decisions of the Supreme Court; but an examination of the cases following this case

will show that Judge Helm in this case laid the foundation for rules which have become fundamental in the jurisprudence of Colorado. We will briefly refer to some of the cardinal principles laid down by Judge Helm which were intended to determine the rights of carrier and consumer, and which have been religiously followed ever since.

We quote the following excerpts from the opinion:

> "The agriculturists in the territory mentioned (referring to the vast plains east of the mountains) are, with few exceptions, unable to convey water from the natural streams to their land. To the successful cultivation of that region the carrier and consumer are, therefore, equally indispensable. Hence a wise legislative policy and an intelligent judicial construction require a careful consideration of the privileges, powers and duties of the carrier, as well as the rights and obligations of the consumer. The courts should protect the consumer in the full enjoyment of *his constitutional and statutory rights;* but they should also jealously guard the rights of the carrier; and so deal with it (the constitution and statutes permitting) as to encourage the investment of capital in the construction of reservoirs and canals for the storage and transportation of water." (Italics ours), Id. 586, 587.
>
> "But to constitute a legal appropriation, the water diverted must be applied

within a reasonable time to some beneficial use. That is to say, the diversion ripens into a valid appropriation only when *the water is utilized by the consumer* * * *." Id. 588.

"Certain peculiar rights are acquired in connection with the water diverted. It is unnecessary now, however, to enumerate these rights in detail. For the present it suffices to say that *they are dependent, for their birth and continued existence, upon the use made by the consumer.*" (Italics ours.)

"But giving these rights all due significance, I cannot consent to the proposition that the carrier becomes a 'proprietor' of the water diverted.

"A cursory reading of the statutes might convey the impression that the legislature regarded the carrier as possessing a salable interest in this water. And the constitutional phrase, 'to be charged for the use of water,' relating to the carrier's compensation, might, at first glance, seem to recognize a like ownership in such *use*. But construing all the provisions of that instrument bearing upon the subject *in pari materia*, the correctness of both these inferences must be denied. The constitutional convention was legislating with reference to the necessities and practical wants of the people. And this body, in its wisdom, ordained that the ownership of water should remain in the public, *with a perpetual right*

to its use, FREE OF CHARGE, in the people." (Last italics ours.)

"By Section 8, Article 16, of the constitution, from which the foregoing phrase is taken, the convention recognized the carrier's right to compensation for transporting water, and provided for a judicial, or *quasi*-judicial tribunal to fix an equitable maximum charge where the parties fail to agree." Id. 588-589.

It is obvious from a consideration of the foregoing quotations that the right to the use of water, which the consumer acquires, is not the only right in such persons making the use, but they are also entitled to the right to the *use free of charge,* and that the only compensation permitted by the constitution and the statute is compensation for transporting the water.

"Under the constitution, as I understand it, the carrier is at least a *quasi*-public servant or agent. It is not the attitude of a private individual *contracting for the sale or use of his private property.* It exists largely for the benefit of others; being engaged in the business of transporting, *for hire, water owned by the public, to the people owning the rights to its use. It is permitted* to acquire certain rights as against those subsequently diverting water from the same natural stream." Id. 589. (All but first italics ours.)

So, therefore, insofar as the foreging opinion of Judge Helm is concerned, there is no possible

question as to the application of the rules therein laid down to the facts in the present case. The appellee company here is a public carrier of water, impounding it and diverting it from the natural streams for the purpose of transporting it to users. It had the right, it is true, not only to divert the water from the natural streams, but also to apply it, itself, to a beneficial use, and thereby, not only acquire the right of carriage, but the right to the ownership of its use; but it didn't do this. It acted in the capacity of a carrier and agent and representative of the users of the water, and under the laws of the state, in performing this service, indispensable though it is, it acquired a right to compensation, but not a compensation for the use of the water, but a compensation for transporting water; and unless this decision of Judge Helm's has been overruled or modified by subsequent decisions of the Supreme Court of Colorado, this item of almost $2,000,000.00, which was awarded by the Master as a part of appellee's property, was improperly included.

We will now briefly review the subsequent cases of the Colorado Supreme Court upon this same question to see if there has been any departure from the principles announced by Judge Helm, but we will first refer to the special concurring opinion of Judge Beck in the case just quoted from. Judge Beck, commencing on page 597 of the opinion, concurred fully in the portions of Judge Helm's opinion heretofore quoted. As to some other features of the case, while he did not dissent, he arrived at them by a different source of reasoning, and expressly stated at the conclusion of his opinion that, except in so far as his views expressed did not concur in Judge Helm's

opinion, he concurred therein. The third member of the Court did not participate.

The direct cause of the institution of the foregoing case was the refusal of the ditch company to furnish water to the consumer at the carriage rates fixed by the company; the company demanding a bonus as a condition precedent to furnishing the water, and during the same year that this case was decided, 1887, the legislature of the state passed a statute in keeping with the opinion of the Court in that case, the statute being Section 3271, Revised Statutes of 1908, and is as follows:

> "It shall not be lawful for any person owning, or controlling, or claiming to own or control any ditch, canal or reservoir, carrying or storing, or designed for the carrying or storing of any water taken from any natural stream or lake within this state, to be furnished or delivered for compensation for irrigation, mining, milling or domestic purposes, to persons not interested in such ownership or control, to demand, bargain for, accept or receive from any person who may apply for water for any of the aforesaid purposes, any money or other valuable thing whatsover, or any promise or agreement therefor, directly or indirectly, as royalty, bonus, or premium prerequisite or condition precedent to the right or privilege of applying, or bargaining for, or procuring such water. But such water shall be furnished, carried and delivered upon payment or tender of the charges fixed by the county com-

> missioners of the proper county, as is, or may be, provided by law. Any and all moneys, and every valuable thing, or consideration of whatsoever kind, which shall be so, as aforesaid, demanded, charged, bargained for, accepted, received, or retained, contrary to the provisions of this section, shall be deemed and held an additional and corrupt rate, charge or consideration for the water intended to be furnished and delivered therefor, or because thereof, and wholly extortionate and illegal; and when paid, delivered or surrendered, may be recovered back by the party paying, delivering or surrendering the same from the party to whom, or for whose use, the same shall have been paid, delivered or surrendered, together with costs of suit, including reasonable fees of attorneys of plaintiff, by proper action of any court having jurisdiction."

Section 3272 and Section 3273 of the same revision provide penalties for violating Section 3271.

The section above referred to, 3271, was declaratory of the law announced by Judge Helm, where, on page 591 of the opinion referred to, he says:

> "Respondent cannot collect of relator the sum of $10.00, or any other sum, for the privilege of exercising his constitutional right to use water,"

and the constitutional right to use water referred to was the right, as announced in another part of the

opinion, to its use free of charge, upon the payment of compensation for transporting the water.

Following the case of Wheeler vs. Irrigation Company, the next case to announce the same principle, was the case of Farmers' High Line Canal & Reservoir Co. et al. vs. Southworth, 13 Colorado 111 (decided in 1889). The three justices, constituting the Court, each wrote an opinion, and we will quote briefly from the opinion of the Chief Justice and of Mr. Justice Elliott.

Chief Justice Helm, on pages 120 and 121 of the opinion, referring to his former opinion in Wheeler vs. Irrigation Company, says:

> "There is, therefore, no escape from the conclusion hitherto announced by this Court, that in cases like the present, the carrier's diversion from the natural stream must unite with the consumer's use in order that there may be a complete appropriation within the meaning of our fundamental law. * * * It would undoubtedly become unlawful were the water diverted not applied to beneficial uses within a reasonable time; but, when thus applied, the diversion unquestionably ripens into a perfect appropriation. * * *
>
> "*The foregoing view is not a recognition of ownership in the carrier, save of its canal;* nor does it in the slightest manner detract from the consumer's constitutional right of user. The carrier in and of itself has no independent priority (though the irrigation statutes use language that might

give this impression), and any rights it may hold in connection with the water diverted depend for their continuance upon the use made by consumers. *The carrier becomes the consumer's agent*, and its labors clearly inure to his benefit. By taking from its canal the consumer recognizes and ratifies its acts of construction and diversion, making them his own. *And the situation, so far as this question is concerned, is not different from what it would have been had the consumer in fact employed the carrier to construct the canal for himself alone.*" (Italics ours.)

And Mr. Justice Elliott, commencing on page 130 of the opinion, says:

"Can the carrier of water for hire be said to be using the water in the sense spoken of in the constitution? The railroad company, which carries farming implements from the great manufactories of the east to supply the farmers residing upon the broad prairies of the west, can hardly be said to be *using* such implements by the mere act of thus transporting them. From the specification of the purposes for which the water may be used it would seem that the 'better right' which attaches to the priority of appropriation was primarily intended for the benefit of those who apply the water to the cultivation of the soil or other beneficial use, rather than for the benefit of those engaged in diverting and carrying it to be

used by others. The diversion and carriage of water in point of time are necessarily prior to the application of it to agricultural or other useful purposes; but they are subordinate in point of right. The former are to the latter as the means to the end—an end without which neither the diversion nor the carriage would be lawful. *The carrier is the agent, the consumer is the principal. The former can lawfully pursue his occupation only by virtue of the service he renders to the latter. The consumer's right is primary, and unconditional; the carrier's is secondary, and dependent.*" (Last Ital. ours.)

On page 132 Mr. Justice Elliott quotes with approval from the language used by Judge Helm in Wheeler vs. Irrigation Company, 10 Colorado, 582, to the effect that the rights of the carrier are dependent for their birth and continued existence upon the use made by the consumer, and also that neither the title nor salable interest in the water from natural streams vests in the carrier by reason of his diversion or carriage thereof.

The next case decided by the Supreme Court of Colorado, directly involving this question, is the case of Combs vs. Agricultural Ditch Company, 17 Colorado, 146 (decided in 1892). The opinion in this case was by Mr. Justice Elliott. We excerpt the following:

"The mere diversion of the water is not an appropriation of it within the meaning of the constitution; there must be an appli-

cation of the water to beneficial use within a reasonable time or the diversion is unlawful.

"The ownership of a prior right to the use of water is essentially different from the ownership of stock in an irrigating company. The ownership of the stock like the title to other property may be acquired by descent or purchase; the ownership of the prior right can be acquired originally only by the actual beneficial use of the water. The very birth and life of a prior right to the use of water is actual *user*.

"The constitution provides that the water of natural streams may be diverted to beneficial use; but the privilege of diversion is granted only for uses truly beneficial, and not for purposes of speculation." Id. 151-152.

The next case decided was Wyatt vs. Larimer etc. Co., 1 Colorado Appeals 480 (decided in 1892). In this case the Court of Appeals, which is inferior to the Supreme Court, assumed to overthrow the doctrine previously held by the Supreme Court, and assumed to overrule the decision in Wheeler vs. Irrigation Company, *supra*, and held that the company was in no legal sense a common or private carrier, and that the canal company by reason of its diversion, appropriation and application of the water to a beneficial use, became the proprietor of the water, and as such could sell, transfer and deliver it to be used by those who required it for irrigation, id. 502; but when this same case was taken to the Su-

preme Court, that court held in 18 Colorado, page 298 (decided 1893), that the principles announced by the Court of Appeals were so at variance with numerous decisions of the Supreme Court, that it felt impelled to express its disapproval thereof, the Supreme Court concluding its opinion as follows:

> "We adhere to the doctrine that such a canal company is not the proprietor of the water diverted by it, but that 'it must be regarded as an intermediate agency existing for the purpose of aiding consumers in the exercise of their constitutional rights, as well as a private enterprise prosecuted for the benefit of its owners' "; citing Wheeler vs. N. Colo. Irrigation Co., 10 Colo, 582; Southworth case, 13 Colo., 111; Strickler vs. City of Colorado Springs, 16 Colo., 61; Combs vs. Agricultural Ditch Co., 17 Colo., 146; id 308.

While the Supreme Court in the above opinion stated that they were unable to see wherein the discussion of the Court of Appeals was essential to the questions involved, yet so jealous was the Court of the fundamental principles previously laid down by it with reference to the status and character of carrier ditch companies, that it would not permit to go unrebuked even an *obiter* opinion assuming to announce a different rule.

The next case is the case of White vs. The Farmers' Highline Canal and Reservoir Company, 22 Colorado 191 (decided 1896). Briefly referring to the facts in the case, the Court said on page 192:

> "This water has been principally used by farmers for agricultural purposes, it being the custom of the ditch company to *carry water for hire* for the defendant and a large number of agriculturists along the line of the ditch." (Italics ours.)

In the course of the opinion at page 197, quoting from Wheeler vs. Irrigation Company, 10 Colo. 582, the Court says:

> "Under the constitution, as I understand it, the carrier is at least a *quasi*-public servant or agent. It is not the attitude of a private individual contracting for the sale or use of his private property. It exists largely for the benefit of others; being engaged in the business of transporting, for hire, *water owned by the public, to the people owning the right to its use.*" (Italics ours.)

Again in the case of Farmers Independent Ditch Company vs. Agricultural Ditch Company, et al, 22 Colorado, 513 (decided 1896), the Court, prefacing its opinion, laid down the following rules:

> "1. A mere diversion of water from a stream does not constitute an appropriation recognized by the constitution and statutes. To make it such there must be an application of the water to a beneficial use, and, in case of irrigation, it must be applied to the land to make the appropriation complete.

"2 Ditch corporations are *quasi publici* carriers—a means to an end to be resorted to for the purpose of conveying water from the natural streams to places where it may be applied to beneficial uses.

"3. Appropriators of water from the same stream, through the same ditch, may have different priorities of right to the use of such water based upon the time of the several appropriations." Id. 521.

In the case of Cache La Poudre Irrigation Company vs. Larimer and Weld Reservoir Co., 25 Colorado, 144 (decided 1898), the question of carrier ditch companies was not directly involved, but the court in making the distinction between the owners of the stock in the ditch and consumers of water from the ditch made it clear as to the character of the respective ownerships of these two classes. It was contended in that case by the appellant that where a ditch belongs to a corporation the priority to the use of water belongs to the consumers, and the stock may be held by persons not using water. The court in answering this contention stated that the accuracy of it depended upon the facts, but that under the facts the owners of stock in the company and the owners of the water rights were the same persons, and that the company having been formed for mutual convenience, the stock in that particular company represented and stood for, not only the rights of the owners in the ditch, but also represented the right to the use of the water in the ditch. The court used this illustration at page 147:

"A ditch company organized merely as a *carrier* of water to those owning the appropriation may, as a corporation, own the physical or tangible ditch. Its stock may be in the hands of A and B, and the consumers of water may be C and D, and the transfer of the capital stock of the company may carry only an interest in the ditch. But where, as is the case at bar, the water rights, and the ditch through which they are enjoyed, are owned by the same persons as tenants in common, and for their mutual convenience they organize a corporation and convey to it the ditch and water right, and the corporation issues to the consumers its capital stock, which represents and stands for, not only the rights of the parties in the ditch, but, by a mutual arrangement, also represents the right to the use of water, or the priority right, then this stock (while not, of course, constituting the ditch or priority use of water) does represent both the ditch and that priority, and a transfer of the stock operates as a transfer of both kinds of property." Id. 147-148. (Italics ours.)

The next case to which we will refer is the case of Wright vs. Platte Valley Irrigation Co., 27 Colorado, 322 (decided 1900), in which the court at page 329 of the opinion quotes with approval from the "unfortunate expression" of Mr. Justice Helm in the 10th Colorado case, and holds that the carrier must be regarded as an intermediate agency existing for the purpose of aiding consumers in the exercise

of their constitutional right, as well as a private enterprise prosecuted for the benefit of its owners.

The case of Schneider vs. The People, 30 Colo., 493 (decided in 1903) was a case in which an indictment had been returned against Schneider for violating the provisions of the statues of 1887 of the State of Colorado, which statute is referred to and quoted at page 101 of this brief. The court held in that case that the information was insufficient as not properly charging the offense, but with reference to the statute itself the court held on page 498 of its opinion:

> "Under such statutes, now and at the time of the passage of the act in question in force, and under the decisions of this Court, the owner of such a ditch as is described in the act we are considering is aptly called a common carrier, and the carrier's diversion from the natural stream must unite with the consumer's use in order that there may be a complete appropriation within the meaning of the fundamental law when the consumer himself makes no diversion from the natural stream. A perfected appropriation, therefore, is the result of the combined act of the carrier—which consists in the taking or carrying away of the water from the channel of the stream—and the successful and actual application of water to the soil by the consumer. *It is also the established doctrine in this state that water may not be diverted from a natural stream unless the right to its beneficial use has been acquired,* and at the time is so needed." (Italics ours.)

In the case of Combs vs. Farmers' High Line Canal and Reservoir Company et al, 38 Colorado, 420 (decided 1906), the court at page 429 says:

> "In *Independent Ditch Co. vs. Agricultural Ditch Co.*, 22 Colo. 513 at page 524. the court says, as plaintiffs here contend, that the statute provides for a decree awarding priorities to the several ditches, and not to those claiming water under them. But the court immediately remarks: 'It is, however, necesary, in making proof, to show that the water has been actually applied to the land, in order that a completed appropriation may be shown.' While it is true that the priority decree is awarded to the ditch or ditch company which carries the water, yet in reality the thing decreed is a completed appropriation. Such appropriation consists of two acts: A diversion of water from a natural stream, and the successful application thereof, within a reasonable time thereafter, to some beneficial use. Where the consumer of water makes the diversion himself, a completed appropriation is made by the same person; but where the diversion is made by a carrier, and the successful application is made by another who is the consumer, a completed appropriation is the result of their combined acts. It is, as we have said, the completed appropriation for which a decre is awarded, and, while it is awarded to the ditch, it is made, as the decrees themselves specify, *for the use and benefit of the persons lawfully entitled*

thereto. And, while no ascertainment is made as to who are consumers under any particular ditch, necessarily the relative rights of ditch owners and all consumers are determined." (Italics ours.)

Again at page 432 said:

"This court, upon several occasions, has held that a ditch company, by means of which water consumers enjoy their appropriation, *is the trustee and representative of the consumers for the protection of the rights of the latter.*" Wheeler vs. Northern Colo. I. Co., 10 Colo., 582, 592; F. H. L. C. & R. Co. vs. Southworth, 13, Colo., 111, 121, 132; Ind. Ditch Co. vs. Agr. Ditch Co. supra; Canal Co. vs. Loutsenhizer D. Co., 23 Colo. 233, 235." (Italics ours.)

In the case of O'Neil vs Fort Lyon Canal Co., et al, 39 Colorado, 487 (decided 1907), the court, quoting from the case of Combs vs. Canal Co., 38 Colo. 420, held that the appropriation where the carrier and consumer were different persons, consisted of two acts, and that the appropriation was the result of these combined acts of the carrier and the consumer, and on page 494 of the opinion said:

"The defendant (carrier) company and its grantors were trustees for the stockholders and consumers and bound to protect the intersts of all."

In the case of Comstock vs. Larimer and Weld Counties, 58 Colorado, 186 (decided 1914), the doc-

trine of ownership of water rights was again reaffirmed. The Court at page 199 of the opinion, said:

> "Begining with the first application of water in Colorado to beneficial uses, the right of preference to such use between respective claimants has been made to depend upon *prior appropriation and necessity of use.* This doctrine has become thoroughly entrenched in our jurisprudence, through constitutional and statutory provisions, and by a uniform and unbroken line of judicial decisions." (Italics ours.)

Appellee's Cases Distinguished.

We have now discussed, not all of the cases in Colorado, but the leading ones with reference to the status of water carriers and the consumers, except the case of the City of Denver vs. Brown, 56 Colorado, 216 (decided 1914), the case upon which counsel so confidently rely to sustain their contention that the carrier and not the consumer is the owner of the water right. This was a decision en banc, all the justices concurring, and the court, far from departing from the fundamental principles laid down by Mr. Justice Helm in Wheeler vs. Irrigation Company, 10 Colorado, 582, and thereafter steadfastly adhered to, at the outset of its opinion on page 222, as an introductory adopted the identical language of Mr. Justice Helm by saying:

> "Such a company is a *quasi* public carrier for the purpose of conveying water from natural streams to places where it may

> be applied to a beneficial use. IT IS NOT THE PROPRIETOR OF THE WATER WHICH IT IS ENTITLED TO DIVERT, BUT MUST BE REGARDED AS AN INTERMEDIATE AGENCY EXISTING FOR THE PURPOSE OF AIDING CONSUMERS IN THE EXERCISE OF THEIR RIGHTS TO APPROPRIATE WATER, as well as a private enterprise prosecuted for its benefit.—Farmers' I. D. Co. vs. Agricultural D. Co., 22 Colo. 513, 45 Pac. 444, 55 Am. St. Rep. 149; Wright vs. Platte Valley I. Co., 27 Colo. 322, 61 Pac. 603; *Wheeler vs. Northern Colo. I. Co.*, 10 Colo. 582, 17 Pac. 487, 3 Am. St. Rep. 603; Wyatt vs. Larimer and Weld I. Co., 18 Colo. 298, 33 Pac. 144, 36 Am. St. Rep. 280" (italics and caps ours),

and by this announcement expressly reaffirmed the doctrine laid down in the Wheeler case and the several cases following it, which counsel say have been overruled by the decision of an inferior court in the case of Wyatt vs. Larimer etc. Co., I Colorado Appeals, 480. But before proceeding with an analysis of the opinion in the foregoing case (Denver vs. Brown), it is necessary to state the facts involved in that controversy. The case was commenced for the purpose of determining the rights to the use of water from the "City ditch." The City ditch had been purchased by the city from its original owners, and at the time the case was tried the city was the beneficial owner of the ditch, and was also the beneficial owner of certain water rights connected with the ditch. There were also others not interested in the ditch, who had water rights

therein (but these rights were not involved in the suit), therefore, the city occupied the dual position of having a ditch through which it conveyed its own water, as well as being a public carrier for the conveyance of water rights owned by others. The city from time to time used the water rights that it had acquired for the purpose of irrigating trees, and along in the 90's began to use this water right for irrigating its parks and filling lakes in parks. It was also shown that when the park area would be increased, the city would require all the water, which it had theretofore applied to the irrigation of trees upon its streets, but in the meantime the city was renting these water rights, to which it had become entitled by use, to others who might desire the use of the water, as well as carrying water to others who had acquired the right to the use thereof. At page 232 the court, after having reviewed the facts, made this finding:

> "At the time the city was exacting these contracts it was the beneficial owner of the ditch and had been for something like 18 years. Its use of water as a contract consumer was continuous each year from the time it first began to apply water to the irrigation of shade trees on the streets of the city. When it became the beneficial owner of the ditch this use was continued without interruption, except that some time in the nineties the volume it used was to some extent decreased. It intended, however, to resume the full use later. *As stated, the contracts under consideration were executed subject to the needs and requirements of the*

> *City as a user.* As to consumers entitled to water from the ditch by virtue of prior user, we think these conditions were invalid in so far as they related to the volume which such consumers were entitled to have turned out to them, for the reason that to this extent their rights had attached, and they could not be deprived of them unless they voluntarily consented." (Italics ours.)

Therefore, while the court in this case laid down rules, not only with reference to water rights owned by the city but the water it was delivering as a carrier, the question here involved *was as to the contracts, which were in the nature of leases of the City's* appropriated water rights, and as to these water rights, which the city owned absolutely, the court held at page 233 of its opinion that the city had leased such rights to the water which it had acquired as a consumer above those necessary for its present needs. There is not one syllable in the whole opinion which in any manner overrules or modifies the decision in the Wheeler case, but it serves to clearly emphasize the principles therein announced.

On pages 260-261 et. seq. of their brief counsel cite and quote from the case of the People vs District Court, a case in the Colorado Supreme Court not yet reported. This case was in the nature of mandamus to compel the District Court to enter a decree in accordance with the judgment and opinion rendered in the case of City and County of Denver vs. Brown, 56 Colorado, 216, which has just been referred to. Counsel have included the opinion in this case in an appendix at pages 436-437 of their brief.

Counsel say that while the determinations of the Supreme Court in the Brown case are clear, they are rendered still clearer and more definite by the Court's own analysis thereof given in this last case.

An examination of this last opinion will show that the court did not intend to in any manner modify, change or overrule the opinion in the Brown case, but simply pointed out again to the lower court what had been its ruling in the Brown case. Therefore, in order to have a full understanding of the court's opinion in the last case, it is necessary to be familiar with the facts and opinion in the Brown case. The Court, for instance, used the following language in People vs. District Court:

> "As to the *excess* water, which term *will be comprehended by those familiar with the litigation*, we held the limitations imposed by the city upon the users of this water were in effect a lease of the amount *not necessary for the city's present needs* and preserved the water privilege in the city the same as though *it had continued in the use.*" (Italics ours.)

The excess water above mentioned was the excess water which was explained on page 233 of the Brown case, and was water which the city had acquired the beneficial use of by its own previous application. It was not water which it was carrying for hire, but water, the use of which belonged to it, and that it had the right to sell, lease or otherwise dispose of, the court saying:

"As to any *excess* water for which these consumers contracted by contracts containing these limitations, or as to those whose rights were initiated under these contracts the limitations imposed must be treated as a lease of the water, the right to the use of which the city had theretofore acquired and, therefore, to this extent are valid. We are also of the opinion that the use of water under these contracts by consumers, bound by the limitations imposed, preserved the status of the city the same as though it had utilized the water covered by these contracts for its own needs. In other words, by these contracts it leased its rights to the water *which it had acquired as a consumer* above that necessary for its present needs, and hence preserved them to all intents and purposes exactly as though it had continued the use of such water. *The Cache La Poudre Ir. Co. vs. Larimer and Weld Co.,* 25 Colo. 144, 53 Pac. 318, 71 Am. St. 123."

Furthermore, the only question under consideration in the Brown case was with reference to this same excess water which belonged to the city, for on page 232 of the opinion it is clearly stated that the contracts under consideration in the case are for water, the use of which the city owned.

Counsel also refer to language in the mandamus case on page 265 of their brief, where they refer to the expression that "the city was the proprietor of the appropriation." By reference to the Brown case to see what the Court was discussing when it used

this expression it is obvious that the Court had reference to the water owned by the city, because that was the only water in controversy in the case.

The Court at the outset of the opinion in the Brown case laid down general rules with reference to carrier companies, with reference to water rights owned by consumers and the obligation the consumers owe to the carrier, thereby again reaffirming the doctrine so long adhered to; but as far as this case is concerned the questions decided were as to water rights owned by the city. However, all of the expressions, are in keeping with the decisions thertofore rendered by the court.

Counsel for the City are criticised for not having referred to this case of the People vs. District Court in their opening brief, and counsel for appellee try to draw the inference that by it not having been mentioned it must have been considered as against the contention of appellants. It would have been highly improper to have referred to the case; it is highly improper to refer to it now, but we are driven to it in self defense. The opinion referred to has not yet been publicly announced. A petition for rehearing has been filed and the case is now pending on rehearing, and as to what the final announcement of the Supreme Court in this case will be we can only speculate.

From a consideration of the Brown case and the previous cases with which it is in line, the following rules clearly result:

1. Persons in Colorado may divert water from a natural stream, either for their own use, or they

may divert the water as carriers for the purpose of furnishing consumers with the use of the same.

2. A corporation or individual may divert water from a natural stream for a double purpose:

(a) For irrigating its or his own lands.

(b) Also to act as carrier to irrigate lands of others.

3. When a corporation is organized for the purpose of acting in the capacity of a carrier, the water rights by it transported belong to the person applying the water to a beneficial use. The corporation is then the owner of the ditch and other structures, and has the right to enter into contracts with the consumers for its protection, and if the consumer fails to comply with the contract, the corporation is no longer under obligation to furnish the service, but upon the termination of such contract the water rights thus lost by the consumer do not become the property of the corporation, but are forfeited to the people of the state until again applied to a beneficial use by some other consumer.

4. A consumer once having contracted with the carrier for the carriage of water is entitled to continue such relationship without intermission by paying the carrier company the rate the company may lawfully exact.

The foregoing rules are conclusively and indisputably the law in Colorado, and with them in view we will analyze the Colorado cases cited by counsel, which they claim sustain the proposition that the carrier and not the user is the owner of the water right.

Counsel on page 237 of their brief say that an appropriator has the right to divert water from the natural streams and to convey it to the place of use, and also has the right, either to apply it himself to a beneficial use, or to sell and thereby confer upon others permanent rights so to do; or if he chooses, to continue to lease such rights to others, himself retaining the title. All of these propositions are conceded, provided the person taking the water from the stream becomes an appropriator, that is, not only diverts the water, but applies it to a beneficial use, but until he has completed the appropriation by applying it to a beneficial use, he cannot lease such rights to others, and cannot sell such rights to others, and he cannot retain the title, for there is as yet no title in him to retain. He can, however, during the process of constructing his system, convey to others an interest in his structure, and those to whom he conveys thereby become proportionate owners in the structures, and by applying water out of the ditch to their land acquire water rights.

Counsel on page 238 of their brief make this statement:

> "It is a fact, which appellants will not dispute, that almost without exception the large irrigation companies of Colorado have from the beginning pursued the course of selling and conveying permanent rights to take water from their ditches, rather than leasing or licensing such rights for limited periods."

While we do not admit the statement of counsel, we do admit that a large number of irrigation

companies of Colorado have conveyed permanent rights to take water from the ditches, but the conveyance of these rights in such cases has made the purchasers owners in the ditch and pro rata owners of the structures, but such companies are not carrier ditch companies; they are mutual ditch companies for the purpose of furnishing water to those interested in the company or its works.

Counsel first cite the case of Combs vs. Agricultural Ditch Co., 17 Colorado, 146, 150 at page 239 of their brief, and quote the following language:

> "Those who construct ditches and divert water for general purposes of irrigation must within a reasonable time apply the water to beneficial use; or else, upon proper application and for proper consideration, they must dispose of the same to those who are ready to make beneficial use of it."

This is illustrative of the principles we have laid down. A person may construct a ditch and divert water and can become the appropriator either by applying the water himself to lands, or may act in the capacity of a carrier, and the use of the words "dispose of" by the court was not intended to mean that the person constructing the ditch had thereby acquired title to the water.

In the case of the New Mercer Ditch Company vs. Armstrong, 21 Colo., 357, 363, cited on page 239 of counsel's brief the court did not hold that a corporation could divert water from a stream for speculative purposes, or that it could sell it to purchasers without itself having made a beneficial use of the

water. The court did hold, however, that a corporation would have the same rights as a natural person in regard to the sale of water, and could sell it in accordance with the doctrine announced in Strickler vs. Colorado Springs, 16 Colo. 61. The case referred to (Strickler vs. Colorado Springs) was the first case in this state in which it was determined that water rights could be transferred by sale separate from land, and one of the points indicated by the court, as included in the issues, was as follows:

> "Can the priority of a farmer to the use of water for agricultural purposes be transferred by sale to a city for city purposes so that it may succeed to the rights of the original appropriator?" id. 66.

So it is readily seen that in the New Mercer Ditch Company case the Court did not decide that a corporation had *something to sell before it had acquired title to it*, but simply held that a corporation had the same rights as a natural person, and that when it had become the owner and appropriator of a water right that it could sell it to others.

Blakely vs. Fort Lyon Canal Co., 31 Colo. 224, page 240 counsel's brief, was a case in which the Canal Company had constructed a ditch and had sold interests therein by deeds, in which deeds it was provided that when the capacity of the canal was disposed of, the canal would vest in the owners of the water rights. This company was not acting as a carrier ditch company, but was disposing of not only the right to carry water in the ditch, but a pro rata interest in the ditch itself to the purchasers. There was not a word said in the opinion about

carrier ditch companies, and nothing to indicate that this was a carrier ditch company. On the contrary it is plainly shown that the rights the company was selling were not the rights of transporting water through its ditch, but were pro rata rights in the structures themselves.

The case of Butterfield vs. O'Neill, 19 Colo. Appeals 7, counsels' brief page 241, was a case of a mutual ditch company; a number of prospective users of water having organized for their mutual benefit to appropriate water through the Cushman ditch. After the ditch had been used for a number of years the plaintiff, Butterfield, commenced a suit against O'Neill, et al, claiming to be the owner of all the water in the ditch, alleged an abandonment by the defendants, and grounded his claim upon a prior appropriation of the water by himself and his grantors, and under the foregoing statement of facts the court held that his claim of a prior appropriation was baseless for the reason that the appropriation had been made by the Cushman Ditch Co., that all the stockholders were interested in such appropriation, that there had been no abandonment, and that therefore there were no facts upon which to base an independent appropriation of the plaintiff. The Court did not hold that the plaintiff in the case was an independent appropriator, but held that his appropriation existed in common with the other appropriators.

Counsel conclude their list of so-called ruling cases by citing the case of Dickson vs Dick, 59 Colo. 583, counsel's brief, page 241. The ditch companies in this case were the same kind of ditch com-

panies as that in the case of Blakey vs. Ft. Lyon Canal Co., 31 Colo. 224, above discussed. The ditch companies in question, the Homestead Co. and the Dickson Reservoir and Irrigation Co., were companies organized for the purpose of selling rights in the ditch. It is nowhere stated or intimated that they were carrier ditches, or that the water rights referred to did not convey rights *pro rata* in the properties of the companies. In fact, as is shown in the statement of facts, some of the rights in question were purchased for the purpose of complying with the provisions of the Desert Land Act, and inasmuch as it is necessary, in order to comply with the Desert Land Act, to have attached to the land a permanent water right, it is to be asumed that these companies were selling such rights, that is, rights which carried with them, not only the privilege of taking water from the ditches, but also a corresponding interest in the structures, and in view of the fact that carrier ditches are nowhere mentioned in this opinion, it must be conclusively presumed that the question of rights, as between carrier ditch companies and consumers, were not involved in the case; in fact, had this company been a carrier ditch company, it would have been unlawful for it to have charged $15.00 per acre, or any other amount, for the privilege of taking water out of the ditch. This was expressly held in the Wheeler case, 10 Colo., 582, wherein it is said at page 591:

> "Respondent cannot collect of relator the sum of $10.00, or any other sum, for the privilege of exercising his constitutional right to use water."

All that could be charged if it were a carrier ditch company would be the annual charges for the carriage of the water. Not one of the cases referred to by counsel was a carrier ditch company. All of them were what is known as mutual ditch companies, or promotion companies designed ultimately to become mutual ditch companies.

But what is the character of the water company in the present case? It was organized in 1894 for the purpose of taking over the rights of the companies that had theretofore furnished water to the city of Denver and its inhabitants for hire. It was the owner of a subsidiary company, The South Platte Canal and Reservoir Company, which also was organized, according to its articles of incorporation, (Record, page 904) to supply water to the City of Denver and additions thereto and towns and cities in the vicinity thereof. Its reservoirs and ditches were decreed water for supplying the city of Denver and the inhabitants thereof with water for municipal, domestic and other purposes (Record, page 920). It has acted as a carrier company; in fact, there is no disputing this contention. By ordinance No. 44 of 1890 (Record, page 941), the company was given "the right and privilege of laying down, continuing and maintaining water pipes, valves, hydrants and apparatus in the conveyance and distribution of water in, upon, along and through the following streets, etc." The ordinance also provided by Section 4 thereof that the company should at all times furnish water from its mains to parties desiring the same upon application, under such reasonable rules as might thereafter be prescribed. Section 5 provided the rates to be charged to private consumers.

This ordinance was passed by the Council by virtue of its powers given by Charter of 1889, referred to on page 54 of appellant's original brief, and the company by accepting the grant of the ordinance became bound by all its terms and it became a carrier for hire for the city and its inhabitants, subject to the constitution and statutes of the state, and subject to the provisions of this ordinance. There was a special provision in this ordinance, the same being Section 11, with reference to the purchase by the city of the company's works at the expiration of the franchise, and in this provision for purchase, it was the *works* of the company referred to, and nowhere were "water rights" mentioned or included in the property provided to be purchased.

There is but one other Colorado case cited by counsel necessary to refer to, and that is the case of Denver vs. Walker, 45 Colorado, 387. Counsel have referred to this case at pages 230, 250 and 253 of their brief. The ditch involved in this case was the same ditch involved in the Brown case. The water right involved was water that belonged to the city, which it had acquired by having applied the same to a beneficial use, and by permission of the Council certain people were allowed to use the water belonging to the city during the times the city did not require it for its own uses. There is nothing whatever in the case which affects the question here involved, except to bear out our interpretation of the Brown case.

The Court in its statement of facts, upon which its conclusion is based, states on page 389 of the opinion:

> "There is not a particle of evidence that plaintiffs' grantors ever made, or acquired, an appropriation of water from the South Platte river, by any means. Perhaps it inferentially appears, or is virtually admitted, that, by means of the ditch in question, an appropriation of water was made by the grantor of the city which right, at least after its acquisition by the city, has been applied by the municipal authorities in irrigating lawns, gardens, trees and parks of the city * * **"

and again on page 393 it is said:

> "Whether the appropriation through the City ditch was originally made for the city's benefit, does not appear and possibly it is not important in this case; but it would seem from the record that, at least after the city acquired the ditch and its accompanying water rights, it has so used them as a source of supply of water for the purpose of irrigating trees, lawns, city parks and municipal property in the City of Denver, lying thereunder."

The result of the case was that the court held that the plaintiffs' rights were not proved, that is, the right of an appropriation of water out of the Platte River; and while the case is not decisive of any question herein involved, it tends to support the facts assumed by the court in the Brown case *supra*, concerning the same ditch, in which it is contended that the City is not only the owner of the ditch, but also of its appropriated water rights.

Let us now examine the master's determination of this question. At page 129 of the record he says:

> "The ownership of the 'appropriation,' under such circumstances, is or may be fixed by contract between the one who diverts and the one who beneficially applies such water. It is plain that such parties by contract between themselves may vest the ownership of the appropriation in whom they please. This I understand to be the rule adopted by the Supreme Court of Colorado in City of Denver vs. Brown, 56 Colorado, 216."

It is not true that in Colorado the ownership of an appropriation may be fixed by contract. An appropriation may be sold or the rights to the use of the water acquired by the appropriation may be leased or otherwise disposed of, but the appropriation originally is fixed by law, giving the benefit to the user. Neither was any such rule as this laid down in the Brown case or even mentioned, and even if it were the rule in Colorado that the ownership of the appropriation or the ownership of the water right could be fixed by contract, there is no evidence in this record to show that any such contract was made.

The master says at page 129 of the Record:

> "There is no testimony, in the voluminous record accompanying this Report, from which it can be fairly inferred that any consumer of the Water Company at the time he paid his water rates and received his

> license, believed or claimed he was making an appropriation of the water of a natural stream of Colorado or was acquiring as against the Water Company any right of any nature to the use of water except as stated in that license."

Neither is there any evidence in the Record that any consumer *believed* or *claimed* that when he used water from the Company's works he was thereby not only paying the company's just dues as a carrier, but that also he was by this act of user perfecting for the company a valuable water right.

There is nothing in the licenses in question that intimates any contractual relation as to this water right or appropriation. These licenses are found in the Record at page 970, and are copies of the forms used for various years in the history of the company. They purport to be licenses, but there is no provision in them that the Denver Union Water Company is the owner of a right that the consumer is perfecting, and they would be without effect if there was. These so-called licenses amount to nothing but a receipt for the money paid by the consumers for the carriage of the water. There are certain provisions in them as to the purpose for which the water shall be used, and providing against furnishing water to others from the consumer's tap. These provisions are regulations, reasonable regulations, that are permitted by the ordinance of 1890 to be made by the company, but there certainly is nothing in them from which it can be inferred that the water right, this valuable right dedicated by the constitution of the state to users of water, is bargained

away or sold to the water company. There is only one contract involved with reference to furnishing water to the City of Denver and its inhabitants, and that is the ordinance of 1890 (Record, page 941). This ordinance is a contract. It fixes the obligations existing on the part of the water company and also on the part of the city and its inhabitants, or did fix them during the period of its existence. The city, through its council, had the right by delegation from the State Legislature, to enter into this contract with the Water Company for the purpose of not only furnishing itself water for necessary uses, but also as the agent and representative of its inhabitants to furnish them water. The permission to make the regulations contained in Section 4 of the ordinance was the provision that gave the company the right to make regulations as indicated in their water receipts, or so-called licenses; so therefore, for the master to arrive at the conclusion that a contract had been made with the users of water and the Water Company whereby it was agreed that the appropriation should belong to the Water Company, is preposterous. There is no evidence whatever to sustain it, and if any such contract had been made, under the doctrine as laid down in the Wheeler case, 10 Colorado, its provisions would have been void.

Here is a company, which has been given an opportunity by the City of Denver to construct works and to furnish water to the City of Denver and its inhabitants for a period of twenty years and an opportunity to make profits in furnishing such water. In the accomplishment of this undertaking it has had to divert water from the natural streams of the state in

order to supply the demands of the city. It has had to acquire land and build reservoirs, construct aqueducts, and for all of this expenditure it is entitled to receive a fair return upon its investment, but the water rights, the most sacred species of property right in the State of Colorado, were not dedicated to carriers, but were dedicated to those who would make use of the water, and thereby materially increase the wealth of the state. This right to the use of water in Colorado, dedicated by the constitution, is a possessory right. The fee, as it were, is retained by the state, and only this possessory right is permitted to be owned by the citizens of the state. It is of the same character as the right granted by Congres to citizens of the United States to the possession of mineral claims on the public domain. A person has the right to go on the public domain of the United States and prospect for minerals, and if he discovers any he is given the possessory right of a mining claim, which he can hold and enjoy as long as he complies with the law with reference to work and development, or he can sell it or lease it, but the fee of the mining claim remains in the Government unless the owner sees fit to patent it. This right of possession and use, like the right in Colorado to the use of water, may be forfeited by nonuse and then becomes open to relocation or reappropriation by others. This possessory right to mining claims is given by the Government free to its citizens to encourage them in exploiting and developing its mineral resources and in Colorado the use of water is granted free to those who will devote it to the enrichment of the soil that the wealth of the state may be increased.

We will now refer briefly to some of counsel's arguments and deductions that they seek to draw from the various decisions in Colorado. It is stated on page 255 of their brief after quoting from the Brown case, that the Supreme Court in that case "pointed out the difference between the status of those who by outright purchase or other permanent arrangement had acquired a perpetual right to water diverted by and flowing in the ditch, and the status of those who were licensees only, under temporary contracts for limited periods, such as one irrigation season."

The court does not attempt to draw any such distinction. There is no distinction in Colorado between permanent arrangements and arrangements from year to year. There is a distinction between carrier ditches and ditches which are mutual, but a person, whether he contracts to take water for a year or to take water for two years or for any other length of time through a carrier company, occupies the same identical position.

Counsel throughout their discussion on this subject have confused the contract rights existing between a consumer and a carrier ditch company. While contracts are entered into in Colorado between carrier companies and consumers, the rights thus obtained from the carrier are concurrent with the consumers' legal right. Under the statutes of the state the consumer has the right to demand water from the carrier company, if there is water available for his use, and the fact that contracts are entered into in no way modify or restrict the consumer's right. As was said by Wiel on Water Rights in the Western States, Third Edition, Section 1328:

"Contract Rights, When Valid are but Concurrent With the Noncontract Right.

"The public service right is wholly irrespective of contract, or, as has been said, "the right of an individual to a public use of water is in the nature of a public right possessed by reason of his status as a person of the class for whose benefit the water is appropriated or dedicated. Where a contract right exists, it is only cumulative thereto. It does not displace the underlying right belonging to the consumer as a member of the public, such as the right to enforce compulsory service, or to complain of unreasonable or discriminating conditions and probably a contract requiring the consumer to surrender this public right is *per se* illegal."

On page 266 *et seq.* counsel draw deductions from the authorities that they theretofore have referred to. Some of their deductions correctly state the law, others are far from being the law. Under their paragraph 3 on page 266 they refer to the rights which the carrier has conferred. The carrier can confer no rights to the use of water unless it has theretofore acquired the title in itself. It can contract to supply the water, but the law confers the water right upon the user.

On page 267 of their brief they conclude that after an appropriator has constructed works and diverted water, they have the right (a) to confer upon others by deeds, etc., perpetual rights to take water from their conduits. This may be true, but such per-

petual water rights are rights not only for the right of carriage of water, but would become rights as well in the structure. Under (b) to confer upon others by leases, licenses or their equivalents, temporary rights to furnish water. The rights conferred are not conferred by the company; the company has no right to lease or license, except that the privilege of using the carrier ditch to convey water might be called a lease or license.

On page 268 they conclude that whenever a consumer's right to use water terminates the diverter has such right for sale, lease or license to others.

As heretofore explained, this would be in direct conflict with the constitution of the state. It would permit a carrier ditch company to acquire water rights without complying with the constitutional mandate of applying it to a beneficial use. The rule is that when one user of water discontinues his use from a carrier company's ditch or system the right is subject to be applied for by others desiring to put it to a beneficial use.

As was said by Mr. Justice Helm in the Wheeler case at page 125:

> "* * * Certain consumers will abandon the use of water from the carrier and other consumers will secure the right to the use thus abandoned."

On pages 272-273 appellee contends that the relation existing in Denver between the company and the citizens is that of licensor and licensee, but what has that to do with the status existing between the company and the consumer, whether the contract exist-

ing between the company and the consumers is denominated a license, a deed, a lease or a real estate mortgage wouldn't change the status from the controlling facts. The company being a carrier, never having acquired title to the use of the water conveyed by it had nothing to license except its carriage and had nothing to lease except its carriage, or if it saw fit in the form of a deed to make this contract with the consumers, the relationship nevertheless would not be changed, because it is fixed by the law.

> "Whenever a private consumer has allowed his license to lapse by failure to renew, or has abandoned or forfeited the same, the company has had the right, which it has exercised, to apply the water to other beneficial uses, or, if it chose, to license some other private consumer to make such application."

It is admitted that the company, in the event that the consumers should forfeit their rights to the use of the water by abandonment or otherwise, has the right itself to apply the water to a beneficial use, the same as any other consumer, and thereby create a title to the water in it, but we deny that the company has ever exercised this right, or that there has ever been any abandonment by the City or its inhabitants of such rights. Nor does the company make any such claim.

A carrier ditch company has nothing to sell in Colorado in addition to its transportation. It is a public servant, a public agent. It is authorized to carry water, not for sale, but for the purpose of furnishing it to those who have the constitutional right

to apply for it, and its compensation for its carriage is full compensation for everything that it has the right to charge for.

On page 277 counsel refer to the case of the San Joaquin etc. Irr. Co. vs. Stanislaus County, 233 U. S. 454 and say "that to hold, as contended by appellants, would be to say that while the law declared that water could be appropriated for sale, yet it meant that there should be nothing to sell. Water could be appropriated for sale in California, but it cannot be appropriated for sale in Colorado. The constitution of California permits the appropriation of water for sale, but in Colorado it can only be appropriated for use. This case will be more fully discussed later in this brief.

The case of Wyatt vs. Larimer etc. Irr. Co., 1 Colo. App. 480, and also the same case in the Supreme Court, 18 Colo. 298, have heretofore in this brief been referred to, and it is only necessary now to remark that counsel have paid a great tribute to the discussion of the inferior court, where the Court ruled according to their contentions, but in referring to the discussion of the Supreme Court, reversing it, state that the opinion was confessedly *obiter*, and in that sense the decision was improper. Counsel are to be congratulated upon their ability to obtain comfort from the ruling of a court, that has been reversed by a higher court.

On page 292 of their brief counsel in quoting from the case of Wright vs. Platte Valley Irrigation Co., 27 Colo., have indicated two omissions in their quotation by asterisks. The first omission is as follows:

"It is true, as has been frequently announced by this Court, that a ditch company is not the owner of the water it diverts through its ditch; neither is its status, in the strict legal sense of the term, that of a 'common carrier.' As was said in *Wheeler vs. Northern Colorado Irrigation Co.*, 10 Colo. 582:

" 'The carrier must be regarded as an intermediate agency existing for the purpose of aiding consumers in the exercise of their constitutional right, as well as a private enterprise prosecuted for the benefit of its owners.' " Id. 329.

This portion omitted by counsel in their quotation is the same "unfortunate expression" made by Mr. Justice Helm in the Wheeler case, and the Wheeler case is cited as authority.

The next omission is as follows:

"While it may not impose conditions that operate to deprive consumers of the enjoyment of their constitutional rights, it may require them to exercise such rights under reasonable regulations and limitations."

At page 295 of their brief counsel for appellee make this statement:

"At pages 33 and 34 of their brief appellants quote from Wiel on 'Water Rights in the Western States," and from Kinney on 'Irrigation and Water Rights.' But these

> text books were written prior to the time when the Colorado doctrine upon this subject was clarified by the recent decisions, and their authors do not distinguish between the case where the consumer has by deed acquired a permanent right, and that where his right has been only temporary and conferred by lease or license (as the later Colorado cases plainly do), and therefore the statements in their text books are clearly inaccurate."

Both Wiel and Kinney, as indicated in appellant's former brief, have said conclusively that in Colorado the consumer who takes water from a carrier ditch is the one in whom the title to the water right is vested, and clearly draw the distinction between the California and Colorado rules. Mr. Wiel made this statement in 1911, and Mr. Kinney in 1912, but counsel say that since these text books were written, the doctrine upon this subject has been clarified by recent decisions, referring to the Brown case and the case of People vs. District Court. Both Wiel and Kinney reviewed at length the decisions in Colorado and came to the same conclusion that the appellant in this case has come to, but let us refer to counsels' brief at page 278, where they say:

> "The argument in support of this contention is fallacious, rests upon no tangible foundation, is in conflict with the long line of Colorado decisions to which we have already referred, and is violative of fundamental principles enunciated by the Constitution of the State and the nation."

But if this long line of decisions in Colorado so emphatically sustain counsel's position, why was it necessary that the doctrine be clarified by the Brown case?

On pages 297 and 298 counsel ask some questions. They first ask the question as to who is the beneficial owner of the water right in Denver, and answer it by saying not the City, because it has been the ultimate consumer only to a limited extent, and not the private consumers, because they have not received and applied to a beneficial use all such water.

It is not important here whether the City or whether the inhabitants of the City are the beneficial owners of the water right. If the City is the owner of the whole water right, then it is the owner in a representative capacity for its inhabitants, but even admitting that the City is only the owner of the rights by it applied, is that any possible reason why there could not be other owners of water rights in the city? All carrier ditches have more than one consumer; they all have a large number of consumers. Some carrier ditch companies in Colorado have different municipalities as consumers, and also the inhabitants of each municipality as consumers.

Counsel ask if it be true that the beneficial ownership is to be ratably apportioned between the City and the private consumers, then who is such owner? The simple answer to this question is that the owner is the person that is consuming the water. But counsel say that the ultimate consumer may not be the same today as he was yesterday, or last month, or ten years ago, and ask in such case what would become of the beneficial ownership? The

plain answer to this is that when one person moves out of a house the next person moving in acquires the right to the use of water. The owner of a house and lot may have a water right the same as an owner of a farm may have a water right. The fact that there happens to be a large number of people in Denver and therefore a large number of changes, or discontinuances of use, in no manner changes the principle. This is upon the theory, however, that the inhabitants of Denver are acting for themselves. We are of the opinion that the status of the consumers is different in cities where the city authorities contract for them, than it is in the country, where each user contracts for himself. The city probably acts in a representative capacity for all of its inhabitants. But that question has never been decided by our Supreme Court, and it is immaterial anyway in this case.

On page 298 counsel make more inquiries. In one instance they ask the question—If a considerable number of Denver's inhabitants should prefer to live in a smaller town, and should thereupon move to a smaller town, and if they should announce that they had at another point diverted their water from the Platte River, and if appellant's theory be sound, who could say them nay? And again, if Denver should carry out its resolve, as evidenced by Section 264-A of the Charter, and should construct a new plant, if appellant's theory is sound, nothing could prevent the City from taking its vested water rights through the new system.

As to the first inquiry, whichever way it might be answered, would in no possible manner affect the issues involved in this case. But we will say that in-

sofar as the company is concerned, if any number of residents would move to a place outside of Denver served by this company's works, they would have the right to demand from the company water from its public carrier system, if there was water available for that purpose.

As to the next question, the City would have the right, in our judgment, although it is not involved in this case, to build a new system of its own and to take the water rights that it has acquired by user, and run the water through the system, but in doing this no doubt the company's water works system would thereby become diminished in value, and it might be argued that the company would be entitled to damages on account of the diminished value of its facilities of carriage but such damages would be measured not by the value of the water rights, because those they do not own, but by the diminished value of its structures, whatever that might be. If this were a purchase case this question might become important, but it is unnecessary to determine here what the company would be entitled to receive as compensation in the event of purchase.

As has been said, in a rate case where the title to the water is beyond all question in the consumer, as has been shown by the repeated announcements of the Colorado courts, and a fair rate of return has been allowed the carrier upon all of its facilities used in the carriage, upon what possible theory is the carrier entitled to any return upon the value of the property which the carrier is simply delivering to its owner? Must the owner, in paying compensation to his agent to deliver the owner's own water, be forced to take into consideration the value of the

owner's own property? It may be urged that the carrier has made large expenditures of money in facilities for carriage, and if the carrier is deprived of his right of carriage, these facilities would be materially reduced in value. This would be important if a proceeding to condemn the water alone was begun, and the water taken away, and the carrier was left with its facilities for carriage without anything to carry. But in a case where the facilities themselves are taken and paid for, or in a rate case as here, where a fair return is given on their value, what property right is the carrier company deprived of when the contract between the owner and carrier is terminated?

It certainly cannot be said that the owner shall be required to return to his agent any more than the agent has employed in the execution of his agency during the existence thereof.

We now come to the discussion of the case of the San Joaquin etc. Irr. Co. vs. County of Stanislaus, 233 U. S. 454, upon which counsel so confidently rely to sustain their contentions on this question of water rights. This case came up from California, and the water rights therein referred to were determined in accordance with the constitution, statutes and decisions of the Supreme Court of the State of California. We have heretofore referred to the differences, not only in the respective constitutions of the two states, but of the decisions of their courts of last resort. In California corporations or persons are given the right to appropriate water for sale. The water is devoted to a public use, the same as it is in Colorado, and therefore, subject to regulation by the state. It is subject to the same regulation that

railroads or other utilities, owning property rights are subject to, and the rule in regard to railroads or other public utilities is the same in Colorado as it is in California. Their property is devoted to a public use, nevertheless, it is privately owned property and owned for the benefit of the utility company; but water rights in Colorado are different. They are so different that they have been the subject of comment by all of the authorities writing on the subject. They have all pointed out the distinction between the rule in California and the rule in Colorado, and while it is perfectly proper in California to compare water appropriated for sale by a company to property owned by a railroad, the same analogy does not apply in Colorado.

Mr. Justice Holmes in the San Joaquin case, at page 460 of the opinion, in characterizing this water right of the company, refers to the constitution of California and states:

> "The declaration in the Constitution of 1879 that water appropriated for sale is appropriated to a public use must be taken according to its subject matter. The use is not by the public at large, like that of the ocean for sailing, but by certain individuals *for their private benefit* respectively. * * * The roadbed of a railroad is devoted to a public use in a stricter sense, yet the title of the railroad remains, and the use, though it may be demanded, must be paid for. * * * It is unreasonable to suppose that the constitutional declaration meant to compel a gift from the former owner to the

> users and that in dealing with water '*appropriated for sale*' is meant that there should be nothing to sell.". (Italics ours.)

But in Colorado the water is not appropriated for sale; it cannot be appropriated for sale, in fact it is not appropriated at all until the consumer applies it to a beneficial use. It has been repeatedly held in Colorado that water cannot be appropriated for sale, and the constitution and laws of the state have thereby been construed by the highest court of the state, and it is not open to question in a Federal Court.

The property of a railroad is compared by Mr. Justice Holmes with the property right acquired in water in California; but compare the property of a railroad in Colorado with that of a consumers' water right and see the marked distinction. The railroad owns its right of way, it owns its roadbed, it owns its rolling stock, not because the state has granted this property to it upon certain conditions, but because it has purchased it outright and owns it the same as any other person owns private property. It is subject to control, and must be devoted to a public use, but this does not affect the private ownership of the property.

What then is there of value in the hands of a water carrier in Colorado when the consumer has acquired the title to the water right? It might be said that inasmuch as the consumer is under obligations to the carrier to have his water brought through the carrier's ditch, and that the law of Colorado protects the carrier in this right, that therefore here is a property right which is of value, and should

be considered as an asset of the company for rate making purposes, but the master has not proceeded upon any such theory; neither have counsel proceeded upon such theory. There is no evidence in the record to support such a valuation. There is no legal basis whatever for such a valuation. This right that the carrier has to carry water through its ditch to a consumer is a reciprocal right. While the carrier, by virtue of the contract existing, and by virtue of the law in Colorado, has the right to carry such water and to receive a reasonable compensation therefor, the consumer has also the right to have the carrier transport the water to him. It is a case of mutual obligations and corresponding mutual benefit. If the carrier should say that the contract right to furnish this water to the consumer is of value, in addition to the rates, the consumer will offset it by saying that his taking of the water is of value to the carrier by enabling it to obtain compensation.

If A should enter into a contract with a railroad company to transport his goods from New York to Chicago, the railroad company would be entitled to a lawful rate for transporting the goods. The contract of the company would be a chose in action and would be of value, not only to the railroad company in the remuneration it would receive, but to the shipper, who would benefit by the transportation.

While we have not attempted to answer all of the various arguments of counsel with reference to this subject, or referred to all the cases cited by them, we have certainly pursued the subject as far as a proper consideration for the Court will justify.

There is only one further case cited by appellees that it is worth while to consider, and that is the case

of Gardner Water Company vs. Inhabitants of Gardner, 185 Mass. 190. This case is a valuable one in distinguishing the difference between the rule in California and the rule in Colorado. This was a water case and involved the purchase of the property of the Gardner Water Company, which had been furnishing water to the inhabitants of Gardner. The water rights involved in that case were the waters of Crystal Lake, together with the waters flowing into it.

This corporation, the Gardner Water Company, was organized by a state statute of 1882, Chapter 145, Section 9. It was organized for the purpose of furnishing water to the inhabitants of Gardner. By Section 2 of the statute it was authorized to take, haul and convey into and through the town of Gardner, or any part thereof, the water, so far as may be necessary for the purpose, of any spring or springs, or of Crystal Lake, so-called, etc. Section 3 of the statute provided that the company should, within sixty days after the taking of any land or water rights, file and cause to be recorded with the Register of Deeds of the County a description thereof, and that upon the filing of said instrument, "*the title of the land AND WATER RIGHTS so taken shall vest in said corporation.*"

It is readily seen, therefore, that by the terms of the grant of the state to the Water Company, the Water Company became the owner of the water rights, but being engaged in a public service, the company must devote such water rights to a public use, subject to the control of the state.

The character of the company's ownership is concisely and fully explained on page 194 of the opinion, where it is said:

"It is true that such ponds are held by the commonwealth for the benefit of the public, and it is not to be presumed that the legislature would attempt to make any disposition of their waters inconsistent with the interests of the public. In this case we have no nice question as to the power of the legislature to grant such property to an individual *solely for a private use*, for the grant to the petitioner was for an important public use. Of the power of the legislature to give to a private corporation, as well as to a city or town, water rights in a great pond, to be used in supplying inhabitants with water, there can be no doubt. This power has been exercised many times in Massachusetts. The rights and privileges of this corporation in the water, under the charter, *are similar to the rights of a railroad company in the land taken for its roadbed.* Such land can be taken and held only for a public use; *but the corporation has a valuable right of property in it.* While the primary object in taking and holding it is the public benefit, which alone justifies a taking without the consent of the owner, an incidental object is the hope of profit to be derived by the corporation from the use of it. In this respect the title of the present petitioner in the use of the water does not differ materially from the *title to the roadbed of a railroad acquired under the right of eminent domain.*" (Italics ours.)

The foregoing case, as well as the Newburyport Water Co. vs. City, 168 Mass. 541, and Gloucester Water Supply Co. vs. Gloucester, 179 Mass. 165, are merely declaratory of the principle that when property that a state has the right to grant has been granted to a company for the public use, while it is granted conditioned upon being employed for a public use, and while also it is subject to the police power of the state in regulating it, nevertheless the grant carries with it a private right, a private ownership which the grantee may enjoy, subject to the limitation of the police power of the state, and such also is the character of the grant by the California Constitution of the right to appropriate water for sale, rental or other disposition, but Colorado, as we have frequently pointed out, has not surrendered its sovereignty as to water, but still controls it, and most of the Western states, following the example of Colorado, have now adopted the same rule, and even California, though reluctant to adopt the principle, in 1911 passed a statute declaring the waters of the state *to be the property of the state*. Of course this statute in California would not affect vested rights, but from now on, or rather, from 1911 on, the rule in California will be the same as it has been here since the adoption of the constitution in Colorado, and the state will retain its sovereignty in the water, and all that can be hereafter acquired will be the right to the use of it. Western states that have now fallen in line with this rule, first adopted by Colorado, are: Arizona, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Wyoming, and the last adherent, California. Wiel on Water Rights, Third Edition, Section 170.

We again assert with confidence that in Colorado water rights, which have been acquired by the application thereof to a beneficial use by a consumer, and where the diversion is effected through the instrumentality of a carrier, become incorporeal hereditaments; as they have been designated by our courts; these rights descend to our heirs when we die; are freehold estates of inheritance; and are owned by the person who has, under the constitution, enhanced the wealth of the state by the enrichment of the soil of the state. This doctrine in no manner infringes or violates the rights of the carrier. The carrier, when the question of rates is to be determined, is to be compensated for the money it has expended in the construction of its works in entering into this public employment. The water, however, has cost it nothing, and therefore, the taking it is not taking away anything that belonged to it, and the same rule would obtain in a purchase or condemnation case. The carrier company would be entitled to a reasonable remuneration for what it had expended in the construction of the works by it employed in furnishing water dedicated by the constitution to consumers, but the condemnation of its works without payment for water rights would not be taking its property for the reason that it never had any ownership in the water, but simply a right guaranteed it by the state to receive compensation for its carriage during the time that it acts as such carrier.

GOING CONCERN.

Appellee spends much time and extensive space urging that appellant's exceptions are insufficient. While admitting that there are three exceptions on the subject, appellee says they all go to the *amount* of the allowance and not to the *principle* of such an allowance. The three exceptions have been referred to and only partly quoted by appellee, but may be found in the record at page 1136. Besides covering all appellee admits they cover, Exception 17 specifically states that going value "ought not to be included in the determination of the present fair value of complainant's property for rate making purposes" This goes directly to the *principle* involved, and in addition to this, the exceptions are full, comprehensive, definite and specific. This objection of appellee is so captious, untenable and completely without foundation that it need not be noticed further. Appellant's original brief covered the subject so fully (pages 63-78) and demonstrated so completely that no specific allowance should be made for going value that further extended discussion seems hardly required. This Court has referred to and discussed it so often that the holdings of inferior courts, respecting same, scarcely need be referred to.

This Court has very aptly stated that "Each case must be controlled by its own circumstances." (Des Moines Gas Co. vs. Des Moines, 238 U. S. 153-165.)

The Master refers to the testimony of several of complainant's witnesses (Record p. 137), and then says:

> "My opinion is that the Company's witnesses assumed that too long a period and too great an expenditure of effort and money would be necessary to establish such a 'going concern' in such a city as Denver. There is no absolute standard by which the fair value of this element can be determined and I adopt $800,000.00, because no matter how often I have considered the evidence and the arguments, my mind always comes back to this amount as reasonable and fair to all parties."

The language he employs is substantially that of the special master in the Des Moines case; in fact, in his report he refers to this case (Record p. 137). As the Des Moines case is susceptible of different interpretations upon only a casual reading, it is evident that the special master misinterpreted that case. There the special master was first inclined to allow $300,000.00 for going value, but subsequently decided not to make the allowance, and his action was upheld by this Court. The master in that case made no separate allowance for "interest during construction" (see page 164 of the opinion), an item for which $805,000 was allowed in this case, and made no separate allowance for "going value," but allowed 15 per cent on the base value of the physical property, exclusive of real estate, as "overhead charges." The master in the Des Moines case, among other things, said on pages 166-167 of the opinion:

> "Such expenditures are termed overhead charges, and are as follows:

1. Time and money expended in the promotion of the enterprise, etc.

2. A competent engineer must be employed, etc.

3. The losses arising from accidents, injuries, etc.

4. Contingencies are such expenditures as arise from the lack of foresight, etc.

5. The cost of administration, which includes the time and money expended by the parties engaged in the enterprise, etc.

6. Interest during construction, etc.

7. Taxes during construction."

The latter the master regarded as very questionable.

Although no specific allowance for going value was made, this Court in commenting on the 15 per cent allowed for overhead charges, and in mentioning the seven items, said on page 171 of its opinion:

> "Overhead charges have been allowed for the items and in the sums already stated, it cannot be said, in view of the facts in this case, that the element of going value has not been given the consideration it deserves, and the appellant's contention in this behalf is not sustained."

Regardless of what interpretation may be put upon the language of the master in the present case, the facts are what control. And although this is not a case for allowance of going concern because of the monopolistic nature of the business and the prime

and legal necessity of the water furnished, nevertheless, if it were such a case the facts unmistakably show that this has been more than covered by the very liberal allowance for "engineering and contingencies," "interest during construction" and the large value placed upon the physical property for the purpose for which it is used, which far exceeds its value for any other purpose, a number of the witnesses having testified that its value for any other purpose would be several millions less (Record, pp. 207-231). Aside from the increased value allowed, there is allowed 20 per cent above this physical value for what 15 per cent covered in the Des Moines case, where the Court said upon such an allowance, "the going value had been sufficiently considered." But when it is remembered that instead of 15 per cent, covering all values above the physical value, that 32 per cent is the allowance in this case, the unreasonableness of such an allowance for going value strikes with added emphasis.

Indeed, according to the ruling in the Des Moines case, no extra allowance should have been made for "interest during construction," because this was included within the 15 per cent overhead charges there allowed. In other words, the 15 per cent covered all of the things therein enumerated, and included "interest during construction" and "going value." Here the master has added to the actual cost of reconstruction of the various items of the property, which must be reproduced, 12 per cent of the reproduction cost of the items, $1,046,272 as an allowance for "engineering and contingencies;" he has added $805,000 for "interest during construction;" and has added $800,000 for "going concern" value. This

makes a total of $2,651,272, which is practically 20 per cent of the total valuation (tangible and intangible) of $13,415,899, found by him as the entire valuation of the company's property.

It thus appears that practically one-fifth of this total valuation is something else than the physical valuation of the property of the company. Indeed, it is nearly one-third of the value of all of the property, such as in the Des Moines case was taken as the basis upon which the 15 per cent allowance for overhead charges was permitted. In the case at bar the structural value of the property was found by the master to be $8,378,167, and that is the contract price new for such structures. The $2,651,272 allowed by the master on the items included in the basis for the 15 per cent allowance mentioned in the Des Moines case is over 32 per cent of the structural cost of the properties to which such an allowance could, under the doctrine of the Des Moines case, be applicable. This is startling, and yet, if upon any state of facts which may be imagined, a 32 per cent allowance may be made, then what is to prevent a 50 per cent allowance being made on the same thing?

Appellant has urged that the master's estimate of the structural value is an estimate of its value in an assembled condition ready to go and ready to do business, and that the going value, if any, was absorbed wholly in any event by the items of "engineering and contingencies" and "interest during construction."

In Omaha vs. Omaha Water Co., 218 U. S. 203, this Court has recognized that there is a distinction in rate making and purchase cases, and referring to

the Knoxville case, 212 U. S. 1, and the Wilcox case, 212 U. S. 19, this Court says:

> "Both cases were rate cases and did not concern the estimates of value under contracts of sale."

A "going concern" value is an indefinite, intangible, almost imaginary something which inheres in a plant or business proposition as an element of value. If it exists at all it must have some basis of fact, and it certainly ought to be possible to express in words just what is meant by the term and to state directly what elements compose it, for it seems entirely unreasonable that a separate, definite and fixed sum of money should be placed on something which cannot be accurately described.

The sound and practical utterance of the Court in the case of Brunswick Water Dist. vs. Maine Water Works Co., 99 Me. 371, appeals to one's sense of reason where it is said:

> "The going concern part of it has no existence except as a characteristic of the structure. If no structure, no going concern. If a structure in use, it is a structure whose value is affected by the fact that it is in use. There is only one value. It is the value of the structure as being used. That is all there is of it." (Page 376 of the opinion.)

Even the skillful witnesses who have testified for the appellee were not able to define definitely just what they meant by "going concern" value, although they were all quite willing to put on it a valuation of

more than a million dollars. The testimony of Mr. Metcalf, the expert witness employed by the complainant, upon whom the special master chiefly relied, among other things had this to say:

> "I have assumed the going value of this property to be $1,200,000. I believe that the actual development expense of this plant has been substantially more than that" (Record page 267),

and referring again to going value, said on page 290 of the record:

> "The cost of establishing the business is one of the criteria of going value or development expense. The cost of reproducing that business is another. Personally I believe that the cost of reproducing the business is the safer criterion of value in the older plant. * * * I have no knowledge of the cost to the D. U. W. Co. of establishing its business. *It cannot be determined except on assumptions.*"

Witness Holman also states that going value includes the cost of developing the business.

In the Wilcox case, 212 U. S. 19, the allowance was made for practically the same, if not the same, element of value as allowed in this case, and the Court termed it "good will" on the theory that the business was of such a nature that people must deal with the public utility then under consideration, which had a practical monopoly. If it was "good will" in that case where the public utility had a practical monopoly, why not "good will" in this case where the public utility has an absolute monopoly?

Cost of developing the business of the appellee has not been shown by any testimony whatever except as it is presented by the expert witnesses in the case, who frankly say that they have no actual facts upon which to base any definite conclusion in this regard, and to use the language of Mr. Metcalf: "It cannot be determined except on assumptions."

Another fact to be taken into consideration why there should be no separate allowance for "going concern" is that this being a rate case, the business of the company is what is being regulated and the business is what is said to give a going value. The value of the going business depends on the rates, and these are the subject of regulation in this case. (Spring Valley Water Co. vs. San Francisco, 165 Fed. 657-695.) In fact, Mr. Metcalf states (Record, page 283):

> "It is partially true that the computations of going concern value are based upon the return under rates in effect here predicated upon the assumed value of water rights,"

and this Court in the Des Moines case, having the same point in mind, said, on page 171 of the opinion:

> "As pointed out in the *Cedar Rapids case*, if return is to be regarded beyond that compensation which a public service corporation is entitled to earn upon the fair value of its property, the right to regulate is of no moment, and income to which the corporation is not entitled would become the basis of valuation in determining the rights of the public."

As has been said, the facts are what must control; but, according to the master, the plant has already been valued as assembled, ready to do business. There is no competing plant; the business is here; the product to be furnished is an absolute necessity, and all must have it to live. For sanitary reasons the law of the City enjoins its use. According to the testimony, the consumers pay the cost of connections and own the corporation cocks. Every property owner is standing waiting impatiently to draw that he and his family may live. In an arid land the people are anxiously awaiting for some one to smite the rock in Horeb that the water may flow out. The people must also connect with the water mains in order to comply with the law. Then if, as the Master says, going concern is the cost of getting the business and building it up, how does it amount to $800,000? He says that he does not know, that he has no means of computation in making the allowance. Mr. Metcalf, whose testimony furnishes him his chief support, says that it is a matter of assumption, but the fact remains that it is $20.00 per connection for each of the 40,000 connections made in the city. If it is anything else it has been paid for. Everything else within the scope of an imaginative mental vision has been allowed for. If there were a competing plant there might be some cost in acquiring the business. If the product were not an absolute necessity and the Water Company had not at present a monopoly in furnishing it, there might be some cost of acquiring the business. As it is, the people must patronize the Water Company; there is no alternative; there is no cost of building it up. The plant has been valued in its assembled condition as an entity, ap-

proximately 20 per cent for overhead charges (including interest during construction) has been allowed, and if allowable at all, as was stated by this Court in the Des Moines case (page 171 of the opinion),

> "When overhead charges have been allowed for the items and in the sums already stated, it cannot be said, in view of the *facts* in this case, that the element of going value has not been given the consideration it deserves" (italics ours),

the item of $800,000 for going concern should unquestionably be eliminated from the rating base.

FAIR VALUE.

Under this topic we will discuss the matters contained in appellee's brief at pages 185 to 226, and pages 391 to 426. The matters contained at said pages all bear directly or incidentally on "fair value." There is no disputing the fact that complainant's case was not only prepared, but tried with great care and detail. But it is also true that their evidence as to value was based almost entirely on testimony of expert witnesses, these witnesses basing their statements upon the data included in Exhibit "C" and the report of the appraisers that had been appointed in 1907. Three of these appraisers, namely, Holman, Freeman and Hazen, testified in behalf of the complainant. Each of them predicated their various estimates on the conclusions that they arrived at in making these appraisements and upon the data contained in Exhibit "C." In so far as these three appraisers' testimony is concerned, the

only information that they could have upon which to predicate an opinion was their personal investigation of the subject matter. The fact that certain appraisers several years before had arrived at a conclusion certainly should not have been considered in basing a judgment on facts. Furthermore, it is not shown that the property included in the appraisement was the same property that the Master used in arriving at his rating base, and the facts upon which they arrived at their conclusion were not sufficiently shown to have justified the result of this appraisement.

Exhibit "C," referred to, was, of course, the principal data upon which the expert witnesses predicated their opinions as to the valuation of the company's property. This Exhibit "C" was not prepared by the witnesses who testified. It was prepared under the direction of complainant's principal witness, Leonard Metcalf. The surveys, examinations, drawings, tabulations, etc., were made by twenty or thirty engineers acting under the direction of Mr. Metcalf and his partner, William T. Barnes, of Chicago (Record, page 259). Mr. Metcalf states that the work was done in collaboration with Mr. George G. Anderson, who furnished the data for the water rights.

Exhibit "C" had been prepared and printed at least two months before the ordinance in question was passed. It was not prepared for the purpose of being used as an exhibit in the rate case, but evidently prepared as a prospectus to be used in a contemplated sale of the company's property either to the City of Denver or other purchasers. The exhibit is

an attractive statistical atlas of the company's property. It contains many beautiful pictures and is gotten up like the usual prospectus used for the purpose of inducing purchasers to buy.

Exhibit "C" was apparently accepted by the Master as establishing the facts that it purported to state, and was used by him as the basis of his findings as to value. But, notwithstanding the fact that all of the witnesses used Exhibit "C" as their basis of their estimates, there was a variance between the witnesses for the complainant from $15,370,000.00 to $16,614,917.00 (Record, page 138). The Master, however, in his finding No. 48 states that he has excluded from consideration a portion of the property included in the estimates of these witnesses. What the value of this excluded property was the Master does not find. He does in his finding No. 21 (Record, page 127) refer to certain tracts of land which were excluded by him as not being useful, but as to what other property he might have excluded it does not appear. It therefore follows that the report of the appraisers heretofore referred to is too indefinite and insufficient to be made the basis of a valuation, even though it was proper evidence to be considered.

The witness Gaffy, produced by the defendant below, found the gross reproduction cost of the structures to be $10,109,789.00. This is referred to in appellee's brief at pages 214-216. And the reproduction cost is estimated by defendant's witness, Bickel, as $9,915,388.00. Both Mr. Gaffy and Mr. Bickel included overhead charges in their estimates, such estimates being as to what it would cost to reproduce the plant. Neither of these, however, included the items of lands, water rights, going value, or supplies on

hand; and, of course, the lands and the value of the purchased water rights should have been included, but not the water rights that have not been purchased by the company. The item of "going value" or "going concern" was included in the overhead charges. The item of "supplies on hand" of $190,000.00 was not included, and should not have been included. It is no doubt true that it is necessary for the company to have on hand a large amount of supplies for the purpose of the proper maintenance of its plant, but these supplies are paid for as a part of the operating expenses, and having been charged to operating expense, should not be included as a part of the physical property of the company.

Counsel on page 216 of their brief tabulate the findings of the witnesses Gaffy and Bickel, and make a very plausible showing that these witnesses valuations were not far from the valuation found by the Master. But it must be taken into consideration that both these witnesses used the same rating base and the same property used by the other witnesses except the water rights and lands. And there was property that was excluded by the Master in arriving at his conclusion that was included by these two witnesses in arriving at their estimate of the value of the property.

Appellant stated in its former brief that there was a variation in the valuations of the various witnesses of from $4,000,000.00 to $5,000,000.00. This may have been slightly exaggerated. However, there is a variation between the witness Holman and the witness Bickel, of more than three and a half million dollars, and there is a variation between the Mas-

ter's valuation and the highest witness of appellee of $3,198,820.00 (Record, page 138).

Rating Base.

The foregoing discussion has been predicated upon taking the cost of reproduction less accrued depreciation as the basis for arriving at the fair value of the property, and we agree with counsel that this method is one of the most frequent methods employed in arriving at fair value. However, there are cases where this basis would afford but little aid in arriving at what the fair value of the property was, and appellant contends that *this case* is one of them.

What is the value of the company's property? Its physical structures and lands of course have some physical value, but its principal value has been by reason of the fact that it had a contract with Denver by which it supplied the means of furnishing water to Denver. But outside of this contract, and outside of its privilege of continuing to furnish water to Denver since its contract has expired, its property is of comparatively little value.

The witness, Freeman, testified at page 205 of the record:

> "I believe that the construction of such a plant by the city would depreciate the present plant at least $10,000,000. I did not take that into consideration in determining the present fair value of the property. I presume that the city can build its own plant if it wants to, but I believe that it is impossible to do so at the price stated."

And again at page 207:

> "I made the statement that the functional depreciation in this plant due to the construction of a new plant by the city would be about $10,000,000.00 as an approximation. This would leave a junk value on the basis of my figures of approximately $5,370,000.00, consisting of lands, *water rights*, large pipes not under expensive pavement, pumping engines, etc. I had given the matter consideration before I went on the witness stand."

Mr. Hazen at page 231 of the record, testified:

> "I believe a conservative estimate of that salvage value is from $5,000,000 to $6,000,000, and that the reduction in value of the present plant and property in that time would be from $9,000,000 to $10,000,000. In order to offset that loss accruing to the Company by reason of its being *obliged* to continue in the business, it would be necessary to increase the rates fully $1,000,000 a year in addition to the normal depreciation allowed."

Both of these witnesses included the value of the water rights in these salvage charges; and assuming their statements to be true and excluding $2,000,000.00 for water rights, the salvage value of the property would not be to exceed between $3,000,000 and $4,000,000. The witness, Hazen, speaks of the Company as being "obliged" to continue in business. When it is admitted that what the Company

owns after it ceases to do business in Denver is not to exceed $4,000,000, and upon this basis the Company is receiving a net rate of return of at least 15 per cent, it can readily be imagined that much compulsion is not necessary to cause the Company to continue to do business. The fact that the Company is still furnishing water to Denver and that it may continue to furnish it for some time adds nothing but a speculative value to the salvage value of its property. It is a tenant at will or by sufference, and as to how long it will continue to have a monopoly in Denver is purely conjectural.

The appellee indulges in severe criticism of the attitude of appellant's brief regarding a situation for which the appellants are in no wise responsible, i. e., the actual diminution of the value of the Water Company's plant, by reason of the fact that it now has no franchise and is an occupant of the streets of Denver merely by sufferance. In presenting what we said on this point in our opening brief, we called attention to a situation which we characterized as inevitable as death, and by this expression we referred to the inevitable expiration of the franchise which ought to have been in contemplation of all parties interested in it, not only in 1910, the date of its expiration, but at every minute of time during its existence. We have insisted that some provisions should have been made by setting aside a sinking fund or some other method for amortization which should meet this very condition, and we repeat and insist that wise business management would have prompted that course instead of the course of dispensing the revenues of the Company in the payment of extravagant expenditures in sal-

aries, executive expenses and in other directions which have already been noted.

The City ought not to be called upon to make good the future losses which may come to the Water Company by reason of the failure of the City to use the Water Company's plant, in case it shall decide to use other means to supply itself and its inhabitants with water. The Company's loss in that direction has already accrued by loss of the franchise, and if such loss exists, it is something that ought to have been cared for by the Water Company during the twenty years of its franchise life; it ought not to be saddled on the City now that the Company is here merely on sufferance.

In our opening brief we intended to say, and we think we did say, emphatically, that Denver had a right and is under the duty to deal with the Water Company, not generously, but fairly, giving to it what it is entitled to, but nothing more. Denver has not been the guardian of the Water Company's conscience or of its business or property or of its affairs, and now that the Company finds itself in a position for which the City is in nowise responsible, it rather than the City, should suffer the consequences of that condition.

The appellee devotes considerable space to the discussion of the word "value" and in one place makes the extraordinary statement that the word value means "just compensation." In another place a refinement of distinction is sought to be made between "exchange value" and "fair value" and we are asked, "would a dollar be worth one hundred cents if the dollar was in the pocket of a man who was being held up?"

There is only one definition of value, so far as we are able to ascertain. Value is the exchange relation of things which may be exchanged. The fact that value is frequently, indeed usually, measured by money does not change this definition at all. If the value is not "fair value," it is not value at all. Value means what a thing is worth, and if it is not exchange value, it is not value at all, and while it is sometimes said that a thing may have a greater value to one person than to another, or may be more valuable in some circumstances than in others, these are not by any means exact statements. Certainly we are not far wrong, indeed we are not wrong at all, when we insist that the value to the Water Company of the property used and useful as a water system for the City of Denver is, in present circumstances, what the Water Company could get for it for some other use.

Answering the question regarding the value of a dollar in the pocket of a man held up by a highwayman, we would ask another, what is the value of a dollar in the pocket of a man cast on a desert island, or otherwise deprived of the opportunity to dispose of it for some other thing which in his estimation is, in view of his needs, of equal value?

At the risk of repetition, we insist that one element to be taken into account in determining the question of the value of this property is what can the Water Company do with it in case the City builds its own plant?

The assertions throughout appellee's brief that the ordinance in question was or may have been a step looking to the purchase by the City of the Water Company's plant at less than its value is totally un-

justifiable and entirely unworthy; it nowhere appears in the record in the cause; it has never been presented, or even suggested before and it has no place whatever in this discussion. Certainly if the City by such trickery and underhanded methods should make such an attempt the courts would know how to meet it and would meet it.

No one would contend, least of all the appellant here, that the Water Company should not have every advantage of the increased value of its property due it by fortuitous circumstances; indeed over and over again the appellee's counsel insist that the question of what is the amount originally invested has absolutely nothing to do with the determination of value; and yet in their brief filed here counsel go so far as to urge that the Water Company should be compensated for the cost of its plant and have interest on the money during the time a new plant might be under construction. This idea permeates the entire argument made by them. In other words, the Company is to have all the advantage, but it is not to take any chances. It is plainly too much to ask that the City pay the rates which it pays for water and protect the Water Company against every conceivable business vicissitude. The Water Company knew in 1894 what the rates allowed to its predecessors under the 1890 franchise were, it came into the situation freely, eagerly and enthusiastically and very shortly thereafter it reduced the rates allowed by that ordinance to those provided by the "leaflet schedule"; and now when the franchise has expired and when it has been told by this Court, as it has in the New York Trust Company case, that it can neither compel the City to grant it a new franchise,

nor prevent the City from building its own plant, it seeks to crowd the City into a corner and to compel the City to reimburse it for the very things which ordinary business prudence would have bidden it provide for itself; for by the method of depreciation estimate followed by the Special Master it would compel the City now to provide the very depreciation fund which it itself ought to have set aside during the twenty years of its franchise; and in addition thereto it insists on very large remuneration for the services which it actually performs.

This case presents anomalous features; indeed we have not been able to find any case at all like it, and certainly no case closely resembling it has been cited by the appellee. The Company apparently had no records from which the actual investment could be determined, the thing which the appellee from its citation of Doherty, et al, against The Toledo Railway, etc., (Appellee's brief, p. 422), seems to think should be the basis for rates. No one of the cases cited by appellee is one where a municipality had sought to establish rates for service of a public utility performing its service merely at sufferance. The City, having the right to exclude the Water Company from its streets, surely has some right to fix the terms upon which the Company shall continue to do business.

Without any justification from the record, the appellee has undertaken to relate to the Court a long story of alleged oppressions by the City and of entirely unwarranted attacks upon it as it has pursued its virtuous, exemplary and disinterested course toward Denver and its inhabitants. All these statements are gratuitous, they have no place here, they

are not warranted by the facts, but it may be well, since we are dealing with imaginings, to suggest that possibly there has been something in the course of the Water Company in its business which has not been altogether above reproach. It may be that it has sometimes sought to interfere unwarrantably in public affairs not connected with its own activities. There may have been a spirit of righteous indignation aroused among Denver's people, because of some acts on the Water Company's part. It is hardly conceivable that even a vivid imagination could determine that the body politic would pursue such a course of injustice and of outrageous oppression against a public utility corporation as is charged against Denver, unless there were, not only provocation, but complete justification, for hostility. But all this is, as we view it, not applicable here. We refer to it merely because of appellee's wanderings from the record and its excursions into the fields of fancy.

Purchased Water Rights.

Appellant has conceded that if water rights were purchased by the Water Company for the purpose of furnishing water to Denver, the Company would be entitled to a fair return on the money thus invested, even though it is claimed that the title to such water thereby vests in the City of Denver and its inhabitants. The reason for this is that it would be working an injustice to permit the Company to lay out and expend its money for the purpose of furnishing water to the City, and then not be allowed a return for the money thus expended. The Master in his report valued these purchased water rights

at $949,500.00, and if these water rights had cost the Company this amount, and there was evidence in the record to show it, and these purchased water rights were actually used in furnishing water to Denver, there would be no doubt as to the propriety of an allowance. But the evidence is so uncertain and indefinite as to these water rights that it is impossible from the record to arrive at any conclusion or estimate as to their value to Denver.

In valuing these purchased water rights, the Master valued them as a whole, making reference to items 1, 2, 3, 4, 5, 13, 14, 15, 16, 17 and 21 of Exhibit "C" (Record, page 130). Table 1 of Exhibit "C" enumerates these water rights and they are valued at $1,150,000.00.

The basis of the valuation by the Master was not as to what these water rights cost the company, but upon the basis of what these water rights would yield in acre feet per annum. The Master placed a value on these water rights of $55.00 per acre foot (Record, page 131). A large part of these purchased water rights were acquired by the purchase of farms, the owners of which owned the water rights in connection with such farms. Complainant's witness, Wall (Record, pages 241-3), enumerates these water rights and testifies as to the value of the farms with the water and without. This testimony was introduced by complainant for the purpose of showing the value of its lands segregated from the water, but it also shows what was paid for a number of these water rights.

Complainant's witness, George G. Anderson, enumerates in his evidence (Record, pages 305-11), the

yield of all the water rights, including Lake Cheesman, the Cherry Creek and Mississippi Galleries. These purchased water rights and others claimed by the Company he gives as a safe annual minimum yield approximately 110,000 acre feet. The Master in his report finds that 54,000 acre feet is a reasonable estimate of the available delivery of water from Lake Cheesman, and that 37,000 acre feet is a safe yield from these purchased water rights (Record, page 131). But the Master does not give the yield of the Cherry Creek and Mississippi Galleries and some other sources of supply. He bases his valuation of water rights on the yield in acre feet annually, finding that the valuation is $55.00 per acre foot. Notwithstanding the Company has included all these water rights in its rating base, and notwithstanding the Master has adopted the same rating base, it will be seen that it was not a proper base to adopt.

The Company has never furnished water to Denver in excess of 55,000 acre feet annually (Record, page 70). The water furnished between 1908 and 1913, according to complainant's own statement, is an average of 16,820,800,000 gallons, which is less than 52,000 acre feet annually. It will thus be seen that the Company has had a large surplus of water on hand, and has used these purchased water rights on its own lands for irrigation. The witness, Anderson, stated (Record, page 310):

> "The Platte Canon ranches were included in our valuation of $16,000,000. Through possession of these ranches the Company is at all times able to make full use of the water available under its water

rights, and protect itself against the claim of abandonment by non-use."

The witness, Freeman, (Record, page 199), says:

> "I do not believe that the Water Company has gone beyond the proper practice in acquiring and holding such property against future need."

It has never been necessary to use these purchased water rights in furnishing water to Denver. The Company evidently intended to hold them as an investment, and in the meantime use them for irrigating its own lands, and for the purpose of preventing any competing company from acquiring sufficient water to supply the City of Denver, and nothing should be allowed whatever for these purchased water rights in arriving at the rating base.

Cost of Producing a New System.

It hardly seems necessary to reply to the argument of appellee to the effect that a new system would cost Denver in excess of the amount found by the master as the fair value of the company's property, but even if it were possible to consider this as having any bearing on this case, the evidence in the record is too meagre to lay any foundation for the cost of the same.

The testimony of the witness Freeman with reference to the building of a new plant is as follows:

> "I presume that the City can build its own plant if it wants to, but I believe it is impossible to do so at the price stated." (Record, p. 205.)

(The price referred to by Freeman being his valuation of the appellee's water plant, which he placed at $15,380,000.)

The only other reference made by counsel to support this contention is to the report of the engineers, who made an estimate of the cost of a complete new water system to the Public Utilities Commission (Record, p. 73), the same being an allegation in complainant's bill. It must be remembered, however, that this report of these engineers was rejected by the Public Utilities Commission as being too high. The total cost as fixed by these engineers was $12,750,000, which included also a hydro-electric plant and a new distributing system for Denver; but this report of the engineers, like the report of the appraisers of 1907, is not proper evidence in this case, and should not be seriously considered. It is not shown what knowledge either the appraisers or the engineers had of the property of the company or of its value, and furthermore, it is not shown what property was included in arriving at the final valuation.

The engineers, according to complainant's allegations, also considered bringing water from the other side of the Continental Divide or from Utah, or some other distant point. Denver would not have to go away from its own tributary water shed to secure an abundant supply of water and at a reasonable price. There is enough water impounded in Lake Cheesman to supply Denver's wants for years yet to come. The water rights in Lake Cheesman belong to the City and its inhabitants. They are already the proprietors of these rights, and all that would have to be done in order to supply Denver

amply with water would be to either purchase or condemn Lake Cheesman and convey its waters to Denver through a modernly constructed aqueduct. Furthermore, Denver has title in its own right to other water rights that could be utilized if the City should grow beyond present expectations.

The value of Lake Cheesman, as found by the master's report, independent of the water rights, is $1,089,225, and allowing $4,000,000 for an efficient distributing system and $2,500,000 for conduits, would leave the City a margin after selling its $8,000,000 of bonds which already have been authorized for the purchase or construction of a system, and there would be no impediments in the way of the City accomplishing this purpose and in the manner pointed out. It has the right to procure by condemnation Lake Cheesman or any of the other units of the company that it needs in the assembling of a municipal water plant, and the price that it would have to pay for those units is the reasonable market value of the units; and to say that Denver would have to expend $20,000,000.00 or anywhere near such sum to provide itself with a practical and efficient plant, or that it would have to go across the Continental Divide to procure its supply of water is purely imaginary.

Appellee at pages 408-9 of its brief refers to an alleged investigation that was concluded December 14, 1916, almost two years after the decision of the District Court from which this appeal was taken, and almost three years after the rate ordinance herein involved was passed. Inasmuch as the master or the court below could not have had any knowledge of what occurred after their decisions were rendered,

counsel must assume that this Court will take judicial notice of this startling contribution.

The investigation referred to purports to have been made at the instance of the Public Utilities Commission by an *impartial* and *thoroughly competent* firm of engineers. The identity of the members composing this firm is not disclosed, neither are we told of their residence, except that they were non-residents. It is admitted, however, by appellee that they made a careful, comprehensive and complete investigation, and as a result found that in order for the City to build as efficient a plant as that of the Denver Union Water Company would require an expenditure of $27,470,498.57 (approximately). The impartiality of these thoroughly competent engineers was established by their recommendation "that the City and County of Denver should, instead of attempting to provide a new and duplicate system, acquire the property of the Denver Union Water Company under the terms of the option agreement dated February 21, 1916."

Even though we were not to question the facts as above established, nevertheless the so-called "facts" fail to show their relevancy. They do not show where this plant was to be constructed, the character of the same, or how large a plant was contemplated. Neither do they show from what state it was proposed to procure the water, or what mountain ranges would have to be tunneled to get the water to Denver. Indeed, it is not shown in what possible manner these so-called facts are at all material. Assuming these facts to be true, the only possible deduction that can be drawn from them is that these engineers recommended that the City purchase the

plant which the appellee is so desirous of selling at less than half of what the new plant could be constructed for.

Of course it is impossible to controvert this statement legitimately, as the evidence in the case has been closed more than two years. It is also impossible to influence this Court by making such statements. We feel that we really owe an apology to the Court for even discussing a matter so foreign to the cause. But such statements illustrate the character and unreliability of the evidence upon which the entire case of the appellee is based. The principal facts involved in this case were attempted to be established by complainant below upon so-called evidence of expert witnesses based upon either estimates or fiction, and we again submit that the evidence was not of that clearness and accuracy that is demanded when it is sought to set aside the acts of a rate making body by judicial interference.

CONCLUSION.

In view of the actually existing conditions, the ordinance complained of is not confiscatory; it does not and cannot deprive the Water Company of a fair return upon the reasonable value of its property; it provides a revenue for the company which is entirely adequate for the use of every single item of the company's property used and useful in the Water Company's business in furnishing water to Denver.

The ordinance and the rates under it certainly should be submitted to a test.

The injunction ought not to continue in force.

The decision of the District Court should be reversed.

Respectfully submitted,

JAMES A. MARSH,
NORTON MONTGOMERY,
EDWARD C. STIMSON,
Attorneys for Appellants.

CITY AND COUNTY OF DENVER ET AL. *v.* DENVER UNION WATER COMPANY.

DENVER UNION WATER COMPANY *v.* CITY AND COUNTY OF DENVER ET AL.

APPEALS FROM THE DISTRICT COURT OF THE UNITED STATES FOR THE DISTRICT OF COLORADO.

Nos. 294, 295. Argued October 3, 4, 1917.—Decided March 4, 1918.

The findings of a special master appointed, with consent of parties, to take the testimony and report it with his findings of fact and conclusions of law for the advisement of the District Court, are not conclusive but subject to review by that court upon exceptions.

Where a master, so appointed, had heard the issues fully and admitted all proffered evidence, and the exceptions to his findings raised no serious questions of fact, this court found it unnecessary to remand the case to the District Court because the latter, erroneously, declined to pass upon the exceptions, but, having before it the evidence and all matters necessary for judgment, proceeded to do what that court should have done—considered the report, passed upon the exceptions, and made such decree as was deemed equitable.

Where a city was peculiarly dependent upon the continued use of the plant of a water company whose franchise had expired, the situation negativing the idea that other means were presently procurable or in contemplation for supplying the water vital to the community, and an ordinance was passed which, by its enacting provisions, not only fixed the rates which the company might charge in future but in addition provided for collecting charges semi-annually in advance for various uses which could not be discontinued on brief notice, required installation of meters for all prospective users, to be paid for monthly, and of hydrants to be ordered thereafter by the city upon extended as well as existing mains, at an annual rental, and imposed fines upon the company or its agents for any violation of the ordinance, *held*, that these provisions were inconsistent with declarations in the preamble characterizing the company as a tenant by sufferance and disclaiming any intention to recognize its right to

occupy the streets or continue the service; and that the ordinance should be construed liberally, so as to preserve the substantial rights of both parties, viz: as recognizing the city's dependence on the plant, as conferring, impliedly, whatever privileges might be necessary to enable the company to continue serving the public, as in effect requiring it to furnish water, and in terms forbidding it from exceeding the specified rates; and so, as granting a new franchise of indefinite duration, terminable either by the city or by the company at such time and under such circumstances as would be consistent with the duty owed by both to the inhabitants.

In view of the new rights so conferred upon the company, its plant employed in supplying the city with water must not be valued as "junk," but as property useful and in use in the public service, in determining whether the rates fixed by the ordinance allow an adequate return.

Nor is this question of value greatly affected, if at all, by the fact that there is neither right nor obligation to continue the use perpetually, or for any long period that may be defined in advance.

In valuing the plant of a public service company as a basis for determining the adequacy of rates fixed by a city, it is proper to estimate land at present market value, and structures at reproduction cost less depreciation.

Also the "going-concern value," due to the fact that the plant is assembled and established, doing business and earning money, is a property right which should be considered in such determinations, and estimated in each case upon the circumstances therein presented.

What rate of compensation may be regarded as adequate depends greatly upon circumstances and locality. In this case, where the net annual return obtainable under the ordinance rates was but 4.3% (approximately), of the value of the plant, excluding certain disputed water rights, in a city where the prevailing rate of interest for secured loans on business and residence properties was 6%, with higher rates for loans less secured, *held*, that the return was clearly insufficient and that the ordinance amounted to a taking of the company's property without due process of law.

Whether, in Colorado, a company under franchise contract to furnish water for a city becomes the owner of water rights which it originates by diverting water from natural streams and supplying it to the consumers under short license contracts—not decided.

Modified and affirmed.

THE case is stated in the opinion.

Mr. James A. Marsh, Mr. Norton Montgomery and *Mr. Edward C. Stimson* for City and County of Denver *et al.*

Mr. Clayton C. Dorsey, with whom *Mr. Gerald Hughes* and *Mr. William V. Hodges* were on the brief, for Denver Union Water Co.

MR. JUSTICE PITNEY delivered the opinion of the court.

We have here an appeal and a cross-appeal from a final decree made in a suit in equity brought by the Denver Union Water Company against the City and County of Denver and the members of its council and other public officials, for the purpose of restraining the enforcement of an ordinance passed March 3, 1914, fixing the rates for water permitted to be charged thereafter by the company, upon the ground that they did not afford a fair and reasonable compensation, based upon the value of the property of complainant necessarily used in the service, and hence amounted to a taking of private property without due process of law within the meaning of the Fourteenth Amendment. The City and County of Denver is a municipal corporation having broad powers of self-government, including the power on the part of five per cent. of the electors to initiate an ordinance by petition. For convenience it will be referred to as the City.

An answer having been filed, putting the cause at issue, the District Court, by consent of parties, appointed a special master, "with all of the powers conferred upon the master under the rules of practice for the courts of equity of the United States, and subject to the further orders of this court, . . . for the purpose of taking all testimony in the suit and reporting to the court said testimony, his findings of fact and such conclusions of law as he may deem essential to the proper advisement of

the court." After a full hearing he made an elaborate report, sustaining complainant's main contention. The City and the Public Utilities Commission, defendants, filed numerous exceptions to his findings and conclusions, raising questions respecting certain elements that entered into his valuation of complainant's plant. Complainant, while declaring that it did not consent to a review of the report so far as it was conclusive under the order of reference, filed exceptions, subject to such ruling as the court might make respecting its reviewability. Upon these exceptions the cause came on to be heard, whereupon the court, being of the opinion that under the terms of the order appointing the special master his findings of fact were not open for its consideration, and that no material questions of law were raised that could be considered without an examination of the facts, ordered that the exceptions of both parties be struck out, confirmed the master's report, and passed a final decree in favor of complainant in accordance with his findings. Defendants appealed to this court, presenting assignments of error based upon the overruling by the District Court of their exceptions to the master's report. Complainant filed a cross-appeal presenting assignments of error for consideration only in the event that defendants' assignments of error, or some of them, should be sustained.

In our opinion, the District Court erred in declining to pass upon the questions raised by the exceptions. Although no opinion was filed, the ruling appears to have been based upon the theory that, because the order of reference was made by consent of parties, the conclusions of the master were not open to question. *Kimberly* v. *Arms*, 129 U. S. 512, 524, and *Davis* v. *Schwartz*, 155 U. S. 631, 633, 636, are cited in support, but they are distinguishable. In the former case, the reference, made by consent of the parties, authorized the master to hear the evidence and decide all the issues between them, and it

was because of this that the court held the findings were not merely advisory, as in the ordinary case, but were to be taken as presumptively correct, "subject, indeed, to be reviewed under the reservation contained in the consent and order of the court, when there has been manifest error in the consideration given to the evidence, or in the application of the law, but not otherwise;" and that the findings ought to have been treated as "so far correct and binding as not to be disturbed, unless clearly in conflict with the weight of the evidence upon which they were made." *Davis* v. *Schwartz* is to the same effect. In the present case, the consent given to the order of reference was conditioned by the terms of the order itself, which, as we have seen, limited the functions of the master to the taking of testimony and reporting it to the court together with his findings of fact and conclusions of law for the advisement of the court.

The error of procedure, however, does not necessitate sending the case back to the District Court. The issues were fully heard before the master, all proffered evidence was admitted, the exceptions taken to his findings raise no serious questions of fact, we have before us in the record the evidence and all other materials necessary for judgment, and will simply proceed to do what the District Court ought to have done, namely, consider the report and pass upon the exceptions, and make such decree as is equitable in the premises.

It was admitted before the master, and is not here controverted, that the company is the sole owner of the water works, plant, and system in question, including lands, diversion works, reservoirs, filters, conduits, distribution works, and other apparatus, and is serving the City and its inhabitants with water, that no other water works or system of distribution exists in the City, and that although the City has power to construct a system of its own (subject to a limit of cost that will be mentioned be-

low), it has not commenced to do so. It was, however, contended by defendants, in the answer and upon the hearing before the master—and the contention is here renewed—that as to such of the company's water diversion rights as had been acquired by it or its predecessors by original appropriation and user (as distinguished from those acquired by purchase) the right to the water itself was not the property of the company but of the City; and this upon the theory that, under the law of appropriation as it obtains in Colorado, the right of diversion belonged to those for whose use and benefit the appropriation was made, the company being entitled to compensation only for its services as carrier in distributing the water by means of the physical system owned by it.

The report of the special master shows, what is not disputed, that his investigation of the matters referred to him was most painstaking and thorough. In estimating the value of the company's property, he adopted the following method, with the practical consent of the parties: lands and water rights were appraised at their present market values; estimates of the cost of reproducing the structures were made, and, from this cost, allowance for accrued depreciation was deducted so as to determine the reasonable value of the structures in their present condition; and in estimating the cost of reproduction it was assumed that the work would be done under contract after fair competitive bidding, and with reasonable costs for engineering and superintendence in addition to the contract cost. Separate consideration was given to the various tracts of land owned by the company, and the various water rights, diversion works, reservoirs, conduits, distribution pipes, personal property, and other items constituting the plant. He found the plant to be in excellent condition, supplying water abundantly in excess of the needs of the community and under a proper pressure, and found its entire value to be $13,415,899, in which the

only elements seriously questioned by the City were: (a) the disputed water diversion rights, which he held to be the property of the company and valued at $1,998,117; and (b) an item of $800,000 for "going-concern" value, allowed by the master upon the ground that the company had "an assembled and established plant doing business and earning money," according to the principle laid down by this court in *Des Moines Gas Co.* v. *City of Des Moines*, 238 U. S. 153, 165. He made no allowance for franchise value or for any permanent right to maintain the water works in the streets of the City; but he did value the plant as capable of use and actually in use in the public service, and found that a new plant capable of serving the public with like efficiency could not be built for $13,415,899; a finding to which no exception was taken. The master further found that the net earnings of the company under the ordinance of 1914, after making proper allowances for operating expenses, taxes, and depreciation, would be $488,820, or only 3.64% of the reasonable value of the plant; while the prevailing rate of interest for secured loans on business and residence properties in Denver was about 6%, with higher rates for loans less adequately secured.

Defendants now insist that the company is occupying the streets and performing its service merely at sufferance; that its rights arose solely out of a franchise ordinance adopted in 1890 and which expired in 1910; and that the City now has the right to exclude the company from its streets, and hence the right to fix the terms upon which it shall continue to do business, and that the value to the company of the property under these circumstances is what it would bring for some other use in case the City should build its own plant—in other words, as to a large part of the property, "junk value." Of course, it is a necessary corollary that the company may discontinue its service at will.

We are unable to regard the case as capable of being thus disposed of upon the basis of "junk value" for complainant's property.

In the first place, no such question is presented, either by the pleadings, the master's report, the exceptions, or the assignments of error. The bill averred that complainant was "entitled to have its property devoted to the public use of supplying the City and County of Denver and its inhabitants with water remain unimpaired in value, and to receive for the water supplied and services rendered a reasonable return upon the value of the property so devoted to said uses, and a sufficient amount to protect said property against depreciation and other impairments of value." The answer admitted complainant's ownership of the system of water works (except that as to certain of the water rights it was denied upon legal grounds that have been indicated), and admitted that "complainant is entitled to have its property devoted to the public use of supplying the City and County of Denver and its inhabitants with water remain unimpaired in value, so far as its actual use in supplying the City and County of Denver and its inhabitants with water is concerned, and to receive for the services rendered in supplying such water a reasonable return upon the value of the property devoted to such use, and a sufficient amount to protect said property against depreciation and other impairments of value in connection with such use and such water service." The answer further alleged that the rates fixed by the ordinance of 1914 "are fair, reasonable, just, and will produce for complainant a fair, reasonable, and adequate return upon the capital actually invested by complainant in its water system and carrying service." The master's report shows that no question was made before him but that the plant should be valued as a plant in use, except as it was contended that the item of $800,000 for going-concern value ought to be eliminated on the

ground that such an element of value, admittedly existent in a "purchase case," could not be considered in a "rate case," and on the further ground that the company's franchise had expired. This latter point was made the basis of one of the exceptions. Aside from this, the exceptions were devoted mainly to the contention, already mentioned, that the company's water rights, other than those which had been purchased, were the property not of the company but of the City. It was at no time contended that any element of value except "going concern value" ought to be excluded because of the expiration of the franchise. Defendants' assignments of error are based upon the exceptions, and raise no other question.

But, supposing the question were properly raised, we are convinced that by the true intent and meaning of the ordinance of 1914 new rights were conferred upon the company of such a nature that in considering the effect of the provisions limiting rates the plant must be valued not as "junk" but as property useful and in use in the public service.

It is true the title and preamble of the ordinance contain indications of a purpose to treat the company as a mere tenant by sufferance of the streets, but its enacting provisions do not carry out this purpose; and the measure must be construed as a whole, in the light of the circumstances existing at the time of its adoption, and with proper regard for the consequences that would result from giving to it the meaning contended for by the City.

Under the ordinance of 1890 the company had a franchise which expired April 10, 1910, at which time the City had an option either to purchase the works at an appraised valuation, or to renew the contract for a period of twenty years. After its expiration litigation ensued as a result of which this court held, in May, 1913, that the City was under no obligation to accept either option, and that its failure to renew the contract did not amount to an elec-

tion to purchase the plant. *Denver* v. *New York Trust Co.*, 229 U. S. 123, 138. Meanwhile fruitless negotiations were conducted looking to a purchase of the plant by the City, but leaving the parties far apart upon the question of valuation. The City on May 17, 1910, adopted a charter amendment whereby it created the Public Utilities Commission, directed that an offer of $7,000,000 be made for the property of the company, and provided that in case of its rejection steps should be taken to construct a water system owned and operated by the City at a cost not to exceed $8,000,000. The water company rejected the offer of $7,000,000; but the City did not commence—has not yet commenced—the construction of its own water system. The company continued to supply water to the City and its inhabitants at the rates charged during the continuance of the ordinance of 1890. In August, 1913—after our decision in the case just mentioned—the City and the Public Utilities Commission appointed a commission of three to inspect, examine, and report upon complainant's water system, and after an investigation, during which complainant gave this commission every reasonable opportunity for inspection and examination of its records and data, the commission, on January 14, 1914, made a unanimous report to the effect that complainant's system was in excellent working condition, adequate for supplying the City's present needs, and worth, exclusive of going-concern value or water rights, something over $10,000,000, and declaring that it would take five years, without allowance for delays in legal proceedings, for the City to construct a new system of its own, and would cost $12,750,000. After this report, and on February 17, there was submitted to the electors and taxpaying electors of the City a contract by which the City was to purchase complainant's water system and properties at a price to be fixed by appraisers including the Public Utilities Commission who were to act for the

City, which contract complainant agreed to accept and abide by if favorably voted on by the taxpaying electors. It was rejected. Prior to the first of February the ordinance now in question, greatly reducing the rates, was prepared at the instance of the Public Utilities Commission, circulated as an initiated bill under the appropriate provision of the city charter, received the signatures of more than five per cent. of the electors, but only 5,593 in all,[1] was filed with the city clerk about a week after the election just mentioned, was introduced in the City Council, published once, and passed by the Council on March 3, without amendment and without hearings; that body having acted either in the belief that, since the measure was presented with the signatures of a sufficient number of the citizens, it was mandatory upon the Council to pass it, or else that they had no other option except to refer it to a vote of the people, which was not done. (See *Speer* v. *People*, 52 Colorado, 325, 343.) We remark upon the legislative procedure simply because of its bearing upon the interpretation of the measure, which, as we shall see, lacks certainty in its enacting clauses.

The practical situation existing at the time of its enactment is sufficiently clear from what has been said. The answer admits the averment of the bill that complainant has been and is compelled to continue to serve the City and its inhabitants with water, because there is no other supply of water available, and a cessation of its service would result in great suffering, damage, and loss of life. The City is located in a semi-arid region, and is and for nearly a half century has been absolutely dependent upon the continued operation of complainant's system. The termination of the legal franchise in 1910 did not absolve the City from its duty to the inhabitants. At the time of the enactment of the ordinance of 1914 the company's plant had been in use for four years since the expiration

[1] The population of the City, by the Census of 1910, was 213,381.

of the former franchise; the City, while endowed with the power to construct a system of its own, but only if it could be done at a cost not exceeding $8,000,000, had not yet commenced the construction of such a system, had just been officially advised that one could not be constructed for less than $12,750,000, and nevertheless had rejected a proposition to purchase complainant's system at an appraised value.

It is in the light of all these circumstances that the provisions of the ordinance of 1914 must be read. There is a preamble reciting that since 1910 the company had been without franchise and a mere tenant by sufferance of the streets, and that, while it had been supplying the City and its inhabitants with water, it had done so "at rates that are excessive and that should be reduced and regulated accordingly;" and there is a declaration that the enactment is made without recognizing the company's right to occupy the streets or to continue its service, but for the purpose of regulating and reducing its charges "during the time it shall further act as a water carrier and tenant by sufferance of said streets." But the enacting provisions, in the terms employed and by necessary intendment, are inconsistent with these declarations, and must be taken to override them. The first section establishes, as the maximum charges permitted to be made by the company, a detailed schedule of "*semi-annual* water rates payable *in advance* on the first day of May and November of *each year*." The various uses are specified, and many of these are of kinds that cannot be discontinued on brief notice. There is a special rate for irrigation by the season, May 1 to November 1. There is a provision for meter rates, payable monthly, with a clause requiring the company to instal a meter for any person desirous of using water by meter. Section 2 provides that for hydrants, including "those which may *thereafter* be ordered by the Council to be set upon existing mains or upon *ex-*

tensions thereof," the City shall pay *annual* rentals. And § 4 imposes fines upon the company and its agents for any violation of the ordinance.

Of course, these provisions are of themselves inexplicit; but in attributing a meaning to them the choice is between a liberal construction that preserves the substantial rights of both parties and a strict construction highly penal and destructive in its effect upon both. The subject-matter was a prime necessity of life, for which there was no substitute available. The very act of regulating the company's rates was a recognition that its plant must continue, as before, to serve the public needs. The fact that no term was specified is, under the existing circumstances, as significant of an intent that the service should continue while the need existed as of an intent that it should not be perpetual. Without attributing to the initiators and to the City Council a purpose to subject the inhabitants to grave danger of disease or worse, we cannot read the enacting provisions as leaving the company actually without the right to maintain its plant in the City thereafter, for necessarily this would leave it at liberty to discontinue the service at will. The alternative, which we adopt, is to construe the ordinance as the grant of a new franchise of indefinite duration, terminable either by the City or by the company at such time and under such circumstances as may be consistent with the duty that both owe to the inhabitants of Denver. It recognizes the dependence of the City upon this plant, by necessary implication confers upon the company whatever privileges may be necessary to enable it to continue serving the public, in effect requires it to furnish water, and in terms prohibits it from exceeding the specified rates.

In this situation, there can be no question of the company's right to adequate compensation for the use of its property employed, and necessarily employed, in the pub-

lic service; nor can it be doubted that the property must be valued as property in use. It involves a practical contradiction of terms to say that property useful and actually used in a public service is not to be estimated as having the value of property in use, but is to be reckoned with on the basis of its "junk value." Nor is the question of value for present purposes greatly affected, if at all, by the fact that there is neither right nor obligation to continue the use perpetually, or for any long period that may be defined in advance. The reason is not obscure: the cost and detriment to a property owner attributable to the use of his property by the public, and the value of the service rendered by the property to the public, are measured day by day, month by month, year by year, and are little influenced by the question how long the service is to continue. The cost of the service includes the use of the plant, but, ordinarily, not its destruction, except through the slow processes of wear and tear and obsolescence, for which graduated depreciation allowances are made. The whole calculation is a matter of income, not capital, accounting; and the cost and value of the use of a given property for a stated period is the same whether the use is to be continued after the expiration of the period or not. If the period is extended, compensation for the use is extended proportionately.

What we have said establishes the propriety of estimating complainant's property on the basis of present market values as to land, and reproduction cost, less depreciation, as to structures. That this method was fairly applied by the special master hardly is disputed by appellants, except as they contest the items allowed for "going-concern value" and for the water rights acquired by complainant and its predecessors by original appropriation. With respect to the former item, we adhere to what was said in *Des Moines Gas Co.* v. *Des Moines*, 238 U. S. 153,

165: "That there is an element of value in an assembled and established plant, doing business and earning money, over one not thus advanced, is self-evident. This element of value is a property right, and should be considered in determining the value of the property, upon which the owner has a right to make a fair return when the same is privately owned although dedicated to public use."

As was then observed, each case must be controlled by its own circumstances. In the present case, the master expressly declared that his detailed valuation of the physical property and water rights included no increment because the property constituted an assembled and established plant, doing business and earning money; and a careful examination of his very elaborate report convinces us that this is true. The amount allowed by him on this account is not open to serious question from the standpoint of appellants.

The only remaining question of serious moment is the allowance of $1,998,117 for the value of water rights acquired by original appropriation as distinguished from acquisitions by purchase.

The master found that these appropriations were made at times when the company or its predecessor held franchise contracts with the City calling for a supply of water to the inhabitants; that these contracts were limited to short periods, while the use by private consumers was under simple permits or licenses for periods of six months, at rates paid in advance, and under expressed conditions that terminated their right to use the water on violation of the reasonable rules of the company. The parties agree that such a diversion and beneficial use of the unappropriated water of a natural stream is sufficient to initiate and perfect a right to continue to use beneficially the volume of water so appropriated. Complainant contends, and the master held, that the ownership of the

appropriation under such circumstances may be fixed by contract between the one who diverts and the one who beneficially applies the water, and that under the circumstances of the case, upon a proper application of the rule adopted by the Supreme Court of Colorado in *City of Denver* v. *Brown*, 56 Colorado, 216, the water rights in question were owned by complainant.

Appellants contend that under the Constitution of Colorado, Art. 16, § 5, and under the law as established by repeated decisions of the Supreme Court, the right to the use of water is not permitted to be acquired by appropriation from the natural streams for purposes of sale or rental; that there is no ownership of the water or right to the use of it except by those actually applying it to a beneficial use; that not only must application to a beneficial use be united to diversion in order to render the right of appropriation complete, but that where a carrying company diverts water for the beneficial use of others it acts as the agent or quasi trustee of the consumers for the protection of their rights, and is not itself the owner of the rights of diversion.

In support of this view, *Wheeler* v. *Northern Colorado Irrigation Co.*, 10 Colorado, 582; *Farmers' High Line Canal & Reservoir Co.* v. *Southworth*, 13 Colorado, 111; *Combs* v. *Agricultural Ditch Co.*, 17 Colorado, 146; *Wyatt* v. *Irrigation Co.*, 18 Colorado, 298; *White* v. *Farmers' High Line Canal Co.*, 22 Colorado, 191; *Farmers' Independent Ditch Co.* v. *Agricultural Ditch Co.*, 22 Colorado, 513; *Wright* v. *Platte Valley Irrigation Co.*, 27 Colorado, 322, and some other cases are cited; it being insisted that they establish the rule contended for, and that their authority is not overthrown, but on the contrary recognized, by *City of Denver* v. *Brown*, 56 Colorado, 216. The question is one of great consequence, and is not free from difficulty. It ought not to be passed upon unless the exigencies of the case require it.

We find it unnecessary to determine it. As we have shown, the master found the value of complainant's entire plant, including these water rights, to be $13,415,899. Deducting $1,998,117, the entire value of the disputed rights, there remains a valuation of $11,417,782. No part of this is seriously disputed except the item for going-concern value, upon which we already have passed. The master found that the net earnings of the company under the ordinance of 1914 would be $488,820. No question is made about this, except some slight criticism of the depreciation charges that enter into the calculation; a criticism that we cannot sustain. The net return, therefore, is found to be only 4.2812 per cent. of the value of the plant, excluding the disputed water rights; while there is no controversy over the master's finding that the prevailing rate of interest for secured loans on business and residence properties in Denver is about 6%, with higher rates for loans less adequately secured. As was declared in *Willcox* v. *Consolidated Gas Co.*, 212 U. S. 19, 48, the question of the rate of compensation that may be regarded as sufficient depends greatly upon circumstances and locality. In that case we held (p. 50) that complainant was entitled to 6% on the fair value of its property devoted to the public use. We have no hesitation in holding that the return yielded by the ordinance now before us is clearly inadequate, and amounts to a taking of complainant's property without due process of law, contrary to the provision of the Fourteenth Amendment in that regard, even excluding from consideration the disputed water rights.

The decree of the District Court will be modified so as to overrule, instead of striking out, the exceptions taken by defendants to the master's report, and as so modified it will be affirmed.

Modified and affirmed.

MR. JUSTICE HOLMES, dissenting.

This is a bill to restrain the enforcement of an ordinance of the City and County of Denver, passed on March 3, 1914, fixing the rates for water permitted to be charged thereafter to the City and its inhabitants. After the coming in of the answer the case was referred to a special master, there was an investigation of the usual kind, a report and afterwards a final decree for the Water Company, vitiated by the judge's assumption that he was bound by the master's findings of fact. But I need not dwell upon this mistake, because in my opinion the decision ought to be reversed upon a more important ground. In some instances it would be proper to send back the case for further consideration, *Wilson Cypress Co.* v. *Del Pozo*, 236 U. S. 635, 657; *Brown* v. *Fletcher*, 237 U. S. 583; *Marconi Wireless Telegraph Co.* v. *Simon*, decided to-day; *ante*, 46, but that is unnecessary when there is disclosed a fundamental bar to the bill, and I may add that, if this be the fact, no omission to raise the point in technical form would induce this Court to enter a decree contrary to the manifest equities of the case. Rule 35.

The Water Company occupied the streets of Denver with its pipes under an ordinance of April 10, 1890, and it is not denied that the franchise granted by that ordinance had expired. *Denver* v. *New York Trust Co.*, 229 U. S. 123. I am of opinion that the ordinance complained of does not grant a new term. Perhaps an instrument could be framed that granted while it said that it did not. But this ordinance qualifies all that follows by a preamble that recites that the Water Company is "without a franchise and a mere tenant by sufferance of the streets of the City and County of Denver" and then, "without in any manner recognizing said The Denver Union Water Company's right to occupy the streets of the City and County of Denver, or to continue its service as a water carrier,

but for the purpose of regulating and reducing the charges made by it during the time it shall further act as a water carrier and tenant by sufferance of said streets," goes on to fix the rates. It seems to me plain that the rates subsequently established even though purporting to be monthly or semi-annual are established subject to the preliminary declaration, and to the chance of the practically improbable earlier termination of the license or tenancy at sufferance. The ordinance does not attempt to require the Company to furnish water but simply fixes a limit to its charges while it does furnish it as such tenant at sufferance. While the service continues it is charged with a public interest and is subject to regulation by law. The question at the bottom of the case is what elements, if any, the Company has a constitutional right to have taken into account in determining whether the rates ordained are confiscatory, and, more generally, whether it has any constitutional rights at all in the matter of rates.

We must assume that the Water Company may be required, within a reasonable time, to remove its pipes from the streets. *Detroit United Railway* v. *Detroit*, 229 U. S. 39, 46. And, to illustrate the problem, it may be asked how a company in that situation can assert a constitutional right to a return upon the value that those pipes would have if there under a permanent right of occupation, as against a city that is legally entitled to reduce them to their value as old iron by ordering them to be removed at once. In view of that right of the City, which, if exercised, would make the Company's whole plant valueless as such, the question recurs whether the fixing of any rate by the City could be said to confiscate property on the ground that the return was too low.

I understand that the Water Company has a right to stop furnishing water, corresponding to the right of the City to order out the pipes. It is hard to see how prop-

erty could be confiscated by the establishment of almost any rate when whatever value it would have over and above that dependent upon the use of the pipes would remain to the Company if it stopped using them and therefore was in the Company's hands to preserve. The ordinance of the City could mean no more than that the Company must accept the City's rates or stop—and as it could be stopped by the City out and out, the general principle is that it could be stopped unless a certain price should be paid. *Lloyd* v. *Dollison*, 194 U. S. 445, 449. *Ashley* v. *Ryan*, 153 U. S. 436, 443, 444. See *Denver* v. *New York Trust Co.*, 229 U. S. 123, 141, 142. It is true that this principle has not been applied in cases where the condition tended to bring about a state of things that there was a predominant public interest to prevent, but I see no ground for the application here of anything to be deduced from *Western Union Telegraph Co.* v. *Kansas*, 216 U. S. 1; *Pullman Co.* v. *Kansas*, 216 U. S. 56, or *Motion Picture Patents Co.* v. *Universal Film Manufacturing Co.*, 243 U. S. 502.

It may be said that to argue from such abstract rights is to discuss the case *in vacuo*—that practically the Company cannot stop furnishing water without being ruined, or the City stop receiving it without being destroyed. And no doubt this is true—but it also is true and not quite as tautologous as it seems, that the law knows nothing but legal rights. Something more than the strong probability that an enjoyment will continue must be shown in order to make an otherwise lawful uncompensated interference with it a wrong. See *Matter of City of Brooklyn*, 143 N. Y. 596, 616. *S. C.*, 166 U. S. 685. Or conversely if a legal title is taken it must be paid for in full notwithstanding a strong probability that the enjoyment of the property will continue long undisturbed. *Howe* v. *Weymouth*, 148 Massachusetts, 605, 606, 607. So here the mutual dependence of the parties upon each

other in fact does not affect the consequences of their independence of each other in law. The question before us is not what would be a fair compensation as between a necessary customer and a necessary seller, but simply whether the property of the Company is taken without due process of law by the City's fixing rates for a service, while it continues, that the Company may discontinue at will and the City may order tomorrow to stop. I am of opinion that it is not. See *Monongahela Navigation Co.* v. *United States*, 148 U. S. 312, 340, 341. *Appelton Water Works Co.* v. *Railroad Commission*, 154 Wisconsin, 121, 136, 137. Whatever may be the duty of the City toward its inhabitants, that cannot enlarge its obligations to the Company or of the Company to it after the franchise of the latter has expired, or change the meaning of an ordinance that to my mind is plain upon its face. I presume that if it be necessary the City or the Legislature can take the water works by eminent domain.

The question is different from that which would arise upon a franchise having but a short time to run but still in force. It might be argued that the short life was a fact to be considered, as no doubt it would be in some connections. See *Monongahela Navigation Co.* v. *United States*, 148 U. S. 312, 344; *West Springfield* v. *West Springfield Aqueduct Co.*, 167 Massachusetts, 128, 135; *Kennebec Water District* v. *Waterville*, 97 Maine, 185, 205. Or it well may be that while a limited franchise is in force the very fact that the Company has to rely upon the returns during the life of the franchise to reimburse its outlay and give it whatever profit it can make, entitles it to returns during that period unaffected by the approach of the end. There is no such question here.

MR. JUSTICE BRANDEIS and MR. JUSTICE CLARKE concur with this opinion.
